The same behavior applies to bindings with a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT where descriptorCount specifies the number of bytes to update while dstArrayElement specifies the starting byte offset, thus in this case if the dstBinding has a smaller byte size than the sum of dstArrayElement and descriptorCount, then the remainder will be used to update the subsequent binding - dstBinding+1 starting at offset zero. This falls out as a special case of the above rule.
**Valid Usage**

- **VUID-VkWriteDescriptorSet-dstBinding-00315**
  dstBinding must be less than or equal to the maximum value of binding of all VkDescriptorSetLayoutBinding structures specified when dstSet’s descriptor set layout was created

- **VUID-VkWriteDescriptorSet-dstBinding-00316**
  dstBinding must be a binding with a non-zero descriptorCount

- **VUID-VkWriteDescriptorSet-descriptorCount-00317**
  All consecutive bindings updated via a single VkWriteDescriptorSet structure, except those with a descriptorCount of zero, must have identical descriptorType and stageFlags

- **VUID-VkWriteDescriptorSet-descriptorType-00319**
  descriptorType must match the type of dstBinding within dstSet

- **VUID-VkWriteDescriptorSet-dstSet-00320**
  dstSet must be a valid VkDescriptorSet handle

- **VUID-VkWriteDescriptorSet-dstArrayElement-00321**
  The sum of dstArrayElement and descriptorCount must be less than or equal to the number of array elements in the descriptor set binding specified by dstBinding, and all applicable consecutive bindings, as described by consecutive binding updates

- **VUID-VkWriteDescriptorSet-descriptorType-02219**
  If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT, dstArrayElement must be an integer multiple of 4

- **VUID-VkWriteDescriptorSet-descriptorType-02220**
  If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT, descriptorCount must be an integer multiple of 4

- **VUID-VkWriteDescriptorSet-descriptorType-00322**
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, pImageInfo must be a valid pointer to an array of descriptorCount valid VkDescriptorImageInfo structures

- **VUID-VkWriteDescriptorSet-descriptorType-02994**
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, each element of pTexelBufferView must be either a valid VkBufferView handle or VK_NULL_HANDLE

- **VUID-VkWriteDescriptorSet-descriptorType-02995**
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER and the nullDescriptor feature is not enabled, each element of pTexelBufferView must not be VK_NULL_HANDLE
If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, pBufferInfo must be a valid pointer to an array of descriptorCount valid VkDescriptorBufferInfo structures.

If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and dstSet was not allocated with a layout that included immutable samplers for dstBinding with descriptorType, the sampler member of each element of pImageInfo must be a valid VkSampler object.

If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT and the nullDescriptor feature is not enabled, the imageView member of each element of pImageInfo must not be VK_NULL_HANDLE.

If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT, the pNext chain must include a VkWriteDescriptorSetInlineUniformBlockEXT structure whose dataSize member equals descriptorCount.

If descriptorType is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, the pNext chain must include a VkWriteDescriptorSetAccelerationStructureKHR structure whose accelerationStructureCount member equals descriptorCount.

If descriptorType is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV, the pNext chain must include a VkWriteDescriptorSetAccelerationStructureNV structure whose accelerationStructureCount member equals descriptorCount.

If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, then the imageView member of each pImageInfo element must have been created without a VkSamplerYcbcrConversionInfo structure in its pNext chain.

If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and if any element of pImageInfo has a imageView member that was created with a VkSamplerYcbcrConversionInfo structure in its pNext chain, then dstSet must have been allocated with a layout that included immutable samplers for dstBinding, and the corresponding immutable sampler must have been created with an identically defined VkSamplerYcbcrConversionInfo object.

If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and dstSet was allocated...
with a layout that included immutable samplers for dstBinding, then the imageView member of each element of pImageInfo which corresponds to an immutable sampler that enables sampler Y’C_bCr conversion must have been created with a VkSamplerYcbcrConversionInfo structure in its pNext chain with an identically defined VkSamplerYcbcrConversionInfo to the corresponding immutable sampler

• VUID-VkWriteDescriptorSet-descriptorType-00327
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, the offset member of each element of pBufferInfo must be a multiple of VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment

• VUID-VkWriteDescriptorSet-descriptorType-00328
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, the offset member of each element of pBufferInfo must be a multiple of VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment

• VUID-VkWriteDescriptorSet-descriptorType-00329
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, and the buffer member of any element of pBufferInfo is the handle of a non-sparse buffer, then that buffer must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-VkWriteDescriptorSet-descriptorType-00330
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, the buffer member of each element of pBufferInfo must have been created with VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT set

• VUID-VkWriteDescriptorSet-descriptorType-00331
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, the buffer member of each element of pBufferInfo must have been created with VK_BUFFER_USAGE_STORAGE_BUFFER_BIT set

• VUID-VkWriteDescriptorSet-descriptorType-00332
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, the range member of each element of pBufferInfo, or the effective range if range is VK_WHOLE_SIZE, must be less than or equal to VkPhysicalDeviceLimits::maxUniformBufferRange

• VUID-VkWriteDescriptorSet-descriptorType-00333
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, the range member of each element of pBufferInfo, or the effective range if range is VK_WHOLE_SIZE, must be less than or equal to VkPhysicalDeviceLimits::maxStorageBufferRange

• VUID-VkWriteDescriptorSet-descriptorType-00334
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER, the VkBuffer that each element of pTexelBufferView was created from must have been created with VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT set

• VUID-VkWriteDescriptorSet-descriptorType-00335
If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, the VkBuffer that each element of pTexelBufferView was created from must have been created with VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT set.

- VUID-VkWriteDescriptorSet-descriptorType-00336
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the imageView member of each element of pImageInfo must have been created with the identity swizzle.

- VUID-VkWriteDescriptorSet-descriptorType-00337
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, each imageView member of each element of pImageInfo must have been created with VK_IMAGE_USAGE_STORAGE_TEXEL_BUFFER_BIT set.

- VUID-VkWriteDescriptorSet-descriptorType-00338
  If descriptorType is VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, dstSet must not have been allocated with a layout that included immutable samplers for dstBinding.

- VUID-VkWriteDescriptorSet-dstSet-04611
  If the VkDescriptorSetLayoutBinding for dstSet at dstBinding is VK_DESCRIPTOR_TYPE_MUTABLE_VALUE, the new active descriptor type descriptorType must exist in the corresponding pMutableDescriptorTypeLists list for dstBinding.
Valid Usage (Implicit)

- **VUID-VkWriteDescriptorSet-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET`.

- **VUID-VkWriteDescriptorSet-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkWriteDescriptorSetAccelerationStructureKHR`, `VkWriteDescriptorSetAccelerationStructureNV`, or `VkWriteDescriptorSetInlineUniformBlockEXT`.

- **VUID-VkWriteDescriptorSet-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkWriteDescriptorSet-descriptorType-parameter**
  
  `descriptorType` must be a valid `VkDescriptorType` value.

- **VUID-VkWriteDescriptorSet-descriptorCount-arraylength**
  
  `descriptorCount` must be greater than `0`.

- **VUID-VkWriteDescriptorSet-commonparent**
  
  Both of `dstSet`, and the elements of `pTexelBufferView` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

The type of descriptors in a descriptor set is specified by `VkWriteDescriptorSet::descriptorType`, which must be one of the values:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorType {
    VK_DESCRIPTOR_TYPE_SAMPLER = 0,
    VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER = 1,
    VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE = 2,
    VK_DESCRIPTOR_TYPE_STORAGE_IMAGE = 3,
    VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER = 4,
    VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER = 5,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER = 6,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER = 7,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC = 8,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC = 9,
    VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT = 10,
    // Provided by VK_EXT_inline_uniform_block
    VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT = 1000138000,
    // Provided by VK_KHR_acceleration_structure
    VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR = 1000150000,
    // Provided by VK_NV_ray_tracing
    VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV = 1000165000,
    // Provided by VK_VALVE_mutable_descriptor_type
    VK_DESCRIPTOR_TYPE_MUTABLE_VALVE = 1000351000,
} VkDescriptorType;
```
• VK_DESCRIPTOR_TYPE_SAMPLER specifies a sampler descriptor.
• VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER specifies a combined image sampler descriptor.
• VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE specifies a sampled image descriptor.
• VK_DESCRIPTOR_TYPE_STORAGE_IMAGE specifies a storage image descriptor.
• VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER specifies a uniform texel buffer descriptor.
• VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER specifies a storage texel buffer descriptor.
• VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER specifies a uniform buffer descriptor.
• VK_DESCRIPTOR_TYPE_STORAGE_BUFFER specifies a storage buffer descriptor.
• VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC specifies a dynamic uniform buffer descriptor.
• VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC specifies a dynamic storage buffer descriptor.
• VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT specifies an input attachment descriptor.
• VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT specifies an inline uniform block.
• VK_DESCRIPTOR_TYPE_MUTABLE_VALVE specifies a descriptor of mutable type.

When a descriptor set is updated via elements of VkWriteDescriptorSet, members of pImageInfo, pBufferInfo and pTexelBufferView are only accessed by the implementation when they correspond to descriptor type being defined - otherwise they are ignored. The members accessed are as follows for each descriptor type:

• For VK_DESCRIPTOR_TYPE_SAMPLER, only the sampler member of each element of VkWriteDescriptorSet::pImageInfo is accessed.
• For VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, only the imageView and imageLayout members of each element of VkWriteDescriptorSet::pImageInfo are accessed.
• For VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, all members of each element of VkWriteDescriptorSet::pImageInfo are accessed.
• For VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, all members of each element of VkWriteDescriptorSet::pBufferInfo are accessed.
• For VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, each element of VkWriteDescriptorSet::pTexelBufferView is accessed.

When updating descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT, none of the pImageInfo, pBufferInfo, or pTexelBufferView members are accessed, instead the source data of the descriptor update operation is taken from the VkWriteDescriptorSetInlineUniformBlockEXT structure in the pNext chain of VkWriteDescriptorSet. When updating descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, none of the pImageInfo, pBufferInfo, or pTexelBufferView members are accessed, instead the source data of the descriptor update operation is taken from the VkWriteDescriptorSetAccelerationStructureKHR structure in the pNext chain of VkWriteDescriptorSet. When updating descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV, none of the pImageInfo, pBufferInfo, or
pTexelBufferView members are accessed, instead the source data of the descriptor update operation is taken from the VkWriteDescriptorSetAccelerationStructureNV structure in the pNext chain of VkWriteDescriptorSet.

The VkDescriptorBufferInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorBufferInfo {
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize range;
} VkDescriptorBufferInfo;
```

- **buffer** is `VK_NULL_HANDLE` or the buffer resource.
- **offset** is the offset in bytes from the start of buffer. Access to buffer memory via this descriptor uses addressing that is relative to this starting offset.
- **range** is the size in bytes that is used for this descriptor update, or `VK_WHOLE_SIZE` to use the range from offset to the end of the buffer.

**Note**

When setting range to `VK_WHOLE_SIZE`, the effective range must not be larger than the maximum range for the descriptor type (maxUniformBufferRange or maxStorageBufferRange). This means that `VK_WHOLE_SIZE` is not typically useful in the common case where uniform buffer descriptors are suballocated from a buffer that is much larger than `maxUniformBufferRange`.

For `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` descriptor types, offset is the base offset from which the dynamic offset is applied and range is the static size used for all dynamic offsets.

**Valid Usage**

- **VUID-VkDescriptorBufferInfo-offset-00340**
  
  offset must be less than the size of buffer

- **VUID-VkDescriptorBufferInfo-range-00341**
  
  If range is not equal to `VK_WHOLE_SIZE`, range must be greater than 0

- **VUID-VkDescriptorBufferInfo-range-00342**
  
  If range is not equal to `VK_WHOLE_SIZE`, range must be less than or equal to the size of buffer minus offset

- **VUID-VkDescriptorBufferInfo-buffer-02998**
  
  If the nullDescriptor feature is not enabled, buffer must not be `VK_NULL_HANDLE`

- **VUID-VkDescriptorBufferInfo-buffer-02999**
  
  If buffer is `VK_NULL_HANDLE`, offset must be zero and range must be `VK_WHOLE_SIZE`
Valid Usage (Implicit)

- VUID-VkDescriptorBufferInfo-buffer-parameter
  If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle

The VkDescriptorImageInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorImageInfo {
    VkSampler sampler;
    VkImageView imageView;
    VkImageLayout imageLayout;
} VkDescriptorImageInfo;
```

- `sampler` is a sampler handle, and is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER if the binding being updated does not use immutable samplers.

- `imageView` is VK_NULL_HANDLE or an image view handle, and is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT.

- `imageLayout` is the layout that the image subresources accessible from `imageView` will be in at the time this descriptor is accessed. `imageLayout` is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT.

Members of VkDescriptorImageInfo that are not used in an update (as described above) are ignored.
Valid Usage

• VUID-VkDescriptorImageInfo-imageView-00343
  `imageView` **must** not be 2D or 2D array image view created from a 3D image

• VUID-VkDescriptorImageInfo-imageView-01976
  If `imageView` is created from a depth/stencil image, the `aspectMask` used to create the `imageView` **must** include either `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` but not both

• VUID-VkDescriptorImageInfo-imageLayout-00344
  `imageLayout` **must** match the actual `VkImageLayout` of each subresource accessible from `imageView` at the time this descriptor is accessed as defined by the image layout matching rules

• VUID-VkDescriptorImageInfo-sampler-01564
  If `sampler` is used and the `VkFormat` of the image is a multi-planar format, the image **must** have been created with `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, and the `aspectMask` of the `imageView` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT` or (for three-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`

• VUID-VkDescriptorImageInfo-mutableComparisonSamplers-04450
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::mutableComparisonSamplers` is `VK_FALSE`, then `sampler` **must** have been created with `VkSamplerCreateInfo::compareEnable` set to `VK_FALSE`

Valid Usage (Implicit)

• VUID-VkDescriptorImageInfo-commonparent
  Both of `imageView`, and `sampler` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

If the `descriptorType` member of `VkWriteDescriptorSet` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` then the data to write to the descriptor set is specified through a `VkWriteDescriptorSetInlineUniformBlockEXT` structure included in the `pNext` chain of `VkWriteDescriptorSet`.

The `VkWriteDescriptorSetInlineUniformBlockEXT` structure is defined as:

```plaintext
// Provided by VK_EXT_inline_uniform_block
typedef struct VkWriteDescriptorSetInlineUniformBlockEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t dataSize;
    const void* pData;
} VkWriteDescriptorSetInlineUniformBlockEXT;
```
• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **dataSize** is the number of bytes of inline uniform block data pointed to by **pData**.
• **pData** is a pointer to **dataSize** number of bytes of data to write to the inline uniform block.

### Valid Usage

- VUID-VkWriteDescriptorSetInlineUniformBlockEXT-dataSize-02222  
  **dataSize must** be an integer multiple of 4

### Valid Usage (Implicit)

- VUID-VkWriteDescriptorSetInlineUniformBlockEXT-sType-sType  
  **sType must** be **VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_INLINE_UNIFORM_BLOCK_EXT**
- VUID-VkWriteDescriptorSetInlineUniformBlockEXT-pData-parameter  
  **pData must** be a valid pointer to an array of **dataSize** bytes
- VUID-VkWriteDescriptorSetInlineUniformBlockEXT-dataSize-arraylength  
  **dataSize must** be greater than 0

The **VkWriteDescriptorSetAccelerationStructureKHR** structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkWriteDescriptorSetAccelerationStructureKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t accelerationStructureCount;
    const VkAccelerationStructureKHR* pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureKHR;
```

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **accelerationStructureCount** is the number of elements in **pAccelerationStructures**.
• **pAccelerationStructures** is a pointer to an array of **VkAccelerationStructureKHR** structures specifying the acceleration structures to update.
Valid Usage

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-02236
  accelerationStructureCount must be equal to descriptorCount in the extended structure

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03579
  Each acceleration structure in pAccelerationStructures must have been created with a type of VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03580
  If the nullDescriptor feature is not enabled, each element of pAccelerationStructures must not be VK_NULL_HANDLE

Valid Usage (Implicit)

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_KHR

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-parameter
  pAccelerationStructures must be a valid pointer to an array of accelerationStructureCount valid or VK_NULL_HANDLE VkAccelerationStructureKHR handles

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-arraylength
  accelerationStructureCount must be greater than 0

The VkWriteDescriptorSetAccelerationStructureNV structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkWriteDescriptorSetAccelerationStructureNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t accelerationStructureCount;
    const VkAccelerationStructureNV* pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureNV;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **accelerationStructureCount** is the number of elements in pAccelerationStructures.
- **pAccelerationStructures** is a pointer to an array of VkAccelerationStructureNV structures specifying the acceleration structures to update.
Valid Usage

- VUID-VkWriteDescriptorSetAccelerationStructureNV-accelerationStructureCount-03747
  \textit{accelerationStructureCount} must be equal to \textit{descriptorCount} in the extended structure.

- VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-03748
  Each acceleration structure in \textit{pAccelerationStructures} must have been created with \textit{VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR}.

- VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-03749
  If the \textit{nullDescriptor} feature is not enabled, each member of \textit{pAccelerationStructures} must not be \textit{VK_NULL_HANDLE}.

Valid Usage (Implicit)

- VUID-VkWriteDescriptorSetAccelerationStructureNV-sType-sType
  \textit{sType} must be \textit{VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_NV}.

- VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-parameter
  \textit{pAccelerationStructures} must be a valid pointer to an array of \textit{accelerationStructureCount} valid or \textit{VK_NULL_HANDLE} VkAccelerationStructureNV handles.

- VUID-VkWriteDescriptorSetAccelerationStructureNV-accelerationStructureCount-arraylength
  \textit{accelerationStructureCount} must be greater than 0.

The \textit{VkCopyDescriptorSet} structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCopyDescriptorSet {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorSet srcSet;
    uint32_t srcBinding;
    uint32_t srcArrayElement;
    VkDescriptorSet dstSet;
    uint32_t dstBinding;
    uint32_t dstArrayElement;
    uint32_t descriptorCount;
} VkCopyDescriptorSet;
```

- \textit{sType} is the type of this structure.
- \textit{pNext} is \textit{NULL} or a pointer to a structure extending this structure.
- \textit{srcSet}, \textit{srcBinding}, and \textit{srcArrayElement} are the source set, binding, and array element, respectively. If the descriptor binding identified by \textit{srcSet} and \textit{srcBinding} has a descriptor type of \textit{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT} then \textit{srcArrayElement} specifies the starting byte offset within the binding to copy from.
- \textit{dstSet}, \textit{dstBinding}, and \textit{dstArrayElement} are the destination set, binding, and array element,
respectively. If the descriptor binding identified by dstSet and dstBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT then dstArrayElement specifies the starting byte offset within the binding to copy to.

- descriptorCount is the number of descriptors to copy from the source to destination. If descriptorCount is greater than the number of remaining array elements in the source or destination binding, those affect consecutive bindings in a manner similar to VkWriteDescriptorSet above. If the descriptor binding identified by srcSet and srcBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT then descriptorCount specifies the number of bytes to copy and the remaining array elements in the source or destination binding refer to the remaining number of bytes in those.

If the VkDescriptorSetLayoutBinding for dstBinding is VK_DESCRIPTOR_TYPE_MUTABLE_VALUE and srcBinding is not VK_DESCRIPTOR_TYPE_MUTABLE_VALUE, the new active descriptor type becomes the descriptor type of srcBinding. If both VkDescriptorSetLayoutBinding for srcBinding and dstBinding are VK_DESCRIPTOR_TYPE_MUTABLE_VALUE, the active descriptor type in each source descriptor is copied into the corresponding destination descriptor. The active descriptor type can be different for each source descriptor.

---

**Note**

The intention is that copies to and from mutable descriptors is a simple memcpy. Copies between non-mutable and mutable descriptors are expected to require one memcpy per descriptor to handle the difference in size, but this use case with more than one descriptorCount is considered rare.
Valid Usage

- **VUID-VkCopyDescriptorSet-srcBinding-00345**
  
  `srcBinding` must be a valid binding within `srcSet`

- **VUID-VkCopyDescriptorSet-srcArrayElement-00346**
  
  The sum of `srcArrayElement` and `descriptorCount` must be less than or equal to the number of array elements in the descriptor set binding specified by `srcBinding`, and all applicable consecutive bindings, as described by consecutive binding updates

- **VUID-VkCopyDescriptorSet-dstBinding-00347**
  
  `dstBinding` must be a valid binding within `dstSet`

- **VUID-VkCopyDescriptorSet-dstArrayElement-00348**
  
  The sum of `dstArrayElement` and `descriptorCount` must be less than or equal to the number of array elements in the descriptor set binding specified by `dstBinding`, and all applicable consecutive bindings, as described by consecutive binding updates

- **VUID-VkCopyDescriptorSet-dstBinding-02632**
  
  The type of `dstBinding` within `dstSet` must be equal to the type of `srcBinding` within `srcSet`

- **VUID-VkCopyDescriptorSet-srcSet-00349**
  
  If `srcSet` is equal to `dstSet`, then the source and destination ranges of descriptors must not overlap, where the ranges may include array elements from consecutive bindings as described by consecutive binding updates

- **VUID-VkCopyDescriptorSet-srcBinding-02223**
  
  If the descriptor type of the descriptor set binding specified by `srcBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, `srcArrayElement` must be an integer multiple of 4

- **VUID-VkCopyDescriptorSet-dstBinding-02224**
  
  If the descriptor type of the descriptor set binding specified by `dstBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, `dstArrayElement` must be an integer multiple of 4

- **VUID-VkCopyDescriptorSet-srcBinding-02225**
  
  If the descriptor type of the descriptor set binding specified by either `srcBinding` or `dstBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, `descriptorCount` must be an integer multiple of 4

- **VUID-VkCopyDescriptorSet-srcSet-01918**
  
  If `srcSet`'s layout was created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set, then `dstSet`'s layout must also have been created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set

- **VUID-VkCopyDescriptorSet-srcSet-04885**
  
  If `srcSet`'s layout was created with neither `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` nor `VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT` flags set, then `dstSet`'s layout must have been created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set
If the descriptor pool from which srcSet was allocated was created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set, then the descriptor pool from which dstSet was allocated must also have been created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set.

If the descriptor pool from which srcSet was allocated was created with neither `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` nor `VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT` flags set, then the descriptor pool from which dstSet was allocated must have been created without the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set.

If the descriptor type of the descriptor set binding specified by dstBinding is `VK_DESCRIPTOR_TYPE_SAMPLER`, then dstSet must not have been allocated with a layout that included immutable samplers for dstBinding.

If VkDescriptorSetLayoutBinding for dstSet at dstBinding is `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE`, the new active descriptor type must exist in the corresponding pMutableDescriptorTypeLists list for dstBinding if the new active descriptor type is not `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE`.

If VkDescriptorSetLayoutBinding for srcSet at srcBinding is `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE` and the VkDescriptorSetLayoutBinding for dstSet at dstBinding is not `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE`, the active descriptor type for the source descriptor must match the descriptor type of dstBinding.

If VkDescriptorSetLayoutBinding for dstSet at dstBinding is `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE`, and the new active descriptor type is `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE`, the pMutableDescriptorTypeLists for srcBinding and dstBinding must match exactly.
### 14.2.5. Descriptor Update Templates

A descriptor update template specifies a mapping from descriptor update information in host memory to descriptors in a descriptor set. It is designed to avoid passing redundant information to the driver when frequently updating the same set of descriptors in descriptor sets.

Descriptor update template objects are represented by `VkDescriptorUpdateTemplate` handles:

```c
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorUpdateTemplate)
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplate VkDescriptorUpdateTemplateKHR;
```

### 14.2.6. Descriptor Set Updates with Templates

Updating a large `VkDescriptorSet` array can be an expensive operation since an application must specify one `VkWriteDescriptorSet` structure for each descriptor or descriptor array to update, each of which re-specifies the same state when updating the same descriptor in multiple descriptor sets. For cases when an application wishes to update the same set of descriptors in multiple descriptor sets allocated using the same `VkDescriptorSetLayout`, `vkUpdateDescriptorSetWithTemplate` can be used as a replacement for `vkUpdateDescriptorSets`.

`VkDescriptorUpdateTemplate` allows implementations to convert a set of descriptor update operations on a single descriptor set to an internal format that, in conjunction with `vkUpdateDescriptorSetWithTemplate` or `vkCmdPushDescriptorSetWithTemplateKHR`, can be more efficient compared to calling `vkUpdateDescriptorSets` or `vkCmdPushDescriptorSetKHR`. The descriptors themselves are not specified in the `VkDescriptorUpdateTemplate`, rather, offsets into an application provided pointer to host memory are specified, which are combined with a pointer
passed to `vkUpdateDescriptorSetWithTemplate` or `vkCmdPushDescriptorSetWithTemplateKHR`. This allows large batches of updates to be executed without having to convert application data structures into a strictly-defined Vulkan data structure.

To create a descriptor update template, call:

```c
// Provided by VK_KHR_descriptor_update_template
VkResult vkCreateDescriptorUpdateTemplateKHR(
    VkDevice device,
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorUpdateTemplate* pDescriptorUpdateTemplate);
```

- **device** is the logical device that creates the descriptor update template.
- **pCreateInfo** is a pointer to a `VkDescriptorUpdateTemplateCreateInfo` structure specifying the set of descriptors to update with a single call to `vkCmdPushDescriptorSetWithTemplateKHR` or `vkUpdateDescriptorSetWithTemplate`.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pDescriptorUpdateTemplate** is a pointer to a `VkDescriptorUpdateTemplate` handle in which the resulting descriptor update template object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDescriptorUpdateTemplate-device-parameter
  
  *device* must be a valid `VkDevice` handle

- VUID-vkCreateDescriptorUpdateTemplate-pCreateInfo-parameter
  
  *pCreateInfo* must be a valid pointer to a valid `VkDescriptorUpdateTemplateCreateInfo` structure

- VUID-vkCreateDescriptorUpdateTemplate-pAllocator-parameter
  
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateDescriptorUpdateTemplate-pDescriptorUpdateTemplate-parameter
  
  *pDescriptorUpdateTemplate* must be a valid pointer to a `VkDescriptorUpdateTemplate` handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDescriptorUpdateTemplateCreateInfo` structure is defined as:

```c
typedef struct VkDescriptorUpdateTemplateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorUpdateTemplateCreateFlags flags;
    uint32_t descriptorUpdateEntryCount;
    const VkDescriptorUpdateTemplateEntry* pDescriptorUpdateEntries;
    VkDescriptorUpdateTemplateType templateType;
    VkDescriptorSetLayout descriptorSetLayout;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipelineLayout pipelineLayout;
    uint32_t set;
} VkDescriptorUpdateTemplateCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateInfo VkDescriptorUpdateTemplateCreateInfoKHR;
```

• `sType` is the type of this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `descriptorUpdateEntryCount` is the number of elements in the `pDescriptorUpdateEntries` array.
• `pDescriptorUpdateEntries` is a pointer to an array of `VkDescriptorUpdateTemplateEntry` structures describing the descriptors to be updated by the descriptor update template.
• `templateType` Specifies the type of the descriptor update template. If set to `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET` it can only be used to update descriptor sets with a fixed `descriptorSetLayout`. If set to `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR` it can only be used to push descriptor sets using the provided `pipelineBindPoint`, `pipelineLayout`, and set number.
• `descriptorSetLayout` is the descriptor set layout used to build the descriptor update template. All descriptor sets which are going to be updated through the newly created descriptor update template must be created with a layout that matches (is the same as, or defined identically to)
this layout. This parameter is ignored if `templateType` is not `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET`.

- `pipelineBindPoint` is a `VkPipelineBindPoint` indicating the type of the pipeline that will use the descriptors. This parameter is ignored if `templateType` is not `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`.

- `pipelineLayout` is a `VkPipelineLayout` object used to program the bindings. This parameter is ignored if `templateType` is not `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`.

- `set` is the set number of the descriptor set in the pipeline layout that will be updated. This parameter is ignored if `templateType` is not `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`.

### Valid Usage

- `VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00350`
  
  If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET`, `descriptorSetLayout` must be a valid `VkDescriptorSetLayout` handle.

- `VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00351`
  
  If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`, `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value.

- `VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00352`
  
  If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`, `pipelineLayout` must be a valid `VkPipelineLayout` handle.

- `VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00353`
  
  If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`, `set` must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`.

- `VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-04615`
  
  If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET`, `descriptorSetLayout` must not contain a binding with type `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE`.
Valid Usage (Implicit)

- **VUID-VkDescriptorUpdateTemplateCreateInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO`

- **VUID-VkDescriptorUpdateTemplateCreateInfo-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkDescriptorUpdateTemplateCreateInfo-flags-zerobitmask**
  
  `flags` must be `0`

- **VUID-VkDescriptorUpdateTemplateCreateInfo-pDescriptorUpdateEntries-parameter**
  
  `pDescriptorUpdateEntries` must be a valid pointer to an array of `descriptorUpdateEntryCount` valid `VkDescriptorUpdateTemplateEntry` structures

- **VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-parameter**
  
  `templateType` must be a valid `VkDescriptorUpdateTemplateType` value

- **VUID-VkDescriptorUpdateTemplateCreateInfo-descriptorUpdateEntryCount-arraylength**
  
  `descriptorUpdateEntryCount` must be greater than `0`

- **VUID-VkDescriptorUpdateTemplateCreateInfo-commonparent**
  
  Both of `descriptorSetLayout`, and `pipelineLayout` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

```c
typedef VkFlags VkDescriptorUpdateTemplateCreateFlags;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateFlags VkDescriptorUpdateTemplateCreateFlagsKHR;
```

`VkDescriptorUpdateTemplateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The descriptor update template type is determined by the `VkDescriptorUpdateTemplateCreateInfo ::templateType` property, which takes the following values:
typedef enum VkDescriptorUpdateTemplateType {
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET = 0,
    // Provided by VK_KHR_push_descriptor with VK_VERSION_1_1, VK_KHR_push_descriptor with
    // VK_KHR_descriptor_update_template, VK_KHR_descriptor_update_template with
    // VK_KHR_push_descriptor
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR = 1,
    // Provided by VK_KHR_descriptor_update_template
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET_KHR = VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET,
} VkDescriptorUpdateTemplateType;

or the equivalent

// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateType VkDescriptorUpdateTemplateTypeKHR;

• VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET specifies that the descriptor update template will be used for descriptor set updates only.
• VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR specifies that the descriptor update template will be used for push descriptor updates only.

The VkDescriptorUpdateTemplateEntry structure is defined as:

typedef struct VkDescriptorUpdateTemplateEntry {
    uint32_t dstBinding;
    uint32_t dstArrayElement;
    uint32_t descriptorCount;
    VkDescriptorType descriptorType;
    size_t offset;
    size_t stride;
} VkDescriptorUpdateTemplateEntry;

or the equivalent

// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateEntry VkDescriptorUpdateTemplateEntryKHR;

• dstBinding is the descriptor binding to update when using this descriptor update template.
• dstArrayElement is the starting element in the array belonging to dstBinding. If the descriptor binding identified by dstBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT then dstArrayElement specifies the starting byte offset to update.
• descriptorCount is the number of descriptors to update. If descriptorCount is greater than the number of remaining array elements in the destination binding, those affect consecutive
bindings in a manner similar to VkWriteDescriptorSet above. If the descriptor binding identified by dstBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT then descriptorCount specifies the number of bytes to update and the remaining array elements in the destination binding refer to the remaining number of bytes in it.

- descriptorType is a VkDescriptorType specifying the type of the descriptor.
- offset is the offset in bytes of the first binding in the raw data structure.
- stride is the stride in bytes between two consecutive array elements of the descriptor update informations in the raw data structure. The actual pointer ptr for each array element j of update entry i is computed using the following formula:

\[
\text{const char *} \text{ptr} = (\text{const char *})\text{pData} + \text{pDescriptorUpdateEntries[i].offset} + j \times \text{pDescriptorUpdateEntries[i].stride}
\]

The stride is useful in case the bindings are stored in structs along with other data. If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT then the value of stride is ignored and the stride is assumed to be 1, i.e. the descriptor update information for them is always specified as a contiguous range.

### Valid Usage

- VUID-VkDescriptorUpdateTemplateEntry-dstBinding-00354
dstBinding must be a valid binding in the descriptor set layout implicitly specified when using a descriptor update template to update descriptors

- VUID-VkDescriptorUpdateTemplateEntry-dstArrayElement-00355
dstArrayElement and descriptorCount must be less than or equal to the number of array elements in the descriptor set binding implicitly specified when using a descriptor update template to update descriptors, and all applicable consecutive bindings, as described by consecutive binding updates

- VUID-VkDescriptorUpdateTemplateEntry-descriptor-02226
If descriptor type is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT, dstArrayElement must be an integer multiple of 4

- VUID-VkDescriptorUpdateTemplateEntry-descriptor-02227
If descriptor type is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT, descriptorCount must be an integer multiple of 4

### Valid Usage (Implicit)

- VUID-VkDescriptorUpdateTemplateEntry-descriptorType-parameter
descriptorType must be a valid VkDescriptorType value

To destroy a descriptor update template, call:
void vkDestroyDescriptorUpdateTemplateKHR(
    VkDevice device,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    const VkAllocationCallbacks* pAllocator);

- `device` is the logical device that has been used to create the descriptor update template.
- `descriptorUpdateTemplate` is the descriptor update template to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- **VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00356**
  If `VkAllocationCallbacks` were provided when `descriptorUpdateTemplate` was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00357**
  If no `VkAllocationCallbacks` were provided when `descriptorUpdateTemplate` was created, `pAllocator` must be `NULL`.

**Valid Usage (Implicit)**

- **VUID-vkDestroyDescriptorUpdateTemplate-device-parameter**
  `device` must be a valid `VkDevice` handle.

- **VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parameter**
  If `descriptorUpdateTemplate` is not `VK_NULL_HANDLE`, `descriptorUpdateTemplate` must be a valid `VkDescriptorUpdateTemplate` handle.

- **VUID-vkDestroyDescriptorUpdateTemplate-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parent**
  If `descriptorUpdateTemplate` is a valid handle, it must have been created, allocated, or retrieved from `device`.

**Host Synchronization**

- Host access to `descriptorUpdateTemplate` must be externally synchronized.

Once a `VkDescriptorUpdateTemplate` has been created, descriptor sets can be updated by calling:
// Provided by VK_KHR_descriptor_update_template
void vkUpdateDescriptorSetWithTemplateKHR(
    VkDevice device,
    VkDescriptorSet descriptorSet,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    const void* pData);

- device is the logical device that updates the descriptor set.
- descriptorSet is the descriptor set to update.
- descriptorUpdateTemplate is a VkDescriptorUpdateTemplate object specifying the update mapping between pData and the descriptor set to update.
- pData is a pointer to memory containing one or more VkDescriptorImageInfo, VkDescriptorBufferInfo, or VkBufferView structures or VkAccelerationStructureKHR or VkAccelerationStructureNV handles used to write the descriptors.

**Valid Usage**

- VUID-vkUpdateDescriptorSetWithTemplate-pData-01685
  pData must be a valid pointer to a memory containing one or more valid instances of VkDescriptorImageInfo, VkDescriptorBufferInfo, or VkBufferView in a layout defined by descriptorUpdateTemplate when it was created with vkCreateDescriptorUpdateTemplate

**Valid Usage (Implicit)**

- VUID-vkUpdateDescriptorSetWithTemplate-device-parameter
  device must be a valid VkDevice handle
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-parameter
  descriptorSet must be a valid VkDescriptorSet handle
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parameter
  descriptorUpdateTemplate must be a valid VkDescriptorUpdateTemplate handle
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parent
  descriptorUpdateTemplate must have been created, allocated, or retrieved from device

**Host Synchronization**

- Host access to descriptorSet must be externally synchronized

**API example**

```c
struct AppBufferView {
    VkBufferView bufferView;
    uint32_t applicationRelatedInformation;
};
```
struct AppDataStructure
{
    VkDescriptorImageInfo imageInfo;  // a single image info
    VkDescriptorBufferInfo bufferInfoArray[3];  // 3 buffer infos in an array
    AppBufferView bufferView[2];  // An application defined structure containing a bufferView
    // ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] =
{
    // binding to a single image descriptor
    { 0, // binding
        0, // dstArrayElement
        1, // descriptorCount
        VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, // descriptorType
        offsetof(AppDataStructure, imageInfo), // offset
        0  // stride is not required if descriptorCount is 1
    },

    // binding to an array of buffer descriptors
    { 1, // binding
        0, // dstArrayElement
        3, // descriptorCount
        VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, // descriptorType
        offsetof(AppDataStructure, bufferInfoArray), // offset
        sizeof(VkDescriptorBufferInfo)  // stride, descriptor buffer infos are compact
    },

    // binding to an array of buffer views
    { 2, // binding
        0, // dstArrayElement
        2, // descriptorCount
        VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, // descriptorType
        offsetof(AppDataStructure, bufferView) + offsetof(AppBufferView, bufferView), // offset
        sizeof(AppBufferView)  // stride, bufferViews do not have to be compact
    },
};

// create a descriptor update template for descriptor set updates
const VkDescriptorUpdateTemplateCreateInfo createInfo =
{  

VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO, // sType
    NULL, // pNext
    0, // flags
descriptorUpdateEntryCount
    descriptorUpdateTemplateEntries, // descriptorUpdateEntryCount
descriptorUpdateEntries
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET, // templateType
    myLayout, // descriptorSetLayout
    0, // pipelineBindPoint,
ignored by given templateType
    0, // pipelineLayout,
ignored by given templateType
    0, // set, ignored by
given templateType
};

VkDescriptorUpdateTemplate myDescriptorUpdateTemplate;
myResult = vkCreateDescriptorUpdateTemplate(
    myDevice,
    &createInfo,
    NULL,
    &myDescriptorUpdateTemplate);

AppDataStructure appData;

// fill appData here or cache it in your engine
vkUpdateDescriptorSetWithTemplate(myDevice, myDescriptorSet, myDescriptorUpdateTemplate, &appData);

14.2.7. Descriptor Set Binding
To bind one or more descriptor sets to a command buffer, call:

// Provided by VK_VERSION_1_0
void vkCmdBindDescriptorSets(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipelineLayout layout,
    uint32_t firstSet,
    uint32_t descriptorSetCount,
    const VkDescriptorSet* pDescriptorSets,
    uint32_t dynamicOffsetCount,
    const uint32_t* pDynamicOffsets);

• commandBuffer is the command buffer that the descriptor sets will be bound to.
• pipelineBindPoint is a VkPipelineBindPoint indicating the type of the pipeline that will use the descriptors. There is a separate set of bind points for each pipeline type, so binding one does not
disturb the others.

- **layout** is a `VkPipelineLayout` object used to program the bindings.

- **firstSet** is the set number of the first descriptor set to be bound.

- **descriptorSetCount** is the number of elements in the `pDescriptorSets` array.

- **pDescriptorSets** is a pointer to an array of handles to `VkDescriptorSet` objects describing the descriptor sets to bind to.

- **dynamicOffsetCount** is the number of dynamic offsets in the `pDynamicOffsets` array.

- **pDynamicOffsets** is a pointer to an array of `uint32_t` values specifying dynamic offsets.

`vkCmdBindDescriptorSets` causes the sets numbered `[firstSet..firstSet+descriptorSetCount-1]` to use the bindings stored in `pDescriptorSets[0..descriptorSetCount-1]` for subsequent bound pipeline commands set by `pipelineBindPoint`. Any bindings that were previously applied via these sets are no longer valid.

Once bound, a descriptor set affects rendering of subsequent commands that interact with the given pipeline type in the command buffer until either a different set is bound to the same set number, or the set is disturbed as described in Pipeline Layout Compatibility.

A compatible descriptor set **must** be bound for all set numbers that any shaders in a pipeline access, at the time that a drawing or dispatching command is recorded to execute using that pipeline. However, if none of the shaders in a pipeline statically use any bindings with a particular set number, then no descriptor set need be bound for that set number, even if the pipeline layout includes a non-trivial descriptor set layout for that set number.

If any of the sets being bound include dynamic uniform or storage buffers, then `pDynamicOffsets` includes one element for each array element in each dynamic descriptor type binding in each set. Values are taken from `pDynamicOffsets` in an order such that all entries for set N come before set N+1; within a set, entries are ordered by the binding numbers in the descriptor set layouts; and within a binding array, elements are in order. **dynamicOffsetCount must** equal the total number of dynamic descriptors in the sets being bound.

The effective offset used for dynamic uniform and storage buffer bindings is the sum of the relative offset taken from `pDynamicOffsets`, and the base address of the buffer plus base offset in the descriptor set. The range of the dynamic uniform and storage buffer bindings is the buffer range as specified in the descriptor set.

Each of the `pDescriptorSets` **must** be compatible with the pipeline layout specified by `layout`. The layout used to program the bindings **must** also be compatible with the pipeline used in subsequent bound pipeline commands with that pipeline type, as defined in the Pipeline Layout Compatibility section.

The descriptor set contents bound by a call to `vkCmdBindDescriptorSets` **may** be consumed at the following times:

- For descriptor bindings created with the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit set, the contents **may** be consumed when the command buffer is submitted to a queue, or during shader execution of the resulting draws and dispatches, or any time in between. Otherwise,
- during host execution of the command, or during shader execution of the resulting draws and dispatches, or any time in between.

Thus, the contents of a descriptor set binding must not be altered (overwritten by an update command, or freed) between the first point in time that it may be consumed, and when the command completes executing on the queue.

The contents of pDynamicOffsets are consumed immediately during execution of vkCmdBindDescriptorSets. Once all pending uses have completed, it is legal to update and reuse a descriptor set.

### Valid Usage

- **VUID-vkCmdBindDescriptorSets-pDescriptorSets-00358**
  Each element of pDescriptorSets must have been allocated with a VkDescriptorSetLayout that matches (is the same as, or identically defined as) the VkDescriptorSetLayout at set n in layout, where n is the sum of firstSet and the index into pDescriptorSets

- **VUID-vkCmdBindDescriptorSets-dynamicOffsetCount-00359**
  dynamicOffsetCount must be equal to the total number of dynamic descriptors in pDescriptorSets

- **VUID-vkCmdBindDescriptorSets-firstSet-00360**
  The sum of firstSet and descriptorSetCount must be less than or equal to VkPipelineLayoutCreateInfo::setLayoutCount provided when layout was created

- **VUID-vkCmdBindDescriptorSets-pipelineBindPoint-00361**
  pipelineBindPoint must be supported by the commandBuffer's parent VkCommandPool's queue family

- **VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01971**
  Each element of pDynamicOffsets which corresponds to a descriptor binding with type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC must be a multiple of VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment

- **VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01972**
  Each element of pDynamicOffsets which corresponds to a descriptor binding with type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC must be a multiple of VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment

- **VUID-vkCmdBindDescriptorSets-pDescriptorSets-01979**
  For each dynamic uniform or storage buffer binding in pDescriptorSets, the sum of the effective offset, as defined above, and the range of the binding must be less than or equal to the size of the buffer

- **VUID-vkCmdBindDescriptorSets-pDescriptorSets-04616**
  Each element of pDescriptorSets must not have been allocated from a VkDescriptorPool with the VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_VALVE flag set
Valid Usage (Implicit)

- VUID-vkCmdBindDescriptorSets-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindDescriptorSets-pipelineBindPoint-parameter
  
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value

- VUID-vkCmdBindDescriptorSets-layout-parameter
  
  `layout` must be a valid `VkPipelineLayout` handle

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-parameter
  
  `pDescriptorSets` must be a valid pointer to an array of `descriptorSetCount` valid `VkDescriptorSet` handles

- VUID-vkCmdBindDescriptorSets-pDynamicOffsets-parameter
  
  If `dynamicOffsetCount` is not 0, `pDynamicOffsets` must be a valid pointer to an array of `dynamicOffsetCount uint32_t` values

- VUID-vkCmdBindDescriptorSets-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdBindDescriptorSets-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdBindDescriptorSets-descriptorSetCount-arraylength
  
  `descriptorSetCount` must be greater than 0

- VUID-vkCmdBindDescriptorSets-commonparent
  
  Each of `commandBuffer`, `layout`, and the elements of `pDescriptorSets` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

14.2.8. Push Descriptor Updates

In addition to allocating descriptor sets and binding them to a command buffer, an application can...
To push descriptor updates into a command buffer, call:

```c
// Provided by VK_KHR_push_descriptor
void vkCmdPushDescriptorSetKHR(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipelineLayout layout,
    uint32_t set,
    uint32_t descriptorWriteCount,
    const VkWriteDescriptorSet* pDescriptorWrites);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.
- `pipelineBindPoint` is a `VkPipelineBindPoint` indicating the type of the pipeline that will use the descriptors. There is a separate set of push descriptor bindings for each pipeline type, so binding one does not disturb the others.
- `layout` is a `VkPipelineLayout` object used to program the bindings.
- `set` is the set number of the descriptor set in the pipeline layout that will be updated.
- `descriptorWriteCount` is the number of elements in the `pDescriptorWrites` array.
- `pDescriptorWrites` is a pointer to an array of `VkWriteDescriptorSet` structures describing the descriptors to be updated.

**Push descriptors** are a small bank of descriptors whose storage is internally managed by the command buffer rather than being written into a descriptor set and later bound to a command buffer. Push descriptors allow for incremental updates of descriptors without managing the lifetime of descriptor sets.

When a command buffer begins recording, all push descriptors are undefined. Push descriptors can be updated incrementally and cause shaders to use the updated descriptors for subsequent bound pipeline commands with the pipeline type set by `pipelineBindPoint` until the descriptor is overwritten, or else until the set is disturbed as described in Pipeline Layout Compatibility. When the set is disturbed or push descriptors with a different descriptor set layout are set, all push descriptors are undefined.

Push descriptors that are statically used by a pipeline must not be undefined at the time that a drawing or dispatching command is recorded to execute using that pipeline. This includes immutable sampler descriptors, which must be pushed before they are accessed by a pipeline (the immutable samplers are pushed, rather than the samplers in `pDescriptorWrites`). Push descriptors that are not statically used can remain undefined.

Push descriptors do not use dynamic offsets. Instead, the corresponding non-dynamic descriptor types can be used and the `offset` member of `VkDescriptorBufferInfo` can be changed each time the descriptor is written.

Each element of `pDescriptorWrites` is interpreted as in `VkWriteDescriptorSet`, except the `dstSet` member is ignored.
To push an immutable sampler, use a `VkWriteDescriptorSet` with `dstBinding` and `dstArrayElement` selecting the immutable sampler's binding. If the descriptor type is `VK_DESCRIPTOR_TYPE_SAMPLER`, the `pImageInfo` parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout. If the descriptor type is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, the `sampler` member of the `pImageInfo` parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout.

