## 1 Introduction

This is the specification of **OpenCL.std.21** extended instruction set.

The library is imported into a SPIR-V module in the following manner:

```
<ext-inst-id> OpExtInstImport "OpenCL.std.21"
```

The library can only be imported when **Memory Model** is set to **OpenCL21**

## 2 Binary Form

This section contains the semantics and exact form of execution of OpenCL 2.1 extended instructions using the **OpExtInst** instruction.

In this section we use the following naming conventions:

- *void* denote an **OpTypeVoid**.
  - *half*, *float* and *double* denote an **OpTypeFloat** with a width of 16, 32 and 64 bits respectively.
  - *i8*, *i16*, *i32* and *i64* denote an **OpTypeInt** with a width of 8, 16, 32 and 64 bits respectively.
  - *bool* denotes an **OpTypeBool**.
  - *size\_t* denotes an *i32* when the **Addressing Model** is **Physical32** and *i64* when the **Addressing Model** is **Physical64**.
-

- *vector*( $n$ ) denotes an **OpTypeVector** where  $n$  indicates the component count.
  - *vector*( $n_1, n_2, \dots, n_i$ ) abbreviates *vector*( $n_1$ ), *vector*( $n_2$ ), ... or *vector*( $n_i$ ).
- *integer* denotes *i8*, *i16*, *i32* or *i64*.
- *floating-point* denotes *half*, *float*, *double*.
- *pointer*(*storage*) denotes an **OpTypePointer** which points to *storage* **Storage Class**.
  - *pointer*(*constant*) denotes an OpTypePointer with **UniformConstant Storage Class**.
  - *pointer*(*generic*) denotes an OpTypePointer with **Generic Storage Class**.
  - *pointer*(*global*) denotes an OpTypePointer with **WorkgroupGlobal Storage Class**.
  - *pointer*(*local*) denotes an OpTypePointer with **WorkgroupLocal Storage Class**.
  - *pointer*(*private*) denotes an OpTypePointer with **Private Storage Class**.
  - *pointer*( $s_1, s_2, \dots, s_i$ ) abbreviates *pointer*( $s_1$ ), *pointer*( $s_2$ ), ... or *pointer*( $s_i$ ).
- *image* defines all types of image memory objects (See [image encoding](#) section).
- *sampler* a SPIR-V sampler object (See [sampler encoding](#) section).

## 2.1 Math extended instructions

This section describes the list of external math instructions. The external math instructions are categorized into the following:

- A list of instructions that have scalar or vector argument versions, and,
- A list of instructions that only take scalar float arguments.

The vector versions of the math instructions operate component-wise. The description is per-component.

The math instructions are not affected by the prevailing rounding mode in the calling environment, and always return the same value as they would if called with the round to nearest even rounding mode.

---

<b>acos</b>						
Compute the arc cosine of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	0	<id> $x$

<b>acosh</b>						
Compute the inverse hyperbolic cosine of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	1	<id> $x$

<b>acospi</b>						
Compute $\text{acos}(x) / \pi$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	2	<id> $x$

<b>asin</b>						
Compute the arc sine of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	3	<id> $x$

<b>asinh</b>						
Compute the inverse hyperbolic sine of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	4	<id> $x$

<b>asinpi</b>						
Compute $\text{asin}(x) / \pi$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	5	<id> $x$

<b>atan</b>						
Compute the arc tangent of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	6	<id> $x$

<b>atan2</b>							
Compute the arc tangent of $y / x$ .							
<i>Result Type</i> , $y$ and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.							
All of the operands, including the <i>Result Type</i> operand, must be of the same type.							
7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	7	<id> $y$	<id> $x$

<b>atanh</b>						
Compute the hyperbolic arc tangent of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	8	<id> $x$

<b>atanpi</b>						
Compute $\text{atan}(x) / \pi$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	9	<id> $x$

<b>atan2pi</b>							
Compute $\text{atan2}(y, x) / \pi$ .							
<i>Result Type</i> , $y$ and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.							
All of the operands, including the <i>Result Type</i> operand, must be of the same type.							
7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	10	<id> $y$	<id> $x$

<b>cbrt</b>						
Compute the cube-root of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	11	<id> $x$

<b>ceil</b>						
Round $x$ to integral value using the round to positive infinity rounding mode.						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	12	<id> $x$

<b>copysign</b>							
Returns $x$ with its sign changed to match the sign of $y$ .							
<i>Result Type</i> , $x$ and $y$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.							
All of the operands, including the <i>Result Type</i> operand, must be of the same type.							
7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	13	<id> $x$	<id> $y$

<b>cos</b>						
Compute the cosine of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	14	<id> $x$

<b>cosh</b>						
Compute the hyperbolic cosine of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	15	<id> $x$

<b>cospi</b>						
Compute $\cos(x) / \pi$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	16	<id> $x$

<b>erfc</b>						
Complementary error function of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	17	<id> $x$

<b>erf</b>						
Error function of $x$ encountered in integrating the normal distribution.						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	18	<id> $x$

<b>exp</b>						
Compute the base-e exponential of $x$ . (i.e. $e^x$ )						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	19	<id> $x$

<b>exp2</b>						
Computes 2 raised to the power of $x$ . (i.e. $2^x$ )						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	20	<id> $x$

<b>exp10</b>						
Computes 10 raised to the power of $x$ . (i.e. $10^x$ )						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	21	<id> $x$

<b>expm1</b>						
Computes $e^x - 1.0$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	22	<id> $x$

<b>fabs</b>						
Compute the absolute value of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	23	<id> $x$

**fdim**

Compute  $x - y$  if  $x > y$ ,  $+0$  if  $x$  is less than or equal to  $y$ .

*Result Type*,  $x$  and  $y$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	24	<id> $x$	<id> $y$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	-------------

**floor**

Round  $x$  to the integral value using the round to negative infinity rounding mode.

*Result Type* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	25	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**fma**

Compute the correctly rounded floating-point representation of the sum of  $c$  with the infinitely precise product of  $a$  and  $b$ . Rounding of intermediate products shall not occur. Edge case behavior is per the IEEE 754-2008 standard.

*Result Type*,  $a$ ,  $b$  and  $c$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	26	<id> $a$	<id> $b$	<id> $c$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	-------------	-------------

**fmax**

Returns  $y$  if  $x < y$ , otherwise it returns  $x$ . If one argument is a NaN, *Fmax* returns the other argument. If both arguments are NaNs, *Fmax* returns a NaN.

*Result Type*,  $x$  and  $y$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

**Note:** fmax behave as defined by C99 and may not match the IEEE 754-2008 definition for maxNum with regard to signaling NaNs. Specifically, signaling NaNs may behave as quiet NaNs

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	27	<id> $x$	<id> $y$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	-------------

**fmin**

Returns  $y$  if  $y < x$ , otherwise it returns  $x$ . If one argument is a NaN, *Fmin* returns the other argument. If both arguments are NaNs, *Fmin* returns a NaN.

*Result Type*,  $x$  and  $y$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

**Note:** *fmin* behave as defined by C99 and may not match the IEEE 754-2008 definition for *minNum* with regard to signaling NaNs. Specifically, signaling NaNs may behave as quiet NaNs

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	28	<id> $x$	<id> $y$
---	----	----------------------------	--------------------------	--------------------------------------	----	-------------	-------------

**fmod**

Modulus. Returns  $x - y * \text{trunc}(x/y)$ .

*Result Type*,  $x$  and  $y$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	29	<id> $x$	<id> $y$
---	----	----------------------------	--------------------------	--------------------------------------	----	-------------	-------------

**fract**

Returns  $\text{fmin}(x - \text{floor}(x), 0x1.\text{ffffep-1f} - \text{floor}(x))$  is returned in *ptr*.

*Result Type* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

*ptr* must be a *pointer(generic)* to *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type, or must be a pointer to the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	30	<id> $x$	<id> <i>ptr</i>
---	----	----------------------------	--------------------------	--------------------------------------	----	-------------	--------------------

**frexp**

Extract the mantissa and exponent from  $x$ . The *Result Type* holds the mantissa, and  $exp$  points to the exponent. For each component the mantissa returned is a *floating-point* with magnitude in the interval  $[1/2, 1)$  or 0. Each component of  $x$  equals mantissa returned  $\times 2^{exp}$ .

*Result Type* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

$exp$  must be a *pointer(generic)* to *i32* or *vector(2,3,4,8,16)* of *i32* values.

*Result Type* and  $x$  operands must be of the same type.  $exp$  operand must point to an *i32* with the same component count as *Result Type* and  $x$  operands.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	31	<id> $x$	<id> $exp$
---	----	----------------------------	--------------------------	--------------------------------------	----	-------------	---------------

**hypot**

Compute the value of the square root of  $x^2 + y^2$  without undue overflow or underflow.

*Result Type*,  $x$  and  $y$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	32	<id> $x$	<id> $y$
---	----	----------------------------	--------------------------	--------------------------------------	----	-------------	-------------

**ilogb**

Return the exponent of  $x$  as an *i32* value.

*Result Type* must be *i32* or *vector(2,3,4,8,16)* of *i32* values.

$x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

*Result Type* and  $x$  operands must have the same component count.

6	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	33	<id> $x$	
---	----	----------------------------	--------------------------	--------------------------------------	----	-------------	--

**ldexp**

Multiply  $x$  by 2 to the power  $k$ .

$k$  must be *i32* or *vector(2,3,4,8,16)* of *i32* values.

*Result Type* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

*Result Type* and  $x$  operands must be of the same type. *exp* operand must have the same component count as *Result Type* and  $x$  operands.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	34	<id> $x$	<id> $k$
---	----	----------------------------	--------------------------	--------------------------------------	----	-------------	-------------

**lgamma**

Log gamma function of  $x$ . Returns the natural logarithm of the absolute value of the gamma function.

*Result Type* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

6	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	35	<id> $x$
---	----	----------------------------	--------------------------	--------------------------------------	----	-------------

**lgamma\_r**

Log gamma function of  $x$ . Returns the natural logarithm of the absolute value of the gamma function. The sign of the gamma function is returned in the *signp* operand

*Result Type* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

*signp* must be a *pointer(generic)* to *i32* or *vector(2,3,4,8,16)* of *i32* values.

*Result Type* and  $x$  operands must be of the same type. *signp* operand must point to an *i32* with the same component count as *Result Type* and  $x$  operands.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	36	<id> $x$	<id> <i>signp</i>
---	----	----------------------------	--------------------------	--------------------------------------	----	-------------	----------------------

**log**

Compute natural logarithm of  $x$ .

*Result Type* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

6	44	<i>&lt;id&gt;</i> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <i>&lt;id&gt;</i>	37	<i>&lt;id&gt;</i> <i>x</i>
---	----	---	--------------------------	---	----	-------------------------------

**log2**

Compute a base 2 logarithm of  $x$ .

*Result Type* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

6	44	<i>&lt;id&gt;</i> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <i>&lt;id&gt;</i>	38	<i>&lt;id&gt;</i> <i>x</i>
---	----	---	--------------------------	---	----	-------------------------------

**log10**

Compute a base 10 logarithm of  $x$ .

*Result Type* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

6	44	<i>&lt;id&gt;</i> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <i>&lt;id&gt;</i>	39	<i>&lt;id&gt;</i> <i>x</i>
---	----	---	--------------------------	---	----	-------------------------------

**log1p**

Compute  $\log_e(1.0 + x)$ .

*Result Type* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

6	44	<i>&lt;id&gt;</i> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <i>&lt;id&gt;</i>	40	<i>&lt;id&gt;</i> <i>x</i>
---	----	---	--------------------------	---	----	-------------------------------

**logb**

Compute the exponent of  $x$ , which is the integral part of  $\log_r |x|$ .

*Result Type* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

6	44	<i>&lt;id&gt;</i> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <i>&lt;id&gt;</i>	41	<i>&lt;id&gt;</i> <i>x</i>
---	----	---	--------------------------	---	----	-------------------------------

**mad**

mad approximates  $a * b + c$ . Whether or how the product of  $a * b$  is rounded and how supernormal or subnormal intermediate products are handled is not defined. mad is intended to be used where speed is preferred over accuracy

*Result Type*,  $a$ ,  $b$  and  $c$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

**Note:** For some usages, e.g.  $\text{mad}(a, b, -a*b)$ , the definition of  $\text{mad}()$  is loose enough that almost any result is allowed from  $\text{mad}()$  for some values of  $a$  and  $b$ .

8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	42	<id> $a$	<id> $b$	<id> $c$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	-------------	-------------

**maxmag**

Returns  $x$  if  $|x| > |y|$ ,  $y$  if  $|y| > |x|$ , otherwise  $\text{fmax}(x, y)$ .

*Result Type*,  $x$  and  $y$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	43	<id> $x$	<id> $y$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	-------------

**minmag**

Returns  $x$  if  $|x| < |y|$ ,  $y$  if  $|y| < |x|$ , otherwise  $\text{fmin}(x, y)$ .

*Result Type*,  $x$  and  $y$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	44	<id> $x$	<id> $y$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	-------------

**modf**

Decompose a *floating-point* number. The modf function breaks the argument  $x$  into integral and fractional parts, each of which has the same sign as the argument. It stores the integral part in the object pointed to by *iptr*

*Result Type* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

*iptr* must be a *pointer(generic)* to *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type, or must be a pointer to the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	45	<id> <i>x</i>	<id> <i>iptr</i>
---	----	----------------------------	--------------------------	--------------------------------------	----	------------------	---------------------

**nan**

Returns a quiet NaN. The *nancode* may be placed in the significand of the resulting NaN.

*nancode* must be *i32* or *vector(2,3,4,8,16)* of *i32* values.

*Result Type* must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

*Result Type* and *nancode* operands must have the same component count.

6	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	46	<id> <i>nancode</i>
---	----	----------------------------	--------------------------	--------------------------------------	----	------------------------

**nextafter**

Computes the next representable *floating-point* value following *x* in the direction of *y*. Thus, if *y* is less than *x*, *nextafter()* returns the largest representable floating-point number less than *x*.

*Result Type*, *x* and *y* must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	47	<id> <i>x</i>	<id> <i>y</i>
---	----	----------------------------	--------------------------	--------------------------------------	----	------------------	------------------

**pow**

Compute *x* to the power *y*.

