OpenXR™ is a cross-platform API that enables a continuum of real-and-virtual combined environments generated by computers through human-machine interaction and is inclusive of the technologies associated with virtual reality, augmented reality, and mixed reality.

More information and specifications at kkhronos.org/openxr

OpenXR API Overview

**Instances**
- GetInstanceProcAddr
- EnumerateInstanceExtensionProperties
- CreateInstance
- DestroyInstance
- GetInstanceProperties

**Sessions**
- CreateSession
- BeginSession
- EndSession
- DestroySession

**Systems**
- GetSystem
- GetSystemProperties
- EnumerateEnvironmentBlendModes

**View Configurations**
- EnumerateViewConfigurations
- GetViewConfigurationProperties
- EnumerateViewConfigurationViews
- LocateViews

**Swapchains**
- EnumerateSwapchainFormats
- CreateSwapchain
- DestroySwapchain
- EnumerateSwapchainImages
- AcquireSwapchainImage
- WaitSwapchainImage
- ReleaseSwapchainImage

**Spaces**
- EnumerateReferenceSpaces
- CreateReferenceSpace
- CreateActionSpace
- LocateSpace
- GetReferenceSpaceBoundsRect
- DestroySpace

**Events**
- PollEvent

**Input and Haptics**
- CreateAction
- DestroyAction
- CreateActionSet
- DestroyActionSet
- GetActionState
- SyncActionData
- GetBoundSourceForAction
- GetInputSourceLocalizedName
- SetInteractionProfileSuggestedBindings
- GetCurrentInteractionProfile
- ApplyHapticFeedback
- StopHapticFeedback

**Render Loop**
- WaitFrame
- BeginFrame
- EndFrame

**Helper Functions**
- ResultToString
- StructureTypeToString
- StringToPath
- PathToString

API Layers

Various layers can be enabled to enhance functionality such as a validation layer, or tracing layer.

Instances

Application’s representation of the OpenXR runtime.

The CreateInstance function calls the loader to determine which installed OpenXR runtime to connect to.

Events

Events are messages sent from the runtime into a queue from which the application will read one at a time.

Sessions

An active interaction between the application and the runtime.

An application indicates it wants to render by beginning a session.

Spaces

Frame of reference, how to track real and virtual objects and their relative motion.

OpenXR defines 3 reference spaces, VIEW, LOCAL, and STAGE.

Input and Haptics

Create action and action spaces

```
xrCreateAction
  name = “teleport”
  type = XR_INPUT_ACTION_TYPE_BOOLEAN

name = “teleport_ray”
  type = XR_INPUT_ACTION_TYPE_POSE

xrCreateActionSpace
  action = “teleport_ray”
```

OpenXR separates the application actions such as Move, Jump, and Teleport from the input device: Trigger, Thumbstick, and Button. This simplifies support for different or future input devices and maximizes user accessibility.

Set up interaction profile bindings

```
xrSetInteractionProfileSuggestedBindings
  /interaction_profiles/oculus/touch_controller
  Action “teleport”
    -> /user/hand/right/input/a/click
  Action “teleport_ray”
    -> /user/hand/right/input/pointer/pose

  /interaction_profiles/htc/vive_controller
  Action “teleport”
    -> /user/hand/right/input/trackpad/click
  Action “teleport_ray”
    -> /user/hand/right/input/pointer/pose
```

Interaction profiles identify a collection of buttons and other input sources in a physical arrangement to allow applications and runtimes to coordinate action to input mapping. Interaction profiles for well known XR systems are included in the specification.

Get action states

```
xrGetActionStateBoolean (“teleport_ray”)
if (state.currentState) // button is pressed
{
  xrLocateSpace (teleport_ray_space,
  stage_reference_space);
}
```
OpenXR Application Lifecycle
A high level overview of a typical OpenXR application including the order of function calls, creation of objects, session state changes, and the rendering loop. Refer to the OpenXR specification at khronos.org/openxr for details.