---

### Valid Usage

- **VUID-vkCmdPushDescriptorSetKHR-pipelineBindPoint-00363**
  
  `pipelineBindPoint` must be supported by the commandBuffer's parent `VkCommandPool`'s queue family

- **VUID-vkCmdPushDescriptorSetKHR-set-00364**
  
  `set` must be less than `VkPipelineLayoutCreateInfo::setLayoutCount` provided when `layout` was created

- **VUID-vkCmdPushDescriptorSetKHR-set-00365**
  
  `set` must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`

---

### Valid Usage (Implicit)

- **VUID-vkCmdPushDescriptorSetKHR-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdPushDescriptorSetKHR-pipelineBindPoint-parameter**
  
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value

- **VUID-vkCmdPushDescriptorSetKHR-layout-parameter**
  
  `layout` must be a valid `VkPipelineLayout` handle

- **VUID-vkCmdPushDescriptorSetKHR-pDescriptorWrites-parameter**
  
  `pDescriptorWrites` must be a valid pointer to an array of `descriptorWriteCount` valid `VkWriteDescriptorSet` structures

- **VUID-vkCmdPushDescriptorSetKHR-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdPushDescriptorSetKHR-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- **VUID-vkCmdPushDescriptorSetKHR-descriptorWriteCount-arraylength**
  
  `descriptorWriteCount` must be greater than 0

- **VUID-vkCmdPushDescriptorSetKHR-commonparent**
  
  Both of `commandBuffer`, and `layout` must have been created, allocated, or retrieved from the same `VkDevice`
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>

</tr>
</tbody>
</table>

14.2.9. Push Descriptor Updates with Descriptor Update Templates

It is also possible to use a descriptor update template to specify the push descriptors to update. To do so, call:

```c
// Provided by VK_KHR_push_descriptor with VK_VERSION_1_1, VK_KHR_push_descriptor with VK_KHR_descriptor_update_template, VK_KHR_descriptor_update_template with VK_KHR_push_descriptor
void vkCmdPushDescriptorSetWithTemplateKHR(
    VkCommandBuffer commandBuffer,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    VkPipelineLayout layout,
    uint32_t set,
    const void* pData);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.
- `descriptorUpdateTemplate` is a descriptor update template defining how to interpret the descriptor information in `pData`.
- `layout` is a `VkPipelineLayout` object used to program the bindings. It must be compatible with the layout used to create the `descriptorUpdateTemplate` handle.
- `set` is the set number of the descriptor set in the pipeline layout that will be updated. This must be the same number used to create the `descriptorUpdateTemplate` handle.
- `pData` is a pointer to memory containing descriptors for the templated update.
Valid Usage

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-00366**
  The `pipelineBindPoint` specified during the creation of the descriptor update template must be supported by the commandBuffer’s parent `VkCommandPool`’s queue family.

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-pData-01686**
  `pData` must be a valid pointer to a memory containing one or more valid instances of `VkDescriptorImageInfo`, `VkDescriptorBufferInfo`, or `VkBufferView` in a layout defined by `descriptorUpdateTemplate` when it was created with `vkCreateDescriptorUpdateTemplate`.

Valid Usage (Implicit)

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-descriptorUpdateTemplate-parameter**
  `descriptorUpdateTemplate` must be a valid `VkDescriptorUpdateTemplate` handle.

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-layout-parameter**
  `layout` must be a valid `VkPipelineLayout` handle.

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-commonparent**
  Each of `commandBuffer`, `descriptorUpdateTemplate`, and `layout` must have been created, allocated, or retrieved from the same `VkDevice`.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

</tbody>
</table>
API example

```c
struct AppDataStructure {
    VkDescriptorImageInfo imageInfo; // a single image info
    // ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] = {
    // binding to a single image descriptor
    {
        0, // binding
        0, // dstArrayElement
        1, // descriptorCount
        VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, // descriptorType
        offsetof(AppDataStructure, imageInfo), // offset
        0 // stride is not required if descriptorCount is 1
    }
};

// create a descriptor update template for push descriptor set updates
const VkDescriptorUpdateTemplateCreateInfo createInfo = {
    VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO, // sType
    NULL, // pNext
    1, // flags
    descriptorUpdateEntryCount
    descriptorUpdateTemplateEntries, // pDescriptorUpdateEntries
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, // templateType
    0, // descriptorSetLayout,
    VK_PIPELINE_BIND_POINT_GRAPHICS, // pipelineBindPoint
    myPipelineLayout, // pipelineLayout
    0, // set
};

VkDescriptorUpdateTemplate myDescriptorUpdateTemplate;
myResult = vkCreateDescriptorUpdateTemplate(
    myDevice,
    &createInfo,
    NULL,
    &myDescriptorUpdateTemplate);

AppDataStructure appData;
// fill appData here or cache it in your engine
vkCmdPushDescriptorSetWithTemplateKHR(myCmdBuffer, myDescriptorUpdateTemplate,
    myPipelineLayout, 0, &appData);
```
14.2.10. Push Constant Updates

As described above in section Pipeline Layouts, the pipeline layout defines shader push constants which are updated via Vulkan commands rather than via writes to memory or copy commands.

**Note**

Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

To update push constants, call:

```c
// Provided by VK_VERSION_1_0
def void vkCmdPushConstants(
    VkCommandBuffer commandBuffer,
    VkPipelineLayout layout,
    VkShaderStageFlags stageFlags,
    uint32_t offset,
    uint32_t size,
    const void* pValues);
```

- `commandBuffer` is the command buffer in which the push constant update will be recorded.
- `layout` is the pipeline layout used to program the push constant updates.
- `stageFlags` is a bitmask of VkShaderStageFlagBits specifying the shader stages that will use the push constants in the updated range.
- `offset` is the start offset of the push constant range to update, in units of bytes.
- `size` is the size of the push constant range to update, in units of bytes.
- `pValues` is a pointer to an array of `size` bytes containing the new push constant values.

When a command buffer begins recording, all push constant values are undefined.

Push constant values can be updated incrementally, causing shader stages in `stageFlags` to read the new data from `pValues` for push constants modified by this command, while still reading the previous data for push constants not modified by this command. When a bound pipeline command is issued, the bound pipeline's layout must be compatible with the layouts used to set the values of all push constants in the pipeline layout's push constant ranges, as described in Pipeline Layout Compatibility. Binding a pipeline with a layout that is not compatible with the push constant layout does not disturb the push constant values.

**Note**

As `stageFlags` needs to include all flags the relevant push constant ranges were created with, any flags that are not supported by the queue family that the `VkCommandPool` used to allocate `commandBuffer` was created on are ignored.
Valid Usage

- VUID-vkCmdPushConstants-offset-01795
  For each byte in the range specified by `offset` and `size` and for each shader stage in `stageFlags`, there must be a push constant range in `layout` that includes that byte and that stage.

- VUID-vkCmdPushConstants-offset-01796
  For each byte in the range specified by `offset` and `size` and for each push constant range that overlaps that byte, `stageFlags` must include all stages in that push constant range's `VkPushConstantRange::stageFlags`.

- VUID-vkCmdPushConstants-offset-00368
  `offset` must be a multiple of 4

- VUID-vkCmdPushConstants-size-00369
  `size` must be a multiple of 4

- VUID-vkCmdPushConstants-offset-00370
  `offset` must be less than `VkPhysicalDeviceLimits::maxPushConstantsSize`

- VUID-vkCmdPushConstants-size-00371
  `size` must be less than or equal to `VkPhysicalDeviceLimits::maxPushConstantsSize` minus `offset`
Valid Usage (Implicit)

- **VUID-vkCmdPushConstants-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdPushConstants-layout-parameter**
  
  `layout` must be a valid `VkPipelineLayout` handle

- **VUID-vkCmdPushConstants-stageFlags-parameter**
  
  `stageFlags` must be a valid combination of `VkShaderStageFlagBits` values

- **VUID-vkCmdPushConstants-stageFlags-required bitmask**
  
  `stageFlags` must not be 0

- **VUID-vkCmdPushConstants-pValues-parameter**
  
  `pValues` must be a valid pointer to an array of `size` bytes

- **VUID-vkCmdPushConstants-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdPushConstants-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- **VUID-vkCmdPushConstants-size-arraylength**
  
  `size` must be greater than 0

- **VUID-vkCmdPushConstants-commonparent**
  
  Both of `commandBuffer`, and `layout` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
</tr>
</tbody>
</table>

14.3. Physical Storage Buffer Access

To query a 64-bit buffer device address value through which buffer memory can be accessed in a shader, call:
// Provided by VK_KHR_buffer_device_address
VkDeviceAddress vkGetBufferDeviceAddressKHR(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);

or the equivalent command

// Provided by VK_EXT_buffer_device_address
VkDeviceAddress vkGetBufferDeviceAddressEXT(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);

• `device` is the logical device that the buffer was created on.
• `pInfo` is a pointer to a `VkBufferDeviceAddressInfo` structure specifying the buffer to retrieve an address for.

The 64-bit return value is an address of the start of `pInfo->buffer`. The address range starting at this value and whose size is the size of the buffer can be used in a shader to access the memory bound to that buffer, using the `SPV_KHR_physical_storage_buffer` extension or the equivalent `SPV_EXT_physical_storage_buffer` extension and the `PhysicalStorageBuffer` storage class. For example, this value can be stored in a uniform buffer, and the shader can read the value from the uniform buffer and use it to do a dependent read/write to this buffer. A value of zero is reserved as a “null” pointer and must not be returned as a valid buffer device address. All loads, stores, and atomics in a shader through `PhysicalStorageBuffer` pointers must access addresses in the address range of some buffer.

If the buffer was created with a non-zero value of `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress` or `VkBufferDeviceAddressCreateInfoEXT::deviceAddress` the return value will be the same address that was returned at capture time.

### Valid Usage

- **VUID-vkGetBufferDeviceAddress-bufferDeviceAddress-03324**
  The `bufferDeviceAddress` or `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::bufferDeviceAddress` feature must be enabled

- **VUID-vkGetBufferDeviceAddress-device-03325**
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` or `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::bufferDeviceAddressMultiDevice` feature must be enabled
Valid Usage (Implicit)

- VUID-vkGetBufferDeviceAddress-device-parameter  
  **device** must be a valid **VkDevice** handle

- VUID-vkGetBufferDeviceAddress-pInfo-parameter  
  **pInfo** must be a valid pointer to a valid **VkBufferDeviceAddressInfo** structure

The **VkBufferDeviceAddressInfo** structure is defined as:

```c
typedef struct VkBufferDeviceAddressInfo {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
} VkBufferDeviceAddressInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkBufferDeviceAddressInfo VkBufferDeviceAddressInfoKHR;
```

or the equivalent

```c
// Provided by VK_EXT_buffer_device_address
typedef VkBufferDeviceAddressInfo VkBufferDeviceAddressInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **buffer** specifies the buffer whose address is being queried.

Valid Usage

- VUID-VkBufferDeviceAddressInfo-buffer-02600  
  If **buffer** is non-sparse and was not created with the **VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT** flag, then it must be bound completely and continguously to a single **VkDeviceMemory** object

- VUID-VkBufferDeviceAddressInfo-buffer-02601  
  **buffer** must have been created with **VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT**
Valid Usage (Implicit)

- VUID-VkBufferDeviceAddressInfo-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_INFO`