*Result Type*, *x*, *y* and *x* must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

8	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	48	<id> <i>x</i>	<id> <i>y</i>	<id> <i>x</i>
---	----	----------------------------	--------------------------	--------------------------------------	----	------------------	------------------	------------------

**pown**

Compute  $x$  to the power  $y$ , where  $y$  is an *i32* integer.

$y$  must be *i32* or *vector(2,3,4,8,16)* of *i32* values.

*Result Type* must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

*Result Type* and  $x$  operands must be of the same type.  $y$  operand must have the same component count as *Result Type* and  $x$  operands.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	49	<id> $y$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**powr**

Compute  $x$  to the power  $y$ , where  $y$  is an integer.

*Result Type*,  $x$  and  $y$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	50	<id> $x$	<id> $y$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	-------------

**remainder**

Compute the value  $r$  such that  $r = x - n*y$ , where  $n$  is the integer nearest the exact value of  $x/y$ . If there are two integers closest to  $x/y$ ,  $n$  shall be the even one. If  $r$  is zero, it is given the same sign as  $x$ .

*Result Type*,  $x$  and  $y$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	51	<id> $x$	<id> $y$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	-------------

**remquo**

The `remquo` function computes the value  $r$  such that  $r = x - k*y$ , where  $k$  is the integer nearest the exact value of  $x/y$ . If there are two integers closest to  $x/y$ ,  $k$  shall be the even one. If  $r$  is zero, it is given the same sign as  $x$ . This is the same value that is returned by the `remainder` function. `remquo` also calculates the lower seven bits of the integral quotient  $x/y$ , and gives that value the same sign as  $x/y$ . It stores this signed value in the object pointed to by `quo`.

*Result Type*,  $x$  and  $y$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

`quo` must be a *pointer(generic)* to *i32* or *vector(2,3,4,8,16)* of *i32* values.

*Result Type*,  $x$  and  $y$  operands must be of the same type. `quo` operand must point to an *i32* with the same component count as *Result Type*,  $x$  and  $y$  operands.

8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	52	<id> $x$	<id> $y$	<id> <code>quo</code>
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	-------------	--------------------------

**rint**

Round  $x$  to integral value (using round to nearest even rounding mode) in floating-point format.

*Result Type* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	53	<id> $x$		
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	--	--

**rootn**

Compute  $x$  to the power  $1/y$ .

$y$  must be *i32* or *vector(2,3,4,8,16)* of *i32* values.

*Result Type* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

*Result Type* and  $x$  operands must be of the same type.  $y$  operand must have the same component count as *Result Type* and  $x$  operands.

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	54	<id> $x$	<id> $y$	
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	-------------	--

<b>round</b>						
Return the integral value nearest to $x$ rounding halfway cases away from zero, regardless of the current rounding direction.						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	55	<id> $x$

<b>rsqrt</b>						
Compute inverse square root of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	56	<id> $x$

<b>sin</b>						
Compute sine of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	57	<id> $x$

<b>sincos</b>							
Compute sine and cosine of $x$ . The computed sine is the return value and computed cosine is returned in <i>cosval</i> .							
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.							
<i>cosval</i> must be a <i>pointer(generic)</i> to <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.							
All of the operands, including the <i>Result Type</i> operand, must be of the same type, or must be a pointer to the same type.							
7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	58	<id> $x$	<id> <i>cosval</i>

<b>sinh</b>						
Compute hyperbolic sine of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	59	<id> $x$

<b>sinpi</b>						
Compute $\sin(\pi x)$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	60	<id> $x$

<b>sqrt</b>						
Compute square root of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	61	<id> $x$

<b>tan</b>						
Compute tangent of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	62	<id> $x$

<b>tanh</b>						
Compute hyperbolic tangent of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	63	<id> $x$

<b>tanpi</b>						
Compute $\tan(\pi x)$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	64	<id> $x$

<b>tgamma</b>						
Compute the gamma function of $x$ .						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	65	<id> $x$

<b>trunc</b>						
Round $x$ to integral value using the round to zero rounding mode.						
<i>Result Type</i> and $x$ must be <i>floating-point</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	66	<id> $x$

**half\_cos**

Compute cosine of  $x$ , where  $x$  must be in the range  $-2^{16} \dots +2^{16}$ .

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

This function is implemented with a minimum of 10-bits of accuracy i.e. an ULP value  $\Leftarrow$  8192 ulp.

The support for denormal values is optional and may return any result allowed even when `-cl-denormals-are-zero` flag is not in force.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	67	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**half\_divide**

Compute  $x / y$ .

*Result Type*,  $x$  and  $y$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

This function is implemented with a minimum of 10-bits of accuracy i.e. an ULP value  $\Leftarrow$  8192 ulp.

The support for denormal values is optional and may return any result allowed even when `-cl-denormals-are-zero` flag is not in force.

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	68	<id> $x$	<id> $y$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	-------------

**half\_exp**

Compute the base-e exponential of  $x$ .

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

This function is implemented with a minimum of 10-bits of accuracy i.e. an ULP value  $\Leftarrow$  8192 ulp.

The support for denormal values is optional and may return any result allowed even when `-cl-denormals-are-zero` flag is not in force.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	69	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**half\_exp2**

Compute the base- 2 exponential of  $x$ .

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

This function is implemented with a minimum of 10-bits of accuracy i.e. an ULP value  $\Leftarrow$  8192 ulp.

The support for denormal values is optional and may return any result allowed even when *-cl-denormals-are-zero* flag is not in force.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	70	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**half\_exp10**

Compute the base- 10 exponential of  $x$ .

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

This function is implemented with a minimum of 10-bits of accuracy i.e. an ULP value  $\Leftarrow$  8192 ulp.

The support for denormal values is optional and may return any result allowed even when *-cl-denormals-are-zero* flag is not in force.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	71	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**half\_log**

Compute natural logarithm of  $x$ .

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

This function is implemented with a minimum of 10-bits of accuracy i.e. an ULP value  $\Leftarrow$  8192 ulp.

The support for denormal values is optional and may return any result allowed even when *-cl-denormals-are-zero* flag is not in force.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	72	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**half\_log2**

Compute a base 2 logarithm of  $x$ .

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

This function is implemented with a minimum of 10-bits of accuracy i.e. an ULP value  $\Leftarrow$  8192 ulp.

The support for denormal values is optional and may return any result allowed even when `-cl-denormals-are-zero` flag is not in force.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	73	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**half\_log10**

Compute a base 10 logarithm of  $x$ .

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

This function is implemented with a minimum of 10-bits of accuracy i.e. an ULP value  $\Leftarrow$  8192 ulp.

The support for denormal values is optional and may return any result allowed even when `-cl-denormals-are-zero` flag is not in force.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	74	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**half\_powr**

Compute  $x$  to the power  $y$ , where  $x$  is  $\geq 0$ .

*Result Type*,  $x$  and  $y$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

This function is implemented with a minimum of 10-bits of accuracy i.e. an ULP value  $\Leftarrow$  8192 ulp.

The support for denormal values is optional and may return any result allowed even when `-cl-denormals-are-zero` flag is not in force.

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	75	<id> $x$	<id> $y$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	-------------

**half\_recip**

Compute reciprocal of  $x$ .

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

This function is implemented with a minimum of 10-bits of accuracy i.e. an ULP value  $\Leftarrow$  8192 ulp.

The support for denormal values is optional and may return any result allowed even when `-cl-denormals-are-zero` flag is not in force.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	76	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**half\_rsqrt**

Compute inverse square root of  $x$ .

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

This function is implemented with a minimum of 10-bits of accuracy i.e. an ULP value  $\Leftarrow$  8192 ulp.

The support for denormal values is optional and may return any result allowed even when `-cl-denormals-are-zero` flag is not in force.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	77	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**half\_sin**

Compute sine of  $x$ , where  $x$  must be in the range  $-2^{16} \dots +2^{16}$ .

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

This function is implemented with a minimum of 10-bits of accuracy i.e. an ULP value  $\Leftarrow$  8192 ulp.

The support for denormal values is optional and may return any result allowed even when `-cl-denormals-are-zero` flag is not in force.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	78	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**half\_sqrt**

Compute the square root of  $x$ .

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

This function is implemented with a minimum of 10-bits of accuracy i.e. an ULP value  $\Leftarrow$  8192 ulp.

The support for denormal values is optional and may return any result allowed even when `-cl-denormals-are-zero` flag is not in force.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	79	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**half\_tan**

Compute tangent value of  $x$ , where  $x$  must be in the range  $-2^{16} \dots +2^{16}$ .

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

This function is implemented with a minimum of 10-bits of accuracy i.e. an ULP value  $\Leftarrow$  8192 ulp.

The support for denormal values is optional and may return any result allowed even when `-cl-denormals-are-zero` flag is not in force.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	80	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**native\_cos**

Compute cosine of  $x$  over an implementation-defined range. The maximum error is implementation-defined.

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

The function may map to one or more native device instructions and will typically have better performance compared to the non native corresponding functions. Support for denormal values is implementation-defined for this function

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	81	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**native\_divide**

Compute  $x / y$  over an implementation-defined range. The maximum error is implementation-defined.

*Result Type*,  $x$  and  $y$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

The function may map to one or more native device instructions and will typically have better performance compared to the non native corresponding functions. Support for denormal values is implementation-defined for this function

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	82	<id> $x$	<id> $y$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	-------------

**native\_exp**

Compute the base-e exponential of  $x$  over an implementation-defined range. The maximum error is implementation-defined.

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

The function may map to one or more native device instructions and will typically have better performance compared to the non native corresponding functions. Support for denormal values is implementation-defined for this function

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	83	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**native\_exp2**

Compute the base- 2 exponential of  $x$  over an implementation-defined range. The maximum error is implementation-defined..

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

The function may map to one or more native device instructions and will typically have better performance compared to the non native corresponding functions. Support for denormal values is implementation-defined for this function

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	84	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**native\_exp10**

Compute the base- 10 exponential of  $x$  over an implementation-defined range. The maximum error is implementation-defined..

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

The function may map to one or more native device instructions and will typically have better performance compared to the non native corresponding functions. Support for denormal values is implementation-defined for this function

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	85	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**native\_log**

Compute natural logarithm of  $x$  over an implementation-defined range. The maximum error is implementation-defined.

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

The function may map to one or more native device instructions and will typically have better performance compared to the non native corresponding functions. Support for denormal values is implementation-defined for this function

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	86	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**native\_log2**

Compute a base 2 logarithm of  $x$  over an implementation-defined range. The maximum error is implementation-defined.

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

The function may map to one or more native device instructions and will typically have better performance compared to the non native corresponding functions. Support for denormal values is implementation-defined for this function

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	87	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**native\_log10**

Compute a base 10 logarithm of  $x$  over an implementation-defined range. The maximum error is implementation-defined.

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

The function may map to one or more native device instructions and will typically have better performance compared to the non native corresponding functions. Support for denormal values is implementation-defined for this function

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	88	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**native\_powr**

Compute  $x$  to the power  $y$ , where  $x$  is  $\geq 0$ .

*Result Type*,  $x$  and  $y$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

The function may map to one or more native device instructions and will typically have better performance compared to the non native corresponding functions. Support for denormal values is implementation-defined for this function

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	89	<id> $x$	<id> $y$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	-------------

**native\_recip**

Compute reciprocal of  $x$  over an implementation-defined range. The range of  $x$  and  $y$  are implementation-defined. The maximum error is implementation-defined.

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

The function may map to one or more native device instructions and will typically have better performance compared to the non native corresponding functions. Support for denormal values is implementation-defined for this function

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	90	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**native\_rsqrt**

Compute inverse square root of  $x$  over an implementation-defined range. The maximum error is implementation-defined.

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

The function may map to one or more native device instructions and will typically have better performance compared to the non native corresponding functions. Support for denormal values is implementation-defined for this function

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	91	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**native\_sin**

Compute sine of  $x$  over an implementation-defined range. The maximum error is implementation-defined.

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

The function may map to one or more native device instructions and will typically have better performance compared to the non native corresponding functions. Support for denormal values is implementation-defined for this function

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	92	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

**native\_sqrt**

Compute the square root of  $x$  over an implementation-defined range. The maximum error is implementation-defined.

*Result Type* and  $x$  must be *float* or *vector(2,3,4,8,16)* of *float* values.

All of the operands, including the *Result Type* operand, must be of the same type.

The function may map to one or more native device instructions and will typically have better performance compared to the non native corresponding functions. Support for denormal values is implementation-defined for this function

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	93	<id> $x$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------

<b>native_tan</b>						
Compute tangent value of $x$ over an implementation-defined range. The maximum error is implementation-defined.						
<i>Result Type</i> and $x$ must be <i>float</i> or <i>vector(2,3,4,8,16)</i> of <i>float</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
The function may map to one or more native device instructions and will typically have better performance compared to the non native corresponding functions. Support for denormal values is implementation-defined for this function						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	94	<id> $x$

## 2.2 Integer instructions

This section describes the list of integer instructions that take scalar or vector arguments. The vector versions of the integer functions operate component-wise. The description is per-component.

<b>s_abs</b>						
Returns $ x $ , where $x$ is treated as signed integer.						
<i>Result Type</i> and $x$ must be <i>integer</i> or <i>vector(2,3,4,8,16)</i> of <i>integer</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	141	<id> $x$

<b>s_abs_diff</b>							
Returns $ x - y $ without modulo overflow, where $x$ and $y$ are treated as signed integers.							
<i>Result Type</i> , $x$ and $y$ must be <i>integer</i> or <i>vector(2,3,4,8,16)</i> of <i>integer</i> values.							
All of the operands, including the <i>Result Type</i> operand, must be of the same type.							
7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	142	<id> $x$	<id> $y$

**s\_add\_sat**

Returns the saturated value of  $x + y$ , where  $x$  and  $y$  are treated as signed integers.

*Result Type*,  $x$  and  $y$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	143	<id> $x$	<id> $y$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	-------------

**u\_add\_sat**

Returns the saturated value of  $x + y$ , where  $x$  and  $y$  are treated as unsigned integers.

*Result Type*,  $x$  and  $y$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	144	<id> $x$	<id> $y$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	-------------

**s\_hadd**

Returns the value of  $(x + y) \gg 1$ , where  $x$  and  $y$  are treated as signed integers. The intermediate sum does not modulo overflow.

*Result Type*,  $x$  and  $y$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	145	<id> $x$	<id> $y$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	-------------

**u\_hadd**

Returns the value of  $(x + y) \gg 1$ , where  $x$  and  $y$  are treated as unsigned integers. The intermediate sum does not modulo overflow.

*Result Type*,  $x$  and  $y$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	146	<id> $x$	<id> $y$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	-------------

**s\_rhadd**

Returns the value of  $(x + y + 1) \gg 1$ , where  $x$  and  $y$  are treated as signed integers. The intermediate sum does not modulo overflow.

*Result Type*,  $x$  and  $y$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	147	<id> $x$	<id> $y$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	-------------

**u\_rhadd**

Returns the value of  $(x + y + 1) \gg 1$ , where  $x$  and  $y$  are treated as unsigned integers. The intermediate sum does not modulo overflow.

*Result Type*,  $x$  and  $y$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	148	<id> $x$	<id> $y$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	-------------

**s\_clamp**

Returns  $s\_min(s\_max(x, minval), maxval)$ . Results are undefined if  $minval > maxval$ .

*Result Type*,  $x$ ,  $minval$  and  $maxval$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

8	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	149	<id> $x$	<id> $minval$	<id> $maxval$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	------------------	------------------

**u\_clamp**

Returns  $u\_min(u\_max(x, minval), maxval)$ . Results are undefined if  $minval > maxval$ .

*Result Type*,  $x$ ,  $minval$  and  $maxval$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

8	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	150	<id> $x$	<id> $minval$	<id> $maxval$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	------------------	------------------

<b>clz</b>						
Returns the number of leading 0-bits in $x$ , starting at the most significant bit position. If $x$ is 0, returns the size in bits of the type of $x$ or component type of $x$ , if $x$ is a vector.						
<i>Result Type</i> and $x$ must be <i>integer</i> or <i>vector(2,3,4,8,16)</i> of <i>integer</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	151	<id> $x$

<b>ctz</b>						
Returns the count of trailing 0-bits in $x$ . If $x$ is 0, returns the size in bits of the type of $x$ or component type of $x$ , if $x$ is a vector.						
<i>Result Type</i> and $x$ must be <i>integer</i> or <i>vector(2,3,4,8,16)</i> of <i>integer</i> values.						
All of the operands, including the <i>Result Type</i> operand, must be of the same type.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	152	<id> $x$

<b>s_mad_hi</b>								
Returns $mul\_hi(a, b) + c$ , where $a, b$ and $c$ are treated as signed integers.								
<i>Result Type</i> , $a, b$ and $c$ must be <i>integer</i> or <i>vector(2,3,4,8,16)</i> of <i>integer</i> values.								
All of the operands, including the <i>Result Type</i> operand, must be of the same type.								
8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	153	<id> $a$	<id> $b$	<id> $c$

<b>s_max</b>							
Returns $y$ if $x < y$ , otherwise it returns $x$ , where $x$ and $y$ are treated as signed integers.							
<i>Result Type</i> , $x$ and $y$ must be <i>integer</i> or <i>vector(2,3,4,8,16)</i> of <i>integer</i> values.							
All of the operands, including the <i>Result Type</i> operand, must be of the same type.							
7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	156	<id> $x$	<id> $y$

**u\_max**

Returns  $y$  if  $x < y$ , otherwise it returns  $x$ , where  $x$  and  $y$  are treated as unsigned integers.

*Result Type*,  $x$  and  $y$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	157	<id> $x$	<id> $y$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	-------------

**s\_min**

Returns  $y$  if  $y < x$ , otherwise it returns  $x$ , where  $x$  and  $y$  are treated as signed integers.

*Result Type*,  $x$  and  $y$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	158	<id> $x$	<id> $y$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	-------------

**u\_min**

Returns  $y$  if  $y < x$ , otherwise it returns  $x$ , where  $x$  and  $y$  are treated as unsigned integers.

*Result Type*,  $x$  and  $y$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	159	<id> $x$	<id> $y$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	-------------

**s\_mul\_hi**

Computes  $x * y$  and returns the high half of the product of  $x$  and  $y$ , where  $x$  and  $y$  are treated as signed integers.

*Result Type*,  $x$  and  $y$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	160	<id> $x$	<id> $y$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	-------------

**rotate**

For each element in  $v$ , the bits are shifted left by the number of bits given by the corresponding element in  $i$ . Bits shifted off the left side of the element are shifted back in from the right.

*Result Type*,  $v$  and  $i$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	161	<id> $v$	<id> $i$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	-------------

**s\_sub\_sat**

Returns the saturated value of  $x - y$ , where  $x$  and  $y$  are treated as signed integers.

*Result Type*,  $x$  and  $y$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	162	<id> $x$	<id> $y$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	-------------

**u\_sub\_sat**

Returns the saturated value of  $x - y$ , where  $x$  and  $y$  are treated as unsigned integers.

*Result Type*,  $x$  and  $y$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	163	<id> $x$	<id> $y$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	-------------

**u\_upsample**

When *hi* and *lo* component type is i8:

Result = ((upcast... to i16)*hi* << 8) | *lo*

When *hi* and *lo* component type is i16:

Result = ((upcast... to i32)*hi* << 8) | *lo*

When *hi* and *lo* component i32:

Result = ((upcast... to i64)*hi* << 8) | *lo*

*hi* and *lo* are treated as unsigned integers.

*hi* and *lo* must be *i8*, *i16* or *i32* or *vector(2,3,4,8,16)* of *i8*, *i16* or *i32* values.

*Result Type* must be *i16*, *i32* or *i64* or *vector(2,3,4,8,16)* of *i16*, *i32* or *i64* values.

*hi* and *lo* operands must be of the same type. When *hi* and *lo* component type is i8, the *Result Type* component type must be i16. When *hi* and *lo* component type is i16, the *Result Type* component type must be i32. When *hi* and *lo* component type is i32, the *Result Type* component type must be i64. *Result Type* must have the same component count as *hi* and *lo* operands.

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	164	<id> <i>hi</i>	<id> <i>lo</i>
---	----	----------------------------	--------------------	--------------------------------------	-----	-------------------	-------------------

**s\_upsample**

When *hi* and *lo* component type is i8:

Result = ((upcast... to i16)*hi* << 8) | *lo*

When *hi* and *lo* component type is i16:

Result = ((upcast... to i32)*hi* << 8) | *lo*

When *hi* and *lo* component i32:

Result = ((upcast... to i64)*hi* << 8) | *lo*

*hi* and *lo* are treated as signed integers.

*hi* and *lo* must be *i8*, *i16* or *i32* or *vector(2,3,4,8,16)* of *i8*, *i16* or *i32* values.

*Result Type* must be *i16*, *i32* or *i64* or *vector(2,3,4,8,16)* of *i16*, *i32* or *i64* values.

*hi* and *lo* operands must be of the same type. When *hi* and *lo* component type is i8, the *Result Type* component type must be i16. When *hi* and *lo* component type is i16, the *Result Type* component type must be i32. When *hi* and *lo* component type is i32, the *Result Type* component type must be i64. *Result Type* must have the same component count as *hi* and *lo* operands.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	165	<id> <i>hi</i>	<id> <i>lo</i>
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------------	-------------------

**popcount**

Returns the number of non-zero bits in  $x$ .

*Result Type* and  $x$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

6	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	166	<id> $x$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------

**s\_mul24**

Multiply two 24-bit integer values  $x$  and  $y$  and add the 32-bit integer result to the 32-bit integer  $z$ . Refer to definition of `s_mul24` to see how the 24-bit integer multiplication is performed.

*Result Type*,  $x$ ,  $y$  and  $z$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

8	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	167	<id> $x$	<id> $y$	<id> $z$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	-------------	-------------

**u\_mul24**

Multiply two 24-bit integer values  $x$  and  $y$  and add the 32-bit integer result to the 32-bit integer  $z$ . Refer to definition of `u_mul24` to see how the 24-bit integer multiplication is performed.

*Result Type*,  $x$ ,  $y$  and  $z$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

8	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	168	<id> $x$	<id> $y$	<id> $z$
---	----	----------------------------	--------------------------	--------------------------------------	-----	-------------	-------------	-------------

**s\_mul24**

Multiply two 24-bit integer values  $x$  and  $y$ , where  $x$  and  $y$  are treated as signed integers.  $x$  and  $y$  are 32-bit integers but only the low 24-bits are used to perform the multiplication. `s_mul24` should only be used when values in  $x$  and  $y$  are in the range  $[-2^{23}, 2^{23}-1]$ . If  $x$  and  $y$  are not in this range, the multiplication result is implementation-defined.

*Result Type*,  $x$  and  $y$  must be *i32* or *vector(2,3,4,8,16)* of *i32* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	169	<id> <i>x</i>	<id> <i>y</i>
---	----	----------------------------	--------------------------	--------------------------------------	-----	------------------	------------------

**u\_mul24**

Multiply two 24-bit integer values  $x$  and  $y$ , where  $x$  and  $y$  are treated as unsigned integers.  $x$  and  $y$  are 32-bit integers but only the low 24-bits are used to perform the multiplication. `u_mul24` should only be used when values in  $x$  and  $y$  are in the range  $[0, 2^{24}-1]$ . If  $x$  and  $y$  are not in this range, the multiplication result is implementation-defined.

*Result Type*,  $x$  and  $y$  must be *i32* or *vector(2,3,4,8,16)* of *i32* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	170	<id> <i>x</i>	<id> <i>y</i>
---	----	----------------------------	--------------------------	--------------------------------------	-----	------------------	------------------

**u\_abs**

Returns  $|x|$ , where  $x$  is treated as unsigned integer.

*Result Type* and  $x$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

6	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	201	<id> <i>x</i>
---	----	----------------------------	--------------------------	--------------------------------------	-----	------------------

**u\_abs\_diff**

Returns  $|x - y|$  without modulo overflow, where  $x$  and  $y$  are treated as unsigned integers.

*Result Type*,  $x$  and  $y$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	202	<id> <i>x</i>	<id> <i>y</i>
---	----	----------------------------	--------------------------	--------------------------------------	-----	------------------	------------------

**u\_mul\_hi**

Computes  $x * y$  and returns the high half of the product of  $x$  and  $y$ , where  $x$  and  $y$  are treated as unsigned integers.

*Result Type*,  $x$  and  $y$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	203	<id> <i>x</i>	<id> <i>y</i>
---	----	----------------------------	--------------------------	--------------------------------------	-----	------------------	------------------

**u\_mad\_hi**

Returns  $mul\_hi(a, b) + c$ , where  $a, b$  and  $c$  are treated as unsigned integers.

*Result Type*,  $a, b$  and  $c$  must be *integer* or *vector(2,3,4,8,16)* of *integer* values.

All of the operands, including the *Result Type* operand, must be of the same type.

8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	204	<id> $a$	<id> $b$	<id> $c$
---	----	----------------------------	--------------------	--------------------------------------	-----	-------------	-------------	-------------

**2.3 Common instructions**

This section describes the the list of common instructions that take scalar or vector arguments. The vector versions of the integer functions operate component-wise. The description is per-component. The common instructions are implemented using the round to nearest even rounding mode.

**fclamp**

Returns  $fmin(fmax(x, minval), maxval)$ . Results are undefined if  $minval > maxval$ .

*Result Type*,  $x, minval$  and  $maxval$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	95	<id> $x$	<id> $minval$	<id> $maxval$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------	------------------	------------------

**degrees**

Converts *radians* to degrees, i.e.  $(180 / \pi) * radians$ .

*Result Type* and *radians* must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	96	<id> $radians$
---	----	----------------------------	--------------------	--------------------------------------	----	-------------------

**fmax\_common**

Returns  $y$  if  $x < y$ , otherwise it returns  $x$ . If  $x$  or  $y$  are infinite or NaN, the return values are undefined.

*Result Type*,  $x$  and  $y$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	97	<id> <i>x</i>	<id> <i>y</i>
---	----	----------------------------	--------------------------	--------------------------------------	----	------------------	------------------

**fmin\_common**

Returns  $y$  if  $y < x$ , otherwise it returns  $x$ . If  $x$  or  $y$  are infinite or NaN, the return values are undefined.

*Result Type*,  $x$  and  $y$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	98	<id> <i>x</i>	<id> <i>y</i>
---	----	----------------------------	--------------------------	--------------------------------------	----	------------------	------------------

**mix**

Returns the linear blend of  $x$  &  $y$  implemented as:

$$x + (y - x) * a$$

*Result Type*,  $x$ ,  $y$  and  $a$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

**Note:** This function can be implemented using contractions such as mad or fma

8	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	99	<id> <i>x</i>	<id> <i>y</i>	<id> <i>a</i>
---	----	----------------------------	--------------------------	--------------------------------------	----	------------------	------------------	------------------

**radians**

Converts *degrees* to radians, i.e.  $(\pi / 180) * \text{degrees}$ .

*Result Type* and *degrees* must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

6	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	100	<id> <i>degrees</i>
---	----	----------------------------	--------------------------	--------------------------------------	-----	------------------------

**step**

Returns 0.0 if  $x < \text{edge}$ , otherwise it returns 1.0.

*Result Type*, *edge* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	101	<id> <i>edge</i>	<id> <i>x</i>
---	----	----------------------------	--------------------	--------------------------------------	-----	---------------------	------------------

**smoothstep**

Returns 0.0 if  $x \leq edge_0$  and 1.0 if  $x \geq edge_1$  and performs smooth Hermite interpolation between 0 and 1, when  $edge_0 < x < edge_1$ .

This is equivalent to :

```
t = fclamp((x - edge0) / (edge1 - edge0), 0, 1);
```

```
return t * t * (3 - 2 * t);
```

Results are undefined if  $edge_0 \geq edge_1$  or if  $x$ ,  $edge_0$  or  $edge_1$  is a NaN.

*Result Type*,  $edge_0$ ,  $edge_1$  and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

**Note:** This function can be implemented using contractions such as mad or fma

8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	102	<id> <i>edge<sub>0</sub></i>	<id> <i>edge<sub>1</sub></i>	<id> <i>x</i>
---	----	----------------------------	--------------------	--------------------------------------	-----	---------------------------------	---------------------------------	------------------

**sign**

Returns 1.0 if  $x > 0$ , -0.0 if  $x = -0.0$ , +0.0 if  $x = +0.0$ , or -1.0 if  $x < 0$ . Returns 0.0 if  $x$  is a NaN.