- VUID-VkBufferDeviceAddressInfo-pNext-pNext
  
  **pNext** must be `NULL`

- VUID-VkBufferDeviceAddressInfo-buffer-parameter
  
  **buffer** must be a valid `VkBuffer` handle

To query a 64-bit buffer opaque capture address, call:

```c
// Provided by VK_KHR_buffer_device_address
uint64_t vkGetBufferOpaqueCaptureAddressKHR(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

- **device** is the logical device that the buffer was created on.
- **pInfo** is a pointer to a `VkBufferDeviceAddressInfo` structure specifying the buffer to retrieve an address for.

The 64-bit return value is an opaque capture address of the start of `pInfo->buffer`.

If the buffer was created with a non-zero value of `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress` the return value **must** be the same address.

Valid Usage

- VUID-vkGetBufferOpaqueCaptureAddress-None-03326
  
  The **bufferDeviceAddress** feature **must** be enabled

- VUID-vkGetBufferOpaqueCaptureAddress-device-03327
  
  If **device** was created with multiple physical devices, then the **bufferDeviceAddressMultiDevice** feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetBufferOpaqueCaptureAddress-device-parameter
  
  **device** must be a valid `VkDevice` handle

- VUID-vkGetBufferOpaqueCaptureAddress-pInfo-parameter
  
  **pInfo** must be a valid pointer to a valid `VkBufferDeviceAddressInfo` structure
Chapter 15. Shader Interfaces

When a pipeline is created, the set of shaders specified in the corresponding `VkPipelineCreateInfo` structure are implicitly linked at a number of different interfaces.

- **Shader Input and Output Interface**
- **Vertex Input Interface**
- **Fragment Output Interface**
- **Fragment Input Attachment Interface**
- **Ray Tracing Pipeline Interface**
- **Shader Resource Interface**

Interface definitions make use of the following SPIR-V decorations:

- `DescriptorSet` and `Binding`
- `Location`, `Component`, and `Index`
- `Flat`, `NoPerspective`, `Centroid`, and `Sample`
- `Block` and `BufferBlock`
- `InputAttachmentIndex`
- `Offset`, `ArrayStride`, and `MatrixStride`
- `BuiltIn`
- `PassthroughNV`

This specification describes valid uses for Vulkan of these decorations. Any other use of one of these decorations is invalid, with the exception that, when using SPIR-V versions 1.4 and earlier: `Block`, `BufferBlock`, `Offset`, `ArrayStride`, and `MatrixStride` can also decorate types and type members used by variables in the Private and Function storage classes.

**Note**

In this chapter, there are references to SPIR-V terms such as the `MeshNV` execution model. These terms will appear even in a build of the specification which does not support any extensions. This is as intended, since these terms appear in the unified SPIR-V specification without such qualifiers.

15.1. Shader Input and Output Interfaces

When multiple stages are present in a pipeline, the outputs of one stage form an interface with the inputs of the next stage. When such an interface involves a shader, shader outputs are matched against the inputs of the next stage, and shader inputs are matched against the outputs of the previous stage.

All the variables forming the shader input and output interfaces are listed as operands to the `OpEntryPoint` instruction and are declared with the `Input` or `Output` storage classes, respectively, in
the SPIR-V module. These generally form the interfaces between consecutive shader stages, regardless of any non-shader stages between the consecutive shader stages.

There are two classes of variables that can be matched between shader stages, built-in variables and user-defined variables. Each class has a different set of matching criteria.

Output variables of a shader stage have undefined values until the shader writes to them or uses the_initializer_operand when declaring the variable.

15.1.1. Built-in Interface Block

Shader built-in variables meeting the following requirements define the built-in interface block. They must

- be explicitly declared (there are no implicit built-ins),
- be identified with a BuiltIn decoration,
- form object types as described in the Built-in Variables section, and
- be declared in a block whose top-level members are the built-ins.

There must be no more than one built-in interface block per shader per interface.

Built-ins must not have any Location or Component decorations.

15.1.2. User-defined Variable Interface

The non-built-in variables listed by OpEntryPoint with the Input or Output storage class form the user-defined variable interface. These must have SPIR-V numerical types or, recursively, composite types of such types. By default, the components of such types have a width of 32 or 64 bits. If an implementation supports storageInputOutput16, components can also have a width of 16 bits. These variables must be identified with a Location decoration and can also be identified with a Component decoration.

15.1.3. Interface Matching

An output variable, block, or structure member in a given shader stage has an interface match with an input variable, block, or structure member in a subsequent shader stage if they both adhere to the following conditions:

- They have equivalent decorations, other than:
  - Interpolation decorations
  - XfbBuffer, XfbStride, Offset, and Stream
  - one is not decorated with Component and the other is declared with a Component of 0

- Their types match as follows:
  a. if the input is declared in a tessellation control or geometry shader as an OpTypeArray with an Element Type equivalent to the OpType* declaration of the output, and neither is a structure member; or
b. if the output is declared in a mesh shader as an `OpTypeArray` with an `Element Type` equivalent to the `OpType*` declaration of the input, and neither is a structure member; or

c. if in any other case they are declared with an equivalent `OpType*` declaration.

- If both are structures and every member has an interface match.

**Note**
The word "structure" above refers to both variables that have an `OpTypeStruct` type and interface blocks (which are also declared as `OpTypeStruct`).

All input variables and blocks **must** have an interface match in the preceding shader stage, except for built-in variables in fragment shaders. Shaders **can** declare and write to output variables that are not declared or read by the subsequent stage.

Matching rules for *passthrough geometry shaders* are slightly different and are described in the *Passthrough Interface Matching* section.

The value of an input variable is undefined if the preceding stage does not write to a matching output variable, as described above.

### 15.1.4. Location Assignment

This section describes location assignments for user-defined variables and how many locations are consumed by a given user-variable type. As mentioned above, some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This outer array level is removed from the type before considering how many locations the type consumes.

The **Location** value specifies an interface slot comprised of a 32-bit four-component vector conveyed between stages. The **Component** specifies components within these vector locations. Only types with widths of 16, 32 or 64 are supported in shader interfaces.

Inputs and outputs of the following types consume a single interface location:

- 16-bit scalar and vector types, and
- 32-bit scalar and vector types, and
- 64-bit scalar and 2-component vector types.

64-bit three- and four-component vectors consume two consecutive locations.

If a declared input or output is an array of size \( n \) and each element takes \( m \) locations, it will be assigned \( m \times n \) consecutive locations starting with the location specified.

If the declared input or output is an \( n \times m \) 16-, 32- or 64-bit matrix, it will be assigned multiple locations starting with the location specified. The number of locations assigned for each matrix will be the same as for an \( n \)-element array of \( m \)-component vectors.

An **OpVariable** with a structure type that is not a block must be decorated with a **Location**.

When an **OpVariable** with a structure type (either block or non-block) is decorated with a **Location**,
the members in the structure type **must** not be decorated with a `Location`. The `OpVariable`'s members are assigned consecutive locations in declaration order, starting from the first member, which is assigned the location decoration from the `OpVariable`.

When a block-type `OpVariable` is declared without a `Location` decoration, each member in its structure type **must** be decorated with a `Location`. Types nested deeper than the top-level members **must** not have `Location` decorations.

The locations consumed by block and structure members are determined by applying the rules above in a depth-first traversal of the instantiated members as though the structure or block member were declared as an input or output variable of the same type.

Any two inputs listed as operands on the same `OpEntryPoint` **must** not be assigned the same location, either explicitly or implicitly. Any two outputs listed as operands on the same `OpEntryPoint` **must** not be assigned the same location, either explicitly or implicitly.

The number of input and output locations available for a shader input or output interface are limited, and dependent on the shader stage as described in Shader Input and Output Locations. All variables in both the built-in interface block and the user-defined variable interface count against these limits. Each effective `Location` **must** have a value less than the number of locations available for the given interface, as specified in the "Locations Available" column in Shader Input and Output Locations.

### 15.1.5. Component Assignment

The `Component` decoration allows the `Location` to be more finely specified for scalars and vectors, down to the individual components within a location that are consumed. The components within a location are 0, 1, 2, and 3. A variable or block member starting at component N will consume...
components N, N+1, N+2, ... up through its size. For 16-, and 32-bit types, it is invalid if this sequence
of components gets larger than 3. A scalar 64-bit type will consume two of these components in
sequence, and a two-component 64-bit vector type will consume all four components available
within a location. A three- or four-component 64-bit vector type must not specify a Component
decoration. A three-component 64-bit vector type will consume all four components of the first
location and components 0 and 1 of the second location. This leaves components 2 and 3 available
for other component-qualified declarations.

A scalar or two-component 64-bit data type must not specify a Component decoration of 1 or 3. A
Component decoration must not be specified for any type that is not a scalar or vector.

15.2. Vertex Input Interface

When the vertex stage is present in a pipeline, the vertex shader input variables form an interface
with the vertex input attributes. The vertex shader input variables are matched by the Location and
Component decorations to the vertex input attributes specified in the pVertexInputState member of
the VkGraphicsPipelineCreateInfo structure.

The vertex shader input variables listed by OpEntryPoint with the Input storage class form the vertex
input interface. These variables must be identified with a Location decoration and can also be
identified with a Component decoration.

For the purposes of interface matching: variables declared without a Component decoration are
considered to have a Component decoration of zero. The number of available vertex input locations is
given by the maxVertexInputAttributes member of the VkPhysicalDeviceLimits structure.

See Attribute Location and Component Assignment for details.

All vertex shader inputs declared as above must have a corresponding attribute and binding in the
pipeline.

15.3. Fragment Output Interface

When the fragment stage is present in a pipeline, the fragment shader outputs form an interface
with the output attachments of the current subpass. The fragment shader output variables are
matched by the Location and Component decorations to the color attachments specified in the
pColorAttachments array of the VkSubpassDescription structure describing the subpass that the
fragment shader is executed in.

The fragment shader output variables listed by OpEntryPoint with the Output storage class form the
fragment output interface. These variables must be identified with a Location decoration. They can
also be identified with a Component decoration and/or an Index decoration. For the purposes of
interface matching: variables declared without a Component decoration are considered to have a
Component decoration of zero, and variables declared without an Index decoration are considered to
have an Index decoration of zero.

A fragment shader output variable identified with a Location decoration of i is directed to the color
attachment indicated by pColorAttachments[i], after passing through the blending unit as described
in Blending, if enabled. Locations are consumed as described in Location Assignment. The number
of available fragment output locations is given by the `maxFragmentOutputAttachments` member of the `VkPhysicalDeviceLimits` structure.

Components of the output variables are assigned as described in Component Assignment. Output components identified as 0, 1, 2, and 3 will be directed to the R, G, B, and A inputs to the blending unit, respectively, or to the output attachment if blending is disabled. If two variables are placed within the same location, they must have the same underlying type (floating-point or integer). The input values to blending or color attachment writes are undefined for components which do not correspond to a fragment shader output.

Fragment outputs identified with an Index of zero are directed to the first input of the blending unit associated with the corresponding Location. Outputs identified with an Index of one are directed to the second input of the corresponding blending unit.

No component aliasing of output variables is allowed, that is there must not be two output variables which have the same location, component, and index, either explicitly declared or implied.

Output values written by a fragment shader must be declared with either `OpTypeFloat` or `OpTypeInt`, and a Width of 32. If `storageInputOutput16` is supported, output values written by a fragment shader can be also declared with either `OpTypeFloat` or `OpTypeInt` and a Width of 16. Composites of these types are also permitted. If the color attachment has a signed or unsigned normalized fixed-point format, color values are assumed to be floating-point and are converted to fixed-point as described in Conversion from Floating-Point to Normalized Fixed-Point; If the color attachment has an integer format, color values are assumed to be integers and converted to the bit-depth of the target. Any value that cannot be represented in the attachment’s format is undefined. For any other attachment format no conversion is performed. If the type of the values written by the fragment shader do not match the format of the corresponding color attachment, the resulting values are undefined for those components.

### 15.4. Fragment Input Attachment Interface

When a fragment stage is present in a pipeline, the fragment shader subpass inputs form an interface with the input attachments of the current subpass. The fragment shader subpass input variables are matched by `InputAttachmentIndex` decorations to the input attachments specified in the `pInputAttachments` array of the `VkSubpassDescription` structure describing the subpass that the fragment shader is executed in.

The fragment shader subpass input variables with the `UniformConstant` storage class and a decoration of `InputAttachmentIndex` that are statically used by `OpEntryPoint` form the fragment input attachment interface. These variables must be declared with a type of `OpTypeImage`, a `Dim` operand of `SubpassData`, an `Arrayed` operand of 0, and a `Sampled` operand of 2. The `MS` operand of the `OpTypeImage` must be 0 if the `samples` field of the corresponding `VkAttachmentDescription` is `VK_SAMPLE_COUNT_1_BIT` and 1 otherwise.

A subpass input variable identified with an `InputAttachmentIndex` decoration of `i` reads from the input attachment indicated by `pInputAttachments[i]` member of `VkSubpassDescription`. If the subpass input variable is declared as an array of size `N`, it consumes `N` consecutive input attachments, starting with the index specified. There must not be more than one input variable with the same `InputAttachmentIndex` whether explicitly declared or implied by an array declaration. The number
of available input attachment indices is given by the `maxPerStageDescriptorInputAttachments` member of the `VkPhysicalDeviceLimits` structure.

Variables identified with the `InputAttachmentIndex` must only be used by a fragment stage. The basic data type (floating-point, integer, unsigned integer) of the subpass input must match the basic format of the corresponding input attachment, or the values of subpass loads from these variables are undefined.

See `Input Attachment` for more details.

### 15.5. Ray Tracing Pipeline Interface

Ray tracing pipelines may have more stages than other pipelines with multiple instances of each stage and more dynamic interactions between the stages, but still have interface structures that obey the same general rules as interfaces between shader stages in other pipelines. The three types of inter-stage interface variables for ray tracing pipelines are:

- Ray payloads which contain data tracked for the entire lifetime of the ray.
- Hit attributes which contain data about a specific hit for the duration of its processing.
- Callable data for passing data into and out of a callable shader.

Ray payloads and callable data are used in explicit shader call instructions, so they have an incoming variant to distinguish the parameter passed to the invocation from any other payloads or data being used by subsequent shader call instructions.

An interface structure used between stages must match between the stages using it. Specifically:

- The hit attribute structure read in an any-hit or closest hit shader must be the same structure as the hit attribute structure written in the corresponding intersection shader in the same hit group.
- The incoming callable data for a callable shader must be the same structure as the callable data referenced by the execute callable instruction in the calling shader.
- The ray payload for a shader invoked by a ray tracing command must be the same structure for all shader stages using the payload for that ray.

Any shader with an incoming ray payload, incoming callable data, or hit attribute must only declare one variable of that type.

15.6. Shader Resource Interface

When a shader stage accesses buffer or image resources, as described in the Resource Descriptors section, the shader resource variables must be matched with the pipeline layout that is provided at pipeline creation time.

The set of shader variables that form the shader resource interface for a stage are the variables statically used by that stage’s OpEntryPoint with a storage class of Uniform, UniformConstant, StorageBuffer, or PushConstant. For the fragment shader, this includes the fragment input attachment interface.

The shader resource interface consists of two sub-interfaces: the push constant interface and the descriptor set interface.

15.6.1. Push Constant Interface

The shader variables defined with a storage class of PushConstant that are statically used by the shader entry points for the pipeline define the push constant interface. They must be:

- typed as OpTypeStruct,
- identified with a Block decoration, and
- laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

There must be no more than one push constant block statically used per shader entry point.

Each statically used member of a push constant block must be placed at an Offset such that the entire member is entirely contained within the VkPushConstantRange for each OpEntryPoint that uses it, and the stageFlags for that range must specify the appropriate VkShaderStageFlagBits for that stage. The Offset decoration for any member of a push constant block must not cause the space required for that member to extend outside the range [0, maxPushConstantsSize).

Any member of a push constant block that is declared as an array must only be accessed with dynamically uniform indices.

15.6.2. Descriptor Set Interface

The descriptor set interface is comprised of the shader variables with the storage class of StorageBuffer, Uniform or UniformConstant (including the variables in the fragment input attachment interface) that are statically used by the shader entry points for the pipeline.
These variables **must** have **DescriptorSet** and **Binding** decorations specified, which are assigned and matched with the **VkDescriptorSetLayout** objects in the pipeline layout as described in **DescriptorSet and Binding Assignment**.

The **Image Format** of an **OpTypeImage** declaration **must** not be **Unknown**, for variables which are used for **OpImageRead**, **OpImageSparseRead**, or **OpImageWrite** operations, except under the following conditions:

- For **OpImageWrite**, if the **shaderStorageImageWriteWithoutFormat** feature is enabled and the shader module declares the **StorageImageWriteWithoutFormat** capability.
- For **OpImageRead** or **OpImageSparseRead**, if the **shaderStorageImageReadWithoutFormat** feature is enabled and the shader module declares the **StorageImageReadWithoutFormat** capability.
- For **OpImageRead**, if Dim is **SubpassData** (indicating a read from an input attachment).

The **Image Format** of an **OpTypeImage** declaration **must** not be **Unknown**, for variables which are used for **OpAtomic*** operations.

Variables identified with the **Uniform** storage class are used to access transparent buffer backed resources. Such variables **must** be:

- typed as **OpTypeStruct**, or an array of this type,
- identified with a **Block** or **BufferBlock** decoration, and
- laid out explicitly using the **Offset**, **ArrayStride**, and **MatrixStride** decorations as specified in **Offset and Stride Assignment**.

Variables identified with the **StorageBuffer** storage class are used to access transparent buffer backed resources. Such variables **must** be:

- typed as **OpTypeStruct**, or an array of this type,
- identified with a **Block** decoration, and
- laid out explicitly using the **Offset**, **ArrayStride**, and **MatrixStride** decorations as specified in **Offset and Stride Assignment**.

The **Offset** decoration for any member of a **Block**-decorated variable in the **Uniform** storage class **must** not cause the space required for that variable to extend outside the range \([0, \text{maxUniformBufferRange})\). The **Offset** decoration for any member of a **Block**-decorated variable in the **StorageBuffer** storage class **must** not cause the space required for that variable to extend outside the range \([0, \text{maxStorageBufferRange})\).

Variables identified with the **Uniform** storage class **can** also be used to access transparent descriptor set backed resources when the variable is assigned to a descriptor set layout binding with a **descriptorType** of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT**. In this case the variable **must** be typed as **OpTypeStruct** and **cannot** be aggregated into arrays of that type. Further, the **Offset** decoration for any member of such a variable **must** not cause the space required for that variable to extend outside the range \([0, \text{maxInlineUniformBlockSize})\).

Variables identified with a storage class of **UniformConstant** and a decoration of **InputAttachmentIndex** **must** be declared as described in **Fragment Input Attachment Interface**.
SPIR-V variables decorated with a descriptor set and binding that identify a combined image sampler descriptor can have a type of `OpTypeImage`, `OpTypeSampler (Sampled=1)`, or `OpTypeSampledImage`. Arrays of any of these types can be indexed with constant integral expressions. The following features must be enabled and capabilities must be declared in order to index such arrays with dynamically uniform or non-uniform indices:

- Storage images (except storage texel buffers and input attachments):
  - Dynamically uniform: `shaderStorageImageArrayDynamicIndexing` and `StorageImageArrayDynamicIndexing`
  - Non-uniform: `shaderStorageImageArrayNonUniformIndexing` and `StorageImageArrayNonUniformIndexing`

- Storage texel buffers:
  - Dynamically uniform: `shaderStorageTexelBufferArrayDynamicIndexing` and `StorageTexelBufferArrayDynamicIndexing`
  - Non-uniform: `shaderStorageTexelBufferArrayNonUniformIndexing` and `StorageTexelBufferArrayNonUniformIndexing`

- Input attachments:
  - Dynamically uniform: `shaderInputAttachmentArrayDynamicIndexing` and `InputAttachmentArrayDynamicIndexing`
  - Non-uniform: `shaderInputAttachmentArrayNonUniformIndexing` and `InputAttachmentArrayNonUniformIndexing`

- Sampled images (except uniform texel buffers), samplers and combined image samplers:
  - Dynamically uniform: `shaderSampledImageArrayDynamicIndexing` and `SampledImageArrayDynamicIndexing`
  - Non-uniform: `shaderSampledImageArrayNonUniformIndexing` and `SampledImageArrayNonUniformIndexing`

- Uniform texel buffers:
  - Dynamically uniform: `shaderUniformTexelBufferArrayDynamicIndexing` and `UniformTexelBufferArrayDynamicIndexing`
  - Non-uniform: `shaderUniformTexelBufferArrayNonUniformIndexing` and `UniformTexelBufferArrayNonUniformIndexing`

- Uniform buffers:
  - Dynamically uniform: `shaderUniformBufferArrayDynamicIndexing` and `UniformBufferArrayDynamicIndexing`
  - Non-uniform: `shaderUniformBufferArrayNonUniformIndexing` and `UniformBufferArrayNonUniformIndexing`

- Storage buffers:
  - Dynamically uniform: `shaderStorageBufferArrayDynamicIndexing` and `StorageBufferArrayDynamicIndexing`
  - Non-uniform: `shaderStorageBufferArrayNonUniformIndexing` and `StorageBufferArrayNonUniformIndexing`

- Acceleration structures:
  - Dynamically uniform: Always supported.
Non-uniform: Always supported.

If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is not dynamically uniform, then the corresponding non-uniform indexing feature must be enabled and the capability must be declared. If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is loaded from an array element with a non-constant index, then the corresponding dynamic or non-uniform indexing feature must be enabled and the capability must be declared.

If the combined image sampler enables sampler YCbCr conversion or samples a subsampled image, it must be indexed only by constant integral expressions when aggregated into arrays in shader code, irrespective of the shaderSampledImageArrayDynamicIndexing feature.

¹ In addition to DescriptorSet and Binding.

### 15.6.3. DescriptorSet and Binding Assignment

A variable decorated with a DescriptorSet decoration of s and a Binding decoration of b indicates that this variable is associated with the VkDescriptorSetLayoutBinding that has a binding equal to b in pSetLayouts[s] that was specified in VkPipelineLayoutCreateInfo.

DescriptorSet decoration values must be between zero and maxBoundDescriptorSets minus one, inclusive. Binding decoration values can be any 32-bit unsigned integer value, as described in Descriptor Set Layout. Each descriptor set has its own binding name space.

If the Binding decoration is used with an array, the entire array is assigned that binding value. The array must be a single-dimensional array and size of the array must be no larger than the number of descriptors in the binding. If the array is runtime-sized, then array elements greater than or equal to the size of that binding in the bound descriptor set must not be used. If the array is runtime-sized, the runtimeDescriptorArray feature must be enabled and the RuntimeDescriptorArray capability must be declared. The index of each element of the array is referred to as the arrayElement. For the purposes of interface matching and descriptor set operations, if a resource variable is not an array, it is treated as if it has an arrayElement of zero.

There is a limit on the number of resources of each type that can be accessed by a pipeline stage as shown in Shader Resource Limits. The “Resources Per Stage” column gives the limit on the number each type of resource that can be statically used for an entry point in any given stage in a pipeline. The “Resource Types” column lists which resource types are counted against the limit. Some resource types count against multiple limits. The VK_DESCRIPTOR_TYPE_MUTABLE_VALUE descriptor type
counts as one individual resource and one for every unique resource limit per descriptor set type that is present in the associated binding's VkMutableDescriptorTypeListVALVE. If multiple descriptor types in VkMutableDescriptorTypeListVALVE map to the same resource limit, only one descriptor is consumed for purposes of computing resource limits.

The pipeline layout may include descriptor sets and bindings which are not referenced by any variables statically used by the entry points for the shader stages in the binding's stageFlags.

However, if a variable assigned to a given DescriptorSet and Binding is statically used by the entry point for a shader stage, the pipeline layout must contain a descriptor set layout binding in that descriptor set layout and for that binding number, and that binding's stageFlags must include the appropriate VkShaderStageFlagBits for that stage. The variable must be of a valid resource type determined by its SPIR-V type and storage class, as defined in Shader Resource and Storage Class Correspondence. The descriptor set layout binding must be of a corresponding descriptor type, as defined in Shader Resource and Descriptor Type Correspondence.

Note

There are no limits on the number of shader variables that can have overlapping set and binding values in a shader; but which resources are statically used has an impact. If any shader variable identifying a resource is statically used in a shader, then the underlying descriptor bound at the declared set and binding must support the declared type in the shader when the shader executes.

If multiple shader variables are declared with the same set and binding values, and with the same underlying descriptor type, they can all be statically used within the same shader. However, accesses are not automatically synchronized, and Aliased decorations should be used to avoid data hazards (see section 2.18.2 Aliasing in the SPIR-V specification).

If multiple shader variables with the same set and binding values are declared in a single shader, but with different declared types, where any of those are not supported by the relevant bound descriptor, that shader can only be executed if the variables with the unsupported type are not statically used.

A noteworthy example of using multiple statically-used shader variables sharing the same descriptor set and binding values is a descriptor of type VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER that has multiple corresponding shader variables in the UniformConstant storage class, where some could be OpTypeImage (Sampled=1), some could be OpTypeSampler, and some could be OpTypeSampledImage.

</tbody>
</table>

\(^1\) Input attachments can only be used in the fragment shader stage.

### 15.6.4. Offset and Stride Assignment

Certain objects must be explicitly laid out using the Offset, ArrayStride, and MatrixStride, as described in SPIR-V explicit layout validation rules. All such layouts also must conform to the following requirements.

**Note**

The numeric order of Offset decorations does not need to follow member declaration order.

#### Alignment Requirements

There are different alignment requirements depending on the specific resources and on the features enabled on the device.

The scalar alignment of the type of an OpTypeStruct member is defined recursively as follows:

- A scalar of size \(N\) has a scalar alignment of \(N\).
• A vector or matrix type has a scalar alignment equal to that of its component type.
• An array type has a scalar alignment equal to that of its element type.
• A structure has a scalar alignment equal to the largest scalar alignment of any of its members.

The base alignment of the type of an OpTypeStruct member is defined recursively as follows:

• A scalar has a base alignment equal to its scalar alignment.
• A two-component vector has a base alignment equal to twice its scalar alignment.
• A three- or four-component vector has a base alignment equal to four times its scalar alignment.
• An array has a base alignment equal to the base alignment of its element type.
• A structure has a base alignment equal to the largest base alignment of any of its members. An empty structure has a base alignment equal to the size of the smallest scalar type permitted by the capabilities declared in the SPIR-V module. (e.g., for a 1 byte aligned empty struct in the StorageBuffer storage class, StorageBuffer8BitAccess or UniformAndStorageBuffer8BitAccess must be declared in the SPIR-V module.)
• A row-major matrix of C columns has a base alignment equal to the base alignment of a vector of C matrix components.
• A column-major matrix has a base alignment equal to the base alignment of the matrix column type.

The extended alignment of the type of an OpTypeStruct member is similarly defined as follows:

• A scalar, vector or matrix type has an extended alignment equal to its base alignment.
• An array or structure type has an extended alignment equal to the largest extended alignment of any of its members, rounded up to a multiple of 16.

A member is defined to improperly straddle if either of the following are true:

• It is a vector with total size less than or equal to 16 bytes, and has Offset decorations placing its first byte at \(F\) and its last byte at \(L\), where \(\text{floor}(F / 16) \neq \text{floor}(L / 16)\).
• It is a vector with total size greater than 16 bytes and has its Offset decorations placing its first byte at a non-integer multiple of 16.

Standard Buffer Layout

Every member of an OpTypeStruct that is required to be explicitly laid out must be aligned according to the first matching rule as follows. If the struct is contained in pointer types of multiple storage classes, it must satisfy the requirements for every storage class used to reference it.

1. If the scalarBlockLayout feature is enabled on the device and the storage class is Uniform, StorageBuffer, PhysicalStorageBuffer, ShaderRecordBufferKHR, or PushConstant then every member must be aligned according to its scalar alignment.
2. If the workgroupMemoryExplicitLayoutScalarBlockLayout feature is enabled on the device and the storage class is Workgroup then every member must be aligned according to its scalar alignment.
3. All vectors must be aligned according to their scalar alignment.
4. If the `uniformBufferStandardLayout` feature is not enabled on the device, then any member of an `OpTypeStruct` with a storage class of `Uniform` and a decoration of `Block` must be aligned according to its extended alignment.

5. Every other member must be aligned according to its base alignment.

   **Note**
   Even if scalar alignment is supported, it is generally more performant to use the base alignment.

The memory layout must obey the following rules:

- The `Offset` decoration of any member must be a multiple of its alignment.
- Any `ArrayStride` or `MatrixStride` decoration must be a multiple of the alignment of the array or matrix as defined above.

If one of the conditions below applies

- The storage class is `Uniform`, `StorageBuffer`, `PhysicalStorageBuffer`, `ShaderRecordBufferKHR`, or `PushConstant`, and the `scalarBlockLayout` feature is not enabled on the device.
- The storage class is `Workgroup`, and either the struct member is not part of a `Block` or the `workgroupMemoryExplicitLayoutScalarBlockLayout` feature is not enabled on the device.
- The storage class is any other storage class.

the memory layout must also obey the following rules:

- Vectors must not improperly straddle, as defined above.
- The `Offset` decoration of a member must not place it between the end of a structure or an array and the next multiple of the alignment of that structure or array.

   **Note**
   The `std430 layout` in GLSL satisfies these rules for types using the base alignment. The `std140 layout` satisfies the rules for types using the extended alignment.

### 15.7. Built-In Variables

Built-in variables are accessed in shaders by declaring a variable decorated with a `BuiltIn` SPIR-V decoration. The meaning of each `BuiltIn` decoration is as follows. In the remainder of this section, the name of a built-in is used interchangeably with a term equivalent to a variable decorated with that particular built-in. Built-ins that represent integer values can be declared as either signed or unsigned 32-bit integers.

As mentioned above, some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This level of arrayness is not included in the type descriptions below, but must be included when declaring the built-in.
BaryCoordNV

The BaryCoordNV decoration can be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using perspective interpolation.

Valid Usage

- VUID-BaryCoordNV-BaryCoordNV-04154
  The BaryCoordNV decoration must be used only within the Fragment Execution Model

- VUID-BaryCoordNV-BaryCoordNV-04155
  The variable decorated with BaryCoordNV must be declared using the Input Storage Class

- VUID-BaryCoordNV-BaryCoordNV-04156
  The variable decorated with BaryCoordNV must be declared as a three-component vector of 32-bit floating-point values

BaryCoordNoPerspAMD

The BaryCoordNoPerspAMD decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at the fragment’s center. The K coordinate of the barycentric coordinates can be derived given the identity $I + J + K = 1.0$.

Valid Usage

- VUID-BaryCoordNoPerspAMD-BaryCoordNoPerspAMD-04157
  The BaryCoordNoPerspAMD decoration must be used only within the Fragment Execution Model

- VUID-BaryCoordNoPerspAMD-BaryCoordNoPerspAMD-04158
  The variable decorated with BaryCoordNoPerspAMD must be declared using the Input Storage Class

- VUID-BaryCoordNoPerspAMD-BaryCoordNoPerspAMD-04159
  The variable decorated with BaryCoordNoPerspAMD must be declared as a two-component vector of 32-bit floating-point values

BaryCoordNoPerspNV

The BaryCoordNoPerspNV decoration can be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using linear interpolation.
Valid Usage

- VUID-BaryCoordNoPerspNV-BaryCoordNoPerspNV-04160
  The BaryCoordNoPerspNV decoration must be used only within the Fragment Execution Model

- VUID-BaryCoordNoPerspNV-BaryCoordNoPerspNV-04161
  The variable decorated with BaryCoordNoPerspNV must be declared using the Input Storage Class

- VUID-BaryCoordNoPerspNV-BaryCoordNoPerspNV-04162
  The variable decorated with BaryCoordNoPerspNV must be declared as a three-component vector of 32-bit floating-point values

BaryCoordNoPerspCentroidAMD

The BaryCoordNoPerspCentroidAMD decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at the centroid. The K coordinate of the barycentric coordinates can be derived given the identity I + J + K = 1.0.

Valid Usage

- VUID-BaryCoordNoPerspCentroidAMD-BaryCoordNoPerspCentroidAMD-04163
  The BaryCoordNoPerspCentroidAMD decoration must be used only within the Fragment Execution Model

- VUID-BaryCoordNoPerspCentroidAMD-BaryCoordNoPerspCentroidAMD-04164
  The variable decorated with BaryCoordNoPerspCentroidAMD must be declared using the Input Storage Class

- VUID-BaryCoordNoPerspCentroidAMD-BaryCoordNoPerspCentroidAMD-04165
  The variable decorated with BaryCoordNoPerspCentroidAMD must be declared as a three-component vector of 32-bit floating-point values

BaryCoordNoPerspSampleAMD

The BaryCoordNoPerspSampleAMD decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at each covered sample. The K coordinate of the barycentric coordinates can be derived given the identity I + J + K = 1.0.
Valid Usage

- VUID-BaryCoordNoPerspSampleAMD-BaryCoordNoPerspSampleAMD-04166
  The `BaryCoordNoPerspSampleAMD` decoration must be used only within the Fragment Execution Model.

- VUID-BaryCoordNoPerspSampleAMD-BaryCoordNoPerspSampleAMD-04167
  The variable decorated with `BaryCoordNoPerspSampleAMD` must be declared using the Input Storage Class.

- VUID-BaryCoordNoPerspSampleAMD-BaryCoordNoPerspSampleAMD-04168
  The variable decorated with `BaryCoordNoPerspSampleAMD` must be declared as a two-component vector of 32-bit floating-point values.

**BaryCoordPullModelAMD**

The `BaryCoordPullModelAMD` decoration can be used to decorate a fragment shader input variable. This variable will contain \((1/W, 1/I, 1/J)\) evaluated at the fragment center and can be used to calculate gradients and then interpolate \(I, J,\) and \(W\) at any desired sample location.

Valid Usage

- VUID-BaryCoordPullModelAMD-BaryCoordPullModelAMD-04169
  The `BaryCoordPullModelAMD` decoration must be used only within the Fragment Execution Model.

- VUID-BaryCoordPullModelAMD-BaryCoordPullModelAMD-04170
  The variable decorated with `BaryCoordPullModelAMD` must be declared using the Input Storage Class.

- VUID-BaryCoordPullModelAMD-BaryCoordPullModelAMD-04171
  The variable decorated with `BaryCoordPullModelAMD` must be declared as a three-component vector of 32-bit floating-point values.

**BaryCoordSmoothAMD**

The `BaryCoordSmoothAMD` decoration can be used to decorate a fragment shader input variable. This variable will contain the \((I,J)\) pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at the fragment's center. The \(K\) coordinate of the barycentric coordinates can be derived given the identity \(I + J + K = 1.0\).
Valid Usage

- VUID-BaryCoordSmoothAMD-BaryCoordSmoothAMD-04172
  The `BaryCoordSmoothAMD` decoration must be used only within the Fragment Execution Model.
- VUID-BaryCoordSmoothAMD-BaryCoordSmoothAMD-04173
  The variable decorated with `BaryCoordSmoothAMD` must be declared using the Input Storage Class.
- VUID-BaryCoordSmoothAMD-BaryCoordSmoothAMD-04174
  The variable decorated with `BaryCoordSmoothAMD` must be declared as a two-component vector of 32-bit floating-point values.

`BaryCoordSmoothCentroidAMD`

The `BaryCoordSmoothCentroidAMD` decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at the centroid. The K coordinate of the barycentric coordinates can be derived given the identity I + J + K = 1.0.

Valid Usage

- VUID-BaryCoordSmoothCentroidAMD-BaryCoordSmoothCentroidAMD-04175
  The `BaryCoordSmoothCentroidAMD` decoration must be used only within the Fragment Execution Model.
- VUID-BaryCoordSmoothCentroidAMD-BaryCoordSmoothCentroidAMD-04176
  The variable decorated with `BaryCoordSmoothCentroidAMD` must be declared using the Input Storage Class.
- VUID-BaryCoordSmoothCentroidAMD-BaryCoordSmoothCentroidAMD-04177
  The variable decorated with `BaryCoordSmoothCentroidAMD` must be declared as a two-component vector of 32-bit floating-point values.

`BaryCoordSmoothSampleAMD`

The `BaryCoordSmoothSampleAMD` decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at each covered sample. The K coordinate of the barycentric coordinates can be derived given the identity I + J + K = 1.0.
Valid Usage

- VUID-BaryCoordSmoothSampleAMD-BaryCoordSmoothSampleAMD-04178
  The BaryCoordSmoothSampleAMD decoration must be used only within the Fragment Execution Model

- VUID-BaryCoordSmoothSampleAMD-BaryCoordSmoothSampleAMD-04179
  The variable decorated with BaryCoordSmoothSampleAMD must be declared using the Input Storage Class

- VUID-BaryCoordSmoothSampleAMD-BaryCoordSmoothSampleAMD-04180
  The variable decorated with BaryCoordSmoothSampleAMD must be declared as a two-component vector of 32-bit floating-point values

**BaseInstance**

Decorating a variable with the BaseInstance built-in will make that variable contain the integer value corresponding to the first instance that was passed to the command that invoked the current vertex shader invocation. BaseInstance is the firstInstance parameter to a *direct drawing command* or the firstInstance member of a structure consumed by an *indirect drawing command*.

Valid Usage

- VUID-BaseInstance-BaseInstance-04181
  The BaseInstance decoration must be used only within the Vertex Execution Model

- VUID-BaseInstance-BaseInstance-04182
  The variable decorated with BaseInstance must be declared using the Input Storage Class

- VUID-BaseInstance-BaseInstance-04183
  The variable decorated with BaseInstance must be declared as a scalar 32-bit integer value

**BaseVertex**

Decorating a variable with the BaseVertex built-in will make that variable contain the integer value corresponding to the first vertex or vertex offset that was passed to the command that invoked the current vertex shader invocation. For *non-indexed drawing commands*, this variable is the firstVertex parameter to a *direct drawing command* or the firstVertex member of the structure consumed by an *indirect drawing command*. For *indexed drawing commands*, this variable is the vertexOffset parameter to a *direct drawing command* or the vertexOffset member of the structure consumed by an *indirect drawing command*. 

1028 | Chapter 15. Shader Interfaces
Valid Usage

- VUID-BaseVertex-BaseVertex-04184
  The `BaseVertex` decoration must be used only within the Vertex Execution Model

- VUID-BaseVertex-BaseVertex-04185
  The variable decorated with `BaseVertex` must be declared using the Input Storage Class

- VUID-BaseVertex-BaseVertex-04186
  The variable decorated with `BaseVertex` must be declared as a scalar 32-bit integer value

**ClipDistance**

Decorating a variable with the `ClipDistance` built-in decoration will make that variable contain the mechanism for controlling user clipping. `ClipDistance` is an array such that the \( i \)th element of the array specifies the clip distance for plane \( i \). A clip distance of 0 means the vertex is on the plane, a positive distance means the vertex is inside the clip half-space, and a negative distance means the vertex is outside the clip half-space.

*Note*

The array variable decorated with `ClipDistance` is explicitly sized by the shader.

*Note*

In the last pre-rasterization shader stage, these values will be linearly interpolated across the primitive and the portion of the primitive with interpolated distances less than 0 will be considered outside the clip volume. If `ClipDistance` is then used by a fragment shader, `ClipDistance` contains these linearly interpolated values.
Valid Usage

- VUID-ClipDistance-ClipDistance-04187
  The ClipDistance decoration must be used only within the MeshNV, Vertex, Fragment, TessellationControl, TessellationEvaluation, or Geometry Execution Model.

- VUID-ClipDistance-ClipDistance-04188
  The variable decorated with ClipDistance within the MeshNV or Vertex Execution Model must be declared using the Output Storage Class.

- VUID-ClipDistance-ClipDistance-04189
  The variable decorated with ClipDistance within the Fragment Execution Model must be declared using the Input Storage Class.

- VUID-ClipDistance-ClipDistance-04190
  The variable decorated with ClipDistance within the TessellationControl, TessellationEvaluation, or Geometry Execution Model must not be declared in a Storage Class other than Input or Output.

- VUID-ClipDistance-ClipDistance-04191
  The variable decorated with ClipDistance must be declared as an array of 32-bit floating-point values.

ClipDistancePerViewNV

Decorating a variable with the ClipDistancePerViewNV built-in decoration will make that variable contain the per-view clip distances. The per-view clip distances have the same semantics as ClipDistance.

Valid Usage

- VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04192
  The ClipDistancePerViewNV decoration must be used only within the MeshNV Execution Model.

- VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04193
  The variable decorated with ClipDistancePerViewNV must be declared using the Output Storage Class.

- VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04194
  The variable decorated with ClipDistancePerViewNV must also be decorated with the PerViewNV decoration.

- VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04195
  The variable decorated with ClipDistancePerViewNV must be declared as a two-dimensional array of 32-bit floating-point values.

CullDistance

Decorating a variable with the CullDistance built-in decoration will make that variable contain the mechanism for controlling user culling. If any member of this array is assigned a negative value for all vertices belonging to a primitive, then the primitive is discarded before rasterization.
Note
In fragment shaders, the values of the `CullDistance` array are linearly interpolated across each primitive.

Note
If `CullDistance` decorates an input variable, that variable will contain the corresponding value from the `CullDistance` decorated output variable from the previous shader stage.

Valid Usage

- VUID-CullDistance-CullDistance-04196
  The `CullDistance` decoration must be used only within the `MeshNV`, `Vertex`, `Fragment`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`.

- VUID-CullDistance-CullDistance-04197
  The variable decorated with `CullDistance` within the `MeshNV` or `Vertex Execution Model` must be declared using the `Output Storage Class`.

- VUID-CullDistance-CullDistance-04198
  The variable decorated with `CullDistance` within the `Fragment Execution Model` must be declared using the `Input Storage Class`.

- VUID-CullDistance-CullDistance-04199
  The variable decorated with `CullDistance` within the `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model` must not be declared using a `Storage Class` other than `Input` or `Output`.

- VUID-CullDistance-CullDistance-04200
  The variable decorated with `CullDistance` must be declared as an array of 32-bit floating-point values.

`CullDistancePerViewNV`
Decorating a variable with the `CullDistancePerViewNV` built-in decoration will make that variable contain the per-view cull distances. The per-view clip distances have the same semantics as `CullDistance`. 
Valid Usage

- VUID-CullDistancePerViewNV-CullDistancePerViewNV-04201
  The `CullDistancePerViewNV` decoration must be used only within the `MeshNV Execution Model`.

- VUID-CullDistancePerViewNV-CullDistancePerViewNV-04202
  The variable decorated with `CullDistancePerViewNV` must be declared using the `Output Storage Class`.

- VUID-CullDistancePerViewNV-CullDistancePerViewNV-04203
  The variable decorated with `CullDistancePerViewNV` must also be decorated with the `PerViewNV` decoration.

- VUID-CullDistancePerViewNV-CullDistancePerViewNV-04204
  The variable decorated with `CullDistancePerViewNV` must be declared as a two-dimensional array of 32-bit floating-point values.

CurrentRayTimeNV

A variable decorated with the `CurrentRayTimeNV` decoration contains the time value passed in to `OpTraceRayMotionNV` which called this shader.

Valid Usage

- VUID-CurrentRayTimeNV-CurrentRayTimeNV-04942
  The `CurrentRayTimeNV` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR Execution Model`.

- VUID-CurrentRayTimeNV-CurrentRayTimeNV-04943
  The variable decorated with `CurrentRayTimeNV` must be declared using the `Input Storage Class`.

- VUID-CurrentRayTimeNV-CurrentRayTimeNV-04944
  The variable decorated with `CurrentRayTimeNV` must be declared as a scalar 32-bit floating-point value.

DeviceIndex

The `DeviceIndex` decoration can be applied to a shader input which will be filled with the device index of the physical device that is executing the current shader invocation. This value will be in the range \([0, \text{max}(1, \text{physicalDeviceCount}))\), where physicalDeviceCount is the `physicalDeviceCount` member of `VkDeviceGroupDeviceCreateInfo`.

Valid Usage

- VUID-DeviceIndex-DeviceIndex-04205
  The variable decorated with `DeviceIndex` must be declared using the `Input Storage Class`.

- VUID-DeviceIndex-DeviceIndex-04206
  The variable decorated with `DeviceIndex` must be declared as a scalar 32-bit integer value.
**DrawIndex**

Decorating a variable with the `DrawIndex` built-in will make that variable contain the integer value corresponding to the zero-based index of the drawing command that invoked the current task, mesh, or vertex shader invocation. For *indirect drawing commands*, `DrawIndex` begins at zero and increments by one for each drawing command executed. The number of drawing commands is given by the `drawCount` parameter. For *direct drawing commands*, if `vkCmdDrawMultiEXT` or `vkCmdDrawMultiIndexedEXT` is used, this variable contains the integer value corresponding to the zero-based index of the draw command. Otherwise, `DrawIndex` is always zero. `DrawIndex` is dynamically uniform.

When task or mesh shaders are used, only the first active stage will have proper access to the variable. The value read by other stages is undefined.

---

### Valid Usage

- **VUID-DrawIndex-DrawIndex-04207**
  
  The `DrawIndex` decoration **must** be used only within the `Vertex`, `MeshNV`, or `TaskNV Execution Model`.

- **VUID-DrawIndex-DrawIndex-04208**
  
  The variable decorated with `DrawIndex` **must** be declared using the `Input Storage Class`.

- **VUID-DrawIndex-DrawIndex-04209**
  
  The variable decorated with `DrawIndex` **must** be declared as a scalar 32-bit integer value.

---

**FragCoord**

Decorating a variable with the `FragCoord` built-in decoration will make that variable contain the framebuffer coordinate \((x, y, z, \frac{w}{w})\) of the fragment being processed. The \((x,y)\) coordinate \((0,0)\) is the upper left corner of the upper left pixel in the framebuffer.

When **Sample Shading** is enabled, the \(x\) and \(y\) components of `FragCoord` reflect the location of one of the samples corresponding to the shader invocation.

Otherwise, the \(x\) and \(y\) components of `FragCoord` reflect the location of the center of the fragment.

The \(z\) component of `FragCoord` is the interpolated depth value of the primitive.

The \(w\) component is the interpolated \(\frac{1}{w}\).

The **Centroid** interpolation decoration is ignored, but allowed, on `FragCoord`.

---

Chapter 15. Shader Interfaces | 1033
Valid Usage

- VUID-FragCoord-FragCoord-04210
  The \texttt{FragCoord} decoration \textbf{must} be used only within the \texttt{Fragment Execution Model}.

- VUID-FragCoord-FragCoord-04211
  The variable decorated with \texttt{FragCoord} \textbf{must} be declared using the \texttt{Input Storage Class}.

- VUID-FragCoord-FragCoord-04212
  The variable decorated with \texttt{FragCoord} \textbf{must} be declared as a four-component vector of 32-bit floating-point values.

\textbf{FragDepth}

To have a shader supply a fragment-depth value, the shader \textbf{must} declare the \texttt{DepthReplacing} execution mode. Such a shader's fragment-depth value will come from the variable decorated with the \texttt{FragDepth} built-in decoration.

This value will be used for any subsequent depth testing performed by the implementation or writes to the depth attachment.

Valid Usage

- VUID-FragDepth-FragDepth-04213
  The \texttt{FragDepth} decoration \textbf{must} be used only within the \texttt{Fragment Execution Model}.

- VUID-FragDepth-FragDepth-04214
  The variable decorated with \texttt{FragDepth} \textbf{must} be declared using the \texttt{Output Storage Class}.

- VUID-FragDepth-FragDepth-04215
  The variable decorated with \texttt{FragDepth} \textbf{must} be declared as a scalar 32-bit floating-point value.

- VUID-FragDepth-FragDepth-04216
  If the shader dynamically writes to the variable decorated with \texttt{FragDepth}, the \texttt{DepthReplacing Execution Mode} \textbf{must} be declared.

\textbf{FragInvocationCountEXT}

Decorating a variable with the \texttt{FragInvocationCountEXT} built-in decoration will make that variable contain the maximum number of fragment shader invocations for the fragment, as determined by \texttt{minSampleShading}.

If \texttt{Sample Shading} is not enabled, \texttt{FragInvocationCountEXT} will be filled with a value of 1.
Valid Usage

- VUID-FragInvocationCountEXT-FragInvocationCountEXT-04217
  The `FragInvocationCountEXT` decoration must be used only within the Fragment Execution Model

- VUID-FragInvocationCountEXT-FragInvocationCountEXT-04218
  The variable decorated with `FragInvocationCountEXT` must be declared using the Input Storage Class

- VUID-FragInvocationCountEXT-FragInvocationCountEXT-04219
  The variable decorated with `FragInvocationCountEXT` must be declared as a scalar 32-bit integer value

**FragSizeEXT**

Decorating a variable with the `FragSizeEXT` built-in decoration will make that variable contain the dimensions in pixels of the area that the fragment covers for that invocation.

If fragment density map is not enabled, `FragSizeEXT` will be filled with a value of (1,1).

Valid Usage

- VUID-FragSizeEXT-FragSizeEXT-04220
  The `FragSizeEXT` decoration must be used only within the Fragment Execution Model

- VUID-FragSizeEXT-FragSizeEXT-04221
  The variable decorated with `FragSizeEXT` must be declared using the Input Storage Class

- VUID-FragSizeEXT-FragSizeEXT-04222
  The variable decorated with `FragSizeEXT` must be declared as a two-component vector of 32-bit integer values

**FragStencilRefEXT**

Decorating a variable with the `FragStencilRefEXT` built-in decoration will make that variable contain the new stencil reference value for all samples covered by the fragment. This value will be used as the stencil reference value used in stencil testing.

To write to `FragStencilRefEXT`, a shader must declare the `StencilRefReplacingEXT` execution mode. If a shader declares the `StencilRefReplacingEXT` execution mode and there is an execution path through the shader that does not set `FragStencilRefEXT`, then the fragment’s stencil reference value is undefined for executions of the shader that take that path.

Only the least significant $s$ bits of the integer value of the variable decorated with `FragStencilRefEXT` are considered for stencil testing, where $s$ is the number of bits in the stencil framebuffer attachment, and higher order bits are discarded.
Valid Usage

• VUID-FragStencilRefEXT-FragStencilRefEXT-04223
  The `FragStencilRefEXT` decoration must be used only within the Fragment Execution Model

• VUID-FragStencilRefEXT-FragStencilRefEXT-04224
  The variable decorated with `FragStencilRefEXT` must be declared using the Output Storage Class

• VUID-FragStencilRefEXT-FragStencilRefEXT-04225
  The variable decorated with `FragStencilRefEXT` must be declared as a scalar integer value

FragmentSizeNV

Decorating a variable with the `FragmentSizeNV` built-in decoration will make that variable contain the width and height of the fragment.

Valid Usage

• VUID-FragmentSizeNV-FragmentSizeNV-04226
  The `FragmentSizeNV` decoration must be used only within the Fragment Execution Model

• VUID-FragmentSizeNV-FragmentSizeNV-04227
  The variable decorated with `FragmentSizeNV` must be declared using the Input Storage Class

• VUID-FragmentSizeNV-FragmentSizeNV-04228
  The variable decorated with `FragmentSizeNV` must be declared as a two-component vector of 32-bit integer values

FrontFacing

Decorating a variable with the `FrontFacing` built-in decoration will make that variable contain whether the fragment is front or back facing. This variable is non-zero if the current fragment is considered to be part of a front-facing polygon primitive or of a non-polygon primitive and is zero if the fragment is considered to be part of a back-facing polygon primitive.

Valid Usage

• VUID-FrontFacing-FrontFacing-04229
  The `FrontFacing` decoration must be used only within the Fragment Execution Model

• VUID-FrontFacing-FrontFacing-04230
  The variable decorated with `FrontFacing` must be declared using the Input Storage Class

• VUID-FrontFacing-FrontFacing-04231
  The variable decorated with `FrontFacing` must be declared as a boolean value

FullyCoveredEXT

Decorating a variable with the `FullyCoveredEXT` built-in decoration will make that variable...
indicate whether the fragment area is fully covered by the generating primitive. This variable is non-zero if conservative rasterization is enabled and the current fragment area is fully covered by the generating primitive, and is zero if the fragment is not covered or partially covered, or conservative rasterization is disabled.

If the implementation supports `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativeRasterizationPostDepthCoverage` and the PostDepthCoverage execution mode is specified, the `SampleMask` built-in input variable will reflect the coverage after the early per-fragment depth and stencil tests are applied.

Valid Usage

- VUID-FullyCoveredEXT-FullyCoveredEXT-04232
  
  The `FullyCoveredEXT` decoration must be used only within the Fragment Execution Model

- VUID-FullyCoveredEXT-FullyCoveredEXT-04233
  
  The variable decorated with `FullyCoveredEXT` must be declared using the Input Storage Class

- VUID-FullyCoveredEXT-FullyCoveredEXT-04234
  
  The variable decorated with `FullyCoveredEXT` must be declared as a boolean value

- VUID-FullyCoveredEXT-conservativeRasterizationPostDepthCoverage-04235
  
  If `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativeRasterizationPostDepthCoverage` is not supported, the PostDepthCoverage Execution Mode must not be declared, when a variable with the `FullyCoveredEXT` decoration is declared

GlobalInvocationId

Decorating a variable with the `GlobalInvocationId` built-in decoration will make that variable contain the location of the current invocation within the global workgroup. Each component is equal to the index of the local workgroup multiplied by the size of the local workgroup plus `LocalInvocationId`.

Valid Usage

- VUID-GlobalInvocationId-GlobalInvocationId-04236
  
  The `GlobalInvocationId` decoration must be used only within the GLCompute, MeshNV, or TaskNV Execution Model

- VUID-GlobalInvocationId-GlobalInvocationId-04237
  
  The variable decorated with `GlobalInvocationId` must be declared using the Input Storage Class

- VUID-GlobalInvocationId-GlobalInvocationId-04238
  
  The variable decorated with `GlobalInvocationId` must be declared as a three-component vector of 32-bit integer values
HelperInvocation

Decorating a variable with the `HelperInvocation` built-in decoration will make that variable contain whether the current invocation is a helper invocation. This variable is non-zero if the current fragment being shaded is a helper invocation and zero otherwise. A helper invocation is an invocation of the shader that is produced to satisfy internal requirements such as the generation of derivatives.

*Note*

It is very likely that a helper invocation will have a value of `SampleMask` fragment shader input value that is zero.

Valid Usage

- **VUID-HelperInvocation-HelperInvocation-04239**
  The `HelperInvocation` decoration must be used only within the Fragment Execution Model

- **VUID-HelperInvocation-HelperInvocation-04240**
  The variable decorated with `HelperInvocation` must be declared using the Input Storage Class

- **VUID-HelperInvocation-HelperInvocation-04241**
  The variable decorated with `HelperInvocation` must be declared as a boolean value

HitKindKHR

A variable decorated with the `HitKindKHR` decoration will describe the intersection that triggered the execution of the current shader. The values are determined by the intersection shader. For user-defined intersection shaders this is the value that was passed to the “Hit Kind” operand of `OpReportIntersectionKHR`. For triangle intersection candidates, this will be one of `HitKindFrontFacingTriangleKHR` or `HitKindBackFacingTriangleKHR`.

Valid Usage

- **VUID-HitKindKHR-HitKindKHR-04242**
  The `HitKindKHR` decoration must be used only within the AnyHitKHR or ClosestHitKHR Execution Model

- **VUID-HitKindKHR-HitKindKHR-04243**
  The variable decorated with `HitKindKHR` must be declared using the Input Storage Class

- **VUID-HitKindKHR-HitKindKHR-04244**
  The variable decorated with `HitKindKHR` must be declared as a scalar 32-bit integer value

HitTNV

A variable decorated with the `HitTNV` decoration is equivalent to a variable decorated with the `RayTmaxKHR` decoration.
Valid Usage

- VUID-HitTNV-HitTNV-04245
  The HitTNV decoration must be used only within the AnyHitNV or ClosestHitNV Execution Model.

- VUID-HitTNV-HitTNV-04246
  The variable decorated with HitTNV must be declared using the Input Storage Class.

- VUID-HitTNV-HitTNV-04247
  The variable decorated with HitTNV must be declared as a scalar 32-bit floating-point value.

IncomingRayFlagsKHR

A variable with the IncomingRayFlagsKHR decoration will contain the ray flags passed in to the trace call that invoked this particular shader. Setting pipeline flags on the raytracing pipeline must not cause any corresponding flags to be set in variables with this decoration.

Valid Usage

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04248
  The IncomingRayFlagsKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model.

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04249
  The variable decorated with IncomingRayFlagsKHR must be declared using the Input Storage Class.

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04250
  The variable decorated with IncomingRayFlagsKHR must be declared as a scalar 32-bit integer value.

InstanceCustomIndexKHR

A variable decorated with the InstanceCustomIndexKHR decoration will contain the application-defined value of the instance that intersects the current ray. This variable contains the value that was specified in VkAccelerationStructureInstanceKHR::instanceCustomIndex for the current acceleration structure instance in the lower 24 bits and the upper 8 bits will be zero.
Valid Usage

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04251
  The `InstanceCustomIndexKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04252
  The variable decorated with `InstanceCustomIndexKHR` must be declared using the Input Storage Class.

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04253
  The variable decorated with `InstanceCustomIndexKHR` must be declared as a scalar 32-bit integer value.

InstanceId

Decorating a variable in an intersection, any-hit, or closest hit shader with the `InstanceId` decoration will make that variable contain the index of the instance that intersects the current ray.

Valid Usage

- VUID-InstanceId-InstanceId-04254
  The `InstanceId` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.

- VUID-InstanceId-InstanceId-04255
  The variable decorated with `InstanceId` must be declared using the Input Storage Class.

- VUID-InstanceId-InstanceId-04256
  The variable decorated with `InstanceId` must be declared as a scalar 32-bit integer value.

InvocationId

Decorating a variable with the `InvocationId` built-in decoration will make that variable contain the index of the current shader invocation in a geometry shader, or the index of the output patch vertex in a tessellation control shader.

In a geometry shader, the index of the current shader invocation ranges from zero to the number of instances declared in the shader minus one. If the instance count of the geometry shader is one or is not specified, then `InvocationId` will be zero.
Valid Usage

- **VUID-InvocationId-InvocationId-04257**
  The **InvocationId** decoration **must** be used only within the **TessellationControl or Geometry Execution Model**

- **VUID-InvocationId-InvocationId-04258**
  The variable decorated with **InvocationId** **must** be declared using the **Input Storage Class**

- **VUID-InvocationId-InvocationId-04259**
  The variable decorated with **InvocationId** **must** be declared as a scalar 32-bit integer value

**InvocationsPerPixelNV**

Decorating a variable with the **InvocationsPerPixelNV** built-in decoration will make that variable contain the maximum number of fragment shader invocations per pixel, as derived from the effective shading rate for the fragment. If a primitive does not fully cover a pixel, the number of fragment shader invocations for that pixel **may** be less than the value of **InvocationsPerPixelNV**. If the shading rate indicates a fragment covering multiple pixels, then **InvocationsPerPixelNV** will be one.

Valid Usage

- **VUID-InvocationsPerPixelNV-InvocationsPerPixelNV-04260**
  The **InvocationsPerPixelNV** decoration **must** be used only within the **Fragment Execution Model**

- **VUID-InvocationsPerPixelNV-InvocationsPerPixelNV-04261**
  The variable decorated with **InvocationsPerPixelNV** **must** be declared using the **Input Storage Class**

- **VUID-InvocationsPerPixelNV-InvocationsPerPixelNV-04262**
  The variable decorated with **InvocationsPerPixelNV** **must** be declared as a scalar 32-bit integer value

**InstanceIndex**

Decorating a variable in a vertex shader with the **InstanceIndex** built-in decoration will make that variable contain the index of the instance that is being processed by the current vertex shader invocation. **InstanceIndex** begins at the **firstInstance** parameter to **vkCmdDraw** or **vkCmdDrawIndexed** or at the **firstInstance** member of a structure consumed by **vkCmdDrawIndirect** or **vkCmdDrawIndexedIndirect**.
Valid Usage

- VUID-InstanceIndex-InstanceIndex-04263
  The InstanceIndex decoration must be used only within the Vertex Execution Model

- VUID-InstanceIndex-InstanceIndex-04264
  The variable decorated with InstanceIndex must be declared using the Input Storage Class

- VUID-InstanceIndex-InstanceIndex-04265
  The variable decorated with InstanceIndex must be declared as a scalar 32-bit integer value

LaunchIdKHR

A variable decorated with the LaunchIdKHR decoration will specify the index of the work item being processed. One work item is generated for each of the $width \times height \times depth$ items dispatched by a vkCmdTraceRaysKHR command. All shader invocations inherit the same value for variables decorated with LaunchIdKHR.

Valid Usage

- VUID-LaunchIdKHR-LaunchIdKHR-04266
  The LaunchIdKHR decoration must be used only within the RayGenerationKHR, IntersectionKHR, AnyHitKHR, ClosestHitKHR, MissKHR, or CallableKHR Execution Model

- VUID-LaunchIdKHR-LaunchIdKHR-04267
  The variable decorated with LaunchIdKHR must be declared using the Input Storage Class

- VUID-LaunchIdKHR-LaunchIdKHR-04268
  The variable decorated with LaunchIdKHR must be declared as a three-component vector of 32-bit integer values

LaunchSizeKHR

A variable decorated with the LaunchSizeKHR decoration will contain the width, height, and depth dimensions passed to the vkCmdTraceRaysKHR command that initiated this shader execution. The width is in the first component, the height is in the second component, and the depth is in the third component.
Valid Usage

- VUID-LaunchSizeKHR-LaunchSizeKHR-04269
  The `LaunchSizeKHR` decoration must be used only within the `RayGenerationKHR`, `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, `MissKHR`, or `CallableKHR` Execution Model.

- VUID-LaunchSizeKHR-LaunchSizeKHR-04270
  The variable decorated with `LaunchSizeKHR` must be declared using the `Input Storage Class`.

- VUID-LaunchSizeKHR-LaunchSizeKHR-04271
  The variable decorated with `LaunchSizeKHR` must be declared as a three-component vector of 32-bit integer values.

Layer

Decorating a variable with the `Layer` built-in decoration will make that variable contain the select layer of a multi-layer framebuffer attachment.

In a mesh, vertex, tessellation evaluation, or geometry shader, any variable decorated with `Layer` can be written with the framebuffer layer index to which the primitive produced by that shader will be directed.

The last active pre-rasterization shader stage (in pipeline order) controls the `Layer` that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the `Layer`.

If the last active pre-rasterization shader stage shader entry point’s interface does not include a variable decorated with `Layer`, then the first layer is used. If a pre-rasterization shader stage shader entry point’s interface includes a variable decorated with `Layer`, it must write the same value to `Layer` for all output vertices of a given primitive. If the `Layer` value is less than 0 or greater than or equal to the number of layers in the framebuffer, then primitives may still be rasterized, fragment shaders may be executed, and the framebuffer values for all layers are undefined.

If a variable with the `Layer` decoration is also decorated with `ViewportRelativeNV`, then the `ViewportIndex` is added to the layer that is used for rendering and that is made available in the fragment shader. If the shader writes to a variable decorated `ViewportMaskNV`, then the layer selected has a different value for each viewport a primitive is rendered to.

In a fragment shader, a variable decorated with `Layer` contains the layer index of the primitive that the fragment invocation belongs to.
Valid Usage

- **VUID-Layer-Layer-04272**
  The `Layer` decoration **must** be used only within the `MeshNV, Vertex, TessellationEvaluation, Geometry, or Fragment Execution Model`.

- **VUID-Layer-Layer-04274**
  The variable decorated with `Layer` within the `MeshNV, Vertex, TessellationEvaluation, or Geometry Execution Model` **must** be declared using the `Output Storage Class`.

- **VUID-Layer-Layer-04275**
  The variable decorated with `Layer` within the `Fragment Execution Model` **must** be declared using the `Input Storage Class`.

- **VUID-Layer-Layer-04276**
  The variable decorated with `Layer` **must** be declared as a scalar 32-bit integer value.

**LayerPerViewNV**

Decorating a variable with the `LayerPerViewNV` built-in decoration will make that variable contain the per-view layer information. The per-view layer has the same semantics as `Layer`, for each view.

Valid Usage

- **VUID-LayerPerViewNV-LayerPerViewNV-04277**
  The `LayerPerViewNV` decoration **must** be used only within the `MeshNV Execution Model`.

- **VUID-LayerPerViewNV-LayerPerViewNV-04278**
  The variable decorated with `LayerPerViewNV` **must** be declared using the `Output Storage Class`.

- **VUID-LayerPerViewNV-LayerPerViewNV-04279**
  The variable decorated with `LayerPerViewNV` **must** also be decorated with the `PerViewNV` decoration.

- **VUID-LayerPerViewNV-LayerPerViewNV-04280**
  The variable decorated with `LayerPerViewNV` **must** be declared as an array of scalar 32-bit integer values.

**LocalInvocationId**

Decorating a variable with the `LocalInvocationId` built-in decoration will make that variable contain the location of the current task, mesh, or compute shader invocation within the local workgroup. Each component ranges from zero through to the size of the workgroup in that dimension minus one.
Note

If the size of the workgroup in a particular dimension is one, then the \texttt{LocalInvocationId} in that dimension will be zero. If the workgroup is effectively two-dimensional, then \texttt{LocalInvocationId.z} will be zero. If the workgroup is effectively one-dimensional, then both \texttt{LocalInvocationId.y} and \texttt{LocalInvocationId.z} will be zero.

Valid Usage

- VUID-LocalInvocationId-LocalInvocationId-04281
  The \texttt{LocalInvocationId} decoration \textbf{must} be used only within the \texttt{GLCompute}, \texttt{MeshNV}, or \texttt{TaskNV} Execution Model

- VUID-LocalInvocationId-LocalInvocationId-04282
  The variable decorated with \texttt{LocalInvocationId} \textbf{must} be declared using the \texttt{Input Storage Class}

- VUID-LocalInvocationId-LocalInvocationId-04283
  The variable decorated with \texttt{LocalInvocationId} \textbf{must} be declared as a three-component vector of 32-bit integer values

\textbf{LocalInvocationIndex}

Decorating a variable with the \texttt{LocalInvocationIndex} built-in decoration will make that variable contain a one-dimensional representation of \texttt{LocalInvocationId}. This is computed as:

\[
\text{LocalInvocationIndex} = \text{LocalInvocationId.z} \times \text{WorkgroupSize.x} \times \text{WorkgroupSize.y} + \text{LocalInvocationId.y} \times \text{WorkgroupSize.x} + \text{LocalInvocationId.x};
\]

Valid Usage

- VUID-LocalInvocationIndex-LocalInvocationIndex-04284
  The \texttt{LocalInvocationIndex} decoration \textbf{must} be used only within the \texttt{GLCompute}, \texttt{MeshNV}, or \texttt{TaskNV} Execution Model

- VUID-LocalInvocationIndex-LocalInvocationIndex-04285
  The variable decorated with \texttt{LocalInvocationIndex} \textbf{must} be declared using the \texttt{Input Storage Class}

- VUID-LocalInvocationIndex-LocalInvocationIndex-04286
  The variable decorated with \texttt{LocalInvocationIndex} \textbf{must} be declared as a scalar 32-bit integer value

\textbf{MeshViewCountNV}

Decorating a variable with the \texttt{MeshViewCountNV} built-in decoration will make that variable contain the number of views processed by the current mesh or task shader invocations.
Valid Usage

- **VUID-MeshViewCountNV-MeshViewCountNV-04287**
  The `MeshViewCountNV` decoration must be used only within the `MeshNV` or `TaskNV` Execution Model

- **VUID-MeshViewCountNV-MeshViewCountNV-04288**
  The variable decorated with `MeshViewCountNV` must be declared using the Input Storage Class

- **VUID-MeshViewCountNV-MeshViewCountNV-04289**
  The variable decorated with `MeshViewCountNV` must be declared as a scalar 32-bit integer value

**MeshViewIndicesNV**

Decorating a variable with the `MeshViewIndicesNV` built-in decoration will make that variable contain the mesh view indices. The mesh view indices is an array of values where each element holds the view number of one of the views being processed by the current mesh or task shader invocations. The values of array elements with indices greater than or equal to `MeshViewCountNV` are undefined. If the value of `MeshViewIndicesNV[i]` is `j`, then any outputs decorated with `PerViewNV` will take on the value of array element `i` when processing primitives for view index `j`.

Valid Usage

- **VUID-MeshViewIndicesNV-MeshViewIndicesNV-04290**
  The `MeshViewIndicesNV` decoration must be used only within the `MeshNV` or `TaskNV` Execution Model

- **VUID-MeshViewIndicesNV-MeshViewIndicesNV-04291**
  The variable decorated with `MeshViewIndicesNV` must be declared using the Input Storage Class

- **VUID-MeshViewIndicesNV-MeshViewIndicesNV-04292**
  The variable decorated with `MeshViewIndicesNV` must be declared as an array of scalar 32-bit integer values

**NumWorkgroups**

Decorating a variable with the `NumWorkgroups` built-in decoration will make that variable contain the number of local workgroups that are part of the dispatch that the invocation belongs to. Each component is equal to the values of the workgroup count parameters passed into the dispatching commands.
Valid Usage

• VUID-NumWorkgroups-NumWorkgroups-04296
  The NumWorkgroups decoration must be used only within the GLCompute Execution Model

• VUID-NumWorkgroups-NumWorkgroups-04297
  The variable decorated with NumWorkgroups must be declared using the Input Storage Class

• VUID-NumWorkgroups-NumWorkgroups-04298
  The variable decorated with NumWorkgroups must be declared as a three-component vector of 32-bit integer values

ObjectRayDirectionKHR

A variable decorated with the ObjectRayDirectionKHR decoration will specify the direction of the ray being processed, in object space.

Valid Usage

• VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04299
  The ObjectRayDirectionKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model

• VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04300
  The variable decorated with ObjectRayDirectionKHR must be declared using the Input Storage Class

• VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04301
  The variable decorated with ObjectRayDirectionKHR must be declared as a three-component vector of 32-bit floating-point values

ObjectRayOriginKHR

A variable decorated with the ObjectRayOriginKHR decoration will specify the origin of the ray being processed, in object space.

Valid Usage

• VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04302
  The ObjectRayOriginKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model

• VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04303
  The variable decorated with ObjectRayOriginKHR must be declared using the Input Storage Class

• VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04304
  The variable decorated with ObjectRayOriginKHR must be declared as a three-component vector of 32-bit floating-point values
**ObjectToWorldKHR**

A variable decorated with the `ObjectToWorldKHR` decoration will contain the current object-to-world transformation matrix, which is determined by the instance of the current intersection.

**Valid Usage**

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04305
  The `ObjectToWorldKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04306
  The variable decorated with `ObjectToWorldKHR` must be declared using the Input Storage Class

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04307
  The variable decorated with `ObjectToWorldKHR` must be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values

**PatchVertices**

Decorating a variable with the `PatchVertices` built-in decoration will make that variable contain the number of vertices in the input patch being processed by the shader. In a Tessellation Control Shader, this is the same as the name:patchControlPoints member of `VkPipelineTessellationStateCreateInfo`. In a Tessellation Evaluation Shader, `PatchVertices` is equal to the tessellation control output patch size. When the same shader is used in different pipelines where the patch sizes are configured differently, the value of the `PatchVertices` variable will also differ.

**Valid Usage**

- VUID-PatchVertices-PatchVertices-04308
  The `PatchVertices` decoration must be used only within the TessellationControl or TessellationEvaluation Execution Model

- VUID-PatchVertices-PatchVertices-04309
  The variable decorated with `PatchVertices` must be declared using the Input Storage Class

- VUID-PatchVertices-PatchVertices-04310
  The variable decorated with `PatchVertices` must be declared as a scalar 32-bit integer value

**PointCoord**

Decorating a variable with the `PointCoord` built-in decoration will make that variable contain the coordinate of the current fragment within the point being rasterized, normalized to the size of the point with origin in the upper left corner of the point, as described in Basic Point Rasterization. If the primitive the fragment shader invocation belongs to is not a point, then the variable decorated with `PointCoord` contains an undefined value.
Note
Depending on how the point is rasterized, PointCoord may never reach (0,0) or (1,1).

Valid Usage

- VUID-PointCoord-PointCoord-04311
  The PointCoord decoration must be used only within the Fragment Execution Model

- VUID-PointCoord-PointCoord-04312
  The variable decorated with PointCoord must be declared using the Input Storage Class

- VUID-PointCoord-PointCoord-04313
  The variable decorated with PointCoord must be declared as a two-component vector of 32-bit floating-point values

PointSize
Decorating a variable with the PointSize built-in decoration will make that variable contain the size of point primitives. The value written to the variable decorated with PointSize by the last pre-rasterization shader stage in the pipeline is used as the framebuffer-space size of points produced by rasterization.

Note
When PointSize decorates a variable in the Input Storage Class, it contains the data written to the output variable decorated with PointSize from the previous shader stage.

Valid Usage

- VUID-PointSize-PointSize-04314
  The PointSize decoration must be used only within the MeshNV, Vertex, TessellationControl, TessellationEvaluation, or Geometry Execution Model

- VUID-PointSize-PointSize-04315
  The variable decorated with PointSize within the MeshNV or Vertex Execution Model must be declared using the Output Storage Class

- VUID-PointSize-PointSize-04316
  The variable decorated with PointSize within the TessellationControl, TessellationEvaluation, or Geometry Execution Model must not be declared using a Storage Class other than Input or Output

- VUID-PointSize-PointSize-04317
  The variable decorated with PointSize must be declared as a scalar 32-bit floating-point value
Position

Decorating a variable with the Position built-in decoration will make that variable contain the position of the current vertex. In the last pre-rasterization shader stage, the value of the variable decorated with Position is used in subsequent primitive assembly, clipping, and rasterization operations.

Note

When Position decorates a variable in the Input Storage Class, it contains the data written to the output variable decorated with Position from the previous shader stage.

Valid Usage

- VUID-Position-Position-04318
  The Position decoration must be used only within the MeshNV, Vertex, TessellationControl, TessellationEvaluation, or Geometry Execution Model

- VUID-Position-Position-04319
  The variable decorated with Position within MeshNV or Vertex Execution Model must be declared using the Output Storage Class

- VUID-Position-Position-04320
  The variable decorated with Position within TessellationControl, TessellationEvaluation, or Geometry Execution Model must not be declared using a Storage Class other than Input or Output

- VUID-Position-Position-04321
  The variable decorated with Position must be declared as a four-component vector of 32-bit floating-point values

PositionPerViewNV

Decorating a variable with the PositionPerViewNV built-in decoration will make that variable contain the position of the current vertex, for each view.

Elements of the array correspond to views in a multiview subpass, and those elements corresponding to views in the view mask of the subpass the shader is compiled against will be used as the position value for those views. For the final pre-rasterization shader stage in the pipeline, values written to an output variable decorated with PositionPerViewNV are used in subsequent primitive assembly, clipping, and rasterization operations, as with Position. PositionPerViewNV output in an earlier pre-rasterization shader stage is available as an input in the subsequent pre-rasterization shader stage.

If a shader is compiled against a subpass that has the VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX bit set, then the position values for each view must not differ in any component other than the X component. If the values do differ, one will be chosen in an implementation-dependent manner.
Valid Usage

- **VUID-PositionPerViewNV-PositionPerViewNV-04322**
  The `PositionPerViewNV` decoration must be used only within the `MeshNV`, `Vertex`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`.

- **VUID-PositionPerViewNV-PositionPerViewNV-04323**
  The variable decorated with `PositionPerViewNV` within the `Vertex`, or `MeshNV Execution Model` must be declared using the `Output Storage Class`.

- **VUID-PositionPerViewNV-PositionPerViewNV-04324**
  The variable decorated with `PositionPerViewNV` within the `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model` must not be declared using a `Storage Class` other than `Input` or `Output`.

- **VUID-PositionPerViewNV-PositionPerViewNV-04325**
  The variable decorated with `PositionPerViewNV` must be declared as an array of four-component vector of 32-bit floating-point values with at least as many elements as the maximum view in the subpass's view mask plus one.

- **VUID-PositionPerViewNV-PositionPerViewNV-04326**
  The array variable decorated with `PositionPerViewNV` must only be indexed by a constant or specialization constant.

**PrimitiveCountNV**

Decorating a variable with the `PrimitiveCountNV` decoration will make that variable contain the primitive count. The primitive count specifies the number of primitives in the output mesh produced by the mesh shader that will be processed by subsequent pipeline stages.

Valid Usage

- **VUID-PrimitiveCountNV-PrimitiveCountNV-04327**
  The `PrimitiveCountNV` decoration must be used only within the `MeshNV Execution Model`.

- **VUID-PrimitiveCountNV-PrimitiveCountNV-04328**
  The variable decorated with `PrimitiveCountNV` must be declared using the `Output Storage Class`.

- **VUID-PrimitiveCountNV-PrimitiveCountNV-04329**
  The variable decorated with `PrimitiveCountNV` must be declared as a scalar 32-bit integer value.

**PrimitiveId**

Decorating a variable with the `PrimitiveId` built-in decoration will make that variable contain the index of the current primitive.

The index of the first primitive generated by a drawing command is zero, and the index is incremented after every individual point, line, or triangle primitive is processed.

For triangles drawn as points or line segments (see Polygon Mode), the primitive index is
incremented only once, even if multiple points or lines are eventually drawn.

Variables decorated with `PrimitiveId` are reset to zero between each instance drawn.

Restarting a primitive topology using primitive restart has no effect on the value of variables decorated with `PrimitiveId`.

In tessellation control and tessellation evaluation shaders, it will contain the index of the patch within the current set of rendering primitives that corresponds to the shader invocation.

In a geometry shader, it will contain the number of primitives presented as input to the shader since the current set of rendering primitives was started.

In a fragment shader, it will contain the primitive index written by the geometry shader if a geometry shader is present, or with the value that would have been presented as input to the geometry shader had it been present.

In an intersection, any-hit, or closest hit shader, it will contain the index within the geometry of the triangle or bounding box being processed.

**Note**

When the `PrimitiveId` decoration is applied to an output variable in the mesh shader or geometry shader, the resulting value is seen through the `PrimitiveId` decorated input variable in the fragment shader.

The fragment shader using `PrimitiveId` will need to declare either the `Geometry` or `Tessellation` capability to satisfy the requirement SPIR-V has to use `PrimitiveId`. 
Valid Usage

- VUID-PrimitiveId-PrimitiveId-04330
  The PrimitiveId decoration must be used only within the MeshNV, IntersectionKHR, AnyHitKHR, ClosestHitKHR, TessellationControl, TessellationEvaluation, Geometry, or Fragment Execution Model.

- VUID-PrimitiveId-Fragment-04331
  If pipeline contains both the Fragment and Geometry Execution Model and a variable decorated with PrimitiveId is read from Fragment shader, then the Geometry shader must write to the output variables decorated with PrimitiveId in all execution paths.

- VUID-PrimitiveId-Fragment-04332
  If pipeline contains both the Fragment and MeshNV Execution Model and a variable decorated with PrimitiveId is read from Fragment shader, then the MeshNV shader must write to the output variables decorated with PrimitiveId in all execution paths.

- VUID-PrimitiveId-Fragment-04333
  If Fragment Execution Model contains a variable decorated with PrimitiveId either the Geometry or Tessellation capability must also be declared.

- VUID-PrimitiveId-PrimitiveId-04334
  The variable decorated with PrimitiveId within the TessellationControl, TessellationEvaluation, Fragment, IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model must be declared using the Input Storage Class.

- VUID-PrimitiveId-PrimitiveId-04335
  The variable decorated with PrimitiveId within the Geometry Execution Model must be declared using the Input or Output Storage Class.

- VUID-PrimitiveId-PrimitiveId-04336
  The variable decorated with PrimitiveId within the MeshNV Execution Model must be declared using the Output Storage Class.

- VUID-PrimitiveId-PrimitiveId-04337
  The variable decorated with PrimitiveId must be declared as a scalar 32-bit integer value.

PrimitiveIndicesNV

Decorating a variable with the PrimitiveIndicesNV decoration will make that variable contain the output array of vertex index values. Depending on the output primitive type declared using the execution mode, the indices are split into groups of one (OutputPoints), two (OutputLinesNV), or three (OutputTriangles) indices and each group generates a primitive.
Valid Usage

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04338**
  The `PrimitiveIndicesNV` decoration **must** be used only within the MeshNV Execution Model.

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04339**
  The variable decorated with `PrimitiveIndicesNV` **must** be declared using the Output Storage Class.

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04340**
  The variable decorated with `PrimitiveIndicesNV` **must** be declared as an array of scalar 32-bit integer values.

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04341**
  All index values of the array decorated with `PrimitiveIndicesNV` **must** be in the range \([0, N-1]\), where \(N\) is the value specified by the OutputVertices Execution Mode.

- **VUID-PrimitiveIndicesNV-OutputPoints-04342**
  If the Execution Mode is OutputPoints, then the array decorated with `PrimitiveIndicesNV` **must** be the size of the value specified by OutputPrimitivesNV.

- **VUID-PrimitiveIndicesNV-OutputLinesNV-04343**
  If the Execution Mode is OutputLinesNV, then the array decorated with `PrimitiveIndicesNV` **must** be the size of two times the value specified by OutputPrimitivesNV.

- **VUID-PrimitiveIndicesNV-OutputTrianglesNV-04344**
  If the Execution Mode is OutputTrianglesNV, then the array decorated with `PrimitiveIndicesNV` **must** be the size of three times the value specified by OutputPrimitivesNV.

**PrimitiveShadingRateKHR**

Decorating a variable with the `PrimitiveShadingRateKHR` built-in decoration will make that variable contain the **primitive fragment shading rate**.

The value written to the variable decorated with `PrimitiveShadingRateKHR` by the last pre-rasterization shader stage in the pipeline is used as the **primitive fragment shading rate**. Outputs in previous shader stages are ignored.

If the last active pre-rasterization shader stage shader entry point's interface does not include a variable decorated with `PrimitiveShadingRateKHR`, then it is as if the shader specified a fragment shading rate value of 0, indicating a horizontal and vertical rate of 1 pixel.

If a shader has `PrimitiveShadingRateKHR` in the output interface and there is an execution path through the shader that does not write to it, its value is undefined for executions of the shader that take that path.
Valid Usage

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04484
  The **PrimitiveShadingRateKHR** decoration **must** be used only within the **MeshNV**, **Vertex**, or **Geometry Execution Model**.

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04485
  The variable decorated with **PrimitiveShadingRateKHR** **must** be declared using the **Output Storage Class**.

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04486
  The variable decorated with **PrimitiveShadingRateKHR** **must** be declared as a scalar 32-bit integer value.

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04487
  The value written to **PrimitiveShadingRateKHR** **must** include no more than one of **Vertical2Pixels** and **Vertical4Pixels**.

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04488
  The value written to **PrimitiveShadingRateKHR** **must** include no more than one of **Horizontal2Pixels** and **Horizontal4Pixels**.

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04489
  The value written to **PrimitiveShadingRateKHR** **must** not have any bits set other than those defined by **Fragment Shading Rate Flags** enumerants in the SPIR-V specification.

**RayGeometryIndexKHR**

A variable decorated with the **RayGeometryIndexKHR** decoration will contain the **geometry index** for the acceleration structure geometry currently being shaded.

Valid Usage

- VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04345
  The **RayGeometryIndexKHR** decoration **must** be used only within the **IntersectionKHR**, **AnyHitKHR**, or **ClosestHitKHR** Execution Model.

- VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04346
  The variable decorated with **RayGeometryIndexKHR** **must** be declared using the **Input Storage Class**.

- VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04347
  The variable decorated with **RayGeometryIndexKHR** **must** be declared as a scalar 32-bit integer value.

**RayTmaxKHR**

A variable decorated with the **RayTmaxKHR** decoration will contain the parametric \( t_{\text{max}} \) value of the ray being processed. The value is independent of the space in which the ray origin and direction exist. The value is initialized to the parameter passed into **OpTraceRayKHR**.

The \( t_{\text{max}} \) value changes throughout the lifetime of the ray that produced the intersection. In the
closest hit shader, the value reflects the closest distance to the intersected primitive. In the any-
hit shader, it reflects the distance to the primitive currently being intersected. In the intersection
shader, it reflects the distance to the closest primitive intersected so far or the initial value. The
value can change in the intersection shader after calling OpReportIntersectionKHR if the
corresponding any-hit shader does not ignore the intersection. In a miss shader, the value is
identical to the parameter passed into OpTraceRayKHR.

Valid Usage

- VUID-RayTmaxKHR-RayTmaxKHR-04348
  The RayTmaxKHR decoration must be used only within the IntersectionKHR, AnyHitKHR,
  ClosestHitKHR, or MissKHR Execution Model

- VUID-RayTmaxKHR-RayTmaxKHR-04349
  The variable decorated with RayTmaxKHR must be declared using the Input Storage Class

- VUID-RayTmaxKHR-RayTmaxKHR-04350
  The variable decorated with RayTmaxKHR must be declared as a scalar 32-bit floating-point value

RayTminKHR

A variable decorated with the RayTminKHR decoration will contain the parametric $t_{\text{min}}$ value of the
ray being processed. The value is independent of the space in which the ray origin and direction
exist. The value is given by the parameter passed into OpTraceRayKHR.

The $t_{\text{min}}$ value remains constant for the duration of the ray query.

Valid Usage

- VUID-RayTminKHR-RayTminKHR-04351
  The RayTminKHR decoration must be used only within the IntersectionKHR, AnyHitKHR,
  ClosestHitKHR, or MissKHR Execution Model

- VUID-RayTminKHR-RayTminKHR-04352
  The variable decorated with RayTminKHR must be declared using the Input Storage Class

- VUID-RayTminKHR-RayTminKHR-04353
  The variable decorated with RayTminKHR must be declared as a scalar 32-bit floating-point value

SampleId

Decorating a variable with the SampleId built-in decoration will make that variable contain the
coverage index for the current fragment shader invocation. SampleId ranges from zero to the
number of samples in the framebuffer minus one. If a fragment shader entry point's interface
includes an input variable decorated with SampleId, Sample Shading is considered enabled with a
minSampleShading value of 1.0.
Valid Usage

- VUID-SampleId-SampleId-04354
  The SampleId decoration must be used only within the Fragment Execution Model

- VUID-SampleId-SampleId-04355
  The variable decorated with SampleId must be declared using the Input Storage Class

- VUID-SampleId-SampleId-04356
  The variable decorated with SampleId must be declared as a scalar 32-bit integer value

SampleMask

Decorating a variable with the SampleMask built-in decoration will make any variable contain the coverage mask for the current fragment shader invocation.

A variable in the Input storage class decorated with SampleMask will contain a bitmask of the set of samples covered by the primitive generating the fragment during rasterization. It has a sample bit set if and only if the sample is considered covered for this fragment shader invocation. SampleMask[] is an array of integers. Bits are mapped to samples in a manner where bit B of mask M (SampleMask[M]) corresponds to sample $32 \times M + B$.

When state specifies multiple fragment shader invocations for a given fragment, the sample mask for any single fragment shader invocation specifies the subset of the covered samples for the fragment that correspond to the invocation. In this case, the bit corresponding to each covered sample will be set in exactly one fragment shader invocation.

If the PostDepthCoverage execution mode is specified, the sample is considered covered if and only if the sample is covered by the primitive, and the sample is still covered after depth testing. Otherwise, the sample is considered covered if the sample is covered by the primitive, regardless of the result of the fragment tests.

A variable in the Output storage class decorated with SampleMask is an array of integers forming a bit array in a manner similar to an input variable decorated with SampleMask, but where each bit represents coverage as computed by the shader. Modifying the sample mask by writing zero to a bit of SampleMask causes the sample to be considered uncovered. If this variable is also decorated with OverrideCoverageNV, the fragment coverage is replaced with the sample mask bits set in the shader otherwise the fragment coverage is ANDed with the bits of the sample mask. If the fragment shader is being evaluated at any frequency other than per-fragment, bits of the sample mask not corresponding to the current fragment shader invocation are ignored. This array must be sized in the fragment shader either implicitly or explicitly, to be no larger than the implementation-dependent maximum sample-mask (as an array of 32-bit elements), determined by the maximum number of samples. If a fragment shader entry point's interface includes an output variable decorated with SampleMask, the sample mask will be undefined for any array elements of any fragment shader invocations that fail to assign a value. If a fragment shader entry point's interface does not include an output variable decorated with SampleMask, the sample mask has no effect on the processing of a fragment.
Valid Usage

- VUID-SampleMask-SampleMask-04357
  The SampleMask decoration must be used only within the Fragment Execution Model

- VUID-SampleMask-SampleMask-04358
  The variable decorated with SampleMask must be declared using the Input or Output Storage Class

- VUID-SampleMask-SampleMask-04359
  The variable decorated with SampleMask must be declared as an array of 32-bit integer values

SamplePosition

Decorating a variable with the SamplePosition built-in decoration will make that variable contain the sub-pixel position of the sample being shaded. The top left of the pixel is considered to be at coordinate (0,0) and the bottom right of the pixel is considered to be at coordinate (1,1).

If the render pass has a fragment density map attachment, the variable will instead contain the sub-fragment position of the sample being shaded. The top left of the fragment is considered to be at coordinate (0,0) and the bottom right of the fragment is considered to be at coordinate (1,1) for any fragment area.

If a fragment shader entry point’s interface includes an input variable decorated with SamplePosition, Sample Shading is considered enabled with a minSampleShading value of 1.0.

If the current pipeline uses custom sample locations the value of any variable decorated with the SamplePosition built-in decoration is undefined.

Valid Usage

- VUID-SamplePosition-SamplePosition-04360
  The SamplePosition decoration must be used only within the Fragment Execution Model

- VUID-SamplePosition-SamplePosition-04361
  The variable decorated with SamplePosition must be declared using the Input Storage Class

- VUID-SamplePosition-SamplePosition-04362
  The variable decorated with SamplePosition must be declared as a two-component vector of 32-bit floating-point values

ShadingRateKHR

Decorating a variable with the ShadingRateKHR built-in decoration will make that variable contain the fragment shading rate for the current fragment invocation.
Valid Usage

- VUID-ShadingRateKHR-ShadingRateKHR-04490
  The **ShadingRateKHR** decoration **must** be used only within the Fragment Execution Model

- VUID-ShadingRateKHR-ShadingRateKHR-04491
  The variable decorated with **ShadingRateKHR** must be declared using the Input Storage Class

- VUID-ShadingRateKHR-ShadingRateKHR-04492
  The variable decorated with **ShadingRateKHR** must be declared as a scalar 32-bit integer value

SMCountNV

Decorating a variable with the **SMCountNV** built-in decoration will make that variable contain the number of SMs on the device.

Valid Usage

- VUID-SMCountNV-SMCountNV-04363
  The variable decorated with **SMCountNV** must be declared using the Input Storage Class

- VUID-SMCountNV-SMCountNV-04364
  The variable decorated with **SMCountNV** must be declared as a scalar 32-bit integer value

SMIDNV

Decorating a variable with the **SMIDNV** built-in decoration will make that variable contain the ID of the SM on which the current shader invocation is running. This variable is in the range \([0, \text{SMCountNV}-1]\).

Valid Usage

- VUID-SMIDNV-SMIDNV-04365
  The variable decorated with **SMIDNV** must be declared using the Input Storage Class

- VUID-SMIDNV-SMIDNV-04366
  The variable decorated with **SMIDNV** must be declared as a scalar 32-bit integer value

SubgroupEqMask

Decorating a variable with the **SubgroupEqMask** builtin decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bit corresponding to the **SubgroupLocalInvocationId** is set in the variable decorated with **SubgroupEqMask**. All other bits are set to zero.

**SubgroupEqMaskKHR** is an alias of **SubgroupEqMask**.
Valid Usage

- VUID-SubgroupEqMask-SubgroupEqMask-04370
  The variable decorated with `SubgroupEqMask` must be declared using the `Input Storage Class`

- VUID-SubgroupEqMask-SubgroupEqMask-04371
  The variable decorated with `SubgroupEqMask` must be declared as a four-component vector of 32-bit integer values

SubgroupEqMask

Decorating a variable with the `SubgroupEqMask` builtin decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bits corresponding to the invocations greater than or equal to `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupEqMask`. All other bits are set to zero.

`SubgroupEqMaskKHR` is an alias of `SubgroupEqMask`.

Valid Usage

- VUID-SubgroupEqMask-SubgroupEqMask-04372
  The variable decorated with `SubgroupEqMask` must be declared using the `Input Storage Class`

- VUID-SubgroupEqMask-SubgroupEqMask-04373
  The variable decorated with `SubgroupEqMask` must be declared as a four-component vector of 32-bit integer values

SubgroupGeMask

Decorating a variable with the `SubgroupGeMask` builtin decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bits corresponding to the invocations greater than or equal to `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupGeMask`. All other bits are set to zero.

`SubgroupGeMaskKHR` is an alias of `SubgroupGeMask`.

Valid Usage

- VUID-SubgroupGeMask-SubgroupGeMask-04374
  The variable decorated with `SubgroupGeMask` must be declared using the `Input Storage Class`

- VUID-SubgroupGeMask-SubgroupGeMask-04375
  The variable decorated with `SubgroupGeMask` must be declared as a four-component vector of 32-bit integer values

SubgroupGtMask

Decorating a variable with the `SubgroupGtMask` builtin decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bits corresponding to the invocations greater than `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupGtMask`. All other bits are set to zero.

`SubgroupGtMaskKHR` is an alias of `SubgroupGtMask`.

Valid Usage

- VUID-SubgroupGtMask-SubgroupGtMask-04376
  The variable decorated with `SubgroupGtMask` must be declared using the `Input Storage Class`

- VUID-SubgroupGtMask-SubgroupGtMask-04377
  The variable decorated with `SubgroupGtMask` must be declared as a four-component vector of 32-bit integer values
**SubgroupLeMask**

Decorating a variable with the `SubgroupLeMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than or equal to `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLeMask`. All other bits are set to zero.

`SubgroupLeMaskKHR` is an alias of `SubgroupLeMask`.

### Valid Usage

- **VUID-SubgroupLeMask-SubgroupLeMask-04376**
  The variable decorated with `SubgroupLeMask` must be declared using the *Input Storage Class*.

- **VUID-SubgroupLeMask-SubgroupLeMask-04377**
  The variable decorated with `SubgroupLeMask` must be declared as a four-component vector of 32-bit integer values.

**SubgroupLtMask**

Decorating a variable with the `SubgroupLtMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLtMask`. All other bits are set to zero.

`SubgroupLtMaskKHR` is an alias of `SubgroupLtMask`.

### Valid Usage

- **VUID-SubgroupLtMask-SubgroupLtMask-04378**
  The variable decorated with `SubgroupLtMask` must be declared using the *Input Storage Class*.

- **VUID-SubgroupLtMask-SubgroupLtMask-04379**
  The variable decorated with `SubgroupLtMask` must be declared as a four-component vector of 32-bit integer values.

**SubgroupLocalInvocationId**

Decorating a variable with the `SubgroupLocalInvocationId` builtin decoration will make that variable contain the index of the invocation within the subgroup. This variable is in range `[0, SubgroupSize-1]`. 
Note

There is no direct relationship between SubgroupLocalInvocationId and LocalInvocationId or LocalInvocationIndex. If the pipeline was created with VK_PIPELINE_SHADER_STAGE_CREATE_REQUIREFULL_SUBGROUPS_BIT_EXT, applications can compute their own local invocation index to serve the same purpose:

\[
\text{index} = \text{SubgroupLocalInvocationId} + \text{SubgroupId} \times \text{SubgroupSize}
\]

If full subgroups are not enabled, some subgroups may be dispatched with inactive invocations that do not correspond to a local workgroup invocation, making the value of index unreliable.

Valid Usage

- VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04380
  The variable decorated with SubgroupLocalInvocationId must be declared using the Input Storage Class

- VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04381
  The variable decorated with SubgroupLocalInvocationId must be declared as a scalar 32-bit integer value

SubgroupSize

Decorating a variable with the SubgroupSize builtin decoration will make that variable contain the implementation-dependent number of invocations in a subgroup. This value must be a power-of-two integer.

If the pipeline was created with the VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT flag set, the SubgroupSize decorated variable will contain the subgroup size for each subgroup that gets dispatched. This value must be between minSubgroupSize and maxSubgroupSize and must be uniform with subgroup scope. The value may vary across a single draw call, and for fragment shaders may vary across a single primitive. In compute dispatches, SubgroupSize must be uniform with command scope.

If the pipeline was created with a chained VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT structure, the SubgroupSize decorated variable will match requiredSubgroupSize.

If the pipeline was not created with the VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT flag set and no VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT structure was chained, the variable decorated with SubgroupSize will match subgroupSize.

The maximum number of invocations that an implementation can support per subgroup is 128.
Valid Usage

- VUID-SubgroupSize-SubgroupSize-04382
  The variable decorated with SubgroupSize must be declared using the Input Storage Class

- VUID-SubgroupSize-SubgroupSize-04383
  The variable decorated with SubgroupSize must be declared as a scalar 32-bit integer value

TaskCountNV

Decorating a variable with the TaskCountNV decoration will make that variable contain the task count. The task count specifies the number of subsequent mesh shader workgroups that get generated upon completion of the task shader.

Valid Usage

- VUID-TaskCountNV-TaskCountNV-04384
  The TaskCountNV decoration must be used only within the TaskNV Execution Model

- VUID-TaskCountNV-TaskCountNV-04385
  The variable decorated with TaskCountNV must be declared using the Output Storage Class

- VUID-TaskCountNV-TaskCountNV-04386
  The variable decorated with TaskCountNV must be declared as a scalar 32-bit integer value

TessCoord

Decorating a variable with the TessCoord built-in decoration will make that variable contain the three-dimensional \((u,v,w)\) barycentric coordinate of the tessellated vertex within the patch. \(u\), \(v\), and \(w\) are in the range \([0,1]\) and vary linearly across the primitive being subdivided. For the tessellation modes of Quads or IsoLines, the third component is always zero.

Valid Usage

- VUID-TessCoord-TessCoord-04387
  The TessCoord decoration must be used only within the TessellationEvaluation Execution Model

- VUID-TessCoord-TessCoord-04388
  The variable decorated with TessCoord must be declared using the Input Storage Class

- VUID-TessCoord-TessCoord-04389
  The variable decorated with TessCoord must be declared as a three-component vector of 32-bit floating-point values

TessLevelOuter

Decorating a variable with the TessLevelOuter built-in decoration will make that variable contain the outer tessellation levels for the current patch.
In tessellation control shaders, the variable decorated with `TessLevelOuter` can be written to, which controls the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and can be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with `TessLevelOuter` can read the values written by the tessellation control shader.

### Valid Usage

- VUID-TessLevelOuter-TessLevelOuter-04390
  The `TessLevelOuter` decoration **must** be used only within the `TessellationControl` or `TessellationEvaluation Execution Model`.

- VUID-TessLevelOuter-TessLevelOuter-04391
  The variable decorated with `TessLevelOuter` within the `TessellationControl Execution Model` **must** be declared using the `Output Storage Class`.

- VUID-TessLevelOuter-TessLevelOuter-04392
  The variable decorated with `TessLevelOuter` within the `TessellationEvaluation Execution Model` **must** be declared using the `Input Storage Class`.

- VUID-TessLevelOuter-TessLevelOuter-04393
  The variable decorated with `TessLevelOuter` **must** be declared as an array of size four, containing 32-bit floating-point values.

### TessLevelInner

Decorating a variable with the `TessLevelInner` built-in decoration will make that variable contain the inner tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with `TessLevelInner` can be written to, which controls the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and can be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with `TessLevelInner` can read the values written by the tessellation control shader.
Valid Usage

- The `TessLevelInner` decoration must be used only within the `TessellationControl` or `TessellationEvaluation Execution Model`.

- The variable decorated with `TessLevelInner` within the `TessellationControl Execution Model` must be declared using the `Output Storage Class`.

- The variable decorated with `TessLevelInner` within the `TessellationEvaluation Execution Model` must be declared using the `Input Storage Class`.

- The variable decorated with `TessLevelInner` must be declared as an array of size two, containing 32-bit floating-point values.

**VertexIndex**

Decorating a variable with the `VertexIndex` built-in decoration will make that variable contain the index of the vertex that is being processed by the current vertex shader invocation. For non-indexed draws, this variable begins at the `firstVertex` parameter to `vkCmdDraw` or the `firstVertex` member of a structure consumed by `vkCmdDrawIndirect` and increments by one for each vertex in the draw. For indexed draws, its value is the content of the index buffer for the vertex plus the `vertexOffset` parameter to `vkCmdDrawIndexed` or the `vertexOffset` member of the structure consumed by `vkCmdDrawIndexedIndirect`.

**Note**

`VertexIndex` starts at the same starting value for each instance.

Valid Usage

- The `VertexIndex` decoration must be used only within the `Vertex Execution Model`.

- The variable decorated with `VertexIndex` must be declared using the `Input Storage Class`.

- The variable decorated with `VertexIndex` must be declared as a scalar 32-bit integer value.

**ViewIndex**

The `ViewIndex` decoration can be applied to a shader input which will be filled with the index of the view that is being processed by the current shader invocation.

If multiview is enabled in the render pass, this value will be one of the bits set in the view mask of the subpass the pipeline is compiled against. If multiview is not enabled in the render pass, this value will be zero.
Valid Usage

- **VUID-ViewIndex-ViewIndex-04401**
  The `ViewIndex` decoration **must not be used within the GLCompute Execution Model**

- **VUID-ViewIndex-ViewIndex-04402**
  The variable decorated with `ViewIndex` **must be declared using the Input Storage Class**

- **VUID-ViewIndex-ViewIndex-04403**
  The variable decorated with `ViewIndex` **must be declared as a scalar 32-bit integer value**

**ViewportIndex**

Decorating a variable with the `ViewportIndex` built-in decoration will make that variable contain the index of the viewport.

In a mesh, vertex, tessellation evaluation, or geometry shader, the variable decorated with `ViewportIndex` can be written to with the viewport index to which the primitive produced by that shader will be directed.

The selected viewport index is used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle.

The last active **pre-rasterization shader stage** (in pipeline order) controls the `ViewportIndex` that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the `ViewportIndex`.

If the last active **pre-rasterization shader stage** shader entry point's interface does not include a variable decorated with `ViewportIndex`, then the first viewport is used. If a **pre-rasterization shader stage** shader entry point's interface includes a variable decorated with `ViewportIndex`, it **must** write the same value to `ViewportIndex` for all output vertices of a given primitive.

In a fragment shader, the variable decorated with `ViewportIndex` contains the viewport index of the primitive that the fragment invocation belongs to.
Valid Usage

- VUID-ViewportIndex-ViewportIndex-04404
  The `ViewportIndex` decoration must be used only within the `MeshNV`, `Vertex`, `TessellationEvaluation`, `Geometry`, or `Fragment Execution Model`

- VUID-ViewportIndex-ViewportIndex-04406
  The variable decorated with `ViewportIndex` within the `MeshNV`, `Vertex`, `TessellationEvaluation`, or `Geometry Execution Model` must be declared using the `Output Storage Class`

- VUID-ViewportIndex-ViewportIndex-04407
  The variable decorated with `ViewportIndex` within the `Fragment Execution Model` must be declared using the `Input Storage Class`

- VUID-ViewportIndex-ViewportIndex-04408
  The variable decorated with `ViewportIndex` must be declared as a scalar 32-bit integer value

**ViewportMaskNV**

Decorating a variable with the `ViewportMaskNV` built-in decoration will make that variable contain the viewport mask.

In a mesh, vertex, tessellation evaluation, or geometry shader, the variable decorated with `ViewportMaskNV` can be written to with the mask of which viewports the primitive produced by that shader will directed.

The `ViewportMaskNV` variable must be an array that has \( \lceil \frac{\text{VkPhysicalDeviceLimits::maxViewports}}{32} \rceil \) elements. When a shader writes to this variable, bit B of element M controls whether a primitive is emitted to viewport \( 32 \times M + B \). The viewports indicated by the mask are used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle that a primitive will be transformed by.

The last active `pre-rasterization shader stage` (in pipeline order) controls the `ViewportMaskNV` that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the `ViewportMaskNV`. When `ViewportMaskNV` is written by the final `pre-rasterization shader stage`, any variable decorated with `ViewportIndex` in the fragment shader will have the index of the viewport that was used in generating that fragment.

If a `pre-rasterization shader stage` shader entry point's interface includes a variable decorated with `ViewportMaskNV`, it must write the same value to `ViewportMaskNV` for all output vertices of a given primitive.
Valid Usage

- VUID-ViewportMaskNV-ViewportMaskNV-04409
  The `ViewportMaskNV` decoration **must** be used only within the `Vertex`, `MeshNV`, `TessellationEvaluation`, or `Geometry Execution Model`

- VUID-ViewportMaskNV-ViewportMaskNV-04410
  The variable decorated with `ViewportMaskNV` **must** be declared using the `Output Storage Class`

- VUID-ViewportMaskNV-ViewportMaskNV-04411
  The variable decorated with `ViewportMaskNV` **must** be declared as an array of 32-bit integer values

**ViewportMaskPerViewNV**

Decorating a variable with the `ViewportMaskPerViewNV` built-in decoration will make that variable contain the mask of viewports primitives are broadcast to, for each view.

The value written to an element of `ViewportMaskPerViewNV` in the last pre-rasterization shader stage is a bitmask indicating which viewports the primitive will be directed to. The primitive will be broadcast to the viewport corresponding to each non-zero bit of the bitmask, and that viewport index is used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle, for each view. The same values **must** be written to all vertices in a given primitive, or else the set of viewports used for that primitive is undefined.

Elements of the array correspond to views in a multiview subpass, and those elements corresponding to views in the view mask of the subpass the shader is compiled against will be used as the viewport mask value for those views. `ViewportMaskPerViewNV` output in an earlier pre-rasterization shader stage is not available as an input in the subsequent pre-rasterization shader stage.

Although `ViewportMaskNV` is an array, `ViewportMaskPerViewNV` is not a two-dimensional array. Instead, `ViewportMaskPerViewNV` is limited to 32 viewports.
Valid Usage

- VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04412
  The `ViewportMaskPerViewNV` decoration must be used only within the Vertex, MeshNV, TessellationControl, TessellationEvaluation, or Geometry Execution Model.

- VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04413
  The variable decorated with `ViewportMaskPerViewNV` must be declared using the Output Storage Class.

- VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04414
  The variable decorated with `ViewportMaskPerViewNV` must be declared as an array of 32-bit integer values.

- VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04415
  The array decorated with `ViewportMaskPerViewNV` must be a size less than or equal to 32.

- VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04416
  The array decorated with `ViewportMaskPerViewNV` must be a size greater than the maximum view in the subpass's view mask.

- VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04417
  The array variable decorated with `ViewportMaskPerViewNV` must only be indexed by a constant or specialization constant.

WarpsPerSMNV

Decorating a variable with the `WarpsPerSMNV` built-in decoration will make that variable contain the maximum number of warps executing on a SM.

Valid Usage

- VUID-WarpsPerSMNV-WarpsPerSMNV-04418
  The variable decorated with `WarpsPerSMNV` must be declared using the Input Storage Class.

- VUID-WarpsPerSMNV-WarpsPerSMNV-04419
  The variable decorated with `WarpsPerSMNV` must be declared as a scalar 32-bit integer value.

WarpIDNV

Decorating a variable with the `WarpIDNV` built-in decoration will make that variable contain the ID of the warp on a SM on which the current shader invocation is running. This variable is in the range [0, `WarpsPerSMNV`-1].
Valid Usage

- VUID-WarpIDNV-WarpIDNV-04420
  The variable decorated with WarpIDNV must be declared using the Input Storage Class

- VUID-WarpIDNV-WarpIDNV-04421
  The variable decorated with WarpIDNV must be declared as a scalar 32-bit integer value

WorkgroupId

Decorating a variable with the WorkgroupId built-in decoration will make that variable contain the global workgroup that the current invocation is a member of. Each component ranges from a base value to a base + count value, based on the parameters passed into the dispatching commands.

Valid Usage

- VUID-WorkgroupId-WorkgroupId-04422
  The WorkgroupId decoration must be used only within the GLCompute, MeshNV, or TaskNV Execution Model

- VUID-WorkgroupId-WorkgroupId-04423
  The variable decorated with WorkgroupId must be declared using the Input Storage Class

- VUID-WorkgroupId-WorkgroupId-04424
  The variable decorated with WorkgroupId must be declared as a three-component vector of 32-bit integer values

WorkgroupSize

Decorating an object with the WorkgroupSize built-in decoration will make that object contain the dimensions of a local workgroup. If an object is decorated with the WorkgroupSize decoration, this takes precedence over any LocalSize execution mode.

Valid Usage

- VUID-WorkgroupSize-WorkgroupSize-04425
  The WorkgroupSize decoration must be used only within the GLCompute, MeshNV, or TaskNV Execution Model

- VUID-WorkgroupSize-WorkgroupSize-04426
  The variable decorated with WorkgroupSize must be a specialization constant or a constant

- VUID-WorkgroupSize-WorkgroupSize-04427
  The variable decorated with WorkgroupSize must be declared as a three-component vector of 32-bit integer values

WorldRayDirectionKHR

A variable decorated with the WorldRayDirectionKHR decoration will specify the direction of the
ray being processed, in world space. The value is given by the parameter passed into \texttt{OpTraceRayKHR}.

**Valid Usage**

- **VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04428**
  The \texttt{WorldRayDirectionKHR} decoration \textbf{must} be used only within the \texttt{IntersectionKHR}, \texttt{AnyHitKHR}, \texttt{ClosestHitKHR}, or \texttt{MissKHR} Execution Model

- **VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04429**
  The variable decorated with \texttt{WorldRayDirectionKHR} \textbf{must} be declared using the \texttt{Input Storage Class}

- **VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04430**
  The variable decorated with \texttt{WorldRayDirectionKHR} \textbf{must} be declared as a three-component vector of 32-bit floating-point values

**WorldRayOriginKHR**

A variable decorated with the \texttt{WorldRayOriginKHR} decoration will specify the origin of the ray being processed, in world space. The value is given by the parameter passed into \texttt{OpTraceRayKHR}.

**Valid Usage**

- **VUID-WorldRayOriginKHR-WorldRayOriginKHR-04431**
  The \texttt{WorldRayOriginKHR} decoration \textbf{must} be used only within the \texttt{IntersectionKHR}, \texttt{AnyHitKHR}, \texttt{ClosestHitKHR}, or \texttt{MissKHR} Execution Model

- **VUID-WorldRayOriginKHR-WorldRayOriginKHR-04432**
  The variable decorated with \texttt{WorldRayOriginKHR} \textbf{must} be declared using the \texttt{Input Storage Class}

- **VUID-WorldRayOriginKHR-WorldRayOriginKHR-04433**
  The variable decorated with \texttt{WorldRayOriginKHR} \textbf{must} be declared as a three-component vector of 32-bit floating-point values

**WorldToObjectKHR**

A variable decorated with the \texttt{WorldToObjectKHR} decoration will contain the current world-to-object transformation matrix, which is determined by the instance of the current intersection.
Valid Usage

- VUID-WorldToObjectKHR-WorldToObjectKHR-04434
  The `WorldToObjectKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR Execution Model`

- VUID-WorldToObjectKHR-WorldToObjectKHR-04435
  The variable decorated with `WorldToObjectKHR` must be declared using the `Input Storage Class`

- VUID-WorldToObjectKHR-WorldToObjectKHR-04436
  The variable decorated with `WorldToObjectKHR` must be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values
Chapter 16. Image Operations

16.1. Image Operations Overview

Vulkan Image Operations are operations performed by those SPIR-V Image Instructions which take an `OpTypeImage` (representing a `VkImageView`) or `OpTypeSampledImage` (representing a (`VkImageView`, `VkSampler`) pair). Read, write, and atomic operations also take texel coordinates as operands, and return a value based on a neighborhood of texture elements (texels) within the image. Query operations return properties of the bound image or of the lookup itself. The “Depth” operand of `OpTypeImage` is ignored.

**Note**

Texel is a term which is a combination of the words texture and element. Early interactive computer graphics supported texture operations on textures, a small subset of the image operations on images described here. The discrete samples remain essentially equivalent, however, so we retain the historical term texel to refer to them.

Image Operations include the functionality of the following SPIR-V Image Instructions:

- `OpImageSample*` and `OpImageSparseSample*` read one or more neighboring texels of the image, and filter the texel values based on the state of the sampler.
  - Instructions with `ImplicitLod` in the name determine the LOD used in the sampling operation based on the coordinates used in neighboring fragments.
  - Instructions with `ExplicitLod` in the name determine the LOD used in the sampling operation based on additional coordinates.
  - Instructions with `Proj` in the name apply homogeneous projection to the coordinates.
- `OpImageFetch` and `OpImageSparseFetch` return a single texel of the image. No sampler is used.
- `OpImage*Gather` and `OpImageSparse*Gather` read neighboring texels and return a single component of each.
- `OpImageRead` (and `OpImageSparseRead`) and `OpImageWrite` read and write, respectively, a texel in the image. No sampler is used.
- `OpImageSampleFootprintNV` identifies and returns information about the set of texels in the image that would be accessed by an equivalent `OpImageSample*` instruction.
- Instructions with `Dref` in the name apply depth comparison on the texel values.
- Instructions with `Sparse` in the name additionally return a sparse residency code.
- `OpImageQueryLod` returns the lod parameters that would be used in a sample operation. The actual operation is not performed.
16.1.1. Texel Coordinate Systems

Images are addressed by *texel coordinates*. There are three *texel coordinate systems*:

- normalized texel coordinates [0.0, 1.0]
- unnormalized texel coordinates [0.0, width / height / depth]
- integer texel coordinates [0, width / height / depth]

SPIR-V *OpImageFetch, OpImageSparseFetch, OpImageRead, OpImageSparseRead*, and *OpImageWrite* instructions use integer texel coordinates. Other image instructions can use either normalized or unnormalized texel coordinates (selected by the *unnormalizedCoordinates* state of the sampler used in the instruction), but there are *limitations* on what operations, image state, and sampler state is supported. Normalized coordinates are logically *converted* to unnormalized as part of image operations, and certain steps are only performed on normalized coordinates. The array layer coordinate is always treated as unnormalized even when other coordinates are normalized.

Normalized texel coordinates are referred to as *(s,t,r,q,a)*, with the coordinates having the following meanings:

- *s*: Coordinate in the first dimension of an image.
- *t*: Coordinate in the second dimension of an image.
- *r*: Coordinate in the third dimension of an image.
  - *(s,t,r)* are interpreted as a direction vector for Cube images.
- *q*: Fourth coordinate, for homogeneous (projective) coordinates.
- *a*: Coordinate for array layer.

The coordinates are extracted from the SPIR-V operand based on the dimensionality of the image variable and type of instruction. For *Proj* instructions, the components are in order *(s, [t,] [r,] q)*, with *t* and *r* being conditionally present based on the *Dim* of the image. For non-*Proj* instructions, the coordinates are *(s [,t] [,r] [,a])* with *t* and *r* being conditionally present based on the *Dim* of the image and *a* being conditionally present based on the *Arrayed* property of the image. Projective image instructions are not supported on *Arrayed* images.

Unnormalized texel coordinates are referred to as *(u,v,w,a)*, with the coordinates having the following meanings:

- *u*: Coordinate in the first dimension of an image.
- *v*: Coordinate in the second dimension of an image.
- *w*: Coordinate in the third dimension of an image.
- *a*: Coordinate for array layer.

Only the *u* and *v* coordinates are directly extracted from the SPIR-V operand, because only 1D and 2D (non-*Arrayed*) dimensionalities support unnormalized coordinates. The components are in order *(u [,v])* with *v* being conditionally present when the dimensionality is 2D. When normalized coordinates are converted to unnormalized coordinates, all four coordinates are used.
Integer texel coordinates are referred to as \((i,j,k,l,n)\), with the coordinates having the following meanings:

- \(i\): Coordinate in the first dimension of an image.
- \(j\): Coordinate in the second dimension of an image.
- \(k\): Coordinate in the third dimension of an image.
- \(l\): Coordinate for array layer.
- \(n\): Index of the sample within the texel.

They are extracted from the SPIR-V operand in order \((i\ [j\ [k\ [l\ [n]\)])\), with \(j\) and \(k\) conditionally present based on the \text{Dim} of the image, and \(l\) conditionally present based on the \text{Arrayed} property of the image. \(n\) is conditionally present and is taken from the \text{Sample} image operand.

For all coordinate types, unused coordinates are assigned a value of zero.

Figure 3. Texel Coordinate Systems, Linear Filtering

The Texel Coordinate Systems - For the example shown of an \(8\times4\) texel two dimensional image.

- Normalized texel coordinates:
  - The \(s\) coordinate goes from 0.0 to 1.0.
  - The \(t\) coordinate goes from 0.0 to 1.0.

- Unnormalized texel coordinates:
  - The \(u\) coordinate within the range 0.0 to 8.0 is within the image, otherwise it is outside the image.
  - The \(v\) coordinate within the range 0.0 to 4.0 is within the image, otherwise it is outside the image.

- Integer texel coordinates:
The i coordinate within the range 0 to 7 addresses texels within the image, otherwise it is outside the image.

The j coordinate within the range 0 to 3 addresses texels within the image, otherwise it is outside the image.

- Also shown for linear filtering:
  - Given the unnormalized coordinates \((u,v)\), the four texels selected are \(i_0 j_0, i_1 j_0, i_0 j_1, \) and \(i_1 j_1\).
  - The fractions \(\alpha\) and \(\beta\).
  - Given the offset \(\Delta_i\) and \(\Delta_j\), the four texels selected by the offset are \(i_0 j'_0, i_1 j'_0, i_0 j'_1, \) and \(i_1 j'_1\).

Note
For formats with reduced-resolution channels, \(\Delta_i\) and \(\Delta_j\) are relative to the resolution of the highest-resolution channel, and therefore may be divided by two relative to the unnormalized coordinate space of the lower-resolution channels.

![Figure 4. Texel Coordinate Systems, Nearest Filtering](image)

The Texel Coordinate Systems - For the example shown of an 8×4 texel two dimensional image.

- Texel coordinates as above. Also shown for nearest filtering:
  - Given the unnormalized coordinates \((u,v)\), the texel selected is \(ij\).
  - Given the offset \(\Delta_i\) and \(\Delta_j\), the texel selected by the offset is \(ij'\).

For corner-sampled images, the texel samples are located at the grid intersections instead of the texel centers.
16.2. Conversion Formulas

16.2.1. RGB to Shared Exponent Conversion

An RGB color (red, green, blue) is transformed to a shared exponent color \((\text{red}_{\text{shared}}, \text{green}_{\text{shared}}, \text{blue}_{\text{shared}}, \text{exp}_{\text{shared}})\) as follows:

First, the components (red, green, blue) are clamped to \((\text{red}_{\text{clamped}}, \text{green}_{\text{clamped}}, \text{blue}_{\text{clamped}})\) as:

\[
\text{red}_{\text{clamped}} = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{red}))
\]

\[
\text{green}_{\text{clamped}} = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{green}))
\]

\[
\text{blue}_{\text{clamped}} = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{blue}))
\]

where:

\[
\begin{align*}
N &= 9 \\
B &= 15 \\
E_{\text{max}} &= 31 \\
\text{sharedexp}_{\text{max}} &= \left(\frac{2^N - 1}{2^N}\right) \times 2^{\left(E_{\text{max}} - B\right)}
\end{align*}
\]

### Note

NaN, if supported, is handled as in IEEE 754-2008 `minNum()` and `maxNum()`. This results in any NaN being mapped to zero.
The largest clamped component, \( \text{max}_{\text{clamped}} \) is determined:

\[
\text{max}_{\text{clamped}} = \max(\text{red}_{\text{clamped}}, \text{green}_{\text{clamped}}, \text{blue}_{\text{clamped}})
\]

A preliminary shared exponent \( \exp' \) is computed:

\[
\exp' = \begin{cases} 
\log_2(\text{max}_{\text{clamped}}) + (B + 1) & \text{for } \text{max}_{\text{clamped}} > 2^{-(B + 1)} \\
0 & \text{for } \text{max}_{\text{clamped}} \leq 2^{-(B + 1)} 
\end{cases}
\]

The shared exponent \( \exp_{\text{shared}} \) is computed:

\[
\text{max}_{\text{shared}} = \frac{\text{max}_{\text{clamped}}}{2^{(\exp' - B - N)}} + \frac{1}{2}
\]

\[
\exp_{\text{shared}} = \begin{cases} 
\exp' & \text{for } 0 \leq \text{max}_{\text{shared}} < 2^N \\
\exp' + 1 & \text{for } \text{max}_{\text{shared}} = 2^N 
\end{cases}
\]

Finally, three integer values in the range 0 to \( 2^N \) are computed:

\[
\text{red}_{\text{shared}} = \left\lfloor \frac{\text{red}_{\text{clamped}}}{2^{(\exp_{\text{shared}} - B - N)}} + \frac{1}{2} \right\rfloor
\]

\[
\text{green}_{\text{shared}} = \left\lfloor \frac{\text{green}_{\text{clamped}}}{2^{(\exp_{\text{shared}} - B - N)}} + \frac{1}{2} \right\rfloor
\]

\[
\text{blue}_{\text{shared}} = \left\lfloor \frac{\text{blue}_{\text{clamped}}}{2^{(\exp_{\text{shared}} - B - N)}} + \frac{1}{2} \right\rfloor
\]

### 16.2.2. Shared Exponent to RGB

A shared exponent color \((\text{red}_{\text{shared}}, \text{green}_{\text{shared}}, \text{blue}_{\text{shared}}, \exp_{\text{shared}})\) is transformed to an RGB color \((\text{red}, \text{green}, \text{blue})\) as follows:

\[
\text{red} = \text{red}_{\text{shared}} \times 2^{(\exp_{\text{shared}} - B - N)}
\]

\[
\text{green} = \text{green}_{\text{shared}} \times 2^{(\exp_{\text{shared}} - B - N)}
\]

\[
\text{blue} = \text{blue}_{\text{shared}} \times 2^{(\exp_{\text{shared}} - B - N)}
\]

where:

\[
N = 9 \text{ (number of mantissa bits per component)}
\]

\[
B = 15 \text{ (exponent bias)}
\]
16.3. Texel Input Operations

*Texel input instructions* are SPIR-V image instructions that read from an image. *Texel input operations* are a set of steps that are performed on state, coordinates, and texel values while processing a texel input instruction, and which are common to some or all texel input instructions. They include the following steps, which are performed in the listed order:

- **Validation operations**
  - Instruction/Sampler/Image validation
  - Coordinate validation
  - Sparse validation
  - Layout validation
- **Format conversion**
- **Texel replacement**
- **Depth comparison**
- **Conversion to RGBA**
- **Component swizzle**
- **Chroma reconstruction**
- **Y′C_bC_r conversion**

For texel input instructions involving multiple texels (for sampling or gathering), these steps are applied for each texel that is used in the instruction. Depending on the type of image instruction, other steps are conditionally performed between these steps or involving multiple coordinate or texel values.

If **Chroma Reconstruction** is implicit, **Texel Filtering** instead takes place during chroma reconstruction, before **sampler Y′C_bC_r conversion** occurs.

### 16.3.1. Texel Input Validation Operations

*Texel input validation operations* inspect instruction/image/sampler state or coordinates, and in certain circumstances cause the texel value to be replaced or become undefined. There are a series of validations that the texel undergoes.

**Instruction/Sampler/Image View Validation**

There are a number of cases where a SPIR-V instruction *can* mismatch with the sampler, the image view, or both, and a number of further cases where the sampler *can* mismatch with the image view. In such cases the value of the texel returned is undefined.

These cases include:

- The sampler **borderColor** is an integer type and the image view **format** is not one of the **VkFormat** integer types or a stencil component of a depth/stencil format.
• The sampler `borderColor` is a float type and the image view `format` is not one of the `VkFormat` float types or a depth component of a depth/stencil format.

• The sampler `borderColor` is one of the opaque black colors (`VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK` or `VK_BORDER_COLOR_INT_OPAQUE_BLACK`) and the image view `VkComponentSwizzle` for any of the `VkComponentMapping` components is not the identity swizzle.

• The sampler `borderColor` is a custom color (`VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`) and the supplied `VkSamplerCustomBorderColorCreateInfoEXT::customBorderColor` is outside the bounds of the values representable in the image view's `format`.

• The `VkImageLayout` of any subresource in the image view does not match that specified in `VkDescriptorImageInfo::imageLayout` used to write the image descriptor.

• The SPIR-V Image Format is not compatible with the image view's `format`.

• The sampler `unnormalizedCoordinates` is `VK_TRUE` and any of the limitations of unnormalized coordinates are violated.

• The sampler was created with `flags` containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` and the image was not created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

• The sampler was not created with `flags` containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` and the image was created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

• The sampler was created with `flags` containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` and is used with a function that is not `OpImageSampleImplicitLod` or `OpImageSampleExplicitLod`, or is used with operands `Offset` or `ConstOffsets`.

• The SPIR-V instruction is one of the `OpImage*Dref*` instructions and the sampler `compareEnable` is `VK_FALSE`.

• The SPIR-V instruction is not one of the `OpImage*Dref*` instructions and the sampler `compareEnable` is `VK_TRUE`.

• The SPIR-V instruction is one of the `OpImage*Dref*` instructions and the image view `format` is not one of the depth/stencil formats with a depth component, or the image view aspect is not `VK_IMAGE_ASPECT_DEPTH_BIT`.

• The SPIR-V instruction's image variable's properties are not compatible with the image view:
  - Rules for `viewType`:
    - `VK_IMAGE_VIEW_TYPE_1D` must have `Dim = 1D, Arrayed = 0, MS = 0`.
    - `VK_IMAGE_VIEW_TYPE_2D` must have `Dim = 2D, Arrayed = 0`.
    - `VK_IMAGE_VIEW_TYPE_3D` must have `Dim = 3D, Arrayed = 0, MS = 0`.
    - `VK_IMAGE_VIEW_TYPE_CUBE` must have `Dim = Cube, Arrayed = 0, MS = 0`.
    - `VK_IMAGE_VIEW_TYPE_1D_ARRAY` must have `Dim = 1D, Arrayed = 1, MS = 0`.
    - `VK_IMAGE_VIEW_TYPE_2D_ARRAY` must have `Dim = 2D, Arrayed = 1`.
    - `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` must have `Dim = Cube, Arrayed = 1, MS = 0`.
  - If the image was created with `VkImageCreateInfo::samples` equal to `VK_SAMPLE_COUNT_1_BIT`, the instruction must have `MS = 0`.
If the image was created with \texttt{VkImageCreateInfo::samples} not equal to \texttt{VK_SAMPLE_COUNT_1_BIT}, the instruction \textbf{must} have \texttt{MS} = 1.

If the \texttt{Sampled Type} of the \texttt{OpTypeImage} does not match the numeric format of the image, as shown in the \textit{SPIR-V Sampled Type} column of the \textit{Interpretation of Numeric Format} table.

If the \texttt{signedness of any read or sample operation} does not match the signedness of the image’s format.

- If the image was created with \texttt{VkImageCreateInfo::flags} containing \texttt{VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV}, the sampler addressing modes \textbf{must} only use a \texttt{VkSamplerAddressMode} of \texttt{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE}.

- The \texttt{SPIR-V} instruction is \texttt{OpImageSampleFootprintNV} with \texttt{Dim} = 2D and \texttt{addressModeU} or \texttt{addressModeV} in the sampler is not \texttt{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE}.

- The \texttt{SPIR-V} instruction is \texttt{OpImageSampleFootprintNV} with \texttt{Dim} = 3D and \texttt{addressModeU}, \texttt{addressModeV}, or \texttt{addressModeW} in the sampler is not \texttt{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE}.

- The sampler was created with a specified \texttt{VkSamplerCustomBorderColorCreateInfoEXT::format} which does not match the \texttt{VkFormat} of the image view(s) it is sampling.

- The sampler is sampling an image view of \texttt{VK_FORMAT_B4G4R4A4_UNORM_PACK16}, \texttt{VK_FORMAT_B5G6R5_UNORM_PACK16}, or \texttt{VK_FORMAT_B5G5R5A1_UNORM_PACK16} format without a specified \texttt{VkSamplerCustomBorderColorCreateInfoEXT::format}.

Only \texttt{OpImageSample*} and \texttt{OpImageSparseSample*} \textbf{can} be used with a sampler that enables \texttt{sampler Y’C_bC_R conversion}.

\texttt{OpImageFetch}, \texttt{OpImageSparseFetch}, \texttt{OpImage*Gather}, and \texttt{OpImageSparse*Gather} \textbf{must} not be used with a sampler that enables \texttt{sampler Y’C_bC_R conversion}.

The \texttt{ConstOffset} and \texttt{Offset} operands \textbf{must} not be used with a sampler that enables \texttt{sampler Y’C_bC_R conversion}.

\textbf{Integer Texel Coordinate Validation}

Integer texel coordinates are validated against the size of the image level, and the number of layers and number of samples in the image. For \texttt{SPIR-V} instructions that use integer texel coordinates, this is performed directly on the integer coordinates. For instructions that use normalized or unnormalized texel coordinates, this is performed on the coordinates that result after \texttt{conversion} to integer texel coordinates.

If the integer texel coordinates do not satisfy all of the conditions

\[ 0 \leq i < w_s \]

\[ 0 \leq j < h_s \]

\[ 0 \leq k < d_s \]
\[ 0 \leq l < \text{layers} \]

\[ 0 \leq n < \text{samples} \]

where:

\[ w_s = \text{width of the image level} \]

\[ h_s = \text{height of the image level} \]

\[ d_s = \text{depth of the image level} \]

\[ \text{layers} = \text{number of layers in the image} \]

\[ \text{samples} = \text{number of samples per texel in the image} \]

then the texel fails integer texel coordinate validation.

There are four cases to consider:

1. **Valid Texel Coordinates**
   
   ◦ If the texel coordinates pass validation (that is, the coordinates lie within the image), then the texel value comes from the value in image memory.

2. **Border Texel**
   
   ◦ If the texel coordinates fail validation, and
   ◦ If the read is the result of an image sample instruction or image gather instruction, and
   ◦ If the image is not a cube image,
   then the texel is a border texel and *texel replacement* is performed.

3. **Invalid Texel**
   
   ◦ If the texel coordinates fail validation, and
   ◦ If the read is the result of an image fetch instruction, image read instruction, or atomic instruction,
   then the texel is an invalid texel and *texel replacement* is performed.

4. **Cube Map Edge or Corner**
Otherwise the texel coordinates lie beyond the edges or corners of the selected cube map face, and Cube map edge handling is performed.

Cube Map Edge Handling

If the texel coordinates lie beyond the edges or corners of the selected cube map face, the following steps are performed. Note that this does not occur when using VK_FILTER_NEAREST filtering within a mip level, since VK_FILTER_NEAREST is treated as using VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

- Cube Map Edge Texel
  - If the texel lies beyond the selected cube map face in either only \(i\) or only \(j\), then the coordinates \((i, j)\) and the array layer \(l\) are transformed to select the adjacent texel from the appropriate neighboring face.

- Cube Map Corner Texel
  - If the texel lies beyond the selected cube map face in both \(i\) and \(j\), then there is no unique neighboring face from which to read that texel. The texel should be replaced by the average of the three values of the adjacent texels in each incident face. However, implementations may replace the cube map corner texel by other methods. The methods are subject to the constraint that for linear filtering if the three available texels have the same value, the resulting filtered texel must have that value, and for cubic filtering if the twelve available samples have the same value, the resulting filtered texel must have that value.

Sparse Validation

If the texel reads from an unbound region of a sparse image, the texel is a sparse unbound texel, and processing continues with texel replacement.

Layout Validation

If all planes of a disjoint multi-planar image are not in the same image layout, the image must not be sampled with sampler \(Y'CbCr\) conversion enabled.

16.3.2. Format Conversion

Texels undergo a format conversion from the VkFormat of the image view to a vector of either floating point or signed or unsigned integer components, with the number of components based on the number of components present in the format.

- Color formats have one, two, three, or four components, according to the format.
- Depth/stencil formats are one component. The depth or stencil component is selected by the aspectMask of the image view.

Each component is converted based on its type and size (as defined in the Format Definition section for each VkFormat), using the appropriate equations in 16-Bit Floating-Point Numbers, Unsigned 11-Bit Floating-Point Numbers, Unsigned 10-Bit Floating-Point Numbers, Fixed-Point Data Conversion, and Shared Exponent to RGB. Signed integer components smaller than 32 bits are sign-extended.
If the image view format is sRGB, the color components are first converted as if they are UNORM, and then sRGB to linear conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the Khronos Data Format Specification. The A component, if present, is unchanged.

If the image view format is block-compressed, then the texel value is first decoded, then converted based on the type and number of components defined by the compressed format.

16.3.3. Texel Replacement

A texel is replaced if it is one (and only one) of:

- a border texel,
- an invalid texel, or
- a sparse unbound texel.

Border texels are replaced with a value based on the image format and the `borderColor` of the sampler. The border color is:

<table>
<thead>
<tr>
<th>Sampler Border Color</th>
<th>Corresponding Border Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 0.0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 1.0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE</td>
<td>([B_r, B_g, B_b, B_a] = [1.0, 1.0, 1.0, 1.0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_TRANSPARENT_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0, 0, 0, 0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_OPAQUE_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0, 0, 0, 1])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_OPAQUE_WHITE</td>
<td>([B_r, B_g, B_b, B_a] = [1, 1, 1, 1])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_CUSTOM_EXT</td>
<td>([B_r, B_g, B_b, B_a] = [U_r, U_g, U_b, U_a])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_CUSTOM_EXT</td>
<td>([B_r, B_g, B_b, B_a] = [U_r, U_g, U_b, U_a])</td>
</tr>
</tbody>
</table>

The custom border color (U) **may** be rounded by implementations prior to texel replacement, but the error introduced by such a rounding **must** not exceed one ULP of the image's format.

**Note**

The names `VK_BORDER_COLOR_*_TRANSPARENT_BLACK`, `VK_BORDER_COLOR_*_OPAQUE_BLACK`, and `VK_BORDER_COLOR_*_OPAQUE_WHITE` are meant to describe which components are zeros and ones in the vocabulary of compositing, and are not meant to imply that the numerical value of `VK_BORDER_COLOR_INT_OPAQUE_WHITE` is a saturating value for integers.

This is substituted for the texel value by replacing the number of components in the image format.

<table>
<thead>
<tr>
<th>Table 24. Border Texel Components After Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Texel Aspect or Format</td>
</tr>
<tr>
<td>-------------------------------</td>
</tr>
<tr>
<td>Depth aspect</td>
</tr>
<tr>
<td>Stencil aspect</td>
</tr>
<tr>
<td>One component color format</td>
</tr>
<tr>
<td>Two component color format</td>
</tr>
<tr>
<td>Three component color format</td>
</tr>
<tr>
<td>Four component color format</td>
</tr>
</tbody>
</table>

The value returned by a read of an invalid texel is undefined, unless that read operation is from a buffer resource and the `robustBufferAccess` feature is enabled. In that case, an invalid texel is replaced as described by the `robustBufferAccess` feature. If the access is to an image resource and the \(x\), \(y\), \(z\), or layer coordinate validation fails and `robustImageAccess` is enabled then zero must be returned for the \(R\), \(G\), and \(B\) channels, if present. Either zero or one must be returned for the \(A\) channel, if present. If `robustImageAccess2` is enabled, zero values must be returned. If only the sample index was invalid, the values returned are undefined.

Additionally, if `robustImageAccess` is enabled, but `robustImageAccess2` is not, any invalid texels may be expanded to four components prior to texel replacement. This means that components not present in the image format may be replaced with 0 or may undergo conversion to RGBA as normal.

Loads from a null descriptor return a four component color value of all zeros. However, for storage images and storage texel buffers using an explicit SPIR-V Image Format, loads from a null descriptor may return an alpha value of 1 (float or integer, depending on format) if the format does not include alpha.

If the `VkPhysicalDeviceSparseProperties::residencyNonResidentStrict` property is `VK_TRUE`, a sparse unbound texel is replaced with 0 or 0.0 values for integer and floating-point components of the image format, respectively.

If `residencyNonResidentStrict` is `VK_FALSE`, the value of the sparse unbound texel is undefined.

### 16.3.4. Depth Compare Operation

If the image view has a depth/stencil format, the depth component is selected by the `aspectMask`, and the operation is a `Dref` instruction, a depth comparison is performed. The value of the result \(D\) is 1.0 if the result of the compare operation is true, and 0.0 otherwise. The compare operation is selected by the `compareOp` member of the sampler.

\[
D = \begin{cases} 1.0 & \text{if } D_{\text{ref}} \leq D_{\text{tex}} \text{ for LEQUAL} \\ \geq & \text{for GEQUAL} \\ < & \text{for LESS} \\ > & \text{for GREATER} \\ = & \text{for EQUAL} \\ \neq & \text{for NOTEQUAL} \\ \text{true} & \text{for ALWAYS} \\ \text{false} & \text{for NEVER} \\
0.0 & \text{otherwise} 
\end{cases}
\]
where $D_{\text{tex}}$ is the texel depth value and $D_{\text{ref}}$ is the reference value from the SPIR-V operand. If the image being sampled has a fixed-point format then the reference value is clamped to $[0, 1]$ before the comparison operation.

### 16.3.5. Conversion to RGBA

The texel is expanded from one, two, or three components to four components based on the image base color:

*Table 25. Texel Color After Conversion To RGBA*

<table>
<thead>
<tr>
<th>Texel Aspect or Format</th>
<th>RGBA Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth aspect</td>
<td>$[\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{Color}_a] = [D,0,0,\text{one}]$</td>
</tr>
<tr>
<td>Stencil aspect</td>
<td>$[\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{Color}_a] = [S,0,0,\text{one}]$</td>
</tr>
<tr>
<td>One component color format</td>
<td>$[\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{Color}_a] = [\text{Color}_r,0,0,\text{one}]$</td>
</tr>
<tr>
<td>Two component color format</td>
<td>$[\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{Color}_a] = [\text{Color}_r,\text{Color}_g,0,\text{one}]$</td>
</tr>
<tr>
<td>Three component color format</td>
<td>$[\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{Color}_a] = [\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{one}]$</td>
</tr>
<tr>
<td>Four component color format</td>
<td>$[\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{Color}_a] = [\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{Color}_a]$</td>
</tr>
</tbody>
</table>

where one $= 1.0f$ for floating-point formats and depth aspects, and one $= 1$ for integer formats and stencil aspects.

### 16.3.6. Component Swizzle

All texel input instructions apply a *swizzle* based on:

- the `VkComponentSwizzle` enums in the `components` member of the `VkImageViewCreateInfo` structure for the image being read if sampler Y’C_bC_r conversion is not enabled, and
- the `VkComponentSwizzle` enums in the `components` member of the `VkSamplerYcbcrConversionCreateInfo` structure for the sampler Y’C_bC_r conversion if sampler Y’C_bC_r conversion is enabled.

The swizzle can rearrange the components of the texel, or substitute zero or one for any components. It is defined as follows for each color component:

\[
\text{Color}'_{\text{component}} = \begin{cases} 
\text{Color}_r & \text{for RED swizzle} \\
\text{Color}_g & \text{for GREEN swizzle} \\
\text{Color}_b & \text{for BLUE swizzle} \\
\text{Color}_a & \text{for ALPHA swizzle} \\
0 & \text{for ZERO swizzle} \\
\text{one} & \text{for ONE swizzle} \\
\text{identity} & \text{for IDENTITY swizzle}
\end{cases}
\]

where:
If the border color is one of the `VK_BORDER_COLOR_*_OPAQUE_BLACK` enums and the `VkComponentSwizzle` is not the `identity swizzle` for all components, the value of the texel after swizzle is undefined.

### 16.3.7. Sparse Residency

`OpImageSparse*` instructions return a structure which includes a *residency code* indicating whether any texels accessed by the instruction are sparse unbound texels. This code can be interpreted by the `OpImageSparseTexelsResident` instruction which converts the residency code to a boolean value.

### 16.3.8. Chroma Reconstruction

In some color models, the color representation is defined in terms of monochromatic light intensity (often called “luma”) and color differences relative to this intensity, often called “chroma”. It is common for color models other than RGB to represent the chroma channels at lower spatial resolution than the luma channel. This approach is used to take advantage of the eye’s lower spatial sensitivity to color compared with its sensitivity to brightness. Less commonly, the same approach is used with additive color, since the green channel dominates the eye’s sensitivity to light intensity and the spatial sensitivity to color introduced by red and blue is lower.

Lower-resolution channels are “downsampled” by resizing them to a lower spatial resolution than the channel representing luminance. This process is also commonly known as “chroma subsampling”. There is one luminance sample in each texture texel, but each chrominance sample may be shared among several texels in one or both texture dimensions.

- “.444” formats do not spatially downsample chroma values compared with luma: there are unique chroma samples for each texel.
- “.422” formats have downsampling in the x dimension (corresponding to u or s coordinates): they are sampled at half the resolution of luma in that dimension.
- “.420” formats have downsampling in the x dimension (corresponding to u or s coordinates) and the y dimension (corresponding to v or t coordinates): they are sampled at half the resolution of luma in both dimensions.

The process of reconstructing a full color value for texture access involves accessing both chroma and luma values at the same location. To generate the color accurately, the values of the lower-resolution channels at the location of the luma samples must be reconstructed from the lower-resolution sample locations, an operation known here as “chroma reconstruction” irrespective of the actual color model.

The location of the chroma samples relative to the luma coordinates is determined by the `xChromaOffset` and `yChromaOffset` members of the `VkSamplerYcbcrConversionCreateInfo` structure.

\[
\begin{align*}
\text{one} &= \begin{cases} 
1.0f & \text{for floating point components} \\
1 & \text{for integer components} 
\end{cases} \\
\text{identity} &= \begin{cases} 
\text{Color}_r & \text{for component } r \\
\text{Color}_g & \text{for component } g \\
\text{Color}_b & \text{for component } b \\
\text{Color}_a & \text{for component } a 
\end{cases}
\end{align*}
\]
used to create the sampler Y’CbCr conversion.

The following diagrams show the relationship between unnormalized \((u, v)\) coordinates and \((i, j)\) integer texel positions in the luma channel (shown in black, with circles showing integer sample positions) and the texel coordinates of reduced-resolution chroma channels, shown as crosses in red.

\[ \text{Note} \]

If the chroma values are reconstructed at the locations of the luma samples by means of interpolation, chroma samples from outside the image bounds are needed; these are determined according to \text{Wrapping Operation}. These diagrams represent this by showing the bounds of the “chroma texel” extending beyond the image bounds, and including additional chroma sample positions where required for interpolation. The limits of a sample for \text{NEAREST} sampling is shown as a grid.

Reconstruction is implemented in one of two ways:

If the format of the image that is to be sampled sets `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT`, or the `VkSamplerYcbcrConversionCreateInfo`'s `forceExplicitReconstruction` is set to `VK_TRUE`, reconstruction is performed as an explicit step independent of filtering, described in the Explicit Reconstruction section.

If the format of the image that is to be sampled does not set `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` and if the `VkSamplerYcbcrConversionCreateInfo`'s `forceExplicitReconstruction` is set to `VK_FALSE`, reconstruction is performed as an implicit part of filtering prior to color model conversion, with no separate post-conversion texel filtering step, as described in the Implicit Reconstruction section.

**Explicit Reconstruction**

- If the `chromaFilter` member of the `VkSamplerYcbcrConversionCreateInfo` structure is `VK_FILTER_NEAREST`:

  - If the format’s R and B channels are reduced in resolution in just width by a factor of two relative to the G channel (i.e. this is a “_422” format), the \( \tau_{ijk}[^{level}] \) values accessed by texel filtering are reconstructed as follows:

    \[
    \tau_R'(i, j) = \tau_G([i \times 0.5], j)[^{level}]
    \]

    \[
    \tau_B'(i, j) = \tau_G([i \times 0.5], j)[^{level}]
    \]

  - If the format’s R and B channels are reduced in resolution in width and height by a factor of two relative to the G channel (i.e. this is a “_420” format), the \( \tau_{ijk}[^{level}] \) values accessed by texel filtering are reconstructed as follows:
Note

The `xChromaOffset` and `yChromaOffset` have no effect if `chromaFilter` is `VK_FILTER_NEAREST` for explicit reconstruction.

- If the `chromaFilter` member of the `VkSamplerYcbcrConversionCreateInfo` structure is `VK_FILTER_LINEAR`:
  - If the format’s R and B channels are reduced in resolution in just width by a factor of two relative to the G channel (i.e. this is a “_422” format):
    - If `xChromaOffset` is `VK_CHROMA_LOCATION_COSITED_EVEN`:
      \[
      \tau_R'(i, j) = \tau_R[i \times 0.5, j][\text{level}] + 0.5 \times (i - 0.5)\]
      \[
      \tau_B'(i, j) = \tau_B[i \times 0.5, j][\text{level}] + 0.5 \times (i - 0.5)\]
    - If `xChromaOffset` is `VK_CHROMA_LOCATION_MIDPOINT`:
      \[
      \tau_R'(i, j) = \tau_R[i \times 0.5, j][\text{level}] + 0.75 \times (i - 0.5)\]
      \[
      \tau_B'(i, j) = \tau_B[i \times 0.5, j][\text{level}] + 0.75 \times (i - 0.5)\]
  - If `xChromaOffset` is `VK_CHROMA_LOCATION_MIDPOINT`:
    - If the format’s R and B channels are reduced in resolution in width and height by a factor of two relative to the G channel (i.e. this is a “_420” format), a similar relationship applies. Due to the number of options, these formulae are expressed more concisely as follows:
      \[
      i_{RB} = \begin{cases} 
      0.5 \times (i) & \text{xChromaOffset=COSITED_EVEN} \\
      0.5 \times (i - 0.5) & \text{xChromaOffset=MIDPOINT}
      \end{cases}
      j_{RB} = \begin{cases} 
      0.5 \times (j) & \text{yChromaOffset=COSITED_EVEN} \\
      0.5 \times (j - 0.5) & \text{yChromaOffset=MIDPOINT}
      \end{cases}
      i_{floor} = \lfloor i_{RB} \rfloor 
      j_{floor} = \lfloor j_{RB} \rfloor 
      i_{frac} = i_{RB} - i_{floor} 
      j_{frac} = j_{RB} - j_{floor}
      \tau_R'(i, j) = \tau_R[i_{floor}, j_{floor}][\text{level}] \times (1 - i_{frac}) \times (1 - j_{frac}) + 
      \tau_R'(i + i_{floor}, j_{floor})[\text{level}] \times i_{frac} \times (1 - j_{frac}) + 
      \tau_R'(i_{floor}, j + j_{floor})[\text{level}] \times (1 - i_{frac}) \times j_{frac} + 
      \tau_R'(i + i_{floor}, j + j_{floor})[\text{level}] \times i_{frac} \times j_{frac}
      \]

Note

In the case where the texture itself is bilinearly interpolated as described in Texel Filtering, thus requiring four full-color samples for the filtering operation, and where the reconstruction of these samples uses bilinear interpolation in the chroma channels due to `chromaFilter=VK_FILTER_LINEAR`, up to nine chroma samples may be required, depending on the sample location.
Implicit Reconstruction

Implicit reconstruction takes place by the samples being interpolated, as required by the filter settings of the sampler, except that chromaFilter takes precedence for the chroma samples.

If chromaFilter is VK_FILTER_NEAREST, an implementation may behave as if xChromaOffset and yChromaOffset were both VK_CHROMA_LOCATION_MIDPOINT, irrespective of the values set.

**Note**

This will not have any visible effect if the locations of the luma samples coincide with the location of the samples used for rasterization.

The sample coordinates are adjusted by the downsample factor of the channel (such that, for example, the sample coordinates are divided by two if the channel has a downsample factor of two relative to the luma channel):

\[
\begin{align*}
    u_R' &= \frac{422}{420} ( \frac{u}{2} + 0.5 ) \\
    v_R' &= \frac{422}{420} ( \frac{v}{2} + 0.5 )
\end{align*}
\]

\[
\begin{align*}
    u_B' &= \frac{0.5 \times (u + 0.5)}{0.5 \times u}, & xChromaOffset &= \text{CUBED}_EVEN \\
    v_B' &= \frac{0.5 \times (v + 0.5)}{0.5 \times v}, & xChromaOffset &= \text{CUBED}_INTERPOLATE}
\]

16.3.9. Sampler Y'CbCr Conversion

Sampler Y'CbCr conversion performs the following operations, which an implementation may combine into a single mathematical operation:

- Sampler Y'CbCr Range Expansion
- Sampler Y'CbCr Model Conversion

**Sampler Y'CbCr Range Expansion**

Sampler Y'CbCr range expansion is applied to color channel values after all texel input operations which are not specific to sampler Y'CbCr conversion. For example, the input values to this stage have been converted using the normal format conversion rules.

Sampler Y'CbCr range expansion is not applied if ycbcrModel is VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY. That is, the shader receives the vector C'rgba as output by the Component Swizzle stage without further modification.

For other values of ycbcrModel, range expansion is applied to the texel channel values output by the Component Swizzle defined by the components member of VkSamplerYcbcrConversionCreateInfo. Range expansion applies independently to each channel of the image. For the purposes of range expansion and Y'CbCr model conversion, the R and B channels contain color difference (chroma) values and the G channel contains luma. The A channel is not modified by sampler Y'CbCr range expansion.

The range expansion to be applied is defined by the ycbcrRange member of the VkSamplerYcbcrConversionCreateInfo structure:

- If ycbcrRange is VK_SAMPLER_YCBCR_RANGE_ITU_FULL, the following transformations are applied:
\[
Y' = C'_{\text{rgba}}[G] \\
C_B = C'_{\text{rgba}}[B] - \frac{2^{(n-1)}}{(2^n-1)} \\
C_R = C'_{\text{rgba}}[R] - \frac{2^{(n-1)}}{(2^n-1)}
\]

Note
These formulae correspond to the “full range” encoding in the “Quantization schemes” chapter of the Khronos Data Format Specification.

Should any future amendments be made to the ITU specifications from which these equations are derived, the formulae used by Vulkan may also be updated to maintain parity.

- If \( \text{ycbcrRange} \) is \( \text{VK_SAMPLER_YCBCR_RANGE_ITU_NARROW} \), the following transformations are applied:

\[
Y' = C'_{\text{rgba}}[G] \times \frac{(2^n-1) - 16 \times 2^{n-8}}{219 \times 2^{n-8}} \\
C_B = C'_{\text{rgba}}[B] \times \frac{(2^n-1) - 128 \times 2^{n-8}}{224 \times 2^{n-8}} \\
C_R = C'_{\text{rgba}}[R] \times \frac{(2^n-1) - 128 \times 2^{n-8}}{224 \times 2^{n-8}}
\]

Note
These formulae correspond to the “narrow range” encoding in the “Quantization schemes” chapter of the Khronos Data Format Specification.

- \( n \) is the bit-depth of the channels in the format.

The precision of the operations performed during range expansion must be at least that of the source format.

An implementation may clamp the results of these range expansion operations such that \( Y' \) falls in the range \([0,1]\), and/or such that \( C_B \) and \( C_R \) fall in the range \([-0.5,0.5]\).

**Sampler \( Y'C_B C_R \) Model Conversion**

The range-expanded values are converted between color models, according to the color model conversion specified in the \( \text{ycbcrModel} \) member:

**\( \text{VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY} \)**

The color channels are not modified by the color model conversion since they are assumed already to represent the desired color model in which the shader is operating; \( Y'C_B C_R \) range expansion is also ignored.

**\( \text{VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY} \)**

The color channels are not modified by the color model conversion and are assumed to be treated as though in \( Y'C_B C_R \) form both in memory and in the shader; \( Y'C_B C_R \) range expansion is applied to the channels as for other \( Y'C_B C_R \) models, with the vector \((C_B,Y',C_R,A)\) provided to the shader.
The color channels are transformed from a $Y'CbCr$ representation to an $R'G'B'$ representation as described in the “BT.709 $Y'CbCr$ conversion” section of the Khronos Data Format Specification.

The color channels are transformed from a $Y'CbCr$ representation to an $R'G'B'$ representation as described in the “BT.601 $Y'CbCr$ conversion” section of the Khronos Data Format Specification.

The color channels are transformed from a $Y'CbCr$ representation to an $R'G'B'$ representation as described in the “BT.2020 $Y'CbCr$ conversion” section of the Khronos Data Format Specification.

In this operation, each output channel is dependent on each input channel. An implementation may clamp the $R'G'B'$ results of these conversions to the range [0,1].

The precision of the operations performed during model conversion must be at least that of the source format.

The alpha channel is not modified by these model conversions.
Note

Sampling operations in a non-linear color space can introduce color and intensity shifts at sharp transition boundaries. To avoid this issue, the technically precise color correction sequence described in the “Introduction to Color Conversions” chapter of the Khronos Data Format Specification may be performed as follows:

- Calculate the unnormalized texel coordinates corresponding to the desired sample position.
- For a minFilter or magFilter of VK_FILTER_NEAREST:
  1. Calculate \((i,j)\) for the sample location as described under the “nearest filtering” formulae in \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection
  2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
  3. Sample using sampler Y’C_bC_a conversion at this location.
- For a minFilter or magFilter of VK_FILTER_LINEAR:
  1. Calculate \((i_{0,1,1,i_{0,1}})\) for the sample location as described under the “linear filtering” formulae in \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection
  2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
  3. Sample using sampler Y’C_bC_a conversion at each of these locations.
  4. Convert the non-linear A’R’G’B’ outputs of the Y’C_bC_a conversions to linear ARGB values as described in the “Transfer Functions” chapter of the Khronos Data Format Specification.
  5. Interpolate the linear ARGB values using the \(\alpha\) and \(\beta\) values described in the “linear filtering” section of \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection and the equations in Texel Filtering.

The additional calculations and, especially, additional number of sampling operations in the VK_FILTER_LINEAR case can be expected to have a performance impact compared with using the outputs directly. Since the variations from “correct” results are subtle for most content, the application author should determine whether a more costly implementation is strictly necessary.

If chromaFilter, and minFilter or magFilter are both VK_FILTER_NEAREST, these operations are redundant and sampling using sampler Y’C_bC_a conversion at the desired sample coordinates will produce the “correct” results without further processing.

16.4. Texel Output Operations

Texel output instructions are SPIR-V image instructions that write to an image. Texel output
operations are a set of steps that are performed on state, coordinates, and texel values while processing a texel output instruction, and which are common to some or all texel output instructions. They include the following steps, which are performed in the listed order:

- Validation operations
  - Format validation
  - Type validation
  - Coordinate validation
  - Sparse validation
- Texel output format conversion

16.4.1. Texel Output Validation Operations

Texel output validation operations inspect instruction/image state or coordinates, and in certain circumstances cause the write to have no effect. There are a series of validations that the texel undergoes.

Texel Format Validation

If the image format of the `OpTypeImage` is not compatible with the `VkImageView`'s format, the write causes the contents of the image's memory to become undefined.

Texel Type Validation

If the `Sampled` Type of the `OpTypeImage` does not match the type defined for the format, as specified in the SPIR-V Sampled Type column of the Interpretation of Numeric Format table, the write causes the value of the texel to become undefined. For integer types, if the signedness of the access does not match the signedness of the accessed resource, the write causes the value of the texel to become undefined.

16.4.2. Integer Texel Coordinate Validation

The integer texel coordinates are validated according to the same rules as for texel input coordinate validation.

If the texel fails integer texel coordinate validation, then the write has no effect.

16.4.3. Sparse Texel Operation

If the texel attempts to write to an unbound region of a sparse image, the texel is a sparse unbound texel. In such a case, if the `VkPhysicalDeviceSparseProperties::residencyNonResidentStrict` property is VK_TRUE, the sparse unbound texel write has no effect. If residencyNonResidentStrict is VK_FALSE, the write may have a side effect that becomes visible to other accesses to unbound texels in any resource, but will not be visible to any device memory allocated by the application.
16.4.4. Texel Output Format Conversion

If the image format is sRGB, a linear to sRGB conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the Khronos Data Format Specification. The A component, if present, is unchanged.

Texels then undergo a format conversion from the floating point, signed, or unsigned integer type of the texel data to the VkFormat of the image view. Any unused components are ignored.

Each component is converted based on its type and size (as defined in the Format Definition section for each VkFormat). Floating-point outputs are converted as described in Floating-Point Format Conversions and Fixed-Point Data Conversion. Integer outputs are converted such that their value is preserved. The converted value of any integer that cannot be represented in the target format is undefined.

16.5. Normalized Texel Coordinate Operations

If the image sampler instruction provides normalized texel coordinates, some of the following operations are performed.

16.5.1. Projection Operation

For Proj image operations, the normalized texel coordinates \((s,t,r,q,a)\) and (if present) the \(D_{ref}\) coordinate are transformed as follows:

\[
\begin{align*}
    s &= \frac{s}{q}, \quad \text{for 1D, 2D, or 3D image} \\
    t &= \frac{t}{q}, \quad \text{for 2D or 3D image} \\
    r &= \frac{r}{q}, \quad \text{for 3D image} \\
    D_{ref} &= \frac{D_{ref}}{q}, \quad \text{if provided}
\end{align*}
\]

16.5.2. Derivative Image Operations

Derivatives are used for LOD selection. These derivatives are either implicit (in an ImplicitLod image instruction in a fragment shader) or explicit (provided explicitly by shader to the image instruction in any shader).

For implicit derivatives image instructions, the derivatives of texel coordinates are calculated in the same manner as derivative operations. That is:

\[
\begin{align*}
    \frac{\partial s}{\partial x} &= dPdx(s), \quad \frac{\partial s}{\partial y} = dPdy(s), \quad \text{for 1D, 2D, Cube, or 3D image} \\
    \frac{\partial t}{\partial x} &= dPdx(t), \quad \frac{\partial t}{\partial y} = dPdy(t), \quad \text{for 2D, Cube, or 3D image} \\
    \frac{\partial r}{\partial x} &= dPdx(r), \quad \frac{\partial r}{\partial y} = dPdy(r), \quad \text{for Cube or 3D image}
\end{align*}
\]

Partial derivatives not defined above for certain image dimensionalities are set to zero.

For explicit LOD image instructions, if the optional SPIR-V operand Grad is provided, then the operand values are used for the derivatives. The number of components present in each derivative
for a given image dimensionality matches the number of partial derivatives computed above.

If the optional SPIR-V operand \texttt{Lod} is provided, then derivatives are set to zero, the cube map derivative transformation is skipped, and the scale factor operation is skipped. Instead, the floating point scalar coordinate is directly assigned to $\lambda_{bas}$ as described in Level-of-Detail Operation.

If the image or sampler object used by an implicit derivative image instruction is not uniform across the quad and \texttt{quadDivergentImplicitLod} is not supported, then the derivative and LOD values are undefined. Implicit derivatives are well-defined when the image and sampler and control flow are uniform across the quad, even if they diverge between different quads.

If \texttt{quadDivergentImplicitLod} is supported, then derivatives and implicit LOD values are well-defined even if the image or sampler object are not uniform within a quad. The derivatives are computed as specified above, and the implicit LOD calculation proceeds for each shader invocation using its respective image and sampler object.

**16.5.3. Cube Map Face Selection and Transformations**

For cube map image instructions, the \((s,t,r)\) coordinates are treated as a direction vector \((r_x,r_y,r_z)\). The direction vector is used to select a cube map face. The direction vector is transformed to a per-face texel coordinate system \((s_{face},t_{face})\), and the direction vector is also used to transform the derivatives to per-face derivatives.

**16.5.4. Cube Map Face Selection**

The direction vector selects one of the cube map's faces based on the largest magnitude coordinate direction (the major axis direction). Since two or more coordinates can have identical magnitude, the implementation must have rules to disambiguate this situation.

The rules should have as the first rule that \(r_z\) wins over \(r_y\) and \(r_x\), and the second rule that \(r_y\) wins over \(r_x\). An implementation may choose other rules, but the rules must be deterministic and depend only on \((r_x,r_y,r_z)\).

The layer number (corresponding to a cube map face), the coordinate selections for \(s_c, t_c, r_c\), and the selection of derivatives, are determined by the major axis direction as specified in the following two tables.

**Table 26. Cube map face and coordinate selection**

16.5.5. Cube Map Coordinate Transformation

\[
s_{\text{face}} = \frac{1}{2} \times s_c \left( \frac{1}{2} + \frac{1}{2} \right) + \frac{1}{2}
\]

\[
t_{\text{face}} = \frac{1}{2} \times t_c \left( \frac{1}{2} + \frac{1}{2} \right) + \frac{1}{2}
\]

16.5.6. Cube Map Derivative Transformation

\[
\frac{\partial s_{\text{face}}}{\partial x} = \frac{\partial}{\partial x} \left( \frac{1}{2} \times s_c \left( \frac{1}{2} + \frac{1}{2} \right) \right)
\]

\[
\frac{\partial s_{\text{face}}}{\partial x} = \frac{1}{2} \times \frac{\partial}{\partial x} \left( \frac{s_c}{r_c} \right)
\]

\[
\frac{\partial s_{\text{face}}}{\partial x} = \frac{1}{2} \times \left( \frac{r_c \times \partial s_c/\partial x - s_c \times \partial r_c/\partial x}{(r_c)^2} \right)
\]

\[
\frac{\partial s_{\text{face}}}{\partial y} = \frac{1}{2} \times \left( \frac{r_c \times \partial s_c/\partial y - s_c \times \partial r_c/\partial y}{(r_c)^2} \right)
\]

16.5.7. Scale Factor Operation, Level-of-Detail Operation and Image Level(s) Selection

LOD selection can be either explicit (provided explicitly by the image instruction) or implicit (determined from a scale factor calculated from the derivatives). The LOD must be computed with `mipmapPrecisionBits` of accuracy.
Scale Factor Operation

The magnitude of the derivatives are calculated by:

\[ m_{ux} = |\partial s/\partial x| \times w_{base} \]

\[ m_{vx} = |\partial t/\partial x| \times h_{base} \]

\[ m_{wx} = |\partial r/\partial x| \times d_{base} \]

\[ m_{uy} = |\partial s/\partial y| \times w_{base} \]

\[ m_{vy} = |\partial t/\partial y| \times h_{base} \]

\[ m_{wy} = |\partial r/\partial y| \times d_{base} \]

where:

\[ \partial t/\partial x = \partial t/\partial y = 0 \quad \text{(for 1D images)} \]

\[ \partial r/\partial x = \partial r/\partial y = 0 \quad \text{(for 1D, 2D or Cube images)} \]

and:

\[ w_{base} = \text{image.w} \]

\[ h_{base} = \text{image.h} \]

\[ d_{base} = \text{image.d} \]

(for the baseMipLevel, from the image descriptor).

For corner-sampled images, the \( w_{base}, h_{base}, \) and \( d_{base} \) are instead:

\[ w_{base} = \text{image.w} - 1 \]

\[ h_{base} = \text{image.h} - 1 \]
\( d_{\text{base}} = \text{image.d} - 1 \)

A point sampled in screen space has an elliptical footprint in texture space. The minimum and maximum scale factors \((\rho_{\text{min}}, \rho_{\text{max}})\) should be the minor and major axes of this ellipse.

The scale factors \(\rho_x\) and \(\rho_y\), calculated from the magnitude of the derivatives in \(x\) and \(y\), are used to compute the minimum and maximum scale factors.

\(\rho_x\) and \(\rho_y\) may be approximated with functions \(f_x\) and \(f_y\), subject to the following constraints:

\[ f_x \text{ is continuous and monotonically increasing in each of } m_{ux}, m_{vx}, \text{ and } m_{wx} \]
\[ f_y \text{ is continuous and monotonically increasing in each of } m_{uy}, m_{vy}, \text{ and } m_{wy} \]
\[ \max(|m_{ux}|, |m_{vx}|, |m_{wx}|) \leq f_x \leq \sqrt{2}(|m_{ux}| + |m_{vx}| + |m_{wx}|) \]
\[ \max(|m_{uy}|, |m_{vy}|, |m_{wy}|) \leq f_y \leq \sqrt{2}(|m_{uy}| + |m_{vy}| + |m_{wy}|) \]

The minimum and maximum scale factors \((\rho_{\text{min}}, \rho_{\text{max}})\) are determined by:

\[ \rho_{\text{max}} = \max(\rho_x, \rho_y) \]
\[ \rho_{\text{min}} = \min(\rho_x, \rho_y) \]

The ratio of anisotropy is determined by:

\[ \eta = \min(\rho_{\text{max}}/\rho_{\text{min}}, \max_{\text{Aniso}}) \]

where:

\[ \text{sampler.max}_{\text{Aniso}} = \max_{\text{Anisotropy}} \text{ (from sampler descriptor)} \]
\[ \text{limits.max}_{\text{Aniso}} = \max_{\text{SamplerAnisotropy}} \text{ (from physical device limits)} \]
\[ \max_{\text{Aniso}} = \min(\text{sampler.max}_{\text{Aniso}}, \text{limits.max}_{\text{Aniso}}) \]

If \(\rho_{\text{max}} = \rho_{\text{min}} = 0\), then all the partial derivatives are zero, the fragment's footprint in texel space is a point, and \(\eta\) should be treated as 1. If \(\rho_{\text{max}} \neq 0\) and \(\rho_{\text{min}} = 0\) then all partial derivatives along one axis are zero, the fragment's footprint in texel space is a line segment, and \(\eta\) should be treated as \(\max_{\text{Aniso}}\). However, anytime the footprint is small in texel space the implementation may use a smaller value of \(\eta\), even when \(\rho_{\text{min}}\) is zero or close to zero. If either \(\text{VkPhysicalDeviceFeatures::samplerAnisotropy}\) or \(\text{VkSamplerCreateInfo::anisotropyEnable}\) are \(\text{VK_FALSE}\), \(\max_{\text{Aniso}}\) is set to 1.

If \(\eta = 1\), sampling is isotropic. If \(\eta > 1\), sampling is anisotropic.
The sampling rate \( (N) \) is derived as:

\[
N = \lceil \eta \rceil
\]

An implementation may round \( N \) up to the nearest supported sampling rate. An implementation may use the value of \( N \) as an approximation of \( \eta \).

**Level-of-Detail Operation**

The LOD parameter \( \lambda \) is computed as follows:

\[
\lambda_{\text{base}}(x, y) = \begin{cases} 
\text{shaderOp.Lod} & \text{(from optional SPIR-V operand)} \\
\log_2\left(\frac{P_{\text{max}}}{\eta}\right) & \text{otherwise}
\end{cases}
\]

\[
\lambda'(x, y) = \lambda_{\text{base}} + \text{clamp}(\text{sampler.bias} + \text{shaderOp.bias}, -\text{maxSamplerLodBias}, \text{maxSamplerLodBias})
\]

\[
\lambda = \begin{cases} 
\text{lod}_{\text{max}}, & \lambda' > \text{lod}_{\text{max}} \\
\lambda', & \text{lod}_{\text{min}} \leq \lambda' \leq \text{lod}_{\text{max}} \\
\text{lod}_{\text{min}}, & \lambda' < \text{lod}_{\text{min}} \\
\text{undefined}, & \text{lod}_{\text{min}} > \text{lod}_{\text{max}}
\end{cases}
\]

where:

\[
\text{sampler.bias} = \text{mipLodBias} \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \qua
\( q = \text{levelCount} - 1 \)

_baseMipLevel_ and _levelCount_ are taken from the _subresourceRange_ of the image view.

If the sampler’s _mipmapMode_ is `VK_SAMPLER_MIPMAP_MODE_NEAREST`, then the level selected is \( d = d_i \).

If the sampler’s _mipmapMode_ is `VK_SAMPLER_MIPMAP_MODE_LINEAR`, two neighboring levels are selected:

\[
\begin{align*}
    d_{hi} &= \lfloor d_i \rfloor \\
    d_{lo} &= \min(d_{hi} + 1, q) \\
    \delta &= d_i - d_{hi}
\end{align*}
\]

\( \delta \) is the fractional value, quantized to the number of _mipmap precision bits_, used for _linear filtering_ between levels.

### 16.5.8. (s,t,r,q,a) to (u,v,w,a) Transformation

The normalized texel coordinates are scaled by the image level dimensions and the array layer is selected.

This transformation is performed once for each level used in _filtering_ (either \( d \), or \( d_{hi} \) and \( d_{lo} \)).

\[
\begin{align*}
    u(x, y) &= s(x, y) \times \text{width}_{scale} + \Delta_i \\
    v(x, y) &= \begin{cases} 0 & \text{for 1D images} \\ t(x, y) \times \text{height}_{scale} + \Delta_j & \text{otherwise} \end{cases} \\
    w(x, y) &= \begin{cases} 0 & \text{for 2D or Cube images} \\ r(x, y) \times \text{depth}_{scale} + \Delta_k & \text{otherwise} \end{cases} \\
    a(x, y) &= \begin{cases} a(x, y) & \text{for array images} \\ 0 & \text{otherwise} \end{cases}
\end{align*}
\]

where:

\[
\begin{align*}
    \text{width}_{scale} &= \text{width}_{level} \\
    \text{height}_{scale} &= \text{height}_{level} \\
    \text{depth}_{scale} &= \text{depth}_{level}
\end{align*}
\]

for conventional images, and:

\[
\begin{align*}
    \text{width}_{scale} &= \text{width}_{level} - 1 \\
    \text{height}_{scale} &= \text{height}_{level} - 1
\end{align*}
\]
depth_{scale} = depth_{level} - 1

for corner-sampled images.

and where \((\Delta_i, \Delta_j, \Delta_k)\) are taken from the image instruction if it includes a `ConstOffset` or `Offset` operand, otherwise they are taken to be zero.

Operations then proceed to Unnormalized Texel Coordinate Operations.

**16.6. Unnormalized Texel Coordinate Operations**

**16.6.1. \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection**

The unnormalized texel coordinates are transformed to integer texel coordinates relative to the selected mipmap level.

The layer index \(l\) is computed as:

\[
l = \text{clamp}(\text{RNE}(a), 0, \text{layerCount} - 1) + \text{baseArrayLayer}
\]

where \(\text{layerCount}\) is the number of layers in the image subresource range of the image view, \(\text{baseArrayLayer}\) is the first layer from the subresource range, and where:

\[
\text{RNE}(a) = \begin{cases} 
\text{roundTiesToEven}(a) & \text{preferred, from IEEE Std 754-2008 Floating-Point Arithmetic} \\
\lfloor a + 0.5 \rfloor & \text{alternative}
\end{cases}
\]

The sample index \(n\) is assigned the value 0.

Nearest filtering (`VK_FILTER_NEAREST`) computes the integer texel coordinates that the unnormalized coordinates lie within:

\[
i = \lfloor u + \text{shift} \rfloor \\
j = \lfloor v + \text{shift} \rfloor \\
k = \lfloor w + \text{shift} \rfloor
\]

where:

\[
\text{shift} = 0.0
\]

for conventional images, and:

\[
\text{shift} = 0.5
\]

for corner-sampled images.

Linear filtering (`VK_FILTER_LINEAR`) computes a set of neighboring coordinates which bound the unnormalized coordinates. The integer texel coordinates are combinations of \(i_0\) or \(i_1\), \(j_0\) or \(j_1\), \(k_0\) or \(k_1\),
as well as weights $\alpha$, $\beta$, and $\gamma$.

\[
\begin{align*}
    i_0 &= \lfloor u - \text{shift} \rfloor \\
    i_1 &= i_0 + 1 \\
    j_0 &= \lfloor v - \text{shift} \rfloor \\
    j_1 &= j_0 + 1 \\
    k_0 &= \lfloor w - \text{shift} \rfloor \\
    k_1 &= k_0 + 1 \\
    \alpha &= \text{frac} (u - \text{shift}) \\
    \beta &= \text{frac} (v - \text{shift}) \\
    \gamma &= \text{frac} (w - \text{shift})
\end{align*}
\]

where:

\[
\text{shift} = 0.5
\]

for conventional images, and:

\[
\text{shift} = 0.0
\]

for corner-sampled images, and where:

\[
\text{frac} (x) = x - \lfloor x \rfloor
\]

where the number of fraction bits retained is specified by \texttt{VkPhysicalDeviceLimits::subTexelPrecisionBits}.

Cubic filtering (\texttt{VK_FILTER_CUBIC_EXT}) computes a set of neighboring coordinates which bound the unnormalized coordinates. The integer texel coordinates are combinations of $i_0$, $i_1$, $i_2$ or $i_3$, $j_0$, $j_1$, $j_2$ or $j_3$, $k_0$, $k_1$, $k_2$ or $k_3$, as well as weights $\alpha$, $\beta$, and $\gamma$.

\[
\begin{align*}
    i_0 &= \lfloor u - \frac{3}{2} \rfloor \\
    i_1 &= i_0 + 1 \\
    i_2 &= i_1 + 1 \\
    i_3 &= i_2 + 1 \\
    j_0 &= \lfloor v - \frac{3}{2} \rfloor \\
    j_1 &= j_0 + 1 \\
    j_2 &= j_1 + 1 \\
    j_3 &= j_2 + 1 \\
    k_0 &= \lfloor w - \frac{3}{2} \rfloor \\
    k_1 &= k_0 + 1 \\
    k_2 &= k_1 + 1 \\
    k_3 &= k_2 + 1 \\
    \alpha &= \text{frac} \left( u - \frac{1}{2} \right) \\
    \beta &= \text{frac} \left( v - \frac{1}{2} \right) \\
    \gamma &= \text{frac} \left( w - \frac{1}{2} \right)
\end{align*}
\]

where:

\[
\text{frac} (x) = x - \lfloor x \rfloor
\]

where the number of fraction bits retained is specified by \texttt{VkPhysicalDeviceLimits}.
16.7. Integer Texel Coordinate Operations

Integer texel coordinate operations may supply a LOD which texels are to be read from or written to using the optional SPIR-V operand Lod. If the Lod is provided then it must be an integer.

The image level selected is:

\[ d = level_{base} + \begin{cases} 
Lod & \text{(from optional SPIR-V operand)} \\
0 & \text{otherwise}
\end{cases} \]

If \( d \) does not lie in the range \([\text{baseMipLevel}, \text{baseMipLevel} + \text{levelCount})\) then any values fetched are zero if robustImageAccess2 is enabled, otherwise are undefined, and any writes (if supported) are discarded.

16.8. Image Sample Operations

16.8.1. Wrapping Operation

Cube images ignore the wrap modes specified in the sampler. Instead, if VK_FILTER_NEAREST is used within a mip level then VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE is used, and if VK_FILTER_LINEAR is used within a mip level then sampling at the edges is performed as described earlier in the Cube map edge handling section.

The first integer texel coordinate \( i \) is transformed based on the addressModeU parameter of the sampler.

\[
i = \begin{cases} 
    i \mod \text{size} & \text{for repeat} \\
    (\text{size} - 1) - \text{mirror}\ ((i \mod (2 \times \text{size})) - \text{size}) & \text{for mirrored repeat} \\
    \text{clamp}\ (i, 0, \text{size} - 1) & \text{for clamp to edge} \\
    \text{clamp}\ (i, -1, \text{size}) & \text{for clamp to border} \\
    \text{clamp}\ (\text{mirror}\ (i), 0, \text{size} - 1) & \text{for mirror clamp to edge}
\end{cases}
\]

where:

\[
mirror\ (n) = \begin{cases} 
    n & \text{for } n \geq 0 \\
    -(1 + n) & \text{otherwise}
\end{cases}
\]

\( j \) (for 2D and Cube image) and \( k \) (for 3D image) are similarly transformed based on the addressModeV and addressModeW parameters of the sampler, respectively.

16.8.2. Texel Gathering

SPIR-V instructions with Gather in the name return a vector derived from 4 texels in the base level of the image view. The rules for the VK_FILTER_LINEAR minification filter are applied to identify the four selected texels. Each texel is then converted to an RGBA value according to conversion to RGBA and then swizzled. A four-component vector is then assembled by taking the component indicated by the Component value in the instruction from the swizzled color value of the four texels. If the
operation does not use the `ConstOffsets` image operand then the four texels form the $2 \times 2$ rectangle used for texture filtering:

$$
\begin{align*}
\tau[R] &= \tau_{i, j, l, comp}^{\text{level}_\text{base}} \\
\tau[G] &= \tau_{i, j, l, comp}^{\text{level}_\text{base}} \\
\tau[B] &= \tau_{i, j, l, comp}^{\text{level}_\text{base}} \\
\tau[A] &= \tau_{i, j, l, comp}^{\text{level}_\text{base}}
\end{align*}
$$

If the operation does use the `ConstOffsets` image operand then the offsets allow a custom filter to be defined:

$$
\begin{align*}
\tau[R] &= \tau_{i, j, l, \Delta_0}^{\text{level}_\text{base},comp} \\
\tau[G] &= \tau_{i, j, l, \Delta_0}^{\text{level}_\text{base},comp} \\
\tau[B] &= \tau_{i, j, l, \Delta_0}^{\text{level}_\text{base},comp} \\
\tau[A] &= \tau_{i, j, l, \Delta_0}^{\text{level}_\text{base},comp}
\end{align*}
$$

where:

$$
\tau^{\text{level}_\text{base},comp} = \begin{cases} 
\tau_{i, j, l, comp}^{\text{level}_\text{base}, R}, & \text{for comp } = 0 \\
\tau_{i, j, l, comp}^{\text{level}_\text{base}, G}, & \text{for comp } = 1 \\
\tau_{i, j, l, comp}^{\text{level}_\text{base}, B}, & \text{for comp } = 2 \\
\tau_{i, j, l, comp}^{\text{level}_\text{base}, A}, & \text{for comp } = 3
\end{cases}
$$

`OpImage*Gather` **must** not be used on a sampled image with `sampler YC_b C_r conversion` enabled.

### 16.8.3. Texel Filtering

Texel filtering is first performed for each level (either $d$ or $d_{hi}$ and $d_{lo}$).

If $\lambda$ is less than or equal to zero, the texture is said to be **magnified**, and the filter mode within a mip level is selected by the `magFilter` in the sampler. If $\lambda$ is greater than zero, the texture is said to be **minified**, and the filter mode within a mip level is selected by the `minFilter` in the sampler.

#### Texel Nearest Filtering

Within a mip level, `VK_FILTER_NEAREST` filtering selects a single value using the $(i, j, k)$ texel coordinates, with all texels taken from layer $l$.

$$
\tau^{\text{level}} = \begin{cases} 
\tau_{i, j, k, \text{level}}, & \text{for 3D image} \\
\tau_{i, j, \text{level}}, & \text{for 2D or Cube image} \\
\tau_{i, \text{level}}, & \text{for 1D image}
\end{cases}
$$

#### Texel Linear Filtering

Within a mip level, `VK_FILTER_LINEAR` filtering combines 8 (for 3D), 4 (for 2D or Cube), or 2 (for 1D) texel values, together with their linear weights. The linear weights are derived from the fractions computed earlier:
The values of multiple texels, together with their weights, are combined to produce a filtered value. The `VkSamplerReductionModeCreateInfo::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, a weighted average is computed:

\[
\tau_{3D} = \sum_{k = j_0}^{k_i} \sum_{j = j_0}^{j_i} \sum_{i = i_0}^{i_1} (w_j)(w_j)(w_k)\tau_{ijk}
\]

\[
\tau_{2D} = \sum_{j = j_0}^{j_i} \sum_{i = i_0}^{i_1} (w_j)\tau_{ij}
\]

\[
\tau_{1D} = \sum_{i = i_0}^{i_1} (w_i)\tau_i
\]

However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the set of texels with non-zero weights.

**Texel Cubic Filtering**

Within a mip level, `VK_FILTER_CUBIC_EXT`, filtering computes a weighted average of 64 (for 3D), 16 (for 2D), or 4 (for 1D) texel values, together with their Catmull-Rom weights.

Catmull-Rom weights are derived from the fractions computed earlier.

\[
\begin{bmatrix}
  w_0 & w_1 & w_2 & w_3 \\
\end{bmatrix} = \frac{1}{2} \begin{bmatrix} 1 & \alpha & \alpha^2 & \alpha^3 \end{bmatrix}
\]

\[
\begin{bmatrix}
  -1 & 0 & 1 & 0 \\
  2 & -5 & 4 & -1 \\
  -3 & 3 & -3 & 1 \\
\end{bmatrix}
\]

\[
\begin{bmatrix}
  w_{j0} & w_{j1} & w_{j2} & w_{j3} \\
\end{bmatrix} = \frac{1}{2} \begin{bmatrix} 1 & \beta & \beta^2 & \beta^3 \end{bmatrix}
\]

\[
\begin{bmatrix}
  -1 & 0 & 1 & 0 \\
  2 & -5 & 4 & -1 \\
  -3 & 3 & -3 & 1 \\
\end{bmatrix}
\]

\[
\begin{bmatrix}
  w_{k0} & w_{k1} & w_{k2} & w_{k3} \\
\end{bmatrix} = \frac{1}{2} \begin{bmatrix} 1 & \gamma & \gamma^2 & \gamma^3 \end{bmatrix}
\]

\[
\begin{bmatrix}
  -1 & 0 & 1 & 0 \\
  2 & -5 & 4 & -1 \\
  -3 & 3 & -3 & 1 \\
\end{bmatrix}
\]

The values of multiple texels, together with their weights, are combined to produce a filtered value.

The `VkSamplerReductionModeCreateInfo::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to
**VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE**, a weighted average is computed:

\[
\tau_{3D} = \sum_{k=j_0}^{k_3} \sum_{j=j_0}^{j_3} \sum_{i=i_0}^{i_3} (w_i)(w_j)(w_k)\tau_{ijk}
\]

\[
\tau_{2D} = \sum_{j=j_0}^{j_3} \sum_{i=i_0}^{i_3} (w_i)(w_j)\tau_{ij}
\]

\[
\tau_{1D} = \sum_{i=i_0}^{i_3} (w_i)\tau_i
\]

However, if the reduction mode is **VK_SAMPLER_REDUCTION_MODE_MIN** or **VK_SAMPLER_REDUCTION_MODE_MAX**, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the set of texels with non-zero weights.

**Texel Mipmap Filtering**

**VK_SAMPLER_MIPMAP_MODE_NEAREST** filtering returns the value of a single mipmap level, \(\tau = \tau[d]\).

**VK_SAMPLER_MIPMAP_MODE_LINEAR** filtering combines the values of multiple mipmap levels (\(\tau[hi]\) and \(\tau[lo]\)), together with their linear weights.

The linear weights are derived from the fraction computed earlier:

\[
w_{hi} = (1 - \delta)
\]

\[
w_{lo} = (\delta)
\]

The values of multiple mipmap levels, together with their weights, are combined to produce a final filtered value.

The **VkSamplerReductionModeCreateInfo::reductionMode** can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the **reductionMode** is set (explicitly or implicitly) to **VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE**, a weighted average is computed:

\[
\tau = (w_{hi})\tau[hi] + (w_{lo})\tau[lo]
\]

**Texel Anisotropic Filtering**

Anisotropic filtering is enabled by the **anisotropyEnable** in the sampler. When enabled, the image filtering scheme accounts for a degree of anisotropy.

The particular scheme for anisotropic texture filtering is implementation-dependent. Implementations **should** consider the **magFilter**, **minFilter** and **mipmapMode** of the sampler to control the specifics of the anisotropic filtering scheme used. In addition, implementations **should** consider **minLod** and **maxLod** of the sampler.

The following describes one particular approach to implementing anisotropic filtering for the 2D Image case, implementations **may** choose other methods:
Given a `magFilter`, `minFilter` of `VK_FILTER_LINEAR` and a `mipmapMode` of `VK_SAMPLER_MIPMAP_MODE_NEAREST`:

Instead of a single isotropic sample, N isotropic samples are sampled within the image footprint of the image level d to approximate an anisotropic filter. The sum $\tau_{2D_{aniso}}$ is defined using the single isotropic $\tau_{2D}(u,v)$ at level d.

$$
\tau_{2D_{aniso}} = \frac{1}{N} \sum_{i=1}^{N} \tau_{2D}(u - \frac{1}{2} + \frac{i}{N+1}, v - \frac{1}{2} + \frac{i}{N+1}), \quad \text{when } \rho_y > \rho_x \\
\tau_{2D_{aniso}} = \frac{1}{N} \sum_{i=1}^{N} \tau_{2D}(u, v - \frac{1}{2} + \frac{i}{N+1}), \quad \text{when } \rho_y \geq \rho_x
$$

When `VkSamplerReductionModeCreateInfo::reductionMode` is set to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, the above summation is used. However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above values, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the values with non-zero weights.

### 16.9. Texel Footprint Evaluation

The SPIR-V instruction `OpImageSampleFootprintNV` evaluates the set of texels from a single mip level that would be accessed during a `texel filtering` operation. In addition to the inputs that would be accepted by an equivalent `OpImageSample*` instruction, `OpImageSampleFootprintNV` accepts two additional inputs. The `Granularity` input is an integer identifying the size of texel groups used to evaluate the footprint. Each bit in the returned footprint mask corresponds to an aligned block of texels whose size is given by the following table:

<table>
<thead>
<tr>
<th>Granularity</th>
<th>Dim = 2D</th>
<th>Dim = 3D</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>unsupported</td>
<td>unsupported</td>
</tr>
<tr>
<td>1</td>
<td>2x2</td>
<td>2x2x2</td>
</tr>
<tr>
<td>2</td>
<td>4x2</td>
<td>unsupported</td>
</tr>
<tr>
<td>3</td>
<td>4x4</td>
<td>4x4x2</td>
</tr>
<tr>
<td>4</td>
<td>8x4</td>
<td>unsupported</td>
</tr>
<tr>
<td>5</td>
<td>8x8</td>
<td>unsupported</td>
</tr>
<tr>
<td>6</td>
<td>16x8</td>
<td>unsupported</td>
</tr>
<tr>
<td>7</td>
<td>16x16</td>
<td>unsupported</td>
</tr>
<tr>
<td>8</td>
<td>unsupported</td>
<td>unsupported</td>
</tr>
<tr>
<td>9</td>
<td>unsupported</td>
<td>unsupported</td>
</tr>
<tr>
<td>10</td>
<td>unsupported</td>
<td>16x16x16</td>
</tr>
<tr>
<td>11</td>
<td>64x64</td>
<td>32x16x16</td>
</tr>
<tr>
<td>12</td>
<td>128x64</td>
<td>32x32x16</td>
</tr>
</tbody>
</table>
The **Coarse** input is used to select between the two mip levels that *may* be accessed during texel filtering when using a `mipmapMode` of VK_SAMPLER_MIPMAP_MODE_LINEAR. When filtering between two mip levels, a `Coarse` value of `true` requests the footprint in the lower-resolution mip level (higher level number), while `false` requests the footprint in the higher-resolution mip level. If texel filtering would access only a single mip level, the footprint in that level would be returned when `Coarse` is set to `false`; an empty footprint would be returned when `Coarse` is set to `true`.

The footprint for `OpImageSampleFootprintNV` is returned in a structure with six members:

- The first member is a boolean value that is true if the texel filtering operation would access only a single mip level.
- The second member is a two- or three-component integer vector holding the footprint anchor location. For two-dimensional images, the returned components are in units of eight texel groups. For three-dimensional images, the returned components are in units of four texel groups.
- The third member is a two- or three-component integer vector holding a footprint offset relative to the anchor. All returned components are in units of texel groups.
- The fourth member is a two-component integer vector mask, which holds a bitfield identifying the set of texel groups in an 8x8 or 4x4x4 neighborhood relative to the anchor and offset.
- The fifth member is an integer identifying the mip level containing the footprint identified by the anchor, offset, and mask.
- The sixth member is an integer identifying the granularity of the returned footprint.

For footprints in two-dimensional images (**Dim2D**), the mask returned by `OpImageSampleFootprintNV` indicates whether each texel group in a 8x8 local neighborhood of texel groups would have one or more texels accessed during texel filtering. In the mask, the texel group with local group coordinates \((lgx, lgy)\) is considered covered if and only if

\[
0 \neq ((mask.x + (mask.y<<32))&(1<<(lgy \times 8+lgx)))
\]

where:

- \(0 \leq lgx<8\) and \(0 \leq lgy<8\); and
- \(mask\) is the returned two-component mask.

The local group with coordinates \((lgx, lgy)\) in the mask is considered covered if and only if the texel filtering operation would access one or more texels \(t_{ij}\) in the returned mip level where:
\[ i0 = \begin{cases} 
  \text{gran}.x \times (8 \times \text{anchor}.x + lgx), & \text{if} lgx + \text{offset}.x < 8 \\
  \text{gran}.x \times (8 \times (\text{anchor}.x - 1) + lgx), & \text{otherwise}
\end{cases} \]

\[ i1 = i0 + \text{gran}.x - 1 \]

\[ j0 = \begin{cases} 
  \text{gran}.y \times (8 \times \text{anchor}.y + lgy), & \text{if} lgy + \text{offset}.y < 8 \\
  \text{gran}.y \times (8 \times (\text{anchor}.y - 1) + lgy), & \text{otherwise}
\end{cases} \]

\[ j1 = j0 + \text{gran}.y - 1 \]

and

- \( i0 \leq i \leq i1 \) and \( j0 \leq j \leq j1 \);
- \text{gran} is a two-component vector holding the width and height of the texel group identified by the granularity;
- \text{anchor} is the returned two-component anchor vector; and
- \text{offset} is the returned two-component offset vector.

For footprints in three-dimensional images (\text{Dim}3D), the mask returned by \text{OpImageSampleFootprintNV} indicates whether each texel group in a 4x4x4 local neighborhood of texel groups would have one or more texels accessed during texel filtering. In the mask, the texel group with local group coordinates \((lgx, lgy, lgz)\), is considered covered if and only if:

\[ 0 \neq ((\text{mask}.x + (\text{mask}.y << 32)) \& ((lgz \times 16 + lgy \times 4 + lgx))) \]

where:

- \( 0 \leq lgx < 4, 0 \leq lgy < 4, \) and \( 0 \leq lgz < 4 \); and
- \text{mask} is the returned two-component mask.

The local group with coordinates \((lgx, lgy, lgz)\) in the mask is considered covered if and only if the texel filtering operation would access one or more texels \( \tau_{ijk} \) in the returned miplevel where:

\[ k0 = \begin{cases} 
  \text{gran}.z \times (4 \times \text{anchor}.z + lgz), & \text{if} lgz + \text{offset}.z < 4 \\
  \text{gran}.z \times (4 \times (\text{anchor}.z - 1) + lgz), & \text{otherwise}
\end{cases} \]

\[ k1 = k0 + \text{gran}.z - 1 \]

and

- \( i0 \leq i \leq i1, j0 \leq j \leq j1, k0 \leq k \leq k1 \);
- \text{gran} is a three-component vector holding the width, height, and depth of the texel group identified by the granularity;
- \text{anchor} is the returned three-component anchor vector; and
- \text{offset} is the returned three-component offset vector.

If the sampler used by \text{OpImageSampleFootprintNV} enables anisotropic texel filtering via
anisotropyEnable, it is possible that the set of texel groups accessed in a mip level may be too large to be expressed using an 8x8 or 4x4x4 mask using the granularity requested in the instruction. In this case, the implementation uses a texel group larger than the requested granularity. When a larger texel group size is used, 

**OpImageSampleFootprintNV** returns an integer granularity value that can be interpreted in the same manner as the granularity value provided to the instruction to determine the texel group size used. If anisotropic texel filtering is disabled in the sampler, or if an anisotropic footprint can be represented as an 8x8 or 4x4x4 mask with the requested granularity, 

**OpImageSampleFootprintNV** will use the requested granularity as-is and return a granularity value of zero.

**OpImageSampleFootprintNV** supports only two- and three-dimensional image accesses (Dim2D and Dim3D), and the footprint returned is undefined if a sampler uses an addressing mode other than VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

### 16.10. Image Operation Steps

Each step described in this chapter is performed by a subset of the image instructions:

- **Texel Input Validation Operations, Format Conversion, Texel Replacement, Conversion to RGBA, and Component Swizzle**: Performed by all instructions except **OpImageWrite**.

- **Depth Comparison**: Performed by **OpImage*Dref** instructions.

- **All Texel output operations**: Performed by **OpImageWrite**.

- **Projection**: Performed by all **OpImage*Proj** instructions.

- **Derivative Image Operations, Cube Map Operations, Scale Factor Operation, Level-of-Detail Operation and Image Level(s) Selection, and Texel Anisotropic Filtering**: Performed by all **OpImageSample** and **OpImageSparseSample** instructions.

- **(s,t,r,q,a) to (u,v,w,a) Transformation, Wrapping, and (u,v,w,a) to (i,j,k,l,n) Transformation And Array Layer Selection**: Performed by all **OpImageSample**, **OpImageSparseSample**, and **OpImage*Gather** instructions.

- **Texel Gathering**: Performed by **OpImage*Gather** instructions.

- **Texel Footprint Evaluation**: Performed by **OpImageSampleFootprint** instructions.

- **Texel Filtering**: Performed by all **OpImageSample** and **OpImageSparseSample** instructions.

- **Sparse Residency**: Performed by all **OpImageSparse** instructions.

### 16.11. Image Query Instructions

#### 16.11.1. Image Property Queries

**OpImageQuerySize**, **OpImageQuerySizeLod**, **OpImageQueryLevels**, and **OpImageQuerySamples** query properties of the image descriptor that would be accessed by a shader image operation. They return 0 if the bound descriptor is a null descriptor.

**OpImageQuerySizeLod** returns the size of the image level identified by the Level of Detail operand. If that level does not exist in the image, and the descriptor is not null, then the value returned is
16.11.2. Lod Query

\textit{OpImageQueryLod} returns the Lod parameters that would be used in an image operation with the given image and coordinates. If the descriptor that would be accessed is a null descriptor then \((0, 0)\) is returned. Otherwise, the steps described in this chapter are performed as if for \textit{OpImageSampleImplicitLod}, up to Scale Factor Operation, Level-of-Detail Operation and Image Level(s) Selection. The return value is the vector \((\lambda', d)\). These values may be subject to implementation-specific maxima and minima for very large, out-of-range values.
Chapter 17. Fragment Density Map Operations

17.1. Fragment Density Map Operations Overview

When a fragment is generated in a render pass that has a fragment density map attachment, its area is determined by the properties of the local framebuffer region that the fragment occupies. The framebuffer is divided into a uniform grid of these local regions, and their fragment area property is derived from the density map with the following operations:

- Fetch density value
  - Component swizzle
  - Component mapping
- Fragment area conversion
  - Fragment area filter
  - Fragment area clamp

17.2. Fetch Density Value

Each local framebuffer region at center coordinate \((x, y)\) fetches a texel from the fragment density map at integer coordinates:

\[
i = \left\lfloor \frac{x}{\text{FragmentDensityTexelSize.width}} \right\rfloor
\]

\[
j = \left\lfloor \frac{y}{\text{FragmentDensityTexelSize.height}} \right\rfloor
\]

Where the size of each region in the framebuffer is:

\[
\text{FragmentDensityTexelSize.width} = 2^{\left\lfloor \log_2\left(\frac{\text{framebuffer.width}}{\text{FragmentDensityMap.width}}\right)\right\rfloor}
\]

\[
\text{FragmentDensityTexelSize.height} = 2^{\left\lfloor \log_2\left(\frac{\text{framebuffer.height}}{\text{FragmentDensityMap.height}}\right)\right\rfloor}
\]

This region is subject to the limits in \texttt{VkPhysicalDeviceFragmentDensityMapPropertiesEXT} and therefore the final region size is clamped:

\[
\text{FragmentDensityTexelSize.width} = \text{clamp}(\text{FragmentDensityTexelSize.width}, \text{minFragmentDensityTexelSize.width}, \text{maxFragmentDensityTexelSize.width})
\]
When multiview is enabled for the render pass and the fragment density map attachment view was created with \texttt{layerCount} greater than 1, the density map layer that the texel is fetched from is:

\[
\text{layer} = \text{baseArrayLayer} + \text{ViewIndex}
\]

Otherwise:

\[
\text{layer} = \text{baseArrayLayer}
\]

The texel fetched from the density map at \((i,j,\text{layer})\) is next converted to density with the following operations.

\subsection{Component Swizzle}

The \texttt{components} member of \texttt{VkImageViewCreateInfo} is applied to the fetched texel as defined in Image component swizzle.

\subsection{Component Mapping}

The swizzled texel’s components are mapped to a density value:

\[
\text{densityValue}_{xy} = (C^{r}, C^{g})
\]

\section{Fragment Area Conversion}

Fragment area for the framebuffer region is undefined if the density fetched is not a normalized floating-point value greater than 0.0. Otherwise, the fetched fragment area for that region is derived as:

\[
\text{fragmentArea}_{wh} = \frac{1.0}{\text{densityValue}_{xy}}
\]

\subsection{Fragment Area Filter}

Optionally, the implementation \texttt{may} fetch additional density map texels in an implementation defined window around \((i,j)\). The texels follow the standard conversion steps up to and including fragment area conversion.

A single fetched fragment area for the framebuffer region is chosen by the implementation and \texttt{must} have an area between the \texttt{min} and \texttt{max} areas of the fetched set.
17.3.2. Fragment Area Clamp

The implementation may clamp the fetched fragment area to one that it supports. The clamped fragment area must have a size less than or equal to the original fetched value. Implementations may vary the supported set of fragment areas per framebuffer region. Fragment area (1,1) must always be in the supported set.

Note
For example, if the fetched fragment area is (1,4) but the implementation only supports areas of {(1,1),(2,2)}, it could choose to clamp the area to (2,2) since it has the same size as (1,4). While this would produce fragments that have lower quality strictly in the x-axis, the overall density is maintained.

The clamped fragment area is assigned to the corresponding framebuffer region.
Chapter 18. Queries

Queries provide a mechanism to return information about the processing of a sequence of Vulkan
commands. Query operations are asynchronous, and as such, their results are not returned
immediately. Instead, their results, and their availability status are stored in a Query Pool. The state
of these queries can be read back on the host, or copied to a buffer object on the device.

The supported query types are Occlusion Queries, Pipeline Statistics Queries, Result Status Queries,
Video Encode Bitstream Queries, and Timestamp Queries. Performance Queries are supported if the
associated extension is available. Transform Feedback Queries are supported if the associated
extension is available. Intel performance queries are supported if the associated extension is
available.

Several additional queries with specific purposes associated with ray tracing are available if the
corresponding extensions are supported, as described for VkQueryType.

18.1. Query Pools

Queries are managed using query pool objects. Each query pool is a collection of a specific number
of queries of a particular type.

Query pools are represented by VkQueryPool handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkQueryPool)
```