*Result Type* and  $x$  must be *floating-point* or *vector(2,3,4,8,16)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	103	<id> <i>x</i>
---	----	----------------------------	--------------------	--------------------------------------	-----	------------------

**2.4 Geometric instructions**

This section describes the the list of geometric instructions. In this section  $x, y, z$  and  $w$  denote the first, second, third and fourth component respectively, of vectors with 3 and four components. The geometric instructions are implemented using the round to nearest even rounding mode.

**Note:** The geometric functions can be implemented using contractions such as mad or fma

**cross**

Returns the cross product of  $p_0.xyz$  and  $p_1.xyz$ .

When the vector component count is 4, the w component returned will be 0.0.

*Result Type*,  $p_0$  and  $p_1$  must be *vector(3,4)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	104	<id> $p_0$	<id> $p_1$
---	----	----------------------------	--------------------	--------------------------------------	-----	---------------	---------------

**distance**

Returns the distance between  $p_0$  and  $p_1$ . This is calculated as  $length(p_0 - p_1)$ .

*Result Type* must be *floating-point*.

$p_0$  and  $p_1$  must be *floating-point* or *vector(2,3,4)* of *floating-point* values.

$p_0$  and  $p_1$  operands must have the same type. *Result Type*,  $p_0$  and  $p_1$  operands must have the same component type

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	105	<id> $p_0$	<id> $p_1$
---	----	----------------------------	--------------------	--------------------------------------	-----	---------------	---------------

**length**

Return the length of vector  $p$ , i.e.  $sqrt(p.x^2 + p.y^2 + \dots)$

*Result Type* must be *floating-point*.

$p$  must be *vector(2,3,4)* of *floating-point* values.

*Result Type* and  $p$  operands must have the same component type

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	106	<id> $p$
---	----	----------------------------	--------------------	--------------------------------------	-----	-------------

**normalize**

Returns a vector in the same direction as  $p$  but with a length of 1.

*Result Type* and  $p$  must be *floating-point* or *vector(2,3,4)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	107	<id> $p$
---	----	----------------------------	--------------------	--------------------------------------	-----	-------------

**fast\_distance**

Returns  $fast\_length(p_0 - p_1)$ .

*Result Type* must be *floating-point*.

$p_0$  and  $p_1$  must be *floating-point* or *vector(2,3,4)* of *floating-point* values.

$p_0$  and  $p_1$  operands must have the same type. *Result Type*,  $p_0$  and  $p_1$  operands must have the same component type

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	108	<id> $p_0$	<id> $p_1$
---	----	----------------------------	--------------------	--------------------------------------	-----	---------------	---------------

**fast\_length**

Return the length of vector  $p$  computed as:  $half\_sqrt(p.x^2 + p.y^2 + \dots)$

*Result Type* must be *floating-point*.

$p$  must be *vector(2,3,4)* of *floating-point* values.

*Result Type* and  $p$  operands must have the same component type

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	109	<id> $p$
---	----	----------------------------	--------------------	--------------------------------------	-----	-------------

**fast\_normalize**

Returns a vector in the same direction as  $p$  but with a length of 1 computed as:

$$p * half\_rsqrt(p.x^2 + p.y^2 \dots)$$

The result shall be within 8192 ulps error from the infinitely precise result of:

if ( $all(p == 0.0f)$ ) { result =  $p$ ; }

else { result =  $p / sqrt(p.x^2 + p.y^2 + \dots)$ ; }

with the following exceptions :

- 1) If the sum of squares is greater than FLT\_MAX then the value of the floating-point values in the result vector are undefined.
- 2) If the sum of squares is less than FLT\_MIN then the implementation may return back  $p$ .
- 3) If the device is in "denorms are flushed to zero" mode, individual operand elements with magnitude less than  $sqrt(FLT\_MIN)$  may be flushed to zero before proceeding with the calculation.

*Result Type* and  $p$  must be *floating-point* or *vector(2,3,4)* of *floating-point* values.

All of the operands, including the *Result Type* operand, must be of the same type.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	110	<id> <i>p</i>
---	----	----------------------------	--------------------	--------------------------------------	-----	------------------

## 2.5 Relational instructions

This section describes the the list of relational instructions that take scalar or vector arguments. The vector versions of the integer functions operate component-wise. The description is per-component.

<b>bitselect</b>								
Each bit of the result is the corresponding bit of <i>a</i> if the corresponding bit of <i>c</i> is 0. Otherwise it is the corresponding bit of <i>b</i> .								
<i>Result Type</i> , <i>a</i> , <i>b</i> and <i>c</i> must be <i>floating-point</i> or <i>integer</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> or <i>integer</i> values.								
All of the operands, including the <i>Result Type</i> operand, must be of the same type.								
8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	186	<id> <i>a</i>	<id> <i>b</i>	<id> <i>c</i>

<b>select</b>								
Each bit of the result is the corresponding bit of <i>a</i> if the corresponding bit of <i>c</i> is 0. Otherwise it is the corresponding bit of <i>b</i> .								
<i>c</i> must be <i>integer</i> or <i>vector(2,3,4,8,16)</i> of <i>integer</i> values.								
<i>Result Type</i> , <i>a</i> and <i>b</i> must be <i>floating-point</i> or <i>integer</i> or <i>vector(2,3,4,8,16)</i> of <i>floating-point</i> or <i>integer</i> values.								
<i>Result Type</i> , <i>a</i> and <i>b</i> must have the same type. <i>c</i> operand must have the same component count and component bit width as the rest of the operands.								
8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	187	<id> <i>a</i>	<id> <i>b</i>	<id> <i>c</i>

## 2.6 Vector Data Load and Store instructions

This section describes the list of instructions that allow reading and writing of vector types from a pointer to memory.

---

**vloadn**

Return a vector value which is read from address ( $p + (offset * n)$ ).

The address computed as ( $p + (offset * n)$ ) must be 8-bit aligned if  $p$  points to i8 value; 16-bit aligned if  $p$  points to i16 or half value; 32-bit aligned if  $p$  points to i32 or float value; 64-bit aligned if  $p$  points to i64 or double value.

$offset$  must be  $size\_t$ .

$p$  must be a *pointer(constant, generic) to floating-point, integer*.

*Result Type* must be *vector(2,3,4,8,16)* of *floating-point* or *integer* values.

*Result Type* component count must be equal to  $n$  and its component type must be equal to the type pointed by  $p$ .

$n$  must be 2,3,4,8 or 16.

8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	171	<id> <i>offset</i>	<id> $p$	<a href="#">Literal Number</a> $n$
---	----	----------------------------	--------------------	--------------------------------------	-----	-----------------------	-------------	---

**vstoren**

Write  $data$  vector value to the address ( $p + (offset * compCountOf(data))$ ), where  $compCountOf(data)$  is equal to the component count of the vector  $data$ .

The address computed as ( $p + (offset * compCountOf(data))$ ) must be 8-bit aligned if  $p$  points to i8 value; 16-bit aligned if  $p$  points to i16 or half value; 32-bit aligned if  $p$  points to i32 or float value; 64-bit aligned if  $p$  points to i64 or double value.

$offset$  must be  $size\_t$ .

*Result Type* must be *void*.

$p$  must be a *pointer(generic) to floating-point, integer*.

$data$  must be *vector(2,3,4,8,16)* of *floating-point* or *integer* values.

$data$  component type must be equal to the type pointed by  $p$ .

8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	172	<id> $data$	<id> <i>offset</i>	<id> $p$
---	----	----------------------------	--------------------	--------------------------------------	-----	----------------	-----------------------	-------------

**vload\_half**

Reads a half value from the address ( $p + (offset)$ ) and converts it to a float return value. The address computed as ( $p + (offset)$ ) must be 16-bit aligned.

*Result Type* must be *float*.

$offset$  must be  $size\_t$ .

$p$  must be a *pointer(constant, generic) to half*.

7	44	<id> Result Type	Result <id>	extended instructions set <id>	173	<id> offset	<id> p
---	----	---------------------	-------------	--------------------------------------	-----	----------------	-----------

**vload\_halfn**

Reads a half vector value from the address ( $p + (offset * n)$ ) and converts it to a float vector return value. The address computed as ( $p + (offset * n)$ ) must be 16-bit aligned.

*offset* must be *size\_t*.

*p* must be a *pointer(constant, generic)* to *half*.

*Result Type* must be *vector(2,3,4,8,16)* of *float* values.

*Result Type* component count must be equal to *n*.

*n* must be 2,3,4,8 or 16.

8	44	<id> Result Type	Result <id>	extended instructions set <id>	174	<id> offset	<id> p	Literal Number <i>n</i>
---	----	---------------------	-------------	--------------------------------------	-----	----------------	-----------	-------------------------------

**vstore\_half**

Converts *data* float or double value to a half value and then write the converted value to the address ( $p + offset$ ). The address computed as ( $p + offset$ ) must be 16-bit aligned.

This function uses the default rounding mode when converting *data* to a half value. The default rounding mode is round to nearest even.

*data* must be *float* or *double*.

*offset* must be *size\_t*.

*Result Type* must be *void*.

*p* must be a *pointer(generic)* to *half*.

8	44	<id> Result Type	Result <id>	extended instructions set <id>	175	<id> data	<id> offset	<id> p
---	----	---------------------	-------------	--------------------------------------	-----	--------------	----------------	-----------

**vstore\_half\_r**

Converts *data* float or double value to a half value and then write the converted value to the address ( $p + \text{offset}$ ). The address computed as ( $p + \text{offset}$ ) must be 16-bit aligned.

This function uses *mode* rounding mode when converting *data* to a half value.

*data* must be *float* or *double*.

*offset* must be *size\_t*.

*Result Type* must be *void*.

*p* must be a *pointer(generic)* to *half*.

9	44	<id> Result Type	Result <id>	extended instruc- tions set <id>	176	<id> <i>data</i>	<id> <i>offset</i>	<id> <i>p</i>	FP Rounding Mode <i>mode</i>
---	----	------------------------	----------------	---	-----	---------------------	-----------------------	------------------	---------------------------------------

**vstore\_halfn**

Converts *data* vector of float or vector of double values to a vector of half values and then write the converted value to the address ( $p + (\text{offset} * \text{compCountOf}(\text{data}))$ ), where  $\text{compCountOf}(\text{data})$  is equal to the component count of the vector *data*.

The address computed as ( $p + (\text{offset} * \text{compCountOf}(\text{data}))$ ) must be 16-bit aligned.

This function uses the default rounding mode when converting *data* to a vector of half values. The default rounding mode is round to nearest even.

*offset* must be *size\_t*.

*Result Type* must be *void*.

*p* must be a *pointer(generic)* to *half*.

*data* must be *vector(2,3,4,8,16)* of *float* or *double* values.

8	44	<id> Result Type	Result <id>	extended instructions set <id>	177	<id> <i>data</i>	<id> <i>offset</i>	<id> <i>p</i>	
---	----	---------------------	-------------	--------------------------------------	-----	---------------------	-----------------------	------------------	--

**vstore\_halfn\_r**

Converts *data* vector of float or vector of double values to a vector of half values and then write the converted value to the address ( $p + (\text{offset} * \text{compCountOf}(\text{data}))$ ), where  $\text{compCountOf}(\text{data})$  is equal to the component count of the vector *data*.

The address computed as ( $p + (\text{offset} * \text{compCountOf}(\text{data}))$ ) must be 16-bit aligned.

This function uses *mode* rounding mode when converting *data* to a half value.

*offset* must be *size\_t*.

*Result Type* must be *void*.

*p* must be a *pointer(generic)* to *half*.

*data* must be *vector(2,3,4,8,16)* of *float* or *double* values.

9	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instruc- tions set <id>	178	<id> <i>data</i>	<id> <i>offset</i>	<id> <i>p</i>	FP Rounding Mode <i>mode</i>
---	----	----------------------------	-----------------------	---	-----	---------------------	-----------------------	------------------	---------------------------------------

**vloada\_halfn**

Reads a half vector value from the address ( $p + (\text{offset} * n)$ ) and converts it to a float vector return value. The address computed as ( $p + (\text{offset} * n)$ ) must be ( $2 * n$ ) bytes aligned, when  $n = 2,4,8,16$ ; For  $n = 3$ , the function returns a vector of 3 float values from the address ( $p + (\text{offset} * 4)$ ). The address computed as ( $p + (\text{offset} * 4)$ ) must be 8-bytes aligned

*offset* must be *size\_t*.

*p* must be a *pointer(constant, generic)* to *half*.

*Result Type* must be *vector(2,3,4,8,16)* of *float* values.

*Result Type* component count must be equal to *n*.

*n* must be 2,3,4,8 or 16.

8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	179	<id> <i>offset</i>	<id> <i>p</i>	Literal Number <i>n</i>
---	----	----------------------------	--------------------	--------------------------------------	-----	-----------------------	------------------	-------------------------------

**vstorea\_halfn**

Converts *data* vector of float or vector of double values to a vector of half values and then write the converted value to the address ( $p + (\text{offset} * \text{compCountOf}(\text{data}))$ ), where  $\text{compCountOf}(\text{data})$  is equal to the component count of the vector *data*.

The address computed as ( $p + (\text{offset} * \text{compCountOf}(\text{data}))$ ) must be  $(2 * \text{compCountOf}(\text{data}))$  bytes aligned, when  $n = 2,4,8,16$ ; For  $n = 3$ , the function returns a vector of 3 float values from the address ( $p + (\text{offset} * 4)$ ). The address computed as ( $p + (\text{offset} * 4)$ ) must be 8-bytes aligned.

This function uses the default rounding mode when converting *data* to a vector of half values. The default rounding mode is round to nearest even.

*offset* must be *size\_t*.

*Result Type* must be *void*.

*p* must be a *pointer(generic)* to *half*.

*data* must be *vector(2,3,4,8,16)* of *float* or *double* values.

**vstorea\_halfn\_r**

Converts *data* vector of float or vector of double values to a vector of half values and then write the converted value to the address ( $p + (\text{offset} * \text{compCountOf}(\text{data}))$ ), where  $\text{compCountOf}(\text{data})$  is equal to the component count of the vector *data*.

The address computed as ( $p + (\text{offset} * \text{compCountOf}(\text{data}))$ ) must be  $(2 * \text{compCountOf}(\text{data}))$  bytes aligned, when  $n = 2,4,8,16$ ; For  $n = 3$ , the function returns a vector of 3 float values from the address ( $p + (\text{offset} * 4)$ ). The address computed as ( $p + (\text{offset} * 4)$ ) must be 8-bytes aligned.

This function uses *mode* rounding mode when converting *data* to a vector of half values.

*offset* must be *size\_t*.

*Result Type* must be *void*.

*p* must be a *pointer(generic)* to *half*.

*data* must be *vector(2,3,4,8,16)* of *float* or *double* values.

## 2.7 Miscellaneous Vector instructions

This section describes additional vector instructions.

**shuffle**

Construct a permutation of components from  $x$  vector value, returning a vector value with the same component type as  $x$  and component count that is the same as *shuffle mask*.

In this function, only the  $\text{ilogb}(2m - 1)$  least significant bits of each mask element are considered, where  $m$  is equal to the component count of  $x$ .

*shuffle mask* operand specifies, for each component in the result vector, which component of  $x$  it gets.

The size of each component in *shuffle mask* must match the size of each component in *Result Type*.

*Result Type* must have the same component type as  $x$  and component count as *shuffle mask*.

*shuffle mask* must be *vector(2,4,8,16)* of integer values.

*Result Type* and  $x$  must be *vector(2,4,8,16)* of floating-point or integer values.

All of the operands, including the *Result Type* operand, must be of the same type.

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	182	<id> $x$	<id> <i>shuffle mask</i>
---	----	----------------------------	--------------------	--------------------------------------	-----	-------------	-----------------------------

**shuffle2**

Construct a permutation of components from  $x$  and  $y$  vector values, returning a vector value with the same component type as  $x$  and  $y$  and component count that is the same as *shuffle mask*.

In this function, only the  $\text{ilogb}(2m - 1) + 1$  least significant bits of each mask component are considered, where  $m$  is equal to the component count of  $x$  and  $y$ .

*shuffle mask* operand specifies, for each component in the result vector, which component of  $x$  or  $y$  it gets. Where component count begins with  $x$  and then proceeds to  $y$ .

$x$  and  $y$  must be of the same type.

The size of each component in *shuffle mask* must match the size of each component in *Result Type*.

*Result Type* must have the same component type as  $x$  and component count as *shuffle mask*.

*shuffle mask* must be *vector(2,4,8,16)* of integer values.

*Result Type*,  $x$  and  $y$  must be *vector(2,4,8,16)* of floating-point or integer values.

All of the operands, including the *Result Type* operand, must be of the same type.

8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	183	<id> $x$	<id> $y$	<id> <i>shuffle mask</i>
---	----	----------------------------	--------------------	--------------------------------------	-----	-------------	-------------	-----------------------------

## 2.8 Misc instructions

This section describes additional miscellaneous instructions.

### printf

The *printf* extended instruction writes output to an implementation-defined stream such as stdout under control of the string pointed to by *format* that specifies how subsequent arguments are converted for output. If there are insufficient arguments for the format, the behavior is undefined. If the format is exhausted while arguments remain, the excess arguments are evaluated (as always) but are otherwise ignored. The *printf* function returns when the end of the format string is encountered

*printf* returns 0 if it was executed successfully and -1 otherwise

*Result Type* must be *i32*.

*format* must be **OpString**.

6 + variable	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	184	<id> <i>format</i>	<id>, <id>, ... <i>additional arguments</i>
--------------	----	----------------------------	--------------------------	-----------------------------------	-----	-----------------------	--

### prefetch

Prefetch *num\_elements* \* size in bytes of the type pointed by *p*, into the global cache. The prefetch instruction is applied to a work-item in a work-group and does not affect the functional behavior of the kernel.

*num\_elements* must be *size\_t*.

*Result Type* must be *void*.

*p* must be a *pointer(global)* to *floating-point, integer* or *vector(2,3,4,8,16)* of *floating-point, integer* values.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	185	<id> <i>num_elements</i>	<id> <i>p</i>
---	----	----------------------------	--------------------------	-----------------------------------	-----	-----------------------------	------------------

## 2.9 Image functions

The instructions defined in this section can only be used with image memory objects. An image memory object can be accessed by specific function calls that read from and/or write to specific locations in the image.

### 2.9.1 Image encoding

The following list denotes the different valid *OpTypeSampler* encodings of image objects.

#### image1d

A 1D image

9	14	<i>Result</i> <id>	<i>Sampled</i> <i>Type</i> <0>	<i>Dim</i> 0	<i>Image</i> <i>Type</i> 1	<i>Array</i> 0	<i>Depth</i> 0	<i>Sample</i> 0	<i>Access</i> <i>Qualifier</i> <i>qualifier</i>
---	----	-----------------------	-----------------------------------	-----------------	----------------------------------	-------------------	-------------------	--------------------	---

**image1dBuffer**

A 1D image created from a buffer object.

9	14	<i>Result</i> <id>	<i>Sampled</i> <i>Type</i> <0>	<i>Dim</i> 5	<i>Image</i> <i>Type</i> 1	<i>Array</i> 0	<i>Depth</i> 0	<i>Sample</i> 0	<i>Access</i> <i>Qualifier</i> <i>qualifier</i>
---	----	-----------------------	-----------------------------------	-----------------	----------------------------------	-------------------	-------------------	--------------------	---

**image1dArray**

A 1D image array.

9	14	<i>Result</i> <id>	<i>Sampled</i> <i>Type</i> <0>	<i>Dim</i> 0	<i>Image</i> <i>Type</i> 1	<i>Array</i> 1	<i>Depth</i> 0	<i>Sample</i> 0	<i>Access</i> <i>Qualifier</i> <i>qualifier</i>
---	----	-----------------------	-----------------------------------	-----------------	----------------------------------	-------------------	-------------------	--------------------	---

**image2d**

A 2D image.

9	14	<i>Result</i> <id>	<i>Sampled</i> <i>Type</i> <0>	<i>Dim</i> 1	<i>Image</i> <i>Type</i> 1	<i>Array</i> 0	<i>Depth</i> 0	<i>Sample</i> 0	<i>Access</i> <i>Qualifier</i> <i>qualifier</i>
---	----	-----------------------	-----------------------------------	-----------------	----------------------------------	-------------------	-------------------	--------------------	---

**image2dArray**

A 2D image array.

9	14	<i>Result</i> <id>	<i>Sampled</i> <i>Type</i> <0>	<i>Dim</i> 1	<i>Image</i> <i>Type</i> 1	<i>Array</i> 1	<i>Depth</i> 0	<i>Sample</i> 0	<i>Access</i> <i>Qualifier</i> <i>qualifier</i>
---	----	-----------------------	-----------------------------------	-----------------	----------------------------------	-------------------	-------------------	--------------------	---

**image2dDepth**

A 2D depth image.

9	14	<i>Result</i> <id>	<i>Sampled</i> <i>Type</i> <0>	<i>Dim</i> 1	<i>Image</i> <i>Type</i> 1	<i>Array</i> 0	<i>Depth</i> 1	<i>Sample</i> 0	<i>Access</i> <i>Qualifier</i> <i>qualifier</i>
---	----	-----------------------	-----------------------------------	-----------------	----------------------------------	-------------------	-------------------	--------------------	---

**image2dArrayDepth**

A 2D depth image array.

9	14	<i>Result</i> <id>	<i>Sampled</i> <i>Type</i> <0>	<i>Dim</i> 1	<i>Image</i> <i>Type</i> 1	<i>Array</i> 1	<i>Depth</i> 1	<i>Sample</i> 0	<i>Access</i> <i>Qualifier</i> <i>qualifier</i>
---	----	-----------------------	-----------------------------------	-----------------	----------------------------------	-------------------	-------------------	--------------------	---

**image2dMsaa**

A 2D multi-sample color image.

9	14	<i>Result</i> <id>	<i>Sampled</i> <i>Type</i> <0>	<i>Dim</i> 1	<i>Image</i> <i>Type</i> 1	<i>Array</i> 0	<i>Depth</i> 0	<i>Sample</i> 1	<i>Access</i> <i>Qualifier</i> <i>qualifier</i>
---	----	-----------------------	-----------------------------------	-----------------	----------------------------------	-------------------	-------------------	--------------------	---

**image2dArrayMsaa**

A 2D multi-sample color image array.

9	14	<i>Result</i> <id>	<i>Sampled</i> <i>Type</i> <0>	<i>Dim</i> 1	<i>Image</i> <i>Type</i> 1	<i>Array</i> 1	<i>Depth</i> 0	<i>Sample</i> 1	<i>Access</i> <i>Qualifier</i> <i>qualifier</i>
---	----	-----------------------	-----------------------------------	-----------------	----------------------------------	-------------------	-------------------	--------------------	---

**image2dMsaaDepth**

A 2D multi-sample depth image.

9	14	<i>Result</i> <id>	<i>Sampled</i> <i>Type</i> <0>	<i>Dim</i> 1	<i>Image</i> <i>Type</i> 1	<i>Array</i> 0	<i>Depth</i> 1	<i>Sample</i> 1	<i>Access</i> <i>Qualifier</i> <i>qualifier</i>
---	----	-----------------------	-----------------------------------	-----------------	----------------------------------	-------------------	-------------------	--------------------	---

**image2dArrayMsaaDepth**

A 2D multi-sample depth image array.

9	14	<i>Result</i> <id>	<i>Sampled</i> <i>Type</i> <0>	<i>Dim</i> 1	<i>Image</i> <i>Type</i> 1	<i>Array</i> 1	<i>Depth</i> 1	<i>Sample</i> 1	<i>Access</i> <i>Qualifier</i> <i>qualifier</i>
---	----	-----------------------	-----------------------------------	-----------------	----------------------------------	-------------------	-------------------	--------------------	---

**image3d**

A 1D image created from a buffer object.

9	14	<i>Result</i> <id>	<i>Sampled</i> <i>Type</i> <0>	<i>Dim</i> 2	<i>Image</i> <i>Type</i> 1	<i>Array</i> 0	<i>Depth</i> 0	<i>Sample</i> 0	<i>Access</i> <i>Qualifier</i> <i>qualifier</i>
---	----	-----------------------	-----------------------------------	-----------------	----------------------------------	-------------------	-------------------	--------------------	---

**2.9.2 Sampler encoding**

A SPIR-V *sampler* object is encoded via the **OpTypeSampler** instruction in the following way:

**sampler**

An image sampler object.

8	14	<i>Result</i> <id>	<i>Sampled</i> <i>Type</i> <0>	<i>Dim</i> 0	<i>Image Type</i> 2	<i>Array</i> 0	<i>Depth</i> 0	<i>Sample</i> 0	
---	----	--------------------	-----------------------------------	-----------------	------------------------	-------------------	-------------------	--------------------	--

In addition, it is possible to define a constant *sampler* using the **OpConstantSampler**.

### 2.9.3 Image format encoding

Every image memory object has a format. An image format is a combination of *channel order* and *channel data type*. The *channel order* specifies the number of channels and the channel layout i.e.the memory layout in which channels are stored in the image. The *channel data type* describes the size of the channel data type.

ImageChannelOrder	
4272	<b>R</b>
4273	<b>A</b>
4274	<b>RG</b>
4275	<b>RA</b>
4276	<b>RGB</b>
4277	<b>RGBA</b>
4278	<b>BGRA</b>
4279	<b>ARGB</b>
4280	<b>INTENSITY</b>
4281	<b>LUMINANCE</b>
4282	<b>R<sub>x</sub></b>
4283	<b>RG<sub>x</sub></b>
4284	<b>RGB<sub>x</sub></b>
4285	<b>DEPTH</b>
4286	<b>DEPTH STENCIL</b>
4287	<b>sRGB</b>
4288	<b>sRGB<sub>x</sub></b>
4289	<b>sRGBA</b>
4290	<b>sBGRA</b>

ImageChannelType	
4304	<b>SNORM INT8</b>
4305	<b>SNORM INT16</b>
4306	<b>UNORM INT8</b>
4307	<b>UNORM_INT16</b>
4308	<b>UNORM SHORT 565</b>
4309	<b>UNORM SHORT 555</b>
4310	<b>UNORM INT 101010</b>
4311	<b>SIGNED INT8</b>
4312	<b>SIGNED INT16</b>
4313	<b>SIGNED INT32</b>
4314	<b>UNSIGNED INT8</b>
4315	<b>UNSIGNED INT16</b>
4316	<b>UNSIGNED INT32</b>
4317	<b>HALF FLOAT</b>
4318	<b>FLOAT</b>
4319	<b>UNORM INT24</b>

### 2.9.4 Image read functions

This section describes the list of instructions that allow reading from image memory objects.

---

---

**read\_imagef**

Use the coordinate specified by *coords* and the *sampler* object specified by *s* to do an element lookup to the image object specified by *img*.

This function returns floating-point values in the range [0.0 ... 1.0] for *image* objects created with *channel data type* set to one of the pre-defined packed formats or **UNORM INT8**, or **UNORM INT16**.

This function returns floating-point values in the range [-1.0 ... 1.0] for *image* objects created with *channel data type* set to **SNORM INT8**, or **SNORM INT16**.

This function returns floating-point values for *image* objects created with *channel data type* set to **HALF FLOAT**, or **FLOAT**.

When called with i32 coordinates the sampler object must be defined with a filter mode set to **Nearest**, coordinates set to non-parametric coordinates and addressing mode set to **ClampToEdge**, **Clamp** or **None**; otherwise the values returned are undefined.

Values returned by this function for image objects with *channel data type* which is not specified in the description above are undefined.

*Result Type* must be *float* or *vector(4)* of *float* values.

*coords* must be *float* or *i32* or *vector(2,4)* of *float* or *i32* values.

*img* must be *image1d*, *image1dArray*, *image2d*, *image2dArray*, *image2dArrayDepth*, *image2dDepth*, *image2dMsaa*, *image2dArrayMsaa*, *image2dMsaaDepth*, *image2dArrayMsaaDepth* or *image3d* value, with *ReadOnly* or *ReadWrite* access qualifier.

*s* must be *sampler* value.

When *img* is a *image1d*, *coords* must be *float* or *i32*.

When *img* is a *image2d*, *image2dDepth*, *image2dMsaa* or *image2dMsaaDepth*, *coords* must be *vector(2)* of *float* or *i32* values.