To create a query pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateQueryPool(
    VkDevice device,
    const VkQueryPoolCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkQueryPool* pQueryPool);
```

- device is the logical device that creates the query pool.
- pCreateInfo is a pointer to a VkQueryPoolCreateInfo structure containing the number and type
  of queries to be managed by the pool.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pQueryPool is a pointer to a VkQueryPool handle in which the resulting query pool object is
  returned.
Valid Usage (Implicit)

- VUID-vkCreateQueryPool-device-parameter
  *device* must be a valid *VkDevice* handle

- VUID-vkCreateQueryPool-pCreateInfo-parameter
  *pCreateInfo* must be a valid pointer to a valid *VkQueryPoolCreateInfo* structure

- VUID-vkCreateQueryPool-pAllocator-parameter
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure

- VUID-vkCreateQueryPool-pQueryPool-parameter
  *pQueryPool* must be a valid pointer to a *VkQueryPool* handle

Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The *VkQueryPoolCreateInfo* structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkQueryPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkQueryPoolCreateFlags flags;
    VkQueryType queryType;
    uint32_t queryCount;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkQueryPoolCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **queryType** is a *VkQueryType* value specifying the type of queries managed by the pool.
- **queryCount** is the number of queries managed by the pool.
- **pipelineStatistics** is a bitmask of *VkQueryPipelineStatisticFlagBits* specifying which counters will be returned in queries on the new pool, as described below in Pipeline Statistics Queries.

**pipelineStatistics** is ignored if **queryType** is not **VK_QUERY_TYPE_PIPELINE_STATISTICS**.
Valid Usage

- VUID-VkQueryPoolCreateInfo-queryType-00791
  If the pipeline statistics queries feature is not enabled, queryType must not be VK_QUERY_TYPE_PIPELINE_STATISTICS

- VUID-VkQueryPoolCreateInfo-queryType-00792
  If queryType is VK_QUERY_TYPE_PIPELINE_STATISTICS, pipelineStatistics must be a valid combination of VkQueryPipelineStatisticFlagBits values

- VUID-VkQueryPoolCreateInfo-queryType-03222
  If queryType is VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the pNext chain must include a VkQueryPoolPerformanceCreateInfoKHR structure

- VUID-VkQueryPoolCreateInfo-queryCount-02763
  queryCount must be greater than 0

Valid Usage (Implicit)

- VUID-VkQueryPoolCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO

- VUID-VkQueryPoolCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkQueryPoolPerformanceCreateInfoKHR, VkQueryPoolPerformanceQueryCreateInfoINTEL, or VkVideoProfileKHR

- VUID-VkQueryPoolCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkQueryPoolCreateInfo-flags-zerobitmask
  flags must be 0

- VUID-VkQueryPoolCreateInfo-queryType-parameter
  queryType must be a valid VkQueryType value

// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryPoolCreateFlags;

VkQueryPoolCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The VkQueryPoolPerformanceCreateInfoKHR structure is defined as:
typedef struct VkQueryPoolPerformanceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t queueFamilyIndex;
    uint32_t counterIndexCount;
    const uint32_t* pCounterIndices;
} VkQueryPoolPerformanceCreateInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **queueFamilyIndex** is the queue family index to create this performance query pool for.
- **counterIndexCount** is the length of the pCounterIndices array.
- **pCounterIndices** is a pointer to an array of indices into the vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR::pCounters to enable in this performance query pool.

**Valid Usage**

- VUID-VkQueryPoolPerformanceCreateInfoKHR-queueFamilyIndex-03236
  queueFamilyIndex must be a valid queue family index of the device

- VUID-VkQueryPoolPerformanceCreateInfoKHR-performanceCounterQueryPools-03237
  The performanceCounterQueryPools feature must be enabled

- VUID-VkQueryPoolPerformanceCreateInfoKHR-pCounterIndices-03321
  Each element of pCounterIndices must be in the range of counters reported by vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR for the queue family specified in queueFamilyIndex

**Valid Usage (Implicit)**

- VUID-VkQueryPoolPerformanceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR

- VUID-VkQueryPoolPerformanceCreateInfoKHR-pCounterIndices-parameter
  pCounterIndices must be a valid pointer to an array of counterIndexCount uint32_t values

- VUID-VkQueryPoolPerformanceCreateInfoKHR-counterIndexCount-arraylength
  counterIndexCount must be greater than 0

To query the number of passes required to query a performance query pool on a physical device, call:
void vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR(
  VkPhysicalDevice physicalDevice,
  const VkQueryPoolPerformanceCreateInfoKHR* pPerformanceQueryCreateInfo,
  uint32_t* pNumPasses);

• physicalDevice is the handle to the physical device whose queue family performance query counter properties will be queried.

• pPerformanceQueryCreateInfo is a pointer to a VkQueryPoolPerformanceCreateInfoKHR of the performance query that is to be created.

• pNumPasses is a pointer to an integer related to the number of passes required to query the performance query pool, as described below.

The pPerformanceQueryCreateInfo member VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex must be a queue family of physicalDevice. The number of passes required to capture the counters specified in the pPerformanceQueryCreateInfo member VkQueryPoolPerformanceCreateInfoKHR ::pCounters is returned in pNumPasses.

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pPerformanceQueryCreateInfo-parameter
  pPerformanceQueryCreateInfo must be a valid pointer to a valid VkQueryPoolPerformanceCreateInfoKHR structure

• VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pNumPasses-parameter
  pNumPasses must be a valid pointer to a uint32_t value

To destroy a query pool, call:

void vkDestroyQueryPool(
  VkDevice device,
  VkQueryPool queryPool,
  const VkAllocationCallbacks* pAllocator);

• device is the logical device that destroys the query pool.

• queryPool is the query pool to destroy.

• pAllocator controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage

- VUID-vkDestroyQueryPool-queryPool-00793
  All submitted commands that refer to `queryPool must` have completed execution

- VUID-vkDestroyQueryPool-queryPool-00794
  If `VkAllocationCallbacks` were provided when `queryPool` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyQueryPool-queryPool-00795
  If no `VkAllocationCallbacks` were provided when `queryPool` was created, `pAllocator must` be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyQueryPool-device-parameter
  `device must` be a valid `VkDevice` handle

- VUID-vkDestroyQueryPool-queryPool-parameter
  If `queryPool` is not `VK_NULL_HANDLE`, `queryPool must` be a valid `VkQueryPool` handle

- VUID-vkDestroyQueryPool-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator must` be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyQueryPool-queryPool-parent
  If `queryPool` is a valid handle, it must have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `queryPool must` be externally synchronized

Possible values of `VkQueryPoolCreateInfo::queryType`, specifying the type of queries managed by the pool, are:
typedef enum VkQueryType {
    VK_QUERY_TYPE_OCCLUSION = 0,
    VK_QUERY_TYPE_PIPELINE_STATISTICS = 1,
    VK_QUERY_TYPE_TIMESTAMP = 2,
}

// Provided by VK_KHR_video_queue
VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR = 1000023000,

// Provided by VK_KHR_framebuffer
VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR = 1000150000,

// Provided by VK_KHR_acceleration_structure
VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR = 1000150001,

// Provided by VK_NV_ray_tracing
VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV = 1000165000,

// Provided by VK_INTEL_performance_query
VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL = 1000210000,

// Provided by VK_KHR_video_encode_queue
VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR = 1000299000,
}

// Provided by VK_EXT_transform_feedback
VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT = 1000028004,

// Provided by VK_KHR_performance_query
VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR = 1000116000,

// Provided by VK_KHR_acceleration_structure
VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR = 1000150000,

// Provided by VK_KHR_acceleration_structure
VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR = 1000150001,

// Provided by VK_NV_ray_tracing
VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV = 1000165000,

// Provided by VK_INTEL_performance_query
VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL = 1000210000,

// Provided by VK_KHR_video_encode_queue
VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR = 1000299000,

• VK_QUERY_TYPE_OCCLUSION specifies an occlusion query.
• VK_QUERY_TYPE_PIPELINE_STATISTICS specifies a pipeline statistics query.
• VK_QUERY_TYPE_TIMESTAMP specifies a timestamp query.
• VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR specifies a performance query.
• VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT specifies a transform feedback query.
• VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR specifies an acceleration structure size query for use with vkCmdWriteAccelerationStructuresPropertiesKHR or vkWriteAccelerationStructuresPropertiesKHR.
• VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR specifies a serialization acceleration structure size query
• VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV specifies a acceleration structure size query for use with vkCmdWriteAccelerationStructuresPropertiesNV.
• VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL specifies an Intel performance query.
• VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR specifies a result status query.
• VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR specifies a video encode bitstream range query.
18.2. Query Operation

The operation of queries is controlled by the commands `vkCmdBeginQuery`, `vkCmdEndQuery`, `vkCmdBeginQueryIndexedEXT`, `vkCmdEndQueryIndexedEXT`, `vkCmdResetQueryPool`, `vkCmdCopyQueryPoolResults`, `vkCmdWriteTimestamp2KHR`, and `vkCmdWriteTimestamp`.

In order for a `VkCommandBuffer` to record query management commands, the queue family for which its `VkCommandPool` was created must support the appropriate type of operations (graphics, compute) suitable for the query type of a given query pool.

Each query in a query pool has a status that is either unavailable or available, and also has state to store the numerical results of a query operation of the type requested when the query pool was created. Resetting a query via `vkCmdResetQueryPool` or `vkResetQueryPool` sets the status to unavailable and makes the numerical results undefined. Performing a query operation with `vkCmdBeginQuery` and `vkCmdEndQuery` changes the status to available when the query finishes, and updates the numerical results. Both the availability status and numerical results are retrieved by calling either `vkGetQueryPoolResults` or `vkCmdCopyQueryPoolResults`.

Query commands, for the same query and submitted to the same queue, execute in their entirety in submission order, relative to each other. In effect there is an implicit execution dependency from each such query command to all query commands previously submitted to the same queue. There is one significant exception to this; if the flags parameter of `vkCmdCopyQueryPoolResults` does not include `VK_QUERY_RESULT_WAIT_BIT`, execution of `vkCmdCopyQueryPoolResults` may happen-before the results of `vkCmdEndQuery` are available.

After query pool creation, each query must be reset before it is used. Queries must also be reset between uses.

If a logical device includes multiple physical devices, then each command that writes a query must execute on a single physical device, and any call to `vkCmdBeginQuery` must execute the corresponding `vkCmdEndQuery` command on the same physical device.

To reset a range of queries in a query pool on a queue, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdResetQueryPool(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the handle of the query pool managing the queries being reset.
- `firstQuery` is the initial query index to reset.
- `queryCount` is the number of queries to reset.

When executed on a queue, this command sets the status of query indices `[firstQuery, firstQuery + queryCount - 1]` to unavailable.
If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command sets the status of query indices `[firstQuery, firstQuery + queryCount - 1]` to unavailable for each pass of `queryPool`, as indicated by a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

**Note**

Because `vkCmdResetQueryPool` resets all the passes of the indicated queries, applications must not record a `vkCmdResetQueryPool` command for a `queryPool` created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` in a command buffer that needs to be submitted multiple times as indicated by a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`. Otherwise applications will never be able to complete the recorded queries.

**Valid Usage**

- VUID-vkCmdResetQueryPool-firstQuery-00796
  
  `firstQuery` must be less than the number of queries in `queryPool`

- VUID-vkCmdResetQueryPool-firstQuery-00797
  
  The sum of `firstQuery` and `queryCount` must be less than or equal to the number of queries in `queryPool`

- VUID-vkCmdResetQueryPool-None-02841
  
  All queries used by the command must not be active

- VUID-vkCmdResetQueryPool-firstQuery-02862
  
  If `queryPool` was created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command must not be recorded in a command buffer that, either directly or through secondary command buffers, also contains begin commands for a query from the set of queries `[firstQuery, firstQuery + queryCount - 1]`
Valid Usage (Implicit)

- VUID-vkCmdResetQueryPool-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdResetQueryPool-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkCmdResetQueryPool-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdResetQueryPool-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdResetQueryPool-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdResetQueryPool-commonparent
  Both of `commandBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
</tr>
</tbody>
</table>

To reset a range of queries in a query pool on the host, call:

```c
// Provided by VK_EXT_host_query_reset
void vkResetQueryPoolEXT(
    VkDevice device,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount);
```

- `device` is the logical device that owns the query pool.
- `queryPool` is the handle of the query pool managing the queries being reset.
• **firstQuery** is the initial query index to reset.
• **queryCount** is the number of queries to reset.

This command sets the status of query indices \([\text{firstQuery}, \text{firstQuery} + \text{queryCount} - 1]\) to unavailable.

If **queryPool** is VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR this command sets the status of query indices \([\text{firstQuery}, \text{firstQuery} + \text{queryCount} - 1]\) to unavailable for each pass.

### Valid Usage

- VUID-vkResetQueryPool-None-02665
  - The **hostQueryReset** feature must be enabled

- VUID-vkResetQueryPool-firstQuery-02666
  - **firstQuery** must be less than the number of queries in **queryPool**

- VUID-vkResetQueryPool-firstQuery-02667
  - The sum of **firstQuery** and **queryCount** must be less than or equal to the number of queries in **queryPool**

- VUID-vkResetQueryPool-firstQuery-02741
  - Submitted commands that refer to the range specified by **firstQuery** and **queryCount** in **queryPool** must have completed execution

- VUID-vkResetQueryPool-firstQuery-02742
  - The range of queries specified by **firstQuery** and **queryCount** in **queryPool** must not be in use by calls to **vkGetQueryPoolResults** or **vkResetQueryPool** in other threads

### Valid Usage (Implicit)

- VUID-vkResetQueryPool-device-parameter
  - **device** must be a valid **VkDevice** handle

- VUID-vkResetQueryPool-queryPool-parameter
  - **queryPool** must be a valid **VkQueryPool** handle

- VUID-vkResetQueryPool-queryPool-parent
  - **queryPool** must have been created, allocated, or retrieved from **device**

Once queries are reset and ready for use, query commands can be issued to a command buffer. Occlusion queries and pipeline statistics queries count events - drawn samples and pipeline stage invocations, respectively - resulting from commands that are recorded between a **vkCmdBeginQuery** command and a **vkCmdEndQuery** command within a specified command buffer, effectively scoping a set of drawing and/or dispatching commands. Timestamp queries write timestamps to a query pool. Performance queries record performance counters to a query pool.

A query must begin and end in the same command buffer, although if it is a primary command buffer, and the **inherited queries** feature is enabled, it can execute secondary command buffers during the query operation. For a secondary command buffer to be executed while a query is
active, it **must** set the `occlusionQueryEnable`, `queryFlags`, and/or `pipelineStatistics` members of `VkCommandBufferInheritanceInfo` to conservative values, as described in the **Command Buffer Recording** section. A query **must** either begin and end inside the same subpass of a render pass instance, or **must** both begin and end outside of a render pass instance (i.e. contain entire render pass instances).

If queries are used while executing a render pass instance that has multiview enabled, the query uses \( N \) consecutive query indices in the query pool (starting at `query`) where \( N \) is the number of bits set in the view mask in the subpass the query is used in. How the numerical results of the query are distributed among the queries is implementation-dependent. For example, some implementations **may** write each view's results to a distinct query, while other implementations **may** write the total result to the first query and write zero to the other queries. However, the sum of the results in all the queries **must** accurately reflect the total result of the query summed over all views. Applications **can** sum the results from all the queries to compute the total result.

Queries used with multiview rendering **must** not span subpasses, i.e. they **must** begin and end in the same subpass.

To begin a query, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBeginQuery(  
    VkCommandBuffer commandBuffer,  
    VkQueryPool queryPool,  
    uint32_t query,  
    VkQueryControlFlags flags);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that will manage the results of the query.
- `query` is the query index within the query pool that will contain the results.
- `flags` is a bitmask of `VkQueryControlFlagBits` specifying constraints on the types of queries that can be performed.

If the `queryType` of the pool is `VK_QUERY_TYPE_OCCLUSION` and `flags` contains `VK_QUERY_CONTROL_PRECISE_BIT`, an implementation **must** return a result that matches the actual number of samples passed. This is described in more detail in **Occlusion Queries**.

Calling `vkCmdBeginQuery` is equivalent to calling `vkCmdBeginQueryIndexedEXT` with the `index` parameter set to zero.

After beginning a query, that query is considered **active** within the command buffer it was called in until that same query is ended. Queries active in a primary command buffer when secondary command buffers are executed are considered active for those secondary command buffers.
Valid Usage

- **VUID-vkCmdBeginQuery-None-00807**
  All queries used by the command **must** be unavailable

- **VUID-vkCmdBeginQuery-queryType-02804**
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_TIMESTAMP`

- **VUID-vkCmdBeginQuery-queryType-04728**
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`

- **VUID-vkCmdBeginQuery-queryType-04729**
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`

- **VUID-vkCmdBeginQuery-queryType-00800**
  If the precise occlusion queries feature is not enabled, or the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_OCCLUSION`, flags **must** not contain `VK_QUERY_CONTROL_PRECISE_BIT`

- **VUID-vkCmdBeginQuery-query-00802**
  `query` **must** be less than the number of queries in `queryPool`

- **VUID-vkCmdBeginQuery-queryType-00803**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_OCCLUSION`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdBeginQuery-queryType-00804**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate graphics operations, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdBeginQuery-queryType-00805**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate compute operations, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

- **VUID-vkCmdBeginQuery-queryType-00808**
  If called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in `queryPool`

- **VUID-vkCmdBeginQuery-queryType-04862**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR` the `VkCommandPool` that `commandBuffer` was allocated from **must** support video encode operations

- **VUID-vkCmdBeginQuery-queryPool-01922**
  `queryPool` **must** have been created with a `queryType` that differs from that of any queries that are active within `commandBuffer`

- **VUID-vkCmdBeginQuery-queryType-02327**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
operations

- **VUID-vkCmdBeginQuery-queryType-02328**
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` then `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackQueries` must be supported.

- **VUID-vkCmdBeginQuery-queryPool-03223**
  
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the profiling lock must have been held before `vkBeginCommandBuffer` was called on `commandBuffer`.

- **VUID-vkCmdBeginQuery-queryPool-03224**
  
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR`, the query begin must be the first recorded command in `commandBuffer`.

- **VUID-vkCmdBeginQuery-queryPool-03225**
  
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR`, the begin command must not be recorded within a render pass instance.

- **VUID-vkCmdBeginQuery-queryPool-03226**
  
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and another query pool with a `queryType` `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` has been used within `commandBuffer`, its parent primary command buffer or secondary command buffer recorded within the same parent primary command buffer as `commandBuffer`, the `performanceCounterMultipleQueryPools` feature must be enabled.

- **VUID-vkCmdBeginQuery-None-02863**
  
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command must not be recorded in a command buffer that, either directly or through secondary command buffers, also contains a `vkCmdResetQueryPool` command affecting the same query.
Valid Usage (Implicit)

- VUID-vkCmdBeginQuery-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBeginQuery-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

- VUID-vkCmdBeginQuery-flags-parameter
  flags must be a valid combination of VkQueryControlFlagBits values

- VUID-vkCmdBeginQuery-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBeginQuery-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdBeginQuery-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
</tr>
</tbody>
</table>

To begin an indexed query, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBeginQueryIndexedEXT(
    VkCommandBuffer commandBuffer,  // Provided by VK_EXT_transform_feedback
    VkQueryPool queryPool,
    uint32_t query,
    VkQueryControlFlags flags,
    uint32_t index);
```

- commandBuffer is the command buffer into which this command will be recorded.
• **queryPool** is the query pool that will manage the results of the query.

• **query** is the query index within the query pool that will contain the results.

• **flags** is a bitmask of **VkQueryControlFlagBits** specifying constraints on the types of queries that can be performed.

• **index** is the query type specific index. When the query type is **VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT** the index represents the vertex stream.

The **vkCmdBeginQueryIndexedEXT** command operates the same as the **vkCmdBeginQuery** command, except that it also accepts a query type specific **index** parameter.
Valid Usage

- VUID-vkCmdBeginQueryIndexedEXT-None-00807
  All queries used by the command must be unavailable

- VUID-vkCmdBeginQueryIndexedEXT-queryType-02804
  The queryType used to create queryPool must not be VK_QUERY_TYPE_TIMESTAMP

- VUID-vkCmdBeginQueryIndexedEXT-queryType-04728
  The queryType used to create queryPool must not be
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR
  or
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZE_SIZE_KHR

- VUID-vkCmdBeginQueryIndexedEXT-queryType-04729
  The queryType used to create queryPool must not be
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV

- VUID-vkCmdBeginQueryIndexedEXT-query-00802
  query must be less than the number of queries in queryPool

- VUID-vkCmdBeginQueryIndexedEXT-queryType-00803
  If the queryType used to create queryPool was VK_QUERY_TYPE_OCCLUSION, the VkCommandPool that
commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBeginQueryIndexedEXT-queryType-00804
  If the queryType used to create queryPool was VK_QUERY_TYPE_PIPELINE_STATISTICS and any
  of the pipelineStatistics indicate graphics operations, the VkCommandPool that
commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBeginQueryIndexedEXT-queryType-00805
  If the queryType used to create queryPool was VK_QUERY_TYPE_PIPELINE_STATISTICS and any
  of the pipelineStatistics indicate compute operations, the VkCommandPool that
commandBuffer was allocated from must support compute operations

- VUID-vkCmdBeginQueryIndexedEXT-query-00808
  If called within a render pass instance, the sum of query and the number of bits set in the
  current subpass’s view mask must be less than or equal to the number of queries in queryPool

- VUID-vkCmdBeginQueryIndexedEXT-queryType-04862
  If the queryType used to create queryPool was
  VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR the VkCommandPool that
commandBuffer was allocated from must support video encode operations

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-04753
  If the queryPool was created with the same queryType as that of another active query
  within commandBuffer, then index must not match the index used for the active query

- VUID-vkCmdBeginQueryIndexedEXT-queryType-02338
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT
  the VkCommandPool that commandBuffer was allocated from must support graphics
operations

• VUID-vkCmdBeginQueryIndexedEXT-queryType-02339
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT the index parameter must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams

• VUID-vkCmdBeginQueryIndexedEXT-queryType-02340
  If the queryType used to create queryPool was not VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT the index must be zero

• VUID-vkCmdBeginQueryIndexedEXT-queryType-02341
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT then VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackQueries must be supported

• VUID-vkCmdBeginQueryIndexedEXT-queryPool-03223
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the profiling lock must have been held before vkBeginCommandBuffer was called on commandBuffer

• VUID-vkCmdBeginQueryIndexedEXT-queryPool-03224
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and one of the counters used to create queryPool was VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR, the query begin must be the first recorded command in commandBuffer

• VUID-vkCmdBeginQueryIndexedEXT-queryPool-03225
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and one of the counters used to create queryPool was VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR, the begin command must not be recorded within a render pass instance

• VUID-vkCmdBeginQueryIndexedEXT-queryPool-03226
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and another query pool with a queryType VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR has been used within commandBuffer, its parent primary command buffer or secondary command buffer recorded within the same parent primary command buffer as commandBuffer, the performanceCounterMultipleQueryPools feature must be enabled

• VUID-vkCmdBeginQueryIndexedEXT-None-02863
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, this command must not be recorded in a command buffer that, either directly or through secondary command buffers, also contains a vkCmdResetQueryPool command affecting the same query
Valid Usage (Implicit)

- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkCmdBeginQueryIndexedEXT-flags-parameter
  `flags` must be a valid combination of `VkQueryControlFlagBits` values

- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdBeginQueryIndexedEXT-commonparent
  Both of `commandBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
</tr>
</tbody>
</table>

Bits which can be set in `vkCmdBeginQuery::flags`, specifying constraints on the types of queries that can be performed, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryControlFlagBits {
    VK_QUERY_CONTROL_PRECISE_BIT = 0x00000001,
} VkQueryControlFlagBits;

- `VK_QUERY_CONTROL_PRECISE_BIT` specifies the precision of occlusion queries.
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryControlFlags;

VkQueryControlFlags is a bitmask type for setting a mask of zero or more VkQueryControlFlagBits.

To end a query after the set of desired drawing or dispatching commands is executed, call:

// Provided by VK_VERSION_1_0
void vkCmdEndQuery(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t query);

- commandBuffer is the command buffer into which this command will be recorded.
- queryPool is the query pool that is managing the results of the query.
- query is the query index within the query pool where the result is stored.

Calling `vkCmdEndQuery` is equivalent to calling `vkCmdEndQueryIndexedEXT` with the `index` parameter set to zero.

As queries operate asynchronously, ending a query does not immediately set the query's status to available. A query is considered finished when the final results of the query are ready to be retrieved by `vkGetQueryPoolResults` and `vkCmdCopyQueryPoolResults`, and this is when the query's status is set to available.

Once a query is ended the query must finish in finite time, unless the state of the query is changed using other commands, e.g. by issuing a reset of the query.
Valid Usage

- **VUID-vkCmdEndQuery-None-01923**
  All queries used by the command must be active

- **VUID-vkCmdEndQuery-query-00810**
  query must be less than the number of queries in queryPool

- **VUID-vkCmdEndQuery-query-00812**
  If `vkCmdEndQuery` is called within a render pass instance, the sum of query and the number of bits set in the current subpass’s view mask must be less than or equal to the number of queries in queryPool

- **VUID-vkCmdEndQuery-queryPool-03227**
  If `queryPool` was created with a `queryType` of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and one or more of the counters used to create `queryPool` was VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR, the `vkCmdEndQuery` must be the last recorded command in `commandBuffer`

- **VUID-vkCmdEndQuery-queryPool-03228**
  If `queryPool` was created with a `queryType` of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and one or more of the counters used to create `queryPool` was VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR, the `vkCmdEndQuery` must not be recorded within a render pass instance

Valid Usage (Implicit)

- **VUID-vkCmdEndQuery-commandBuffer-parameter**
  commandBuffer must be a valid VkCommandBuffer handle

- **VUID-vkCmdEndQuery-queryPool-parameter**
  queryPool must be a valid VkQueryPool handle

- **VUID-vkCmdEndQuery-commandBuffer-recording**
  commandBuffer must be in the recording state

- **VUID-vkCmdEndQuery-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- **VUID-vkCmdEndQuery-commonparent**
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To end an indexed query after the set of desired drawing or dispatching commands is recorded, call:

```c
void vkCmdEndQueryIndexedEXT(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t query,
    uint32_t index);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that is managing the results of the query.
- `query` is the query index within the query pool where the result is stored.
- `index` is the query type specific index.

The `vkCmdEndQueryIndexedEXT` command operates the same as the `vkCmdEndQuery` command, except that it also accepts a query type specific `index` parameter.
Valid Usage

- VUID-vkCmdEndQueryIndexedEXT-None-02342
  All queries used by the command must be active

- VUID-vkCmdEndQueryIndexedEXT-query-02343
  query must be less than the number of queries in queryPool

- VUID-vkCmdEndQueryIndexedEXT-query-02345
  If vkCmdEndQueryIndexedEXT is called within a render pass instance, the sum of query and the number of bits set in the current subpass's view mask must be less than or equal to the number of queries in queryPool

- VUID-vkCmdEndQueryIndexedEXT-queryType-02346
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT the index parameter must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams

- VUID-vkCmdEndQueryIndexedEXT-queryType-02347
  If the queryType used to create queryPool was not VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT the index must be zero

- VUID-vkCmdEndQueryIndexedEXT-queryType-02723
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT index must equal the index used to begin the query

Valid Usage (Implicit)

- VUID-vkCmdEndQueryIndexedEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdEndQueryIndexedEXT-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

- VUID-vkCmdEndQueryIndexedEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdEndQueryIndexedEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdEndQueryIndexedEXT-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tr>
</tbody>
</table>

An application can retrieve results either by requesting they be written into application-provided memory, or by requesting they be copied into a `VkBuffer`. In either case, the layout in memory is defined as follows:

- The first query's result is written starting at the first byte requested by the command, and each subsequent query's result begins `stride` bytes later.

- Occlusion queries, pipeline statistics queries, transform feedback queries, and timestamp queries store results in a tightly packed array of unsigned integers, either 32- or 64-bits as requested by the command, storing the numerical results and, if requested, the availability status.

- Performance queries store results in a tightly packed array whose type is determined by the `unit` member of the corresponding `VkPerformanceCounterKHR`.

- If `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is used, the final element of each query's result is an integer indicating whether the query's result is available, with any non-zero value indicating that it is available.

- If `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` is used, the final element of each query's result is an integer value indicating that status of the query result. Positive values indicate success, negative values indicate failure, and 0 indicates that the result is not yet available. Specific error codes are encoded in the `VkQueryResultStatusKHR` enumeration.

- Occlusion queries write one integer value - the number of samples passed. Pipeline statistics queries write one integer value for each bit that is enabled in the `pipelineStatistics` when the pool is created, and the statistics values are written in bit order starting from the least significant bit. Timestamp queries write one integer value. Performance queries write one `VkPerformanceCounterResultKHR` value for each `VkPerformanceCounterKHR` in the query. Transform feedback queries write two integers; the first integer is the number of primitives successfully written to the corresponding transform feedback buffer and the second is the number of primitives output to the vertex stream, regardless of whether they were successfully captured or not. In other words, if the transform feedback buffer was sized too small for the number of primitives output by the vertex stream, the first integer represents the number of primitives actually written and the second is the number that would have been written if all the transform feedback buffers associated with that vertex stream were large enough.
• If more than one query is retrieved and stride is not at least as large as the size of the array of values corresponding to a single query, the values written to memory are undefined.

To retrieve status and results for a set of queries, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetQueryPoolResults(
    VkDevice device,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount,
    size_t dataSize,
    void* pData,
    VkDeviceSize stride,
    VkQueryResultFlags flags);
```

• device is the logical device that owns the query pool.
• queryPool is the query pool managing the queries containing the desired results.
• firstQuery is the initial query index.
• queryCount is the number of queries to read.
• dataSize is the size in bytes of the buffer pointed to by pData.
• pData is a pointer to a user-allocated buffer where the results will be written
• stride is the stride in bytes between results for individual queries within pData.
• flags is a bitmask of VkQueryResultFlagBits specifying how and when results are returned.

The range of queries read is defined by [firstQuery, firstQuery + queryCount - 1]. For pipeline statistics queries, each query index in the pool contains one integer value for each bit that is enabled in VkQueryPoolCreateInfo::pipelineStatistics when the pool is created.

If no bits are set in flags, and all requested queries are in the available state, results are written as an array of 32-bit unsigned integer values. The behavior when not all queries are available, is described below.

If VK_QUERY_RESULT_64_BIT is not set and the result overflows a 32-bit value, the value may either wrap or saturate. Similarly, if VK_QUERY_RESULT_64_BIT is set and the result overflows a 64-bit value, the value may either wrap or saturate.

If VK_QUERY_RESULT_WAIT_BIT is set, Vulkan will wait for each query to be in the available state before retrieving the numerical results for that query. In this case, vkGetQueryPoolResults is guaranteed to succeed and return VK_SUCCESS if the queries become available in a finite time (i.e. if they have been issued and not reset). If queries will never finish (e.g. due to being reset but not issued), then vkGetQueryPoolResults may not return in finite time.

If VK_QUERY_RESULT_WAIT_BIT and VK_QUERY_RESULT_PARTIAL_BIT are both not set then no result values are written to pData for queries that are in the unavailable state at the time of the call, and vkGetQueryPoolResults returns VK_NOT_READY. However, availability state is still written to pData for
those queries if `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is set. Similarly, the status is still written to `pData` for those queries if `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` is set.

If `VK_QUERY_RESULT_WAIT_BIT` is not set, `vkGetQueryPoolResults` may return `VK_NOT_READY` if there are queries in the unavailable state.

**Note**  
Applications **must** take care to ensure that use of the `VK_QUERY_RESULT_WAIT_BIT` bit has the desired effect.

For example, if a query has been used previously and a command buffer records the commands `vkCmdResetQueryPool`, `vkCmdBeginQuery`, and `vkCmdEndQuery` for that query, then the query will remain in the available state until `vkResetQueryPool` is called or the `vkCmdResetQueryPool` command executes on a queue. Applications **can** use fences or events to ensure that a query has already been reset before checking for its results or availability status. Otherwise, a stale value could be returned from a previous use of the query.

The above also applies when `VK_QUERY_RESULT_WAIT_BIT` is used in combination with `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`. In this case, the returned availability status **may** reflect the result of a previous use of the query unless `vkResetQueryPool` is called or the `vkCmdResetQueryPool` command has been executed since the last use of the query.

A similar situation can arise with the `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` flag.

**Note**  
Applications **can** double-buffer query pool usage, with a pool per frame, and reset queries at the end of the frame in which they are read.

If `VK_QUERY_RESULT_PARTIAL_BIT` is set, `VK_QUERY_RESULT_WAIT_BIT` is not set, and the query's status is unavailable, an intermediate result value between zero and the final result value is written to `pData` for that query.

If `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is set, the final integer value written for each query is non-zero if the query's status was available or zero if the status was unavailable. When `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is used, implementations **must** guarantee that if they return a non-zero availability value then the numerical results **must** be valid, assuming the results are not reset by a subsequent command.

**Note**  
Satisfying this guarantee **may** require careful ordering by the application, e.g. to read the availability status before reading the results.

If `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` is set, the final integer value written for each query indicates whether the result is available or not, and whether an error occurred. A value of zero indicates that the results are not yet available. Positive values indicate that the operations within the query completed successfully, and the query results are valid. Negative values indicate that the
operations within the query completed unsuccessfully.

Specific result codes are defined by the VkQueryResultStatusKHR enumeration.

### Valid Usage

- **VUID-vkGetQueryPoolResults-firstQuery-00813**
  
  firstQuery must be less than the number of queries in queryPool

- **VUID-vkGetQueryPoolResults-flags-02828**
  
  If VK_QUERY_RESULT_64_BIT is not set in flags and the queryType used to create queryPool was not VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, then pData and stride must be multiples of 4

- **VUID-vkGetQueryPoolResults-flags-00815**
  
  If VK_QUERY_RESULT_64_BIT is set in flags then pData and stride must be multiples of 8

- **VUID-vkGetQueryPoolResults-queryType-03229**
  
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, then pData and stride must be multiples of the size of VkPerformanceCounterResultKHR

- **VUID-vkGetQueryPoolResults-queryType-04519**
  
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, then stride must be large enough to contain VkQueryPoolPerformanceCreateInfoKHR::counterIndexCount used to create queryPool times the size of VkPerformanceCounterResultKHR

- **VUID-vkGetQueryPoolResults-firstQuery-00816**
  
  The sum of firstQuery and queryCount must be less than or equal to the number of queries in queryPool

- **VUID-vkGetQueryPoolResults-dataSize-00817**
  
  dataSize must be large enough to contain the result of each query, as described here

- **VUID-vkGetQueryPoolResults-queryType-00818**
  
  If the queryType used to create queryPool was VK_QUERY_TYPE_TIMESTAMP, flags must not contain VK_QUERY_RESULT_PARTIAL_BIT

- **VUID-vkGetQueryPoolResults-queryType-03230**
  
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, flags must not contain VK_QUERY_RESULT_WITH_AVAILABILITY_BIT, VK_QUERY_RESULT_PARTIAL_BIT or VK_QUERY_RESULT_64_BIT

- **VUID-vkGetQueryPoolResults-queryType-03231**
  
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the queryPool must have been recorded once for each pass as retrieved via a call to vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR

- **VUID-vkGetQueryPoolResults-queryType-04810**
  
  If the queryType used to create queryPool was VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR, flags must include VK_QUERY_RESULT_WITH_STATUS_BIT_KHR

- **VUID-vkGetQueryPoolResults-flags-04811**
  
  If flags includes VK_QUERY_RESULT_WITH_STATUS_BIT_KHR, it must not include VK_QUERY_RESULT_WITH_AVAILABILITY_BIT
Valid Usage (Implicit)

• VUID-vkGetQueryPoolResults-device-parameter
  
  `device` must be a valid `VkDevice` handle

• VUID-vkGetQueryPoolResults-queryPool-parameter
  
  `queryPool` must be a valid `VkQueryPool` handle

• VUID-vkGetQueryPoolResults-pData-parameter
  
  `pData` must be a valid pointer to an array of `dataSize` bytes

• VUID-vkGetQueryPoolResults-flags-parameter
  
  `flags` must be a valid combination of `VkQueryResultFlagBits` values

• VUID-vkGetQueryPoolResults-dataSize-arraylength
  
  `dataSize` must be greater than 0

• VUID-vkGetQueryPoolResults-queryPool-parent
  
  `queryPool` must have been created, allocated, or retrieved from `device`

Return Codes

Success

• `VK_SUCCESS`

• `VK_NOT_READY`

Failure

• `VK_ERROR_OUT_OF_HOST_MEMORY`

• `VK_ERROR_OUT_OF_DEVICE_MEMORY`

• `VK_ERROR_DEVICE_LOST`

Bits which can be set in `vkGetQueryPoolResults::flags` and `vkCmdCopyQueryPoolResults::flags`, specifying how and when results are returned, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryResultFlagBits {
    VK_QUERY_RESULT_64_BIT = 0x00000001,
    VK_QUERY_RESULT_WAIT_BIT = 0x00000002,
    VK_QUERY_RESULT_WITH_AVAILABILITY_BIT = 0x00000004,
    VK_QUERY_RESULT_PARTIAL_BIT = 0x00000008,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_queue
    VK_QUERY_RESULT_WITH_STATUS_BIT_KHR = 0x00000010,
    #endif
} VkQueryResultFlagBits;
```

• `VK_QUERY_RESULT_64_BIT` specifies the results will be written as an array of 64-bit unsigned
integer values. If this bit is not set, the results will be written as an array of 32-bit unsigned integer values.

- **VK_QUERY_RESULT_WAIT_BIT** specifies that Vulkan will wait for each query’s status to become available before retrieving its results.

- **VK_QUERY_RESULT_WITH_AVAILABILITY_BIT** specifies that the availability status accompanies the results.

- **VK_QUERY_RESULT_PARTIAL_BIT** specifies that returning partial results is acceptable.

- **VK_QUERY_RESULT_WITH_STATUS_BIT_KHR** specifies that the last value returned in the query is a `VkQueryResultStatusKHR` value.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryResultFlags;
```

`VkQueryResultFlags` is a bitmask type for setting a mask of zero or more `VkQueryResultFlagBits`.