When *img* is a *image1dArray*, *coords* must be *vector(2)* of *i32* values. The second component of *coords* is used to identify the image in the array

When *img* is a *image2dArray*, *image2dArrayDepth*, *image2dArrayMsaa* or *image2dArrayMsaaDepth*, *coords* must be *vector(4)* of *i32* values. The third component of *coords* is used to identify the image in the array, while the fourth component is ignored.

When *img* is a *image3d*, *coords* must be *vector(4)* of *float* or *i32* values. The fourth component of *coords* is ignored.

*Result Type* must be a *float* when *img* is a *image2dArrayDepth*, *image2dDepth*, *image2dMsaaDepth* or *image2dArrayMsaaDepth*, and *vector(4)* of *float* values when *img* is on of the remaining valid image types for this instruction.

8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	111	<id> <i>img</i>	<id> <i>s</i>	<id> <i>coords</i>
---	----	----------------------------	--------------------	--------------------------------------	-----	--------------------	------------------	-----------------------

**read\_imagei**

Use the coordinate specified by *coords* and the *sampler* object specified by *s* to do an element lookup to the image object specified by *img*.

This function returns a non-parametric *i32* integer value.

This function can only be used if *img* image object *channel data type* is set to **SIGNED INT8**, **SIGNED INT16** or **SIGNED INT32**. If the *channel data type* is not one of these values, the values returned by *read\_imagei* are undefined.

The sampler object must be defined with a filter mode set to **Nearest**, coordinates set to non-parametric coordinates and addressing mode set to **ClampToEdge**, **Clamp** or **None**; otherwise the values returned are undefined.

*Result Type* must be *vector(4)* of *i32* values.

*coords* must be *float* or *i32* or *vector(2,4)* of *float* or *i32* values.

*img* must be *image1d*, *image1dArray*, *image2d*, *image2dArray*, *image2dMsaa*, *image2dArrayMsaa* or *image3d* value, with *ReadOnly* or *ReadWrite* access qualifier.

*s* must be *sampler* value.

When *img* is a *image1d*, *coords* must be *float* or *i32*.

When *img* is a *image2d*, *image2dDepth*, *image2dMsaa* or *image2dMsaaDepth*, *coords* must be *vector(2)* of *float* or *i32* values.

When *img* is a *image1dArray*, *coords* must be *vector(2)* of *i32* values. The second component of *coords* is used to identify the image in the array

When *img* is a *image2dArray*, *image2dArrayDepth*, *image2dArrayMsaa* or *image2dArrayMsaaDepth*, *coords* must be *vector(4)* of *i32* values. The third component of *coords* is used to identify the image in the array, while the fourth component is ignored.

When *img* is a *image3d*, *coords* must be *vector(4)* of *float* or *i32* values. The fourth component of *coords* is ignored.

8	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	112	<id> <i>img</i>	<id> <i>s</i>	<id> <i>coords</i>
---	----	----------------------------	--------------------------	--------------------------------------	-----	--------------------	------------------	-----------------------

**read\_imageui**

Use the coordinate specified by *coords* and the *sampler* object specified by *s* to do an element lookup to the image object specified by *img*.

This function returns a non-parametric *i32* integer value.

This function can only be used if *img* image object *channel data type* is set to **UNSIGNED INT8**, **UNSIGNED INT16** or **UNSIGNED INT32**. If the *channel data type* is not one of these values, the values returned by *read\_imageui* are undefined.

The sampler object must be defined with a filter mode set to **Nearest**, coordinates set to non-parametric coordinates and addressing mode set to **ClampToEdge**, **Clamp** or **None**; otherwise the values returned are undefined.

*Result Type* must be *vector(4)* of *i32* values.

*coords* must be *float* or *i32* or *vector(2,4)* of *float* or *i32* values.

*img* must be *image1d*, *image1dArray*, *image2d*, *image2dArray*, *image2dMsaa*, *image2dArrayMsaa* or *image3d* value, with *ReadOnly* or *ReadWrite* access qualifier.

*s* must be *sampler* value.

When *img* is a *image1d*, *coords* must be *float* or *i32*.

When *img* is a *image2d*, *image2dDepth*, *image2dMsaa* or *image2dMsaaDepth*, *coords* must be *vector(2)* of *float* or *i32* values.

When *img* is a *image1dArray*, *coords* must be *vector(2)* of *i32* values. The second component of *coords* is used to identify the image in the array

When *img* is a *image2dArray*, *image2dArrayDepth*, *image2dArrayMsaa* or *image2dArrayMsaaDepth*, *coords* must be *vector(4)* of *i32* values. The third component of *coords* is used to identify the image in the array, while the fourth component is ignored.

When *img* is a *image3d*, *coords* must be *vector(4)* of *float* or *i32* values. The fourth component of *coords* is ignored.

8	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	113	<id> <i>img</i>	<id> <i>s</i>	<id> <i>coords</i>
---	----	----------------------------	--------------------------	--------------------------------------	-----	--------------------	------------------	-----------------------

**read\_imageh**

Use the coordinate specified by *coords* and the *sampler* object specified by *s* to do an element lookup to the image object specified by *img*.

This function returns half precision floating-point values in the range [0.0 ... 1.0] for *image* objects created with *channel data type* set to one of the pre-defined packed formats or **UNORM INT8**, or **UNORM INT16**.

This function returns half precision floating-point values in the range[-1.0 ... 1.0] for *image* objects created with *channel data type* set to **SNORM INT8**, or **SNORM INT16**.

This function returns half precision floating-point values for *image* objects created with *channel data type* set to **HALF FLOAT**, or **FLOAT**.

When called with *i32* coordinates the sampler object must be defined with a filter mode set to **Nearest**, coordinates set to non-parametric coordinates and addressing mode set to **ClampToEdge**, **Clamp** or **None**; otherwise the values returned are undefined.

Values returned by this function for image objects with *channel data type* which is not specified in the description above are undefined.

*Result Type* must be *half* or *vector(4)* of *half* values.

*coords* must be *float* or *i32* or *vector(2,4)* of *float* or *i32* values.

*img* must be *image1d*, *image1dArray*, *image2d*, *image2dArray* or *image3d* value, with *ReadOnly* or *ReadWrite* access qualifier.

*s* must be *sampler* value.

When *img* is a *image1d*, *coords* must be *float* or *i32*.

When *img* is a *image2d*, *coords* must be *vector(2)* of *float* or *i32* values.

When *img* is a *image1dArray*, *coords* must be *vector(2)* of *i32* values. The second component of *coords* is used to identify the image in the array

When *img* is a *image2dArray*, *coords* must be *vector(4)* of *i32* values. The third component of *coords* is used to identify the image in the array, while the fourth component is ignored.

When *img* is a *image3d*, *coords* must be *vector(4)* of *float* or *i32* values. The fourth component of *coords* is ignored.

*Result Type* must be a *half* when *img* is a *image2dArrayDepth*, *image2dDepth*, *image2dMsaaDepth* or *image2dArrayMsaaDepth*, and *vector(4)* of *half* values when *img* is on of the remaining valid image types for this instruction.

8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	114	<id> <i>img</i>	<id> <i>s</i>	<id> <i>coords</i>
---	----	----------------------------	--------------------	--------------------------------------	-----	--------------------	------------------	-----------------------

**read\_imagef\_samplerless**

Use the coordinate specified by *coords* to do an element lookup to the image object specified by *img*. This function behaves exactly as the corresponding *read\_imagef* function that take integer coordinates and a sampler with filter mode set to **Nearest**, non-parametric coordinates and addressing mode set to **None**.

*Result Type* must be *float* or *vector(4)* of *float* values.

*coords* must be *i32* or *vector(2,4)* of *i32* values.

*img* must be *image1d*, *image1dBuffer*, *image1dArray*, *image2d*, *image2dArray*, *image2dArrayDepth*, *image2dDepth* or *image3d* value, with *ReadOnly* or *ReadWrite* access qualifier.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	115	<id> <i>img</i>	<id> <i>coords</i>
---	----	----------------------------	--------------------------	--------------------------------------	-----	--------------------	-----------------------

**read\_imagei\_samplerless**

Use the coordinate specified by *coords* to do an element lookup to the image object specified by *img*. This function behaves exactly as the corresponding *read\_imagei* function that take integer coordinates and a sampler with filter mode set to **Nearest**, non-parametric coordinates and addressing mode set to **None**.

*Result Type* must be *vector(4)* of *i32* values.

*coords* must be *i32* or *vector(2,4)* of *i32* values.

*img* must be *image1d*, *image1dBuffer*, *image1dArray*, *image2d*, *image2dArray*, *image2dMsaa*, *image2dArrayMsaa* or *image3d* value, with *ReadOnly* or *ReadWrite* access qualifier.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	116	<id> <i>img</i>	<id> <i>coords</i>
---	----	----------------------------	--------------------------	--------------------------------------	-----	--------------------	-----------------------

**read\_imageui\_samplerless**

Use the coordinate specified by *coords* to do an element lookup to the image object specified by *img*. This function behaves exactly as the corresponding *read\_imageui* function that take integer coordinates and a sampler with filter mode set to **Nearest**, non-parametric coordinates and addressing mode set to **None**.

*Result Type* must be *vector(4)* of *i32* values.

*coords* must be *i32* or *vector(2,4)* of *i32* values.

*img* must be *image1d*, *image1dBuffer*, *image1dArray*, *image2d*, *image2dArray* or *image3d* value, with *ReadOnly* or *ReadWrite* access qualifier.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	117	<id> <i>img</i>	<id> <i>coords</i>
---	----	----------------------------	--------------------------	--------------------------------------	-----	--------------------	-----------------------

**read\_imageh\_samplerless**

Use the coordinate specified by *coords* to do an element lookup to the image object specified by *img*. This function behaves exactly as the corresponding *read\_imageh* function that take integer coordinates and a sampler with filter mode set to **Nearest**, non-parametric coordinates and addressing mode set to **None**.

*Result Type* must be *vector(4)* of *half* values.

*coords* must be *i32* or *vector(2,4)* of *i32* values.

*img* must be *image1d*, *image1dBuffer*, *image1dArray*, *image2d*, *image2dArray* or *image3d* value, with *ReadOnly* or *ReadWrite* access qualifier.

7	44	<id> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <id>	118	<id> <i>img</i>	<id> <i>coords</i>
---	----	----------------------------	--------------------------	--------------------------------------	-----	--------------------	-----------------------

**read\_imagef\_mipmap\_lod**

Use the coordinate specified by *coords*, and the sampler object specified by *s* to do an element lookup in the mip-level specified by *lod* in the image object specified by *img*.

*Result Type* must be *float* or *vector(4)* of *float* values.

*img* must be *image1d*, *image1dArray*, *image2d*, *image2dArray*, *image2dArrayDepth*, *image2dDepth* or *image3d* value, with *ReadOnly* or *ReadWrite* access qualifier.

*s* must be *sampler* value.

*s* must be set to use parametric coordinates.

*lod* is clamped to the minimum of (actual number of mip-levels - 1) in the image or value specified for *CL\_SAMPLER\_LOD\_MAX*.

When *img* type is *image2d*:

- *coords* must be a *vector(2)* of *float* values.
- *Result Type* must be a *vector(4)* of *float* values.

When *img* type is *image2dArray*:

- *coords* must be a *vector(4)* of *float* values.
- *Result Type* must be a *vector(4)* of *float* values.

When *img* type is *image1d*:

- *coords* must be a *float*.
- *Result Type* must be a *vector(4)* of *float* values.

When *img* type is *image1dArray*:

- *coords* must be a *vector(2)* of *float* values.
- *Result Type* must be a *vector(4)* of *float* values.

When *img* type is *image3d*:

- *coords* must be a *vector(4)* of *float* values.
- *Result Type* must be a *vector(4)* of *float* values.

When *img* type is *image2dDepth*:

- *coords* must be a *vector(2)* of *float* values.
- *Result Type* must be a *float*.

When *img* type is *image2dArrayDepth*:

- *coords* must be a *vector(4)* of *float* values.
- *Result Type* must be a *float*.

9	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instruc- tions set <id>	123	<id> <i>img</i>	<id> <i>s</i>	<id> <i>coords</i>	<id> <i>lod</i>
---	----	--------------------------------	-----------------------	---	-----	--------------------	------------------	-----------------------	--------------------

**read\_imagei\_mipmap\_lod**

Use the coordinate specified by *coords*, and the sampler object specified by *s* to do an element lookup in the mip-level specified by *lod* in the image object specified by *img*.

*Result Type* must be *vector(4)* of *i32* values.

*img* must be *image1d*, *image1dArray*, *image2d*, *image2dArray* or *image3d* value, with *ReadOnly* or *ReadWrite* access qualifier.

*s* must be *sampler* value.

*s* must be set to use parametric coordinates.

*lod* is clamped to the minimum of (actual number of mip-levels - 1) in the image or value specified for *CL\_SAMPLER\_LOD\_MAX*.

When *img* type is *image2d*:

- *coords* must be a *vector(2)* of *float* values.

- *lod* must be a *float*.

When *img* type is *image2dArray*:

- *coords* must be a *vector(4)* of *float* values.

When *img* type is *image1d*:

- *coords* must be a *float*.

When *img* type is *image1dArray*:

- *coords* must be a *vector(2)* of *float* values.

When *img* type is *image3d*:

- *coords* must be a *vector(4)* of *float* values.

9	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instruc- tions set <id>	124	<id> <i>img</i>	<id> <i>s</i>	<id> <i>coords</i>	<id> <i>lod</i>
---	----	--------------------------------	-----------------------	---	-----	--------------------	------------------	-----------------------	--------------------

**read\_imageui\_mipmap\_lod**

Use the coordinate specified by *coords*, and the sampler object specified by *s* to do an element lookup in the mip-level specified by *lod* in the image object specified by *img*.

*Result Type* must be *vector(4)* of *i32* values.

*img* must be *image1d*, *image1dArray*, *image2d*, *image2dArray* or *image3d* value, with *ReadOnly* or *ReadWrite* access qualifier.

*s* must be *sampler* value.

*s* must be set to use parametric coordinates.

*lod* is clamped to the minimum of (actual number of mip-levels - 1) in the image or value specified for *CL\_SAMPLER\_LOD\_MAX*.