Specific status codes that **can** be returned from a query are:

```c
// Provided by VK_KHR_video_queue
typedef enum VkQueryResultStatusKHR {
    VK_QUERY_RESULT_STATUS_ERROR_KHR = -1,
    VK_QUERY_RESULT_STATUS_NOT_READY_KHR = 0,
    VK_QUERY_RESULT_STATUS_COMPLETE_KHR = 1,
} VkQueryResultStatusKHR;
```

- **VK_QUERY_RESULT_STATUS_NOT_READY_KHR** specifies that the query result is not yet available.

- **VK_QUERY_RESULT_STATUS_ERROR_KHR** specifies that operations did not complete successfully.

- **VK_QUERY_RESULT_STATUS_COMPLETE_KHR** specifies that operations completed successfully and the query result is available.

To copy query statuses and numerical results directly to buffer memory, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyQueryPoolResults(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    VkDeviceSize stride,
    VkQueryResultFlags flags);
```

- **commandBuffer** is the command buffer into which this command will be recorded.

- **queryPool** is the query pool managing the queries containing the desired results.
- \texttt{firstQuery} is the initial query index.
- \texttt{queryCount} is the number of queries. \texttt{firstQuery} and \texttt{queryCount} together define a range of queries.
- \texttt{dstBuffer} is a \texttt{VkBuffer} object that will receive the results of the copy command.
- \texttt{dstOffset} is an offset into \texttt{dstBuffer}.
- \texttt{stride} is the stride in bytes between results for individual queries within \texttt{dstBuffer}. The required size of the backing memory for \texttt{dstBuffer} is determined as described above for \texttt{vkGetQueryPoolResults}.
- \texttt{flags} is a bitmask of \texttt{VkQueryResultFlagBits} specifying how and when results are returned.

\texttt{vkCmdCopyQueryPoolResults} is guaranteed to see the effect of previous uses of \texttt{vkCmdResetQueryPool} in the same queue, without any additional synchronization. Thus, the results will always reflect the most recent use of the query.

\texttt{flags} has the same possible values described above for the \texttt{flags} parameter of \texttt{vkGetQueryPoolResults}, but the different style of execution causes some subtle behavioral differences. Because \texttt{vkCmdCopyQueryPoolResults} executes in order with respect to other query commands, there is less ambiguity about which use of a query is being requested.

Results for all requested occlusion queries, pipeline statistics queries, transform feedback queries, and timestamp queries are written as 64-bit unsigned integer values if \texttt{VK_QUERY_RESULT_64_BIT} is set or 32-bit unsigned integer values otherwise. Performance queries store results in a tightly packed array whose type is determined by the \texttt{unit} member of the corresponding \texttt{VkPerformanceCounterKHR}.

If neither of \texttt{VK_QUERY_RESULT_WAIT_BIT} and \texttt{VK_QUERY_RESULT_WITH_AVAILABILITY_BIT} are set, results are only written out for queries in the available state.

If \texttt{VK_QUERY_RESULT_WAIT_BIT} is set, the implementation will wait for each query's status to be in the available state before retrieving the numerical results for that query. This is guaranteed to reflect the most recent use of the query on the same queue, assuming that the query is not being simultaneously used by other queues. If the query does not become available in a finite amount of time (e.g. due to not issuing a query since the last reset), a \texttt{VK_ERROR_DEVICE_LOST} error may occur.

Similarly, if \texttt{VK_QUERY_RESULT_WITH_AVAILABILITY_BIT} is set and \texttt{VK_QUERY_RESULT_WAIT_BIT} is not set, the availability is guaranteed to reflect the most recent use of the query on the same queue, assuming that the query is not being simultaneously used by other queues. As with \texttt{vkGetQueryPoolResults}, implementations must guarantee that if they return a non-zero availability value, then the numerical results are valid.

If \texttt{VK_QUERY_RESULT_PARTIAL_BIT} is set, \texttt{VK_QUERY_RESULT_WAIT_BIT} is not set, and the query's status is unavailable, an intermediate result value between zero and the final result value is written for that query.

\texttt{VK_QUERY_RESULT_PARTIAL_BIT} must not be used if the pool's \texttt{queryType} is \texttt{VK_QUERY_TYPE_TIMESTAMP}.

\texttt{vkCmdCopyQueryPoolResults} is considered to be a transfer operation, and its writes to buffer memory must be synchronized using \texttt{VK_PIPELINE_STAGE_TRANSFER_BIT} and \texttt{VK_ACCESS_TRANSFER_WRITE_BIT}.
before using the results.
Valid Usage

- **VUID-vkCmdCopyQueryPoolResults-dstOffset-00819**
  
  `dstOffset` **must** be less than the size of `dstBuffer`

- **VUID-vkCmdCopyQueryPoolResults-firstQuery-00820**
  
  `firstQuery` **must** be less than the number of queries in `queryPool`

- **VUID-vkCmdCopyQueryPoolResults-firstQuery-00821**
  
  The sum of `firstQuery` and `queryCount` **must** be less than or equal to the number of queries in `queryPool`

- **VUID-vkCmdCopyQueryPoolResults-flags-00822**
  
  If `VK_QUERY_RESULT_64_BIT` is not set in `flags` then `dstOffset` and `stride` **must** be multiples of 4

- **VUID-vkCmdCopyQueryPoolResults-flags-00823**
  
  If `VK_QUERY_RESULT_64_BIT` is set in `flags` then `dstOffset` and `stride` **must** be multiples of 8

- **VUID-vkCmdCopyQueryPoolResults-dstBuffer-00824**
  
  `dstBuffer` **must** have enough storage, from `dstOffset`, to contain the result of each query, as described [here](#).

- **VUID-vkCmdCopyQueryPoolResults-dstBuffer-00825**
  
  `dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag

- **VUID-vkCmdCopyQueryPoolResults-dstBuffer-00826**
  
  If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdCopyQueryPoolResults-queryType-00827**
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TIMESTAMP`, `flags` **must not** contain `VK_QUERY_RESULT_PARTIAL_BIT`

- **VUID-vkCmdCopyQueryPoolResults-queryType-03232**
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, `VkPhysicalDevicePerformanceQueryPropertiesKHR::allowCommandBufferQueryCopies` **must** be `VK_TRUE`

- **VUID-vkCmdCopyQueryPoolResults-queryType-03233**
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, `flags` **must not** contain `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`, `VK_QUERY_RESULT_PARTIAL_BIT` or `VK_QUERY_RESULT_64_BIT`

- **VUID-vkCmdCopyQueryPoolResults-queryType-03234**
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `queryPool` **must** have been submitted once for each pass as retrieved via a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`

- **VUID-vkCmdCopyQueryPoolResults-queryType-02734**
  
  `vkCmdCopyQueryPoolResults` **must not be called** if the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL`

- **VUID-vkCmdCopyQueryPoolResults-queryType-04812**
  
  `vkCmdCopyQueryPoolResults` **must not be called** if the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`
Valid Usage (Implicit)

- **VUID-vkCmdCopyQueryPoolResults-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyQueryPoolResults-queryPool-parameter**
  
  `queryPool` must be a valid `VkQueryPool` handle

- **VUID-vkCmdCopyQueryPoolResults-dstBuffer-parameter**
  
  `dstBuffer` must be a valid `VkBuffer` handle

- **VUID-vkCmdCopyQueryPoolResults-flags-parameter**
  
  `flags` must be a valid combination of `VkQueryResultFlagBits` values

- **VUID-vkCmdCopyQueryPoolResults-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdCopyQueryPoolResults-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- **VUID-vkCmdCopyQueryPoolResults-renderpass**
  
  This command must only be called outside of a render pass instance

- **VUID-vkCmdCopyQueryPoolResults-commonparent**
  
  Each of `commandBuffer`, `dstBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Rendering operations such as clears, MSAA resolves, attachment load/store operations, and blits may count towards the results of queries. This behavior is implementation-dependent and may vary depending on the path used within an implementation. For example, some implementations have several types of clears, some of which may include vertices and some not.
18.3. Occlusion Queries

Occlusion queries track the number of samples that pass the per-fragment tests for a set of drawing commands. As such, occlusion queries are only available on queue families supporting graphics operations. The application can then use these results to inform future rendering decisions. An occlusion query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively. When an occlusion query begins, the count of passing samples always starts at zero. For each drawing command, the count is incremented as described in Sample Counting. If flags does not contain `VK_QUERY_CONTROL_PRECISE_BIT` an implementation may generate any non-zero result value for the query if the count of passing samples is non-zero.

```
Note
Not setting `VK_QUERY_CONTROL_PRECISE_BIT` mode may be more efficient on some implementations, and should be used where it is sufficient to know a boolean result on whether any samples passed the per-fragment tests. In this case, some implementations may only return zero or one, indifferent to the actual number of samples passing the per-fragment tests.
```

When an occlusion query finishes, the result for that query is marked as available. The application can then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

```
Note
If occluding geometry is not drawn first, samples can pass the depth test, but still not be visible in a final image.
```

18.4. Pipeline Statistics Queries

Pipeline statistics queries allow the application to sample a specified set of `VkPipeline` counters. These counters are accumulated by Vulkan for a set of either drawing or dispatching commands while a pipeline statistics query is active. As such, pipeline statistics queries are available on queue families supporting either graphics or compute operations. The availability of pipeline statistics queries is indicated by the `pipelineStatisticsQuery` member of the `VkPhysicalDeviceFeatures` object (see `vkGetPhysicalDeviceFeatures` and `vkCreateDevice` for detecting and requesting this query type on a `VkDevice`).

A pipeline statistics query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively. When a pipeline statistics query begins, all statistics counters are set to zero. While the query is active, the pipeline type determines which set of statistics are available, but these must be configured on the query pool when it is created. If a statistic counter is issued on a command buffer that does not support the corresponding operation, the value of that counter is undefined after the query has finished. At least one statistic counter relevant to the operations supported on the recording command buffer must be enabled.

Bits which can be set to individually enable pipeline statistics counters for query pools with `VkQueryPoolCreateInfo::pipelineStatistics`, and for secondary command buffers with `VkCommandBufferInheritanceInfo::pipelineStatistics`, are:
typedef enum VkQueryPipelineStatisticFlagBits {
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT = 0x00000001,
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT = 0x00000002,
    VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT = 0x00000004,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT = 0x00000008,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT = 0x00000010,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT = 0x00000020,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT = 0x00000040,
    VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT = 0x00000080,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT = 0x00000100,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT = 0x00000200,
    VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT = 0x00000400,
} VkQueryPipelineStatisticFlagBits;

• **VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT** specifies that queries managed by the pool will count the number of vertices processed by the input assembly stage. Vertices corresponding to incomplete primitives may contribute to the count.

• **VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives processed by the input assembly stage. If primitive restart is enabled, restarting the primitive topology has no effect on the count. Incomplete primitives may be counted.

• **VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of vertex shader invocations. This counter’s value is incremented each time a vertex shader is invoked.

• **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of geometry shader invocations. This counter’s value is incremented each time a geometry shader is invoked. In the case of instanced geometry shaders, the geometry shader invocations count is incremented for each separate instanced invocation.

• **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives generated by geometry shader invocations. The counter’s value is incremented each time the geometry shader emits a primitive. Restarting primitive topology using the SPIR-V instructions `OpEndPrimitive` or `OpEndStreamPrimitive` has no effect on the geometry shader output primitives count.

• **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of primitives processed by the Primitive Clipping stage of the pipeline. The counter’s value is incremented each time a primitive reaches the primitive clipping stage.

• **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives output by the Primitive Clipping stage of the pipeline. The counter’s value is incremented each time a primitive passes the primitive clipping stage. The actual number of primitives output by the primitive clipping stage for a particular input primitive is implementation-dependent but must satisfy the following conditions:
- If at least one vertex of the input primitive lies inside the clipping volume, the counter is incremented by one or more.
- Otherwise, the counter is incremented by zero or more.

- **VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of fragment shader invocations. The counter's value is incremented each time the fragment shader is **invoked**.

- **VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT** specifies that queries managed by the pool will count the number of patches processed by the tessellation control shader. The counter's value is incremented once for each patch for which a tessellation control shader is **invoked**.

- **VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of invocations of the tessellation evaluation shader. The counter's value is incremented each time the tessellation evaluation shader is **invoked**.

- **VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of compute shader invocations. The counter's value is incremented every time the compute shader is invoked. Implementations may skip the execution of certain compute shader invocations or execute additional compute shader invocations for implementation-dependent reasons as long as the results of rendering otherwise remain unchanged.

These values are intended to measure relative statistics on one implementation. Various device architectures will count these values differently. Any or all counters may be affected by the issues described in **Query Operation**.

**Note**

For example, tile-based rendering devices may need to replay the scene multiple times, affecting some of the counts.

If a pipeline has `rasterizerDiscardEnable` enabled, implementations may discard primitives after the final **pre-rasterization shader stage**. As a result, if `rasterizerDiscardEnable` is enabled, the clipping input and output primitives counters may not be incremented.

When a pipeline statistics query finishes, the result for that query is marked as available. The application can copy the result to a buffer (via `vkCmdCopyQueryPoolResults`), or request it be put into host memory (via `vkGetQueryPoolResults`).

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryPipelineStatisticFlags;
```

**VkQueryPipelineStatisticFlags** is a bitmask type for setting a mask of zero or more **VkQueryPipelineStatisticFlagBits**.
18.5. Timestamp Queries

Timestamps provide applications with a mechanism for timing the execution of commands. A timestamp is an integer value generated by the VkPhysicalDevice. Unlike other queries, timestamps do not operate over a range, and so do not use vkCmdBeginQuery or vkCmdEndQuery. The mechanism is built around a set of commands that allow the application to tell the VkPhysicalDevice to write timestamp values to a query pool and then either read timestamp values on the host (using vkGetQueryPoolResults) or copy timestamp values to a VkBuffer (using vkCmdCopyQueryPoolResults). The application can then compute differences between timestamps to determine execution time.

The number of valid bits in a timestamp value is determined by the VkQueueFamilyProperties::timestampValidBits property of the queue on which the timestamp is written. Timestamps are supported on any queue which reports a non-zero value for timestampValidBits via vkGetPhysicalDeviceQueueFamilyProperties. If the timestampComputeAndGraphics limit is VK_TRUE, timestamps are supported by every queue family that supports either graphics or compute operations (see VkQueueFamilyProperties).

The number of nanoseconds it takes for a timestamp value to be incremented by 1 can be obtained from VkPhysicalDeviceLimits::timestampPeriod after a call to vkGetPhysicalDeviceProperties.

To request a timestamp, call:

```cpp
// Provided by VK_KHR_synchronization2
void vkCmdWriteTimestamp2KHR(VkCommandBuffer commandBuffer,
                             VkPipelineStageFlags2KHR stage,
                             VkQueryPool queryPool,
                             uint32_t query);
```

- commandBuffer is the command buffer into which the command will be recorded.
- stage specifies a stage of the pipeline.
- queryPool is the query pool that will manage the timestamp.
- query is the query within the query pool that will contain the timestamp.

When vkCmdWriteTimestamp2KHR is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and writes a timestamp to a query pool.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations on the pipeline stage specified by stage.

The second synchronization scope includes only the timestamp write operation.

When the timestamp value is written, the availability status of the query is set to available.
**Note**
If an implementation is unable to detect completion and latch the timer at any specific stage of the pipeline, it **may** instead do so at any logically later stage.

Comparisons between timestamps are not meaningful if the timestamps are written by commands submitted to different queues.

**Note**
An example of such a comparison is subtracting an older timestamp from a newer one to determine the execution time of a sequence of commands.

If `vkCmdWriteTimestamp2KHR` is called while executing a render pass instance that has multiview enabled, the timestamp uses \(N\) consecutive query indices in the query pool (starting at `query`) where \(N\) is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

- The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the difference between the first query written by each command.

- All \(N\) queries are timestamp values. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the sum of the difference between corresponding queries written by each command. The difference between corresponding queries **may** be the execution time of a single view.

In either case, the application **can** sum the differences between all \(N\) queries to determine the total execution time.
Valid Usage

- **VUID-vkCmdWriteTimestamp2KHR-stage-03929**
  If the geometry shaders feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR`

- **VUID-vkCmdWriteTimestamp2KHR-stage-03930**
  If the tessellation shaders feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT_KHR` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT_KHR`

- **VUID-vkCmdWriteTimestamp2KHR-stage-03931**
  If the conditional rendering feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-vkCmdWriteTimestamp2KHR-stage-03932**
  If the fragment density map feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-vkCmdWriteTimestamp2KHR-stage-03933**
  If the transform feedback feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-vkCmdWriteTimestamp2KHR-stage-03934**
  If the mesh shaders feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_NV`

- **VUID-vkCmdWriteTimestamp2KHR-stage-03935**
  If the task shaders feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_NV`

- **VUID-vkCmdWriteTimestamp2KHR-stage-04956**
  If the shading rate image feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV`

- **VUID-vkCmdWriteTimestamp2KHR-stage-04957**
  If the subpass shading feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI`

- **VUID-vkCmdWriteTimestamp2KHR-stage-04955**
  If the invocation mask image feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`

- **VUID-vkCmdWriteTimestamp2KHR-synchronization2-03858**
  The synchronization2 feature must be enabled

- **VUID-vkCmdWriteTimestamp2KHR-stage-03859**
  stage must only include a single pipeline stage

- **VUID-vkCmdWriteTimestamp2KHR-stage-03860**
  stage must only include stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from

- **VUID-vkCmdWriteTimestamp2KHR-queryPool-03861**
  queryPool must have been created with a queryType of `VK_QUERY_TYPE_TIMESTAMP`

- **VUID-vkCmdWriteTimestamp2KHR-queryPool-03862**
  The query identified by queryPool and query must be unavailable
The command pool’s queue family must support a non-zero `timestampValidBits`.

`query` must be less than the number of queries in `queryPool`.

All queries used by the command must be unavailable.

If `vkCmdWriteTimestamp2KHR` is called within a render pass instance, the sum of `query` and the number of bits set in the current subpass’s view mask must be less than or equal to the number of queries in `queryPool`.

### Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `stage` must be a valid combination of `VkPipelineStageFlagBits2KHR` values.
- `stage` must not be 0.
- `queryPool` must be a valid `VkQueryPool` handle.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations.
- Both of `commandBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.
To request a timestamp, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdWriteTimestamp(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlagBits pipelineStage,
    VkQueryPool queryPool,
    uint32_t query);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineStage` is a `VkPipelineStageFlagBits` value, specifying a stage of the pipeline.
- `queryPool` is the query pool that will manage the timestamp.
- `query` is the query within the query pool that will contain the timestamp.

`vkCmdWriteTimestamp` latches the value of the timer when all previous commands have completed executing as far as the specified pipeline stage, and writes the timestamp value to memory. When the timestamp value is written, the availability status of the query is set to available.

**Note**

If an implementation is unable to detect completion and latch the timer at any specific stage of the pipeline, it *may* instead do so at any logically later stage.

Comparisons between timestamps are not meaningful if the timestamps are written by commands submitted to different queues.

**Note**

An example of such a comparison is subtracting an older timestamp from a newer one to determine the execution time of a sequence of commands.

If `vkCmdWriteTimestamp` is called while executing a render pass instance that has multiview enabled, the timestamp uses N consecutive query indices in the query pool (starting at `query`) where N is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

- The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the difference between the first
query written by each command.

- All N queries are timestamp values. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the sum of the difference between corresponding queries written by each command. The difference between corresponding queries may be the execution time of a single view.

In either case, the application can sum the differences between all N queries to determine the total execution time.
Valid Usage

- VUID-vkCmdWriteTimestamp-pipelineStage-04074
  pipelineStage must be a valid stage for the queue family that was used to create the command pool that commandBuffer was allocated from.

- VUID-vkCmdWriteTimestamp-pipelineStage-04075
  If the geometry shaders feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT.

- VUID-vkCmdWriteTimestamp-pipelineStage-04076
  If the tessellation shaders feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT.

- VUID-vkCmdWriteTimestamp-pipelineStage-04077
  If the conditional rendering feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT.

- VUID-vkCmdWriteTimestamp-pipelineStage-04078
  If the fragment density map feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT.

- VUID-vkCmdWriteTimestamp-pipelineStage-04079
  If the transform feedback feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT.

- VUID-vkCmdWriteTimestamp-pipelineStage-04080
  If the mesh shaders feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV or VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV.

- VUID-vkCmdWriteTimestamp-pipelineStage-04081
  If the shading rate image feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV.

- VUID-vkCmdWriteTimestamp-queryPool-01416
  queryPool must have been created with a queryType of VK_QUERY_TYPE_TIMESTAMP.

- VUID-vkCmdWriteTimestamp-queryPool-00828
  The query identified by queryPool and query must be unavailable.

- VUID-vkCmdWriteTimestamp-queryPool-00829
  The command pool’s queue family must support a non-zero timestampValidBits.

- VUID-vkCmdWriteTimestamp-query-04904
  query must be less than the number of queries in queryPool.

- VUID-vkCmdWriteTimestamp-None-00830
  All queries used by the command must be unavailable.

- VUID-vkCmdWriteTimestamp-query-00831
  If vkCmdWriteTimestamp is called within a render pass instance, the sum of query and the number of bits set in the current subpass’s view mask must be less than or equal to the number of queries in queryPool.
Valid Usage (Implicit)

- **VUID-vkCmdWriteTimestamp-commandBuffer-parameter**
  commandBuffer must be a valid VkCommandBuffer handle

- **VUID-vkCmdWriteTimestamp-pipelineStage-parameter**
  pipelineStage must be a valid VkPipelineStageFlagBits value

- **VUID-vkCmdWriteTimestamp-queryPool-parameter**
  queryPool must be a valid VkQueryPool handle

- **VUID-vkCmdWriteTimestamp-commandBuffer-recording**
  commandBuffer must be in the recording state

- **VUID-vkCmdWriteTimestamp-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

- **VUID-vkCmdWriteTimestamp-commonparent**
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

18.6. Performance Queries

*Performance queries* provide applications with a mechanism for getting performance counter information about the execution of command buffers, render passes, and commands.

Each queue family advertises the performance counters that can be queried on a queue of that family via a call to `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR`. Implementations may limit access to performance counters based on platform requirements or only to specialized drivers for development purposes.
Note
This may include no performance counters being enumerated, or a reduced set. Please refer to platform-specific documentation for guidance on any such restrictions.

Performance queries use the existing `vkCmdBeginQuery` and `vkCmdEndQuery` to control what command buffers, render passes, or commands to get performance information for.

Implementations may require multiple passes where the command buffer, render passes, or commands being recorded are the same and are executed on the same queue to record performance counter data. This is achieved by submitting the same batch and providing a `VkPerformanceQuerySubmitInfoKHR` structure containing a counter pass index. The number of passes required for a given performance query pool can be queried via a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

Note
Command buffers created with `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` must not be re-submitted. Changing command buffer usage bits may affect performance. To avoid this, the application should re-record any command buffers with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` when multiple counter passes are required.

Performance counter results from a performance query pool can be obtained with the command `vkGetQueryPoolResults`.

Performance query results are returned in an array of `VkPerformanceCounterResultKHR` unions containing the data associated with each counter in the query, stored in the same order as the counters supplied in `pCounterIndices` when creating the performance query. The `VkPerformanceCounterKHR::unit` enumeration specifies how to parse the counter data.

```c
// Provided by VK_KHR_performance_query
typedef union VkPerformanceCounterResultKHR {
    int32_t int32;
    int64_t int64;
    uint32_t uint32;
    uint64_t uint64;
    float float32;
    double float64;
} VkPerformanceCounterResultKHR;
```

18.6.1. Profiling Lock
To record and submit a command buffer that contains a performance query pool the profiling lock must be held. The profiling lock must be acquired prior to any call to `vkBeginCommandBuffer` that will be using a performance query pool. The profiling lock must be held while any command buffer that contains a performance query pool is in the recording, executable, or pending state. To acquire the profiling lock, call:
// Provided by VK_KHR_performance_query
VkResult vkAcquireProfilingLockKHR(
    VkDevice device,
    const VkAcquireProfilingLockInfoKHR* pInfo);

- device is the logical device to profile.
- pInfo is a pointer to a VkAcquireProfilingLockInfoKHR structure which contains information about how the profiling is to be acquired.

Implementations may allow multiple actors to hold the profiling lock concurrently.

Valid Usage (Implicit)

- VUID-vkAcquireProfilingLockKHR-device-parameter
device must be a valid VkDevice handle
- VUID-vkAcquireProfilingLockKHR-pInfo-parameter
pInfo must be a valid pointer to a valid VkAcquireProfilingLockInfoKHR structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_TIMEOUT

The VkAcquireProfilingLockInfoKHR structure is defined as:

// Provided by VK_KHR_performance_query
typedef struct VkAcquireProfilingLockInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAcquireProfilingLockFlagsKHR flags;
    uint64_t timeout;
} VkAcquireProfilingLockInfoKHR;

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- timeout indicates how long the function waits, in nanoseconds, if the profiling lock is not available.
Valid Usage (Implicit)

- VUID-VkAcquireProfilingLockInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR

- VUID-VkAcquireProfilingLockInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkAcquireProfilingLockInfoKHR-flags-zerobitmask
  flags must be 0

If timeout is 0, vkAcquireProfilingLockKHR will not block while attempting to acquire the profiling lock. If timeout is UINT64_MAX, the function will not return until the profiling lock was acquired.

```c
// Provided by VK_KHR_performance_query
typedef enum VkAcquireProfilingLockFlagBitsKHR {
} VkAcquireProfilingLockFlagBitsKHR;
```

```c
// Provided by VK_KHR_performance_query
typedef VkFlags VkAcquireProfilingLockFlagsKHR;
```

VkAcquireProfilingLockFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

To release the profiling lock, call:

```c
// Provided by VK_KHR_performance_query
void vkReleaseProfilingLockKHR(
    VkDevice device);
```

- device is the logical device to cease profiling on.

Valid Usage

- VUID-vkReleaseProfilingLockKHR-device-03235
  The profiling lock of device must have been held via a previous successful call to vkAcquireProfilingLockKHR

Valid Usage (Implicit)

- VUID-vkReleaseProfilingLockKHR-device-parameter
  device must be a valid VkDevice handle
18.7. Transform Feedback Queries

Transform feedback queries track the number of primitives attempted to be written and actually written, by the vertex stream being captured, to a transform feedback buffer. This query is updated during drawing commands while transform feedback is active. The number of primitives actually written will be less than the number attempted to be written if the bound transform feedback buffer size was too small for the number of primitives actually drawn. Primitives are not written beyond the bound range of the transform feedback buffer. A transform feedback query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively to query for vertex stream zero. `vkCmdBeginQueryIndexedEXT` and `vkCmdEndQueryIndexedEXT` can be used to begin and end transform feedback queries for any supported vertex stream. When a transform feedback query begins, the count of primitives written and primitives needed starts from zero. For each drawing command, the count is incremented as vertex attribute outputs are captured to the transform feedback buffers while transform feedback is active.

When a transform feedback query finishes, the result for that query is marked as available. The application can then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

18.8. Intel performance queries

Intel performance queries allow an application to capture performance data for a set of commands. Performance queries are used in a similar way than other types of queries. A main difference with existing queries is that the resulting data should be handed over to a library capable to produce human readable results rather than being read directly by an application.

Prior to creating a performance query pool, initialize the device for performance queries with the call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkInitializePerformanceApiINTEL(
    VkDevice device,
    const VkInitializePerformanceApiInfoINTEL* pInitializeInfo);
```

- `device` is the logical device used for the queries.
- `pInitializeInfo` is a pointer to a `VkInitializePerformanceApiInfoINTEL` structure specifying initialization parameters.

**Valid Usage (Implicit)**

- VUID-vkInitializePerformanceApiINTEL-device-parameter
device must be a valid `VkDevice` handle
- VUID-vkInitializePerformanceApiINTEL-pInitializeInfo-parameter
  pInitializeInfo must be a valid pointer to a valid `VkInitializePerformanceApiInfoINTEL` structure
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

The VkInitializePerformanceApiInfoINTEL structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkInitializePerformanceApiInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    void* pUserData;
} VkInitializePerformanceApiInfoINTEL;
```

• `sType` is the type of this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `pUserData` is a pointer for application data.

Valid Usage (Implicit)

• `VUID-VkInitializePerformanceApiInfoINTEL-sType-sType`
  `sType` must be `VK_STRUCTURE_TYPE_INITIALIZE_PERFORMANCE_API_INFO_INTEL`

• `VUID-VkInitializePerformanceApiInfoINTEL-pNext-pNext`
  `pNext` must be NULL

Once performance query operations have completed, uninitialize the device for performance queries with the call:

```c
// Provided by VK_INTEL_performance_query
void vkUninitializePerformanceApiINTEL(VkDevice device);
```

• `device` is the logical device used for the queries.

Valid Usage (Implicit)

• `VUID-vkUninitializePerformanceApiINTEL-device-parameter`
  `device` must be a valid `VkDevice` handle
Some performance query features of a device can be discovered with the call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkGetPerformanceParameterINTEL(
    VkDevice device,
    VkPerformanceParameterTypeINTEL parameter,
    VkPerformanceValueINTEL* pValue);
```

- `device` is the logical device to query.
- `parameter` is the parameter to query.
- `pValue` is a pointer to a `VkPerformanceValueINTEL` structure in which the type and value of the parameter are returned.

**Valid Usage (Implicit)**

- `VUID-vkGetPerformanceParameterINTEL-device-parameter` `device` must be a valid `VkDevice` handle
- `VUID-vkGetPerformanceParameterINTEL-parameter-parameter` `parameter` must be a valid `VkPerformanceParameterTypeINTEL` value
- `VUID-vkGetPerformanceParameterINTEL-pValue-parameter` `pValue` must be a valid pointer to a `VkPerformanceValueINTEL` structure

**Return Codes**

- **Success**
  - `VK_SUCCESS`
- **Failure**
  - `VK_ERROR_TOO_MANY_OBJECTS`
  - `VK_ERROR_OUT_OF_HOST_MEMORY`

Possible values of `vkGetPerformanceParameterINTEL::parameter`, specifying a performance query feature, are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceParameterTypeINTEL {
    VK_PERFORMANCE_PARAMETER_TYPE_HW_COUNTERS_SUPPORTED_INTEL = 0,
    VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL = 1,
} VkPerformanceParameterTypeINTEL;
```

- `VK_PERFORMANCE_PARAMETER_TYPE_HW_COUNTERS_SUPPORTED_INTEL` has a boolean result which tells whether hardware counters can be captured.
• **VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL** has a 32 bits integer result which tells how many bits can be written into the VkPerformanceValueINTEL value.

The **VkPerformanceValueINTEL** structure is defined as:

```
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceValueINTEL {
    VkPerformanceValueTypeINTEL type;
    VkPerformanceValueDataINTEL data;
} VkPerformanceValueINTEL;
```

• **type** is a VkPerformanceValueTypeINTEL value specifying the type of the returned data.
• **data** is a VkPerformanceValueDataINTEL union specifying the value of the returned data.

### Valid Usage (Implicit)

• VUID-VkPerformanceValueINTEL-type-parameter
type must be a valid VkPerformanceValueTypeINTEL value

• VUID-VkPerformanceValueINTEL-valueString-parameter
If type is VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL, the valueString member of data must be a null-terminated UTF-8 string

Possible values of **VkPerformanceValueINTEL::type**, specifying the type of the data returned in **VkPerformanceValueINTEL::data**, are:

• **VK_PERFORMANCE_VALUE_TYPE_UINT32_INTEL** specifies that unsigned 32-bit integer data is returned in data.value32.

• **VK_PERFORMANCE_VALUE_TYPE_UINT64_INTEL** specifies that unsigned 64-bit integer data is returned in data.value64.

• **VK_PERFORMANCE_VALUE_TYPE_FLOAT_INTEL** specifies that floating-point data is returned in data.valueFloat.

• **VK_PERFORMANCE_VALUE_TYPE_BOOL_INTEL** specifies that Bool32 data is returned in data.valueBool.

• **VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL** specifies that a pointer to a null-terminated UTF-8 string is returned in data.valueString. The pointer is valid for the lifetime of the device parameter passed to vkGetPerformanceParameterINTEL.

```
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceValueTypeINTEL {
    VK_PERFORMANCE_VALUE_TYPE_UINT32_INTEL = 0,
    VK_PERFORMANCE_VALUE_TYPE_UINT64_INTEL = 1,
    VK_PERFORMANCE_VALUE_TYPE_FLOAT_INTEL = 2,
    VK_PERFORMANCE_VALUE_TYPE_BOOL_INTEL = 3,
    VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL = 4,
} VkPerformanceValueTypeINTEL;
```
The `VkPerformanceValueDataINTEL` union is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef union VkPerformanceValueDataINTEL {
    uint32_t value32;
    uint64_t value64;
    float valueFloat;
    VkBool32 valueBool;
    const char* valueString;
} VkPerformanceValueDataINTEL;
```

- `data.value32` represents 32-bit integer data.
- `data.value64` represents 64-bit integer data.
- `data.valueFloat` represents floating-point data.
- `data.valueBool` represents `Bool32` data.
- `data.valueString` represents a pointer to a null-terminated UTF-8 string.

The correct member of the union is determined by the associated `VkPerformanceValueTypeINTEL` value.

The `VkQueryPoolPerformanceQueryCreateInfoINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkQueryPoolPerformanceQueryCreateInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    VkQueryPoolSamplingModeINTEL performanceCountersSampling;
} VkQueryPoolPerformanceQueryCreateInfoINTEL;
```

To create a pool for Intel performance queries, set `VkQueryPoolCreateInfo::queryType` to `VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL` and add a `VkQueryPoolPerformanceQueryCreateInfoINTEL` structure to the `pNext` chain of the `VkQueryPoolCreateInfo` structure.

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `performanceCountersSampling` describe how performance queries should be captured.

Valid Usage (Implicit)

- VUID-VkQueryPoolPerformanceQueryCreateInfoINTEL-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_QUERY_CREATE_INFO_INTEL`

- VUID-VkQueryPoolPerformanceQueryCreateInfoINTEL-performanceCountersSampling-parameter
  `performanceCountersSampling` must be a valid `VkQueryPoolSamplingModeINTEL` value
Possible values of `VkQueryPoolPerformanceQueryCreateInfoINTEL::performanceCountersSampling` are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkQueryPoolSamplingModeINTEL {
    VK_QUERY_POOL_SAMPLING_MODE_MANUAL_INTEL = 0,
} VkQueryPoolSamplingModeINTEL;
```

- `VK_QUERY_POOL_SAMPLING_MODE_MANUAL_INTEL` is the default mode in which the application calls `vkCmdBeginQuery` and `vkCmdEndQuery` to record performance data.

To help associate query results with a particular point at which an application emitted commands, markers can be set into the command buffers with the call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkCmdSetPerformanceMarkerINTEL(
    VkCommandBuffer commandBuffer,
    const VkPerformanceMarkerInfoINTEL* pMarkerInfo);
```

The last marker set onto a command buffer before the end of a query will be part of the query result.

### Valid Usage (Implicit)

- `VUID-vkCmdSetPerformanceMarkerINTEL-commandBuffer-parameter` commandBuffer must be a valid `VkCommandBuffer` handle
- `VUID-vkCmdSetPerformanceMarkerINTEL-pMarkerInfo-parameter` pMarkerInfo must be a valid pointer to a valid `VkPerformanceMarkerInfoINTEL` structure
- `VUID-vkCmdSetPerformanceMarkerINTEL-commandBuffer-recording` commandBuffer must be in the recording state
- `VUID-vkCmdSetPerformanceMarkerINTEL-commandBuffer-cmdpool` The `VkCommandPool` that commandBuffer was allocated from must support graphics, compute, or transfer operations

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the `VkCommandPool` that commandBuffer was allocated from must be externally synchronized

- VK_ERROR_OUT_OF_HOST_MEMORY

The VkPerformanceMarkerInfoINTEL structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceMarkerInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    uint64_t marker;
} VkPerformanceMarkerInfoINTEL;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `marker` is the marker value that will be recorded into the opaque query results.

Valid Usage (Implicit)

- VUID-VkPerformanceMarkerInfoINTEL-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_PERFORMANCE_MARKER_INFO_INTEL
- VUID-VkPerformanceMarkerInfoINTEL-pNext-pNext
  `pNext` must be NULL

When monitoring the behavior of an application within the dataset generated by the entire set of applications running on the system, it is useful to identify draw calls within a potentially huge amount of performance data. To do so, application can generate stream markers that will be used to trace back a particular draw call with a particular performance data item.
VkResult vkCmdSetPerformanceStreamMarkerINTEL(
    VkCommandBuffer commandBuffer,
    const VkPerformanceStreamMarkerInfoINTEL* pMarkerInfo);

Valid Usage (Implicit)

- VUID-vkCmdSetPerformanceStreamMarkerINTEL-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetPerformanceStreamMarkerINTEL-pMarkerInfo-parameter
  pMarkerInfo must be a valid pointer to a valid VkPerformanceStreamMarkerInfoINTEL structure
- VUID-vkCmdSetPerformanceStreamMarkerINTEL-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetPerformanceStreamMarkerINTEL-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, or transfer operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY
The `VkPerformanceStreamMarkerInfoINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceStreamMarkerInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    uint32_t marker;
} VkPerformanceStreamMarkerInfoINTEL;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `marker` is the marker value that will be recorded into the reports consumed by an external application.

**Valid Usage**

- VUID-VkPerformanceStreamMarkerInfoINTEL-marker-02735
  The value written by the application into `marker` **must** only used the valid bits as reported by `vkGetPerformanceParameterINTEL` with the `VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL`.

**Valid Usage (Implicit)**

- VUID-VkPerformanceStreamMarkerInfoINTEL-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_STREAM_MARKER_INFO_INTEL`
- VUID-VkPerformanceStreamMarkerInfoINTEL-pNext-pNext
  `pNext` **must** be `NULL`

Some applications might want measure the effect of a set of commands with a different settings. It is possible to override a particular settings using:

```c
// Provided by VK_INTEL_performance_query
VkResult vkCmdSetPerformanceOverrideINTEL(
    VkCommandBuffer commandBuffer,
    const VkPerformanceOverrideInfoINTEL* pOverrideInfo);
```

- `commandBuffer` is the command buffer where the override takes place.
- `pOverrideInfo` is a pointer to a `VkPerformanceOverrideInfoINTEL` structure selecting the parameter to override.
Valid Usage

- VUID-vkCmdSetPerformanceOverrideINTEL-pOverrideInfo-02736
  *pOverrideInfo* must not be used with a *VkPerformanceOverrideTypeINTEL* that is not reported available by *vkGetPerformanceParameterINTEL*

Valid Usage (Implicit)

- VUID-vkCmdSetPerformanceOverrideINTEL-commandBuffer-parameter
  *commandBuffer* must be a valid *VkCommandBuffer* handle

- VUID-vkCmdSetPerformanceOverrideINTEL-pOverrideInfo-parameter
  *pOverrideInfo* must be a valid pointer to a valid *VkPerformanceOverrideInfoINTEL* structure

- VUID-vkCmdSetPerformanceOverrideINTEL-commandBuffer-recording
  *commandBuffer* must be in the recording state

- VUID-vkCmdSetPerformanceOverrideINTEL-commandBuffer-cmdpool
  The *VkCommandPool* that *commandBuffer* was allocated from must support graphics, compute, or transfer operations

Host Synchronization

- Host access to *commandBuffer* must be externally synchronized

- Host access to the *VkCommandPool* that *commandBuffer* was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Transfer</td>
</tr>
</tbody>
</table>
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkPerformanceOverrideInfoINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceOverrideInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    VkPerformanceOverrideTypeINTEL type;
    VkBool32 enable;
    uint64_t parameter;
} VkPerformanceOverrideInfoINTEL;
```

- `type` is the particular `VkPerformanceOverrideTypeINTEL` to set.
- `enable` defines whether the override is enabled.
- `parameter` is a potential required parameter for the override.

**Valid Usage (Implicit)**

- `VUID-VkPerformanceOverrideInfoINTEL-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_OVERRIDE_INFO_INTEL`

- `VUID-VkPerformanceOverrideInfoINTEL-pNext-pNext`  
  `pNext` must be `NULL`

- `VUID-VkPerformanceOverrideInfoINTEL-type-parameter`  
  `type` must be a valid `VkPerformanceOverrideTypeINTEL` value

Possible values of `VkPerformanceOverrideInfoINTEL::type`, specifying performance override types, are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceOverrideTypeINTEL {
    VK_PERFORMANCE_OVERRIDE_TYPE_NULL_HARDWARE_INTEL = 0,
    VK_PERFORMANCE_OVERRIDE_TYPE_FLUSH_GPU_CACHES_INTEL = 1,
} VkPerformanceOverrideTypeINTEL;
```

- `VK_PERFORMANCE_OVERRIDE_TYPE_NULL_HARDWARE_INTEL` turns all rendering operations into noop.
• **VK_PERFORMANCE_OVERRIDE_TYPE_FLUSH_GPU_CACHES_INTEL** stalls the stream of commands until all previously emitted commands have completed and all caches have been flushed and invalidated.

Before submitting command buffers containing performance queries commands to a device queue, the application must acquire and set a performance query configuration. The configuration can be released once all command buffers containing performance query commands are not in a pending state.

```cpp
// Provided by VK_INTEL_performance_query
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPerformanceConfigurationINTEL)
```

To acquire a device performance configuration, call:

```cpp
// Provided by VK_INTEL_performance_query
VkResult vkAcquirePerformanceConfigurationINTEL(
    VkDevice device,
    const VkPerformanceConfigurationAcquireInfoINTEL* pAcquireInfo,
    VkPerformanceConfigurationINTEL* pConfiguration);
```

- `device` is the logical device that the performance query commands will be submitted to.
- `pAcquireInfo` is a pointer to a `VkPerformanceConfigurationAcquireInfoINTEL` structure, specifying the performance configuration to acquire.
- `pConfiguration` is a pointer to a `VkPerformanceConfigurationINTEL` handle in which the resulting configuration object is returned.

**Valid Usage (Implicit)**

- **VUID-vkAcquirePerformanceConfigurationINTEL-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkAcquirePerformanceConfigurationINTEL-pAcquireInfo-parameter**
  
  `pAcquireInfo` must be a valid pointer to a valid `VkPerformanceConfigurationAcquireInfoINTEL` structure

- **VUID-vkAcquirePerformanceConfigurationINTEL-pConfiguration-parameter**
  
  `pConfiguration` must be a valid pointer to a `VkPerformanceConfigurationINTEL` handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

The `VkPerformanceConfigurationAcquireInfoINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceConfigurationAcquireInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    VkPerformanceConfigurationTypeINTEL type;
} VkPerformanceConfigurationAcquireInfoINTEL;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `type` is one of the `VkPerformanceConfigurationTypeINTEL` type of performance configuration that will be acquired.