When *img* type is *image2d*:

- *coords* must be a *vector(2)* of *float* values.

When *img* type is *image2dArray*:

- *coords* must be a *vector(4)* of *float* values.

When *img* type is *image1d*:

- *coords* must be a *float*.

When *img* type is *image1dArray*:

- *coords* must be a *vector(2)* of *float* values.

When *img* type is *image3d*:

- *coords* must be a *vector(4)* of *float* values.

9	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	125	<id> <i>img</i>	<id> <i>s</i>	<id> <i>coords</i>	<id> <i>lod</i>
---	----	----------------------------	-----------------------	-----------------------------------	-----	--------------------	------------------	-----------------------	--------------------

**read\_imagef\_mipmap\_gradient**

Use the gradients *grad\_x* and *grad\_y*, the coordinates specified by *coords*, and the sampler object specified by *s* to do an element lookup in the computed mip-level in the image object specified by *img*.

*Result Type* must be *float* or *vector(4)* of *float* values.

*img* must be *image1d*, *image1dArray*, *image2d*, *image2dArray*, *image2dArrayDepth*, *image2dDepth* or *image3d* value, with *ReadOnly* or *ReadWrite* access qualifier.

*s* must be *sampler* value.

*s* must be set to use parametric coordinates.

When *img* type is *image2d*:

- *coords* must be a *vector(2)* of *float* values.
- *grad\_x* and *grad\_y* must be a *vector(2)* of *float* values.
- *Result Type* must be a *vector(4)* of *float* values.

When *img* type is *image2dArray*:

- *coords* must be a *vector(4)* of *float* values.
- *grad\_x* and *grad\_y* must be a *vector(2)* of *float* values.
- *Result Type* must be a *vector(4)* of *float* values.

When *img* type is *image1d*:

- *coords* must be a *float*.
- *grad\_x* and *grad\_y* must be a *float*.
- *Result Type* must be a *vector(4)* of *float* values.

When *img* type is *image1dArray*:

- *coords* must be a *vector(2)* of *float* values.
- *grad\_x* and *grad\_y* must be a *float*.
- *Result Type* must be a *vector(4)* of *float* values.

When *img* type is *image3d*:

- *coords* must be a *vector(4)* of *float* values.
- *grad\_x* and *grad\_y* must be a *vector(4)* of *float* values.
- *Result Type* must be a *vector(4)* of *float* values.

When *img* type is *image2dDepth*:

- *coords* must be a *vector(2)* of *float* values.
- *grad\_x* and *grad\_y* must be a *vector(2)* of *float* values.

- *Result Type* must be a *float*.

When *img* type is *image2dArrayDepth*:

---

10	44	<i>&lt;id&gt;</i> <i>Result</i> <i>Type</i>	<i>Result</i> <i>&lt;id&gt;</i>	extended instruc- tions set <i>&lt;id&gt;</i>	126	<i>&lt;id&gt;</i> <i>img</i>	<i>&lt;id&gt;</i> <i>s</i>	<i>&lt;id&gt;</i> <i>coords</i>	<i>&lt;id&gt;</i> <i>grad_x</i>	<i>&lt;id&gt;</i> <i>grad_y</i>

**read\_imagei\_mipmap\_gradient**

Use the gradients *grad\_x* and *grad\_y*, the coordinates specified by *coords*, and the sampler object specified by *s* to do an element lookup in the computed mip-level in the image object specified by *img*.

*Result Type* must be *vector(4)* of *i32* values.

*img* must be *image1d*, *image1dArray*, *image2d*, *image2dArray* or *image3d* value, with *ReadOnly* or *ReadWrite* access qualifier.

*s* must be *sampler* value.

*s* must be set to use parametric coordinates.

When *img* type is *image2d*:

- *coords* must be a *vector(2)* of *float* values.
- *grad\_x* and *grad\_y* must be a *vector(2)* of *float* values.

When *img* type is *image2dArray*:

- *coords* must be a *vector(4)* of *float* values.
- *grad\_x* and *grad\_y* must be a *vector(2)* of *float* values.

When *img* type is *image1d*:

- *coords* must be a *float*.
- *grad\_x* and *grad\_y* must be a *float*.

When *img* type is *image1dArray*:

- *coords* must be a *vector(2)* of *float* values.
- *grad\_x* and *grad\_y* must be a *float*.

When *img* type is *image3d*:

- *coords* must be a *vector(4)* of *float* values.
- *grad\_x* and *grad\_y* must be a *vector(4)* of *float* values.

When *img* type is *image2dDepth*:

- *coords* must be a *vector(2)* of *float* values.
- *grad\_x* and *grad\_y* must be a *vector(2)* of *float* values.

When *img* type is *image2dArrayDepth*:

- *coords* must be a *vector(4)* of *float* values.
- *grad\_x* and *grad\_y* must be a *vector(2)* of *float* values.

**read\_imageui\_mipmap\_gradient**

Use the gradients *grad\_x* and *grad\_y*, the coordinates specified by *coords*, and the sampler object specified by *s* to do an element lookup in the computed mip-level in the image object specified by *img*.

*Result Type* must be *vector(4)* of *i32* values.

*img* must be *image1d*, *image1dArray*, *image2d*, *image2dArray* or *image3d* value, with *ReadOnly* or *ReadWrite* access qualifier.

*s* must be *sampler* value.

*s* must be set to use parametric coordinates.

When *img* type is *image2d*:

- *coords* must be a *vector(2)* of *float* values.
- *grad\_x* and *grad\_y* must be a *vector(2)* of *float* values.

When *img* type is *image2dArray*:

- *coords* must be a *vector(4)* of *float* values.
- *grad\_x* and *grad\_y* must be a *vector(2)* of *float* values.

When *img* type is *image1d*:

- *coords* must be a *float*.
- *grad\_x* and *grad\_y* must be a *float*.

When *img* type is *image1dArray*:

- *coords* must be a *vector(2)* of *float* values.
- *grad\_x* and *grad\_y* must be a *float*.

When *img* type is *image3d*:

- *coords* must be a *vector(4)* of *float* values.
- *grad\_x* and *grad\_y* must be a *vector(4)* of *float* values.

When *img* type is *image2dDepth*:

- *coords* must be a *vector(2)* of *float* values.
- *grad\_x* and *grad\_y* must be a *vector(2)* of *float* values.

When *img* type is *image2dArrayDepth*:

- *coords* must be a *vector(4)* of *float* values.
- *grad\_x* and *grad\_y* must be a *vector(2)* of *float* values.

### 2.9.5 Image write functions

This section describes the list of instructions that allow writing to image memory objects.

---

**write\_imagef**

Write *value* to the coordinates specified by *coords* to the image object specified by *img*. The write happens only after the data in *value* is converted to the appropriate *img* image *channel data type*. *coords* are considered to be non-parametric coordinates.

*Result Type* must be *void*.

*img* must be *image1d*, *image1dBuffer*, *image1dArray*, *image2d*, *image2dArray*, *image2dArrayDepth*, *image2dDepth* or *image3d* value, with WriteOnly or ReadWrite access qualifier.

When *img* is a *image2d*, the behavior of the function is undefined unless:

- The *channel data type* of *img* is set to **UNORM SHORT 565, UNORM SHORT 555, UNORM INT 101010, UNORM INT8, SNORM INT8, UNORM INT16, SNORM INT16, HALF FLOAT, FLOAT**.

- *coords* is a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width - 1), (0 ... image height - 1) respectively.

- *value* is a *vector(4)* of *float* values.

When *img* is a *image2dArray*, the behavior of the function is undefined unless:

- The *channel data type* of *img* is set to **UNORM SHORT 565, UNORM SHORT 555, UNORM INT 101010, UNORM INT8, SNORM INT8, UNORM INT16, SNORM INT16, HALF FLOAT, FLOAT**.

- *coords* is a *vector(4)* of *i32* values, where the first, second and third components are in the range (0 ... image width - 1), (0 ... image height - 1), (0 ... image number of layers - 1) respectively. The fourth component is ignored.

- *value* is a *vector(4)* of *float* values.

When *img* is a *image1d* or *image1dBuffer*, the behavior of the function is undefined unless:

- The *channel data type* of *img* is set to **UNORM SHORT 565, UNORM SHORT 555, UNORM INT 101010, UNORM INT8, SNORM INT8, UNORM INT16, SNORM INT16, HALF FLOAT, FLOAT**.

- *coords* is a *i32*, and is in the range (0 ... image width - 1)

- *value* is a *vector(4)* of *float* values.

When *img* is a *image1dArray*, the behavior of the function is undefined unless:

- The *channel data type* of *img* is set to **UNORM SHORT 565, UNORM SHORT 555, UNORM INT 101010, UNORM INT8, SNORM INT8, UNORM INT16, SNORM INT16, HALF FLOAT, FLOAT**.

- *coords* is a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width - 1), (0 ... image number of layers - 1) respectively.

- *value* is a *vector(4)* of *float* values

When *img* is a *image2dDepth*, the behavior of the function is undefined unless:

- The *channel data type* of *img* is set to **UNORM INT16, UNORM INT24, FLOAT**.

- *coords* is a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width - 1), (0 ... image height - 1) respectively.

- *value* is a *float*.

When *img* is a *image2dArrayDepth*, the behavior of the function is undefined unless:

- The *channel data type* of *img* is set to **UNORM INT16, UNORM INT24, FLOAT**.

8	44	<id> Result Type	Result <id>	extended instructions set <id>	119	<id> img	<id> coords	<id> value
---	----	---------------------	-------------	--------------------------------------	-----	-------------	----------------	---------------

**write\_imagei**

Write *value* to the coordinates specified by *coords* to the image object specified by *img*. The write happens only after the data in *value* is converted to the appropriate *img* image *channel data type*. *value* component type is considered to be a signed integer. *coords* are considered to be non-parametric coordinates.

*Result Type* must be *void*.

*img* must be *image1d*, *image1dBuffer*, *image1dArray*, *image2d*, *image2dArray* or *image3d* value, with WriteOnly or ReadWrite access qualifier.

The *channel data type* of *img* must be set to **SIGNED INT8**, **SIGNED INT16**, **SIGNED INT32**.

When *img* is a *image2d*:

- *coords* must be a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width - 1), (0 ... image height - 1) respectively.

- *value* must be a *vector(4)* of *i32* values.

When *img* is a *image2dArray*:

- *coords* must be a *vector(4)* of *i32* values, where the first, second and third components are in the range (0 ... image width - 1), (0 ... image height - 1), (0 ... image number of layers - 1) respectively. The fourth component is ignored.

- *value* must be a *vector(4)* of *i32* values.

When *img* is a *image1d* or *image1dBuffer*:

- *coords* must be a *i32*, and is in the range (0 ... image width - 1)

- *value* must be a *vector(4)* of *i32* values.

When *img* is a *image1dArray*:

- *coords* must be a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width - 1), (0 ... image number of layers - 1) respectively.

- *value* must be a *vector(4)* of *i32* values

When *img* is a *image3d*:

- *coords* must be a *vector(4)* of *i32* values, where the first, second and third components are in the range (0 ... image width - 1), (0 ... image height - 1), (0 ... image depth - 1) respectively. The fourth component is ignored.

- *value* must be a *vector(4)* of *i32* values.

8	44	<id> Result Type	Result <id>	extended instructions set <id>	120	<id> img	<id> coords	<id> value
---	----	---------------------	-------------	--------------------------------------	-----	-------------	----------------	---------------

**write\_imageui**

Write *value* to the coordinates specified by *coords* to the image object specified by *img*. The write happens only after the data in *value* is converted to the appropriate *img* image *channel data type*. *value* component type is considered to be an unsigned integer. *coords* are considered to be non-parametric coordinates.

*Result Type* must be *void*.

*img* must be *image1d*, *image1dBuffer*, *image1dArray*, *image2d*, *image2dArray* or *image3d* value, with WriteOnly or ReadWrite access qualifier.

The *channel data type* of *img* must be set to **UNSIGNED INT8**, **UNSIGNED INT16**, **UNSIGNED INT32**.

When *img* is a *image2d*:

- *coords* must be a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width - 1), (0 ... image height - 1) respectively.

- *value* must be a *vector(4)* of *i32* values.

When *img* is a *image2dArray*:

- *coords* must be a *vector(4)* of *i32* values, where the first, second and third components are in the range (0 ... image width - 1), (0 ... image height - 1), (0 ... image number of layers - 1) respectively. The fourth component is ignored.

- *value* must be a *vector(4)* of *i32* values.

When *img* is a *image1d* or *image1dBuffer*:

- *coords* must be a *i32*, and is in the range (0 ... image width - 1)

- *value* must be a *vector(4)* of *i32* values.

When *img* is a *image1dArray*:

- *coords* must be a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width - 1), (0 ... image number of layers - 1) respectively.

- *value* must be a *vector(4)* of *i32* values

When *img* is a *image3d*:

- *coords* must be a *vector(4)* of *i32* values, where the first, second and third components are in the range (0 ... image width - 1), (0 ... image height - 1), (0 ... image depth - 1) respectively. The fourth component is ignored.

- *value* must be a *vector(4)* of *i32* values.

8	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	121	<id> <i>img</i>	<id> <i>coords</i>	<id> <i>value</i>
---	----	----------------------------	--------------------	--------------------------------------	-----	--------------------	-----------------------	----------------------

**write\_imageh**

Write *value* to the coordinates specified by *coords* to the image object specified by *img*. The write happens only after the data in *value* is converted to the appropriate *img* image *channel data type*. *coords* are considered to be non-parametric coordinates.

*Result Type* must be *void*.

*img* must be *image1d*, *image1dBuffer*, *image1dArray*, *image2d*, *image2dArray* or *image3d* value, with WriteOnly or ReadWrite access qualifier.

When *img* is a *image2d*, the behavior of the function is undefined unless:

- The *channel data type* of *img* is set to **UNORM SHORT 565, UNORM SHORT 555, UNORM INT 101010, UNORM INT8, SNORM INT8, UNORM INT16, SNORM INT16, HALF FLOAT**.

- *coords* is a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width - 1), (0 ... image height - 1) respectively.

- *value* is a *vector(4)* of *half* values.

When *img* is a *image2dArray*, the behavior of the function is undefined unless:

- The *channel data type* of *img* is set to **UNORM SHORT 565, UNORM SHORT 555, UNORM INT 101010, UNORM INT8, SNORM INT8, UNORM INT16, SNORM INT16, HALF FLOAT**.

- *coords* is a *vector(4)* of *i32* values, where the first, second and third components are in the range (0 ... image width - 1), (0 ... image height - 1), (0 ... image number of layers - 1) respectively. The fourth component is ignored.

- *value* is a *vector(4)* of *half* values.

When *img* is a *image1d* or *image1dBuffer*, the behavior of the function is undefined unless:

- The *channel data type* of *img* is set to **UNORM SHORT 565, UNORM SHORT 555, UNORM INT 101010, UNORM INT8, SNORM INT8, UNORM INT16, SNORM INT16, HALF FLOAT**.

- *coords* is a *i32*, and is in the range (0 ... image width - 1)

- *value* is a *vector(4)* of *half* values.

When *img* is a *image1dArray*, the behavior of the function is undefined unless:

- The *channel data type* of *img* is set to **UNORM SHORT 565, UNORM SHORT 555, UNORM INT 101010, UNORM INT8, SNORM INT8, UNORM INT16, SNORM INT16, HALF FLOAT**.

- *coords* is a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width - 1), (0 ... image number of layers - 1) respectively.

- *value* is a *vector(4)* of *half* values

When *img* is a *image3d*, the behavior of the function is undefined unless:

- The *channel data type* of *img* is set to **UNORM SHORT 565, UNORM SHORT 555, UNORM INT 101010, UNORM INT8, SNORM INT8, UNORM INT16, SNORM INT16, HALF FLOAT**.

- *coords* is a *vector(4)* of *i32* values, where the first, second and third components are in the range (0 ... image width - 1), (0 ... image height - 1), (0 ... image depth - 1) respectively. The fourth component is ignored.

- *value* is a *vector(4)* of *half* values.

---

8	44	<i>&lt;id&gt;</i> <i>Result Type</i>	<i>Result &lt;id&gt;</i>	extended instructions set <i>&lt;id&gt;</i>	122	<i>&lt;id&gt;</i> <i>img</i>	<i>&lt;id&gt;</i> <i>coords</i>	<i>&lt;id&gt;</i> <i>value</i>
---	----	---	--------------------------	---	-----	---------------------------------	------------------------------------	-----------------------------------

---

**write\_imagef\_mipmap\_lod**

Write *value* to the coordinates specified by *coords* in the mip-level specified by *lod* to the image object specified by *img*. The write happens only after the data in *value* is converted to the appropriate *img* image *channel data type*. *coords* are considered to be non-parametric coordinates.

*Result Type* must be *void*.

*img* must be *image1d*, *image1dArray*, *image2d*, *image2dArray*, *image2dArrayDepth*, *image2dDepth* or *image3d* value, with WriteOnly or ReadWrite access qualifier.

The behavior of the function is undefined unless *lod* value is in the range (0 ... number of mip-levels in the image - 1).

When *img* is a *image2d*, the behavior of the function is undefined unless:

- *coords* is a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width of the mip-level specified by *lod* - 1), (0 ... image height of the mip-level specified by *lod* - 1) respectively.

- *value* is a *vector(4)* of *float* values.

When *img* is a *image2dArray*, the behavior of the function is undefined unless:

- *coords* is a *vector(4)* of *i32* values, where the first, second and third components are in the range (0 ... image width of the mip-level specified by *lod* - 1), (0 ... image height of the mip-level specified by *lod* - 1), (0 ... image number of layers - 1) respectively. The fourth component is ignored.

- *value* is a *vector(4)* of *float* values.

When *img* is a *image1d* or *image1dBuffer*, the behavior of the function is undefined unless:

- *coords* is a *i32*, and is in the range (0 ... image width of the mip-level specified by *lod* - 1)

- *value* is a *vector(4)* of *float* values.

When *img* is a *image1dArray*, the behavior of the function is undefined unless:

- *coords* is a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width of the mip-level specified by *lod* - 1), (0 ... image number of layers - 1) respectively.

- *value* is a *vector(4)* of *float* values.

When *img* is a *image2dDepth*, the behavior of the function is undefined unless:

- *coords* is a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width of the mip-level specified by *lod* - 1), (0 ... image height of the mip-level specified by *lod* - 1) respectively.

- *value* is a *float*.

When *img* is a *image2dArrayDepth*, the behavior of the function is undefined unless:

- *coords* is a *vector(4)* of *i32* values, where the first, second and third components are in the range (0 ... image width of the mip-level specified by *lod* - 1), (0 ... image height of the mip-level specified by *lod* - 1), (0 ... image number of layers - 1) respectively. The fourth component is ignored.

- *value* is a *float*.

When *img* is a *image3d*, the behavior of the function is undefined unless:

- *coords* is a *vector(4)* of *i32* values, where the first, second and third components are in the range (0 ... image width of the mip-level specified by *lod* - 1), (0 ... image height of the mip-level specified by *lod* - 1), (0 ... image depth of the mip-level specified by *lod* - 1) respectively. The fourth component is ignored.

- *value* is a *vector(4)* of *float* values.

9	44	<id> Result Type	Result <id>	extended instruc- tions set <id>	129	<id> img	<id> coords	<id> lod	<id> value
---	----	------------------------	----------------	---	-----	-------------	----------------	-------------	---------------

**write\_imagei\_mipmap\_lod**

Write *value* to the coordinates specified by *coords* in the mip-level specified by *lod* to the image object specified by *img*. The write happens only after the data in *value* is converted to the appropriate *img* image *channel data type*. *coords* are considered to be non-parametric coordinates. *value* component type is treated as signed integer.

*Result Type* must be *void*.

*img* must be *image1d*, *image1dArray*, *image2d*, *image2dArray* or *image3d* value, with WriteOnly or ReadWrite access qualifier.

The behavior of the function is undefined unless *lod* value is in the range (0 ... number of mip-levels in the image - 1).

When *img* is a *image2d*, the behavior of the function is undefined unless:

- *coords* is a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width of the mip-level specified by *lod* - 1), (0 ... image height of the mip-level specified by *lod* - 1) respectively.

When *img* is a *image2dArray*, the behavior of the function is undefined unless:

- *coords* is a *vector(4)* of *i32* values, where the first, second and third components are in the range (0 ... image width of the mip-level specified by *lod* - 1), (0 ... image height of the mip-level specified by *lod* - 1), (0 ... image number of layers - 1) respectively. The fourth component is ignored.

When *img* is a *image1d* or *image1dBuffer*, the behavior of the function is undefined unless:

- *coords* is a *i32*, and is in the range (0 ... image width of the mip-level specified by *lod* - 1)

When *img* is a *image1dArray*, the behavior of the function is undefined unless:

- *coords* is a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width of the mip-level specified by *lod* - 1), (0 ... image number of layers - 1) respectively.

When *img* is a *image3d*, the behavior of the function is undefined unless:

- *coords* is a *vector(4)* of *i32* values, where the first, second and third components are in the range (0 ... image width of the mip-level specified by *lod* - 1), (0 ... image height of the mip-level specified by *lod* - 1), (0 ... image depth of the mip-level specified by *lod* - 1) respectively. The fourth component is ignored.

9	44	<id> Result Type	Result <id>	extended instruc- tions set <id>	130	<id> img	<id> coords	<id> lod	<id> value
---	----	------------------------	----------------	---	-----	-------------	----------------	-------------	---------------

**write\_imageui\_mipmap\_lod**

Write *value* to the coordinates specified by *coords* in the mip-level specified by *lod* to the image object specified by *img*. The write happens only after the data in *value* is converted to the appropriate *img* image channel data type. *coords* are considered to be non-parametric coordinates. *value* component type is treated as unsigned integer.

*Result Type* must be *void*.

*img* must be *image1d*, *image1dArray*, *image2d*, *image2dArray* or *image3d* value, with WriteOnly or ReadWrite access qualifier.

The behavior of the function is undefined unless *lod* value is in the range (0 ... number of mip-levels in the image - 1).

When *img* is a *image2d*, the behavior of the function is undefined unless:

- *coords* is a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width of the mip-level specified by *lod* - 1), (0 ... image height of the mip-level specified by *lod* - 1) respectively.

When *img* is a *image2dArray*, the behavior of the function is undefined unless:

- *coords* is a *vector(4)* of *i32* values, where the first, second and third components are in the range (0 ... image width of the mip-level specified by *lod* - 1), (0 ... image height of the mip-level specified by *lod* - 1), (0 ... image number of layers - 1) respectively. The fourth component is ignored.

When *img* is a *image1d* or *image1dBuffer*, the behavior of the function is undefined unless:

- *coords* is a *i32*, and is in the range (0 ... image width of the mip-level specified by *lod* - 1)

When *img* is a *image1dArray*, the behavior of the function is undefined unless:

- *coords* is a *vector(2)* of *i32* values, where the first and second components are in the range (0 ... image width of the mip-level specified by *lod* - 1), (0 ... image number of layers - 1) respectively.

When *img* is a *image3d*, the behavior of the function is undefined unless:

- *coords* is a *vector(4)* of *i32* values, where the first, second and third components are in the range (0 ... image width of the mip-level specified by *lod* - 1), (0 ... image height of the mip-level specified by *lod* - 1), (0 ... image depth of the mip-level specified by *lod* - 1) respectively. The fourth component is ignored.

**2.9.6 Image query functions**

This section describes the list of instructions that provide information of image memory objects.

<b>get_image_width</b>						
Return the width in pixels of the image object specified by <i>img</i> .						
<i>Result Type</i> must be <i>i32</i> .						
<i>img</i> must be <i>image1d</i> , <i>image1dBuffer</i> , <i>image1dArray</i> , <i>image2d</i> , <i>image2dArray</i> , <i>image2dArrayDepth</i> , <i>image2dDepth</i> or <i>image3d</i> value, with <i>ReadOnly</i> , <i>WriteOnly</i> or <i>ReadWrite</i> access qualifier.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	132	<id> <i>img</i>

<b>get_image_height</b>						
Return the height in pixels of the image object specified by <i>img</i> .						
<i>Result Type</i> must be <i>i32</i> .						
<i>img</i> must be <i>image2d</i> , <i>image2dArray</i> , <i>image2dArrayDepth</i> , <i>image2dDepth</i> or <i>image3d</i> value, with <i>ReadOnly</i> , <i>WriteOnly</i> or <i>ReadWrite</i> access qualifier.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	133	<id> <i>img</i>

<b>get_image_depth</b>						
Return the depth in pixels of the image object specified by <i>img</i> .						
<i>Result Type</i> must be <i>i32</i> .						
<i>img</i> must be <i>image3d</i> value, with <i>ReadOnly</i> , <i>WriteOnly</i> or <i>ReadWrite</i> access qualifier.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	134	<id> <i>img</i>

<b>get_image_channel_data_type</b>						
Return the <i>channel data type</i> of the image object specified by <i>img</i> .						
<i>Result Type</i> must be <i>i32</i> .						
<i>img</i> must be <i>image1d</i> , <i>image1dBuffer</i> , <i>image1dArray</i> , <i>image2d</i> , <i>image2dArray</i> , <i>image2dArrayDepth</i> , <i>image2dDepth</i> or <i>image3d</i> value, with <i>ReadOnly</i> , <i>WriteOnly</i> or <i>ReadWrite</i> access qualifier.						
<i>Result Type</i> must contain a value from <a href="#">ImageChannelType</a> enumeration.						
6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	135	<id> <i>img</i>

**get\_image\_channel\_order**

Return the *channel order* of the image object specified by *img*.

*Result Type* must be *i32*.

*img* must be *image1d*, *image1dBuffer*, *image1dArray*, *image2d*, *image2dArray*, *image2dArrayDepth*, *image2dDepth* or *image3d* value, with *ReadOnly*, *WriteOnly* or *ReadWrite* access qualifier.

*Result Type* must contain a value from [ImageChannelOrder](#) enumeration.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	136	<id> <i>img</i>
---	----	----------------------------	--------------------	--------------------------------------	-----	--------------------

**get\_image\_dim**

Return the dimensions of the image object specified by *img*.

*Result Type* must be *i32* or *vector(2,4)* of *i32* values.

*img* must be *image2d*, *image2dArray*, *image2dArrayDepth*, *image2dDepth* or *image3d* value, with *ReadOnly*, *WriteOnly* or *ReadWrite* access qualifier.

*Result Type* must be *vector(2)* of *i32* values when *img* is a *image2d*, *image2dArray*, *image2dArrayDepth* or *image2dDepth*. The width and height of the image are contained in the first and second components of the return value respectively.

*Result Type* must be *vector(4)* of *i32* values when *img* is a *image3d*. The width, height and depth of the image are contained in the first, second and third components of the return value respectively. The fourth component is 0.

6	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	137	<id> <i>img</i>
---	----	----------------------------	--------------------	--------------------------------------	-----	--------------------

**get\_image\_array\_size**

Return the number of samples in the MSAA image object specified by *img*.

*Result Type* must be *i32*.

*Result Type* must be *size\_t*.

*img* must be *image1dArray*, *image2dArray* or *image2dArrayDepth* value, with *ReadOnly*, *WriteOnly* or *ReadWrite* access qualifier.

*img* must be *image2dMsaa*, *image2dArrayMsaa*, *image2dMsaaDepth* or *image2dArrayMsaaDepth* value, with *ReadOnly*, *WriteOnly* or *ReadWrite* access qualifier.

7	44	<id> <i>Result Type</i>	<i>Result</i> <id>	extended instructions set <id>	138	<id> <i>img</i>	<id> <i>img</i>
---	----	----------------------------	--------------------	--------------------------------------	-----	--------------------	--------------------

<b>get_image_num_mip_levels</b>						
Return the number of mip-levels of the image object specified by <i>img</i> .						
<i>Result Type</i> must be <i>i32</i> .						
<i>img</i> must be <i>image1d</i> , <i>image1dArray</i> , <i>image2d</i> , <i>image2dArray</i> , <i>image2dArrayDepth</i> , <i>image2dDepth</i> or <i>image3d</i> value, with <i>ReadOnly</i> , <i>WriteOnly</i> or <i>ReadWrite</i> access qualifier.						
6	44	< <i>id</i> > <i>Result Type</i>	<i>Result</i> < <i>id</i> >	extended instructions set < <i>id</i> >	140	< <i>id</i> > <i>img</i>