Valid Usage (Implicit)

- `VUID-VkPerformanceConfigurationAcquireInfoINTEL-sType-sType` 
  `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_CONFIGURATION_ACQUIRE_INFO_INTEL`
- `VUID-VkPerformanceConfigurationAcquireInfoINTEL-pNext-pNext` 
  `pNext` must be `NULL`
- `VUID-VkPerformanceConfigurationAcquireInfoINTEL-type-parameter` 
  `type` must be a valid `VkPerformanceConfigurationTypeINTEL` value

Possible values of `VkPerformanceConfigurationAcquireInfoINTEL::type`, specifying performance configuration types, are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceConfigurationTypeINTEL {
    VK_PERFORMANCE_CONFIGURATION_TYPE_COMMAND_QUEUE_METRICS_DISCOVERYActivated_INTEL = 0,
} VkPerformanceConfigurationTypeINTEL;
```

To set a performance configuration, call:
// Provided by VK_INTEL_performance_query
VkResult vkQueueSetPerformanceConfigurationINTEL(
    VkQueue queue, VkPerformanceConfigurationINTEL configuration);

- queue is the queue on which the configuration will be used.
- configuration is the configuration to use.

Valid Usage (Implicit)

- VUID-vkQueueSetPerformanceConfigurationINTEL-queue-parameter
  queue must be a valid VkQueue handle
- VUID-vkQueueSetPerformanceConfigurationINTEL-configuration-parameter
  configuration must be a valid VkPerformanceConfigurationINTEL handle
- VUID-vkQueueSetPerformanceConfigurationINTEL-commonparent
  Both of configuration, and queue must have been created, allocated, or retrieved from the same VkDevice

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>

</table>

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

To release a device performance configuration, call:

// Provided by VK_INTEL_performance_query
VkResult vkReleasePerformanceConfigurationINTEL(
    VkDevice device, VkPerformanceConfigurationINTEL configuration);

- device is the device associated to the configuration object to release.
• **configuration** is the configuration object to release.

### Valid Usage

- **VUID-vkReleasePerformanceConfigurationINTEL-configuration-02737**
  - **configuration** must not be released before all command buffers submitted while the configuration was set are in pending state

### Valid Usage (Implicit)

- **VUID-vkReleasePerformanceConfigurationINTEL-device-parameter**
  - **device** must be a valid VkDevice handle

- **VUID-vkReleasePerformanceConfigurationINTEL-configuration-parameter**
  - If **configuration** is not VK_NULL_HANDLE, **configuration** must be a valid VkPerformanceConfigurationINTEL handle

- **VUID-vkReleasePerformanceConfigurationINTEL-configuration-parent**
  - If **configuration** is a valid handle, it must have been created, allocated, or retrieved from device

### Host Synchronization

- Host access to **configuration** must be externally synchronized

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

### 18.9. Result Status Queries

Result status queries are used for a single purpose - to check whether a set of operations has completed successfully or not, using the VK_QUERY_RESULT_WITH_STATUS_BIT_KHR flag.

No other data is written to such a query.

### 18.10. Video Encode Bitstream Buffer Range

Bitstream buffer range queries describe the range of bytes written in the bitstream buffer by video
encode commands.

When an encode command is recorded within a bitstream buffer range query, two values are written to the query slot. The first value is an offset into the bitstream buffer where the encoded video data was written. This offset is an additional offset from the start of the range specified by the application. The second value is a size value describing the number of bytes written to the bitstream buffer beyond the offset.

One slot is consumed for each slice in each command recorded between a begin and end query pair.
Chapter 19. Clear Commands

19.1. Clearing Images Outside A Render Pass Instance

Color and depth/stencil images can be cleared outside a render pass instance using `vkCmdClearColorImage` or `vkCmdClearDepthStencilImage`, respectively. These commands are only allowed outside of a render pass instance.

To clear one or more subranges of a color image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdClearColorImage(
   VkCommandBuffer commandBuffer,
    VkImage image,
    VkImageLayout imageLayout,
    const VkClearColorValue* pColor,
    uint32_t rangeCount,
    const VkImageSubresourceRange* pRanges);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `image` is the image to be cleared.
- `imageLayout` specifies the current layout of the image subresource ranges to be cleared, and must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`.
- `pColor` is a pointer to a `VkClearColorValue` structure containing the values that the image subresource ranges will be cleared to (see Clear Values below).
- `rangeCount` is the number of image subresource range structures in `pRanges`.
- `pRanges` is a pointer to an array of `VkImageSubresourceRange` structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in Image Views.

Each specified range in `pRanges` is cleared to the value specified by `pColor`.

...
Valid Usage

- VUID-vkCmdClearColorImage-image-01993
  The format features of image must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT

- VUID-vkCmdClearColorImage-image-00002
  image must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag

- VUID-vkCmdClearColorImage-image-01545
  image must not use a format listed in Formats requiring sampler Y’CbCr conversion for VK_IMAGE_ASPECT_COLOR_BIT image views

- VUID-vkCmdClearColorImage-image-00003
  If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdClearColorImage-imageLayout-00004
  imageLayout must specify the layout of the image subresource ranges of image specified in pRanges at the time this command is executed on a VkDevice

- VUID-vkCmdClearColorImage-imageLayout-01394
  imageLayout must be VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, VK_IMAGE_LAYOUT_GENERAL, or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR

- VUID-vkCmdClearColorImage-aspectMask-02498
  The VkImageSubresourceRange::aspectMask members of the elements of the pRanges array must each only include VK_IMAGE_ASPECT_COLOR_BIT

- VUID-vkCmdClearColorImage-baseMipLevel-01470
  The VkImageSubresourceRange::baseMipLevel members of the elements of the pRanges array must each be less than the mipLevels specified in VkImageCreateInfo when image was created

- VUID-vkCmdClearColorImage-pRanges-01692
  For each VkImageSubresourceRange element of pRanges, if the levelCount member is not VK_REMAINING_MIP_LEVELS, then baseMipLevel + levelCount must be less than the mipLevels specified in VkImageCreateInfo when image was created

- VUID-vkCmdClearColorImage-baseArrayLayer-01472
  The VkImageSubresourceRange::baseArrayLayer members of the elements of the pRanges array must each be less than the arrayLayers specified in VkImageCreateInfo when image was created

- VUID-vkCmdClearColorImage-pRanges-01693
  For each VkImageSubresourceRange element of pRanges, if the layerCount member is not VK_REMAINING_ARRAY_LAYERS, then baseArrayLayer + layerCount must be less than the arrayLayers specified in VkImageCreateInfo when image was created

- VUID-vkCmdClearColorImage-image-00007
  image must not have a compressed or depth/stencil format

- VUID-vkCmdClearColorImage-pColor-04961
  pColor must be a valid pointer to a VkClearColorValue union
Valid Usage (Implicit)

- VUID-vkCmdClearColorImage-commandBuffer-parameter
  
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdClearColorImage-image-parameter
  
  image must be a valid VkImage handle

- VUID-vkCmdClearColorImage-imageLayout-parameter
  
  imageLayout must be a valid VkImageLayout value

- VUID-vkCmdClearColorImage-pRanges-parameter
  
  pRanges must be a valid pointer to an array of rangeCount valid VkImageSubresourceRange structures

- VUID-vkCmdClearColorImage-commandBuffer-recording
  
  commandBuffer must be in the recording state

- VUID-vkCmdClearColorImage-commandBuffer-cmdpool
  
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdClearColorImage-renderpass
  
  This command must only be called outside of a render pass instance

- VUID-vkCmdClearColorImage-rangeCount-arraylength
  
  rangeCount must be greater than 0

- VUID-vkCmdClearColorImage-commonparent
  
  Both of commandBuffer, and image must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
</tr>
</tbody>
</table>

To clear one or more subranges of a depth/stencil image, call:
void vkCmdClearDepthStencilImage(
    VkCommandBuffer commandBuffer,
    VkImage image,
    VkImageLayout imageLayout,
    const VkClearDepthStencilValue* pDepthStencil,
    uint32_t rangeCount,
    const VkImageSubresourceRange* pRanges);

• `commandBuffer` is the command buffer into which the command will be recorded.

• `image` is the image to be cleared.

• `imageLayout` specifies the current layout of the image subresource ranges to be cleared, and must be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`.

• `pDepthStencil` is a pointer to a `VkClearDepthStencilValue` structure containing the values that the depth and stencil image subresource ranges will be cleared to (see Clear Values below).

• `rangeCount` is the number of image subresource range structures in `pRanges`.

• `pRanges` is a pointer to an array of `VkImageSubresourceRange` structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in Image Views.
Valid Usage

- **VUID-vkCmdClearDepthStencilImage-image-01994**
  The format features of image must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT

- **VUID-vkCmdClearDepthStencilImage-pRanges-02658**
  If the aspect member of any element of pRanges includes VK_IMAGE_ASPECT_STENCIL_BIT, and image was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create image

- **VUID-vkCmdClearDepthStencilImage-pRanges-02659**
  If the aspect member of any element of pRanges includes VK_IMAGE_ASPECT_STENCIL_BIT, and image was not created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo::usage used to create image

- **VUID-vkCmdClearDepthStencilImage-pRanges-02660**
  If the aspect member of any element of pRanges includes VK_IMAGE_ASPECT_DEPTH_BIT, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo::usage used to create image

- **VUID-vkCmdClearDepthStencilImage-image-00010**
  If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdClearDepthStencilImage-imageLayout-00011**
  imageLayout must specify the layout of the image subresource ranges of image specified in pRanges at the time this command is executed on a VkDevice

- **VUID-vkCmdClearDepthStencilImage-imageLayout-00012**
  imageLayout must be either of VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- **VUID-vkCmdClearDepthStencilImage-aspectMask-02824**
  The VkImageSubresourceRange::aspectMask member of each element of the pRanges array must not include bits other than VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

- **VUID-vkCmdClearDepthStencilImage-image-02825**
  If the image's format does not have a stencil component, then the VkImageSubresourceRange::aspectMask member of each element of the pRanges array must not include the VK_IMAGE_ASPECT_STENCIL_BIT bit

- **VUID-vkCmdClearDepthStencilImage-image-02826**
  If the image's format does not have a depth component, then the VkImageSubresourceRange::aspectMask member of each element of the pRanges array must not include the VK_IMAGE_ASPECT_DEPTH_BIT bit

- **VUID-vkCmdClearDepthStencilImage-baseMipLevel-01474**
  The VkImageSubresourceRange::baseMipLevel members of the elements of the pRanges array must each be less than the mipLevels specified in VkImageCreateInfo when image was created

- **VUID-vkCmdClearDepthStencilImage-pRanges-01694**
  For each VkImageSubresourceRange element of pRanges, if the levelCount member is not
VK_REMAINING_MIP_LEVELS, then baseMipLevel + levelCount must be less than the mipLevels specified in VkImageCreateInfo when image was created

- VUID-vkCmdClearDepthStencilImage-baseArrayLayer-01476
  The VkImageSubresourceRange::baseArrayLayer members of the elements of the pRanges array must each be less than the arrayLayers specified in VkImageCreateInfo when image was created

- VUID-vkCmdClearDepthStencilImage-pRanges-01695
  For each VkImageSubresourceRange element of pRanges, if the layerCount member is not VK_REMAINING_ARRAY_LAYERS, then baseArrayLayer + layerCount must be less than the arrayLayers specified in VkImageCreateInfo when image was created

• image must have a depth/stencil format

Valid Usage (Implicit)

- VUID-vkCmdClearDepthStencilImage-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdClearDepthStencilImage-image-parameter
  image must be a valid VkImage handle

- VUID-vkCmdClearDepthStencilImage-imageLayout-parameter
  imageLayout must be a valid VkImageLayout value

- VUID-vkCmdClearDepthStencilImage-pDepthStencil-parameter
  pDepthStencil must be a valid pointer to a valid VkClearDepthStencilValue structure

- VUID-vkCmdClearDepthStencilImage-pRanges-parameter
  pRanges must be a valid pointer to an array of rangeCount valid VkImageSubresourceRange structures

- VUID-vkCmdClearDepthStencilImage-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdClearDepthStencilImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdClearDepthStencilImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdClearDepthStencilImage-rangeCount-arraylength
  rangeCount must be greater than 0

- VUID-vkCmdClearDepthStencilImage-commonparent
  Both of commandBuffer, and image must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

Clears outside render pass instances are treated as transfer operations for the purposes of memory barriers.

19.2. Clearing Images Inside A Render Pass Instance

To clear one or more regions of color and depth/stencil attachments inside a render pass instance, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdClearAttachments(
    VkCommandBuffer commandBuffer,
    uint32_t attachmentCount,
    const VkClearAttachment* pAttachments,
    uint32_t rectCount,
    const VkClearRect* pRects);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `attachmentCount` is the number of entries in the `pAttachments` array.
- `pAttachments` is a pointer to an array of `VkClearAttachment` structures defining the attachments to clear and the clear values to use. If any attachment index to be cleared is not backed by an image view, then the clear has no effect.
- `rectCount` is the number of entries in the `pRects` array.
- `pRects` is a pointer to an array of `VkClearRect` structures defining regions within each selected attachment to clear.

If the render pass has a fragment density map attachment, clears follow the operations of fragment density maps as if each clear region was a primitive which generates fragments. The clear color is applied to all pixels inside each fragment’s area regardless if the pixels lie outside of the clear region. Clears may have a different set of supported fragment areas than draws.
Unlike other clear commands, `vkCmdClearAttachments` executes as a drawing command, rather than a transfer command, with writes performed by it executing in rasterization order. Clears to color attachments are executed as color attachment writes, by the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` stage. Clears to depth/stencil attachments are executed as depth writes and writes by the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` and `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` stages.

`vkCmdClearAttachments` is not affected by the bound pipeline state.

**Note**

It’s generally advised that attachments are cleared by using the `VK_ATTACHMENT_LOAD_OP_CLEAR` load operation at the start of rendering, which will be more efficient on some implementations.
Valid Usage

- VUID-vkCmdClearAttachments-aspectMask-02501
  If the aspectMask member of any element of pAttachments contains
  VK_IMAGE_ASPECT_COLOR_BIT, then the colorAttachment member of that element must either refer to a color attachment which is VK_ATTACHMENT_UNUSED, or must be a valid color attachment

- VUID-vkCmdClearAttachments-aspectMask-02502
  If the aspectMask member of any element of pAttachments contains
  VK_IMAGE_ASPECT_DEPTH_BIT, then the current subpass' depth/stencil attachment must either be VK_ATTACHMENT_UNUSED, or must have a depth component

- VUID-vkCmdClearAttachments-aspectMask-02503
  If the aspectMask member of any element of pAttachments contains
  VK_IMAGE_ASPECT_STENCIL_BIT, then the current subpass' depth/stencil attachment must either be VK_ATTACHMENT_UNUSED, or must have a stencil component

- VUID-vkCmdClearAttachments-rect-02682
  The rect member of each element of pRects must have an extent.width greater than 0

- VUID-vkCmdClearAttachments-rect-02683
  The rect member of each element of pRects must have an extent.height greater than 0

- VUID-vkCmdClearAttachments-pRects-00016
  The rectangular region specified by each element of pRects must be contained within the render area of the current render pass instance

- VUID-vkCmdClearAttachments-pRects-00017
  The layers specified by each element of pRects must be contained within every attachment that pAttachments refers to

- VUID-vkCmdClearAttachments-layerCount-01934
  The layerCount member of each element of pRects must not be 0

- VUID-vkCmdClearAttachments-baseArrayLayer-00018
  If the render pass instance this is recorded in uses multiview, then baseArrayLayer must be zero and layerCount must be one
Valid Usage (Implicit)

- VUID-vkCmdClearAttachments-commandBuffer-parameter
  \textit{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdClearAttachments-pAttachments-parameter
  \textit{pAttachments} must be a valid pointer to an array of \texttt{attachmentCount} valid \texttt{VkClearAttachment} structures

- VUID-vkCmdClearAttachments-pRects-parameter
  \textit{pRects} must be a valid pointer to an array of \texttt{rectCount} \texttt{VkClearRect} structures

- VUID-vkCmdClearAttachments-commandBuffer-recording
  \textit{commandBuffer} must be in the 	exttt{recording} state

- VUID-vkCmdClearAttachments-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \textit{commandBuffer} was allocated from must support graphics operations

- VUID-vkCmdClearAttachments-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdClearAttachments-attachmentCount-arraylength
  \textit{attachmentCount} must be greater than 0

- VUID-vkCmdClearAttachments-rectCount-arraylength
  \textit{rectCount} must be greater than 0

Host Synchronization

- Host access to \textit{commandBuffer} must be externally synchronized

- Host access to the \texttt{VkCommandPool} that \textit{commandBuffer} was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The \texttt{VkClearRect} structure is defined as:
```c
// Provided by VK_VERSION_1_0
typedef struct VkClearRect {
    VkRect2D rect;
    uint32_t baseArrayLayer;
    uint32_t layerCount;
} VkClearRect;
```

- `rect` is the two-dimensional region to be cleared.
- `baseArrayLayer` is the first layer to be cleared.
- `layerCount` is the number of layers to clear.

The layers `[baseArrayLayer, baseArrayLayer + layerCount)` counting from the base layer of the attachment image view are cleared.

The `VkClearAttachment` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearAttachment {
    VkImageAspectFlags aspectMask;
    uint32_t colorAttachment;
    VkClearValue clearValue;
} VkClearAttachment;
```

- `aspectMask` is a mask selecting the color, depth and/or stencil aspects of the attachment to be cleared.
- `colorAttachment` is only meaningful if `VK_IMAGE_ASPECT_COLOR_BIT` is set in `aspectMask`, in which case it is an index into the currently bound color attachments.
- `clearValue` is the color or depth/stencil value to clear the attachment to, as described in `Clear Values` below.

### Valid Usage

- **VUID-VkClearAttachment-aspectMask-00019**
  If `aspectMask` includes `VK_IMAGE_ASPECT_COLOR_BIT`, it must not include `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`

- **VUID-VkClearAttachment-aspectMask-00020**
  `aspectMask` must not include `VK_IMAGE_ASPECT_METADATA_BIT`

- **VUID-VkClearAttachment-aspectMask-02246**
  `aspectMask` must not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index `i`

- **VUID-VkClearAttachment-clearValue-00021**
  `clearValue` must be a valid `VkClearValue` union
Valid Usage (Implicit)

- VUID-VkClearAttachment-aspectMask-parameter
  `aspectMask` must be a valid combination of `VkImageAspectFlagBits` values

- VUID-VkClearAttachment-aspectMask-requiredbitmask
  `aspectMask` must not be 0

19.3. Clear Values

The `VkClearColorValue` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef union VkClearColorValue {
    float float32[4];
    int32_t int32[4];
    uint32_t uint32[4];
} VkClearColorValue;
```

- `float32` are the color clear values when the format of the image or attachment is one of the formats in the Interpretation of Numeric Format table other than signed integer (`SINT`) or unsigned integer (`UINT`). Floating point values are automatically converted to the format of the image, with the clear value being treated as linear if the image is sRGB.

- `int32` are the color clear values when the format of the image or attachment is signed integer (`SINT`). Signed integer values are converted to the format of the image by casting to the smaller type (with negative 32-bit values mapping to negative values in the smaller type). If the integer clear value is not representable in the target type (e.g. would overflow in conversion to that type), the clear value is undefined.

- `uint32` are the color clear values when the format of the image or attachment is unsigned integer (`UINT`). Unsigned integer values are converted to the format of the image by casting to the integer type with fewer bits.

The four array elements of the clear color map to R, G, B, and A components of image formats, in order.

If the image has more than one sample, the same value is written to all samples for any pixels being cleared.

The `VkClearDepthStencilValue` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearDepthStencilValue {
    float depth;
    uint32_t stencil;
} VkClearDepthStencilValue;
```
• depth is the clear value for the depth aspect of the depth/stencil attachment. It is a floating-point value which is automatically converted to the attachment's format.

• stencil is the clear value for the stencil aspect of the depth/stencil attachment. It is a 32-bit integer value which is converted to the attachment’s format by taking the appropriate number of LSBs.

Valid Usage

• VUID-VkClearDepthStencilValue-depth-00022

Unless the VK_EXT_depth_range_unrestricted extension is enabled depth must be between 0.0 and 1.0, inclusive

The VkClearValue union is defined as:

```c
// Provided by VK_VERSION_1_0
typedef union VkClearValue {
    VkClearColorValue        color;
    VkClearDepthStencilValue depthStencil;
} VkClearValue;
```

• color specifies the color image clear values to use when clearing a color image or attachment.

• depthStencil specifies the depth and stencil clear values to use when clearing a depth/stencil image or attachment.

This union is used where part of the API requires either color or depth/stencil clear values, depending on the attachment, and defines the initial clear values in the VkRenderPassBeginInfo structure.

19.4. Filling Buffers

To clear buffer data, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdFillBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    VkDeviceSize size,
    uint32_t data);
```

• commandBuffer is the command buffer into which the command will be recorded.

• dstBuffer is the buffer to be filled.

• dstOffset is the byte offset into the buffer at which to start filling, and must be a multiple of 4.

• size is the number of bytes to fill, and must be either a multiple of 4, or VK_WHOLE_SIZE to fill the
range from offset to the end of the buffer. If VK_WHOLE_SIZE is used and the remaining size of the buffer is not a multiple of 4, then the nearest smaller multiple is used.

- **data** is the 4-byte word written repeatedly to the buffer to fill size bytes of data. The data word is written to memory according to the host endianness.

**vkCmdFillBuffer** is treated as “transfer” operation for the purposes of synchronization barriers. The VK_BUFFER_USAGE_TRANSFER_DST_BIT must be specified in usage of VkBufferCreateInfo in order for the buffer to be compatible with vkCmdFillBuffer.

### Valid Usage

- **VUID-vkCmdFillBuffer-dstOffset-00024**
  \[\text{dstOffset} \text{ must be less than the size of dstBuffer}\]

- **VUID-vkCmdFillBuffer-dstOffset-00025**
  \[\text{dstOffset} \text{ must be a multiple of 4}\]

- **VUID-vkCmdFillBuffer-size-00026**
  \[\text{If size is not equal to VK_WHOLE_SIZE, size must be greater than 0}\]

- **VUID-vkCmdFillBuffer-size-00027**
  \[\text{If size is not equal to VK_WHOLE_SIZE, size must be less than or equal to the size of dstBuffer minus dstOffset}\]

- **VUID-vkCmdFillBuffer-size-00028**
  \[\text{If size is not equal to VK_WHOLE_SIZE, size must be a multiple of 4}\]

- **VUID-vkCmdFillBuffer-dstBuffer-00029**
  \[\text{dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag}\]

- **VUID-vkCmdFillBuffer-dstBuffer-00031**
  \[\text{If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object}\]
### Valid Usage (Implicit)

- **VUID-vkCmdFillBuffer-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdFillBuffer-dstBuffer-parameter**
  - `dstBuffer` must be a valid `VkBuffer` handle

- **VUID-vkCmdFillBuffer-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdFillBuffer-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics or compute operations

- **VUID-vkCmdFillBuffer-renderpass**
  - This command must only be called outside of a render pass instance

- **VUID-vkCmdFillBuffer-commonparent**
  - Both of `commandBuffer`, and `dstBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tr>
</tbody>
</table>

### 19.5. Updating Buffers

To update buffer data inline in a command buffer, call:
void vkCmdUpdateBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    VkDeviceSize dataSize,
    const void* pData);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `dstBuffer` is a handle to the buffer to be updated.
- `dstOffset` is the byte offset into the buffer to start updating, and **must** be a multiple of 4.
- `dataSize` is the number of bytes to update, and **must** be a multiple of 4.
- `pData` is a pointer to the source data for the buffer update, and **must** be at least `dataSize` bytes in size.

`dataSize` **must** be less than or equal to 65536 bytes. For larger updates, applications **can** use buffer to buffer copies.

**Note**

Buffer updates performed with `vkCmdUpdateBuffer` first copy the data into command buffer memory when the command is recorded (which requires additional storage and may incur an additional allocation), and then copy the data from the command buffer into `dstBuffer` when the command is executed on a device.

The additional cost of this functionality compared to buffer to buffer copies means it is only recommended for very small amounts of data, and is why it is limited to only 65536 bytes.

Applications **can** work around this by issuing multiple `vkCmdUpdateBuffer` commands to different ranges of the same buffer, but it is strongly recommended that they **should** not.

The source data is copied from the user pointer to the command buffer when the command is called.

`vkCmdUpdateBuffer` is only allowed outside of a render pass. This command is treated as “transfer” operation, for the purposes of synchronization barriers. The `VK_BUFFER_USAGE_TRANSFER_DST_BIT` **must** be specified in `usage` of `VkBufferCreateInfo` in order for the buffer to be compatible with `vkCmdUpdateBuffer`. 
Valid Usage

• VUID-vkCmdUpdateBuffer-dstOffset-00032
dstOffset must be less than the size of dstBuffer

• VUID-vkCmdUpdateBuffer-dataSize-00033
dataSize must be less than or equal to the size of dstBuffer minus dstOffset

• VUID-vkCmdUpdateBuffer-dstBuffer-00034
dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag

• VUID-vkCmdUpdateBuffer-dstBuffer-00035
If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdUpdateBuffer-dstOffset-00036
dstOffset must be a multiple of 4

• VUID-vkCmdUpdateBuffer-dataSize-00037
dataSize must be less than or equal to 65536

• VUID-vkCmdUpdateBuffer-dataSize-00038
dataSize must be a multiple of 4

Valid Usage (Implicit)

• VUID-vkCmdUpdateBuffer-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdUpdateBuffer-dstBuffer-parameter
dstBuffer must be a valid VkBuffer handle

• VUID-vkCmdUpdateBuffer-pData-parameter
pData must be a valid pointer to an array of dataSize bytes

• VUID-vkCmdUpdateBuffer-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdUpdateBuffer-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

• VUID-vkCmdUpdateBuffer-renderpass
This command must only be called outside of a render pass instance

• VUID-vkCmdUpdateBuffer-dataSize-arraylength
dataSize must be greater than 0

• VUID-vkCmdUpdateBuffer-commonparent
Both of commandBuffer, and dstBuffer must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Transfer</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Graphics</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Compute</td>
</tr>
</tbody>
</table>

**Note**
The `pData` parameter was of type `uint32_t*` instead of `void*` prior to version 1.0.19 of the Specification and `VK_HEADER_VERSION 19` of the Vulkan Header Files. This was a historical anomaly, as the source data may be of other types.
Chapter 20. Copy Commands

An application can copy buffer and image data using several methods depending on the type of data transfer. Data can be copied between buffer objects with `vkCmdCopyBuffer2KHR` and `vkCmdCopyBuffer` and a portion of an image can be copied to another image with `vkCmdCopyImage2KHR` and `vkCmdCopyImage`. Image data can also be copied to and from buffer memory using `vkCmdCopyImageToBuffer2KHR`, `vkCmdCopyImageToBuffer`, `vkCmdCopyBufferToImage2KHR`, and `vkCmdCopyBufferToImage`. Image data can be blitted (with or without scaling and filtering) with `vkCmdBlitImage2KHR` and `vkCmdBlitImage`. Multisampled images can be resolved to a non-multisampled image with `vkCmdResolveImage2KHR` and `vkCmdResolveImage`.

20.1. Common Operation

The following valid usage rules apply to all copy commands:

- Copy commands must be recorded outside of a render pass instance.
- The set of all bytes bound to all the source regions must not overlap the set of all bytes bound to the destination regions.
- The set of all bytes bound to each destination region must not overlap the set of all bytes bound to another destination region.
- Copy regions must be non-empty.
- Regions must not extend outside the bounds of the buffer or image level, except that regions of compressed images can extend as far as the dimension of the image level rounded up to a complete compressed texel block.
- Source image subresources must be in either the `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` layout. Destination image subresources must be in the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` layout. As a consequence, if an image subresource is used as both source and destination of a copy, it must be in the `VK_IMAGE_LAYOUT_GENERAL` layout.
- Source images must have `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT` in their format features.
- Destination images must have `VK_FORMAT_FEATURE_TRANSFER_DST_BIT` in their format features.
- Source buffers must have been created with the `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage bit enabled and destination buffers must have been created with the `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage bit enabled.
- Source images must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` set in `VkImageCreateInfo::usage`
- Destination images must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` set in `VkImageCreateInfo::usage`
- If the stencil aspect of source image is accessed, and the source image was not created with separate stencil usage, the source image must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` set in `VkImageCreateInfo::usage`
- If the stencil aspect of destination image is accessed, and the destination image was not created
with separate stencil usage, the destination image **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` set in `VkImageCreateInfo::usage`.

- If the stencil aspect of source image is accessed, and the source image was created with separate stencil usage, the source image **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` set in `VkImageStencilUsageCreateInfo::stencilUsage`.

- If the stencil aspect of destination image is accessed, and the destination image was created with separate stencil usage, the destination image **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` set in `VkImageStencilUsageCreateInfo::stencilUsage`.

- If non-stencil aspects of a source image are accessed, the source image **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` set in `VkImageCreateInfo::usage`.

- If non-stencil aspects of a destination image are accessed, the destination image **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` set in `VkImageCreateInfo::usage`.

All copy commands are treated as “transfer” operations for the purposes of synchronization barriers.

All copy commands that have a source format with an X component in its format description read undefined values from those bits.

All copy commands that have a destination format with an X component in its format description write undefined values to those bits.

### 20.2. Copying Data Between Buffers

To copy data between buffer objects, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer srcBuffer,
    VkBuffer dstBuffer,
    uint32_t regionCount,
    const VkBufferCopy* pRegions);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **srcBuffer** is the source buffer.
- **dstBuffer** is the destination buffer.
- **regionCount** is the number of regions to copy.
- **pRegions** is a pointer to an array of `VkBufferCopy` structures specifying the regions to copy.

Each region in `pRegions` is copied from the source buffer to the same region of the destination buffer. **srcBuffer** and **dstBuffer** can be the same buffer or alias the same memory, but the resulting values are undefined if the copy regions overlap in memory.
Valid Usage

- VUID-vkCmdCopyBuffer-srcOffset-00113
  The `srcOffset` member of each element of `pRegions` must be less than the size of `srcBuffer`.

- VUID-vkCmdCopyBuffer-dstOffset-00114
  The `dstOffset` member of each element of `pRegions` must be less than the size of `dstBuffer`.

- VUID-vkCmdCopyBuffer-size-00115
  The `size` member of each element of `pRegions` must be less than or equal to the size of `srcBuffer` minus `srcOffset`.

- VUID-vkCmdCopyBuffer-size-00116
  The `size` member of each element of `pRegions` must be less than or equal to the size of `dstBuffer` minus `dstOffset`.

- VUID-vkCmdCopyBuffer-pRegions-00117
  The union of the source regions, and the union of the destination regions, specified by the elements of `pRegions`, must not overlap in memory.

- VUID-vkCmdCopyBuffer-srcBuffer-00118
  `srcBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag.

- VUID-vkCmdCopyBuffer-srcBuffer-00119
  If `srcBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdCopyBuffer-dstBuffer-00120
  `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag.

- VUID-vkCmdCopyBuffer-dstBuffer-00121
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.
Valid Usage (Implicit)

- VUID-vkCmdCopyBuffer-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyBuffer-srcBuffer-parameter
  
  `srcBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdCopyBuffer-dstBuffer-parameter
  
  `dstBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdCopyBuffer-pRegions-parameter
  
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkBufferCopy` structures

- VUID-vkCmdCopyBuffer-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdCopyBuffer-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdCopyBuffer-renderpass
  
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyBuffer-regionCount-arraylength
  
  `regionCount` must be greater than 0

- VUID-vkCmdCopyBuffer-commonparent
  
  Each of `commandBuffer`, `dstBuffer`, and `srcBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Transfer</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Graphics</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Compute</td>
</tr>
</tbody>
</table>

The `VkBufferCopy` structure is defined as:
// Provided by VK_VERSION_1_0

typedef struct VkBufferCopy {
    VkDeviceSize srcOffset;
    VkDeviceSize dstOffset;
    VkDeviceSize size;
} VkBufferCopy;

• srcOffset is the starting offset in bytes from the start of srcBuffer.
• dstOffset is the starting offset in bytes from the start of dstBuffer.
• size is the number of bytes to copy.

Valid Usage

• VUID-VkBufferCopy-size-01988
  The size must be greater than 0

A more extensible version of the copy buffer command is defined below.

To copy data between buffer objects, call:

// Provided by VK_KHR_copy_commands2

void vkCmdCopyBuffer2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyBufferInfo2KHR* pCopyBufferInfo);

• commandBuffer is the command buffer into which the command will be recorded.
• pCopyBufferInfo is a pointer to a VkCopyBufferInfo2KHR structure describing the copy parameters.

This command is functionally identical to vkCmdCopyBuffer, but includes extensible sub-structures that include sType and pNext parameters, allowing them to be more easily extended.

Valid Usage
Valid Usage (Implicit)

- VUID-vkCmdCopyBuffer2KHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyBuffer2KHR-pCopyBufferInfo-parameter
  pCopyBufferInfo must be a valid pointer to a valid VkCopyBufferInfo2KHR structure

- VUID-vkCmdCopyBuffer2KHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdCopyBuffer2KHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdCopyBuffer2KHR-renderpass
  This command must only be called outside of a render pass instance

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Transfer</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Graphics</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Compute</td>
</tr>
</tbody>
</table>

The VkCopyBufferInfo2KHR structure is defined as:

```c
// Provided by VK_KHR_copy_commands2
typedef struct VkCopyBufferInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkBuffer srcBuffer;
    VkBuffer dstBuffer;
    uint32_t regionCount;
    const VkBufferCopy2KHR* pRegions;
} VkCopyBufferInfo2KHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
• **srcBuffer** is the source buffer.
• **dstBuffer** is the destination buffer.
• **regionCount** is the number of regions to copy.
• **pRegions** is a pointer to an array of **VkBufferCopy2KHR** structures specifying the regions to copy.

Members defined by this structure with the same name as parameters in **vkCmdCopyBuffer** have the identical effect to those parameters; the child structure **VkBufferCopy2KHR** is a variant of **VkBufferCopy** which includes **sType** and **pNext** parameters, allowing it to be extended.

</table>
Valid Usage (Implicit)

- **VUID-VkCopyBufferInfo2KHR-sType-sType**
  - sType must be `VK_STRUCTURE_TYPE_COPY_BUFFER_INFO_2_KHR`

- **VUID-VkCopyBufferInfo2KHR-pNext-pNext**
  - pNext must be `NULL`

- **VUID-VkCopyBufferInfo2KHR-srcBuffer-parameter**
  - srcBuffer must be a valid `VkBuffer` handle

- **VUID-VkCopyBufferInfo2KHR-dstBuffer-parameter**
  - dstBuffer must be a valid `VkBuffer` handle

- **VUID-VkCopyBufferInfo2KHR-pRegions-parameter**
  - pRegions must be a valid pointer to an array of `regionCount` valid `VkBufferCopy2KHR` structures

- **VUID-VkCopyBufferInfo2KHR-regionCount-arraylength**
  - regionCount must be greater than 0

- **VUID-VkCopyBufferInfo2KHR-commonparent**
  - Both of dstBuffer, and srcBuffer must have been created, allocated, or retrieved from the same `VkDevice`

The `VkBufferCopy2KHR` structure is defined as:

```c
// Provided by VK_KHR_copy_commands2
typedef struct VkBufferCopy2KHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize srcOffset;
    VkDeviceSize dstOffset;
    VkDeviceSize size;
} VkBufferCopy2KHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcOffset** is the starting offset in bytes from the start of srcBuffer.
- **dstOffset** is the starting offset in bytes from the start of dstBuffer.
- **size** is the number of bytes to copy.

Valid Usage

- **VUID-VkBufferCopy2KHR-size-01988**
  - The size must be greater than 0
20.3. Copying Data Between Images

`vkCmdCopyImage` performs image copies in a similar manner to a host memcpy. It does not perform general-purpose conversions such as scaling, resizing, blending, color-space conversion, or format conversions. Rather, it simply copies raw image data. `vkCmdCopyImage` can copy between images with different formats, provided the formats are compatible as defined below.

To copy data between image objects, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the current layout of the source image subresource.
- `dstImage` is the destination image.
- `dstImageLayout` is the current layout of the destination image subresource.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy` structures specifying the regions to copy.

Each region in `pRegions` is copied from the source image to the same region of the destination image. `srcImage` and `dstImage` can be the same image or alias the same memory.

The formats of `srcImage` and `dstImage` must be compatible. Formats are compatible if they share the same class, as shown in the Compatible Formats table. Depth/stencil formats must match exactly.

If either `srcImage` or `dstImage` has a multi-planar format, regions of each plane to be copied must be specified separately using the `srcSubresource` and `dstSubresource` members of the `VkImageCopy` structure. In this case, the `aspectMask` of the `srcSubresource` or `dstSubresource` that refers to the multi-planar image must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`.
For the purposes of \texttt{vkCmdCopyImage}, each plane of a multi-planar image is treated as having the format listed in Compatible formats of planes of multi-planar formats for the plane identified by the \texttt{aspectMask} of the corresponding subresource. This applies both to \texttt{VkFormat} and to coordinates used in the copy, which correspond to texels in the \textit{plane} rather than how these texels map to coordinates in the image as a whole.

\begin{notes}
For example, the \texttt{VK_IMAGE_ASPECT_PLANE_1_BIT} plane of a \texttt{VK_FORMAT_G8_B8R8_2PLANE_420_UNORM} image is compatible with an image of format \texttt{VK_FORMAT_R8G8_UNORM} and (less usefully) with the \texttt{VK_IMAGE_ASPECT_PLANE_0_BIT} plane of an image of format \texttt{VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_420_UNORM_3PACK16}, as each texel is 2 bytes in size.
\end{notes}

\texttt{vkCmdCopyImage} allows copying between \textit{size-compatible} compressed and uncompressed internal formats. Formats are size-compatible if the texel block size of the uncompressed format is equal to the texel block size of the compressed format. Such a copy does not perform on-the-fly compression or decompression. When copying from an uncompressed format to a compressed format, each texel of uncompressed data of the source image is copied as a raw value to the corresponding compressed texel block of the destination image. When copying from a compressed format to an uncompressed format, each compressed texel block of the source image is copied as a raw value to the corresponding texel of uncompressed data in the destination image. Thus, for example, it is legal to copy between a 128-bit uncompressed format and a compressed format which has a 128-bit sized compressed texel block representing \(4 \times 4\) texels (using 8 bits per texel), or between a 64-bit uncompressed format and a compressed format which has a 64-bit sized compressed texel block representing \(4 \times 4\) texels (using 4 bits per texel).

When copying between compressed and uncompressed formats the \texttt{extent} members represent the texel dimensions of the source image and not the destination. When copying from a compressed image to an uncompressed image the image texel dimensions written to the uncompressed image will be source extent divided by the compressed texel block dimensions. When copying from an uncompressed image to a compressed image the image texel dimensions written to the compressed image will be the source extent multiplied by the compressed texel block dimensions. In both cases the number of bytes read and the number of bytes written will be identical.

Copying to or from block-compressed images is typically done in multiples of the compressed texel block size. For this reason the \texttt{extent} \textbf{must} be a multiple of the compressed texel block dimension. There is one exception to this rule which is \textbf{required} to handle compressed images created with dimensions that are not a multiple of the compressed texel block dimensions: if the \texttt{srcImage} is compressed, then:

- If \texttt{extent.width} is not a multiple of the compressed texel block width, then \((\texttt{extent.width} + \texttt{srcOffset.x})\) \textbf{must} equal the image subresource width.
- If \texttt{extent.height} is not a multiple of the compressed texel block height, then \((\texttt{extent.height} + \texttt{srcOffset.y})\) \textbf{must} equal the image subresource height.
- If \texttt{extent.depth} is not a multiple of the compressed texel block depth, then \((\texttt{extent.depth} + \texttt{srcOffset.z})\) \textbf{must} equal the image subresource depth.
Similarly, if the `dstImage` is compressed, then:

- If `extent.width` is not a multiple of the compressed texel block width, then `(extent.width + dstOffset.x)` **must** equal the image subresource width.

- If `extent.height` is not a multiple of the compressed texel block height, then `(extent.height + dstOffset.y)` **must** equal the image subresource height.

- If `extent.depth` is not a multiple of the compressed texel block depth, then `(extent.depth + dstOffset.z)` **must** equal the image subresource depth.

This allows the last compressed texel block of the image in each non-multiple dimension to be included as a source or destination of the copy.

“_422” image formats that are not *multi-planar* are treated as having a 2×1 compressed texel block for the purposes of these rules.

`vkCmdCopyImage` **can** be used to copy image data between multisample images, but both images **must** have the same number of samples.
Valid Usage

- **VUID-vkCmdCopyImage-pRegions-00124**
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory

- **VUID-vkCmdCopyImage-srcImage-01995**
  The **format features** of `srcImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`

- **VUID-vkCmdCopyImage-srcImage-00126**
  `srcImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag

- **VUID-vkCmdCopyImage-srcImage-01546**
  If `srcImage` is non-sparse then the image or **disjoint** plane to be copied **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdCopyImage-srcImageLayout-00128**
  `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-vkCmdCopyImage-srcImageLayout-01917**
  `srcImageLayout` **must** be `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`

- **VUID-vkCmdCopyImage-dstImage-01996**
  The **format features** of `dstImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`

- **VUID-vkCmdCopyImage-dstImage-00131**
  `dstImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag

- **VUID-vkCmdCopyImage-dstImage-01547**
  If `dstImage` is non-sparse then the image or **disjoint** plane that is the destination of the copy **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdCopyImage-dstImageLayout-00133**
  `dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-vkCmdCopyImage-dstImageLayout-01395**
  `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`

- **VUID-vkCmdCopyImage-srcImage-01548**
  If the `VkFormat` of each of `srcImage` and `dstImage` is not a **multi-planar format**, the `VkFormat` of each of `srcImage` and `dstImage` **must** be compatible, as defined above

- **VUID-vkCmdCopyImage-None-01549**
  In a copy to or from a plane of a **multi-planar image**, the `VkFormat` of the image and plane **must** be compatible according to the description of compatible planes for the plane being copied

- **VUID-vkCmdCopyImage-srcImage-00136**
  The sample count of `srcImage` and `dstImage` **must** match

- **VUID-vkCmdCopyImage-srcSubresource-01696**
  The `srcSubresource.mipLevel` member of each element of `pRegions` **must** be less than the
mipLevels specified in VkImageCreateInfo when srcImage was created

- VUID-vkCmdCopyImage-dstSubresource-01697
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

- VUID-vkCmdCopyImage-srcSubresource-01698
  The srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

- VUID-vkCmdCopyImage-dstSubresource-01699
  The dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

- VUID-vkCmdCopyImage-srcOffset-01783
  The srcOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

- VUID-vkCmdCopyImage-dstOffset-01784
  The dstOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

- VUID-vkCmdCopyImage-dstImage-02542
  dstImage and srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

- VUID-vkCmdCopyImage-srcImage-01551
  If neither srcImage nor dstImage has a multi-planar image format then for each element of pRegions, srcSubresource.aspectMask and dstSubresource.aspectMask must match

- VUID-vkCmdCopyImage-srcImage-01552
  If srcImage has a VkFormat with two planes then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT

- VUID-vkCmdCopyImage-srcImage-01553
  If srcImage has a VkFormat with three planes then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT

- VUID-vkCmdCopyImage-dstImage-01554
  If dstImage has a VkFormat with two planes then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT

- VUID-vkCmdCopyImage-dstImage-01555
  If dstImage has a VkFormat with three planes then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT

- VUID-vkCmdCopyImage-srcImage-01556
  If srcImage has a multi-planar image format and the dstImage does not have a multi-planar
image format, then for each element of `pRegions`, `dstSubresource.aspectMask` must be `VK_IMAGE_ASPECT_COLOR_BIT`

- **VUID-vkCmdCopyImage-dstImage-01557**
  
  If `dstImage` has a multi-planar image format and the `srcImage` does not have a multi-planar image format, then for each element of `pRegions`, `srcSubresource.aspectMask` must be `VK_IMAGE_ASPECT_COLOR_BIT`

- **VUID-vkCmdCopyImage-srcImage-04443**
  
  If `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` must be 0 and `srcSubresource.layerCount` must be 1

- **VUID-vkCmdCopyImage-dstImage-04444**
  
  If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstSubresource.baseArrayLayer` must be 0 and `dstSubresource.layerCount` must be 1

- **VUID-vkCmdCopyImage-aspectMask-00142**
  
  For each element of `pRegions`, `srcSubresource.aspectMask` must specify aspects present in `srcImage`

- **VUID-vkCmdCopyImage-aspectMask-00143**
  
  For each element of `pRegions`, `dstSubresource.aspectMask` must specify aspects present in `dstImage`

- **VUID-vkCmdCopyImage-srcOffset-00144**
  
  For each element of `pRegions`, `srcOffset.x` and `(extent.width + srcOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`

- **VUID-vkCmdCopyImage-srcOffset-00145**
  
  For each element of `pRegions`, `srcOffset.y` and `(extent.height + srcOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`

- **VUID-vkCmdCopyImage-srcImage-01785**
  
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` must be 0 and `extent.height` must be 1

- **VUID-vkCmdCopyImage-srcOffset-00147**
  
  For each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`

- **VUID-vkCmdCopyImage-dstImage-01786**
  
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.z` must be 0 and `extent.depth` must be 1

- **VUID-vkCmdCopyImage-dstImage-01788**
  
  If `dstImage` is of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `dstOffset.z` must be 0
must be 0

• VUID-vkCmdCopyImage-srcImage-01790
  If srcImage and dstImage are both of type VK_IMAGE_TYPE_2D, then for each element of 
pRegions, extent.depth must be 1

• VUID-vkCmdCopyImage-srcImage-01791
  If srcImage is of type VK_IMAGE_TYPE_2D, and dstImage is of type VK_IMAGE_TYPE_3D, then for 
each element of pRegions, extent.depth must equal srcSubresource.layerCount

• VUID-vkCmdCopyImage-dstImage-01792
  If dstImage is of type VK_IMAGE_TYPE_2D, and srcImage is of type VK_IMAGE_TYPE_3D, then for 
each element of pRegions, extent.depth must equal dstSubresource.layerCount

• VUID-vkCmdCopyImage-dstOffset-00150
  For each element of pRegions, dstOffset.x and (extent.width + dstOffset.x) must both be 
greater than or equal to 0 and less than or equal to the width of the specified 
dstSubresource of dstImage

• VUID-vkCmdCopyImage-dstOffset-00151
  For each element of pRegions, dstOffset.y and (extent.height + dstOffset.y) must both be 
greater than or equal to 0 and less than or equal to the height of the specified 
dstSubresource of dstImage

• VUID-vkCmdCopyImage-dstOffset-00152
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.y 
must be 0 and extent.height must be 1

• VUID-vkCmdCopyImage-dstOffset-00153
  For each element of pRegions, dstOffset.z and (extent.depth + dstOffset.z) must both be 
greater than or equal to 0 and less than or equal to the depth of the specified 
dstSubresource of dstImage

• VUID-vkCmdCopyImage-srcImage-01727
  If srcImage is a blocked image, then for each element of pRegions, all members of srcOffset 
must be a multiple of the corresponding dimensions of the compressed texel block

• VUID-vkCmdCopyImage-srcImage-01728
  If srcImage is a blocked image, then for each element of pRegions, extent.width must be a 
multiple of the compressed texel block width or (extent.width + srcOffset.x) must equal 
the width of the specified srcSubresource of srcImage

• VUID-vkCmdCopyImage-srcImage-01729
  If srcImage is a blocked image, then for each element of pRegions, extent.height must be a 
multiple of the compressed texel block height or (extent.height + srcOffset.y) must equal 
the height of the specified srcSubresource of srcImage

• VUID-vkCmdCopyImage-srcImage-01730
  If srcImage is a blocked image, then for each element of pRegions, extent.depth must be a 
multiple of the compressed texel block depth or (extent.depth + srcOffset.z) must equal 
the depth of the specified srcSubresource of srcImage

• VUID-vkCmdCopyImage-dstImage-01731
  If dstImage is a blocked image, then for each element of pRegions, all members of dstOffset 
must be a multiple of the corresponding dimensions of the compressed texel block
If \texttt{dstImage} is a \textit{blocked image}, then for each element of \texttt{pRegions}, \texttt{extent.width} \textbf{must} be a multiple of the compressed texel block width or \((\texttt{extent.width} + \texttt{dstOffset.x})\) \textbf{must} equal the width of the specified \texttt{dstSubresource} of \texttt{dstImage}.

If \texttt{dstImage} is a \textit{blocked image}, then for each element of \texttt{pRegions}, \texttt{extent.height} \textbf{must} be a multiple of the compressed texel block height or \((\texttt{extent.height} + \texttt{dstOffset.y})\) \textbf{must} equal the height of the specified \texttt{dstSubresource} of \texttt{dstImage}.

If \texttt{dstImage} is a \textit{blocked image}, then for each element of \texttt{pRegions}, \texttt{extent.depth} \textbf{must} be a multiple of the compressed texel block depth or \((\texttt{extent.depth} + \texttt{dstOffset.z})\) \textbf{must} equal the depth of the specified \texttt{dstSubresource} of \texttt{dstImage}.

\section*{Valid Usage (Implicit)}

- \textbf{VUID-vkCmdCopyImage-commandBuffer-parameter} \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle.
- \textbf{VUID-vkCmdCopyImage-srcImage-parameter} \texttt{srcImage} \textbf{must} be a valid \texttt{VkImage} handle.
- \textbf{VUID-vkCmdCopyImage-srcImageLayout-parameter} \texttt{srcImageLayout} \textbf{must} be a valid \texttt{VkImageLayout} value.
- \textbf{VUID-vkCmdCopyImage-dstImage-parameter} \texttt{dstImage} \textbf{must} be a valid \texttt{VkImage} handle.
- \textbf{VUID-vkCmdCopyImage-dstImageLayout-parameter} \texttt{dstImageLayout} \textbf{must} be a valid \texttt{VkImageLayout} value.
- \textbf{VUID-vkCmdCopyImage-pRegions-parameter} \texttt{pRegions} \textbf{must} be a valid pointer to an array of \texttt{regionCount} valid \texttt{VkImageCopy} structures.
- \textbf{VUID-vkCmdCopyImage-commandBuffer-recording} \texttt{commandBuffer} \textbf{must} be in the \texttt{recording state}.
- \textbf{VUID-vkCmdCopyImage-commandBuffer-cmdpool} The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support transfer, graphics, or compute operations.
- \textbf{VUID-vkCmdCopyImage-renderpass} This command \textbf{must} only be called outside of a render pass instance.
- \textbf{VUID-vkCmdCopyImage-regionCount-arraylength} \texttt{regionCount} \textbf{must} be greater than \texttt{0}.
- \textbf{VUID-vkCmdCopyImage-commonparent} Each of \texttt{commandBuffer}, \texttt{dstImage}, and \texttt{srcImage} \textbf{must} have been created, allocated, or retrieved from the same \texttt{VkDevice}.
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Transfer Graphics Compute</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkImageCopy structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageCopy {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageCopy;
```

- `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively.
- `srcOffset` and `dstOffset` select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the image to copy in width, height and depth.

For VK_IMAGE_TYPE_3D images, copies are performed slice by slice starting with the z member of the `srcOffset` or `dstOffset`, and copying `depth` slices. For images with multiple layers, copies are performed layer by layer starting with the `baseArrayLayer` member of the `srcSubresource` or `dstSubresource` and copying `layerCount` layers. Image data can be copied between images with different image types. If one image is VK_IMAGE_TYPE_3D and the other image is VK_IMAGE_TYPE_2D with multiple layers, then each slice is copied to or from a different layer.

Copies involving a multi-planar image format specify the region to be copied in terms of the `plane` to be copied, not the coordinates of the multi-planar image. This means that copies accessing the R/B planes of “.422” format images must fit the copied region within half the `width` of the parent image, and that copies accessing the R/B planes of “.420” format images must fit the copied region within half the `width` and `height` of the parent image.
Valid Usage

- VUID-VkImageCopy-extent-00140
  The number of slices of the **extent** (for 3D) or layers of the **srcSubresource** (for non-3D) must match the number of slices of the **extent** (for 3D) or layers of the **dstSubresource** (for non-3D).

Valid Usage (Implicit)

- VUID-VkImageCopy-srcSubresource-parameter
  **srcSubresource** must be a valid VkImageSubresourceLayers structure

- VUID-VkImageCopy-dstSubresource-parameter
  **dstSubresource** must be a valid VkImageSubresourceLayers structure

The **VkImageSubresourceLayers** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresourceLayers {
    VkImageAspectFlags aspectMask;
    uint32_t mipLevel;
    uint32_t baseArrayLayer;
    uint32_t layerCount;
} VkImageSubresourceLayers;
```

- **aspectMask** is a combination of VkImageAspectFlagBits, selecting the color, depth and/or stencil aspects to be copied.
- **mipLevel** is the mipmap level to copy
- **baseArrayLayer** and **layerCount** are the starting layer and number of layers to copy.

Valid Usage

- VUID-VkImageSubresourceLayers-aspectMask-00167
  If **aspectMask** contains VK_IMAGE_ASPECT_COLOR_BIT, it must not contain either of VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkImageSubresourceLayers-aspectMask-00168
  **aspectMask** must not contain VK_IMAGE_ASPECT_METADATA_BIT

- VUID-VkImageSubresourceLayers-aspectMask-02247
  **aspectMask** must not include VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT for any index i

- VUID-VkImageSubresourceLayers-layerCount-01700
  **layerCount** must be greater than 0
A more extensible version of the copy image command is defined below.

To copy data between image objects, call:

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyImageInfo2KHR* pCopyImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyImageInfo` is a pointer to a `VkCopyImageInfo2KHR` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

---

**Valid Usage (Implicit)**

- VUID-vkImageSubresourceLayers-aspectMask-parameter
  - `aspectMask` must be a valid combination of `VkImageAspectFlagBits` values
- VUID-VkImageSubresourceLayers-aspectMask-requiredbitmask
  - `aspectMask` must not be 0

---

**Valid Usage**

- VUID-vkCmdCopyImage2KHR-commandBuffer-parameter
  - `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdCopyImage2KHR-pCopyImageInfo-parameter
  - `pCopyImageInfo` must be a valid pointer to a `VkCopyImageInfo2KHR` structure
- VUID-vkCmdCopyImage2KHR-commandBuffer-recording
  - `commandBuffer` must be in the `recording` state
- VUID-vkCmdCopyImage2KHR-commandBuffer-cmdpool
  - The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations
- VUID-vkCmdCopyImage2KHR-renderpass
  - This command must only be called outside of a render pass instance
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Transfer, Graphics, Compute</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkCopyImageInfo2KHR` structure is defined as:

```c
// Provided by VK_KHR_copy_commands2
typedef struct VkCopyImageInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageCopy2KHR* pRegions;
} VkCopyImageInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the current layout of the source image subresource.
- `dstImage` is the destination image.
- `dstImageLayout` is the current layout of the destination image subresource.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy2KHR` structures specifying the regions to copy.
Valid Usage

- **VUID-VkCopyImageInfo2KHR-pRegions-00124**
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory

- **VUID-VkCopyImageInfo2KHR-srcImage-01995**
  The **format features** of `srcImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`

- **VUID-VkCopyImageInfo2KHR-srcImage-00126**
  `srcImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag

- **VUID-VkCopyImageInfo2KHR-srcImage-01546**
  If `srcImage` is non-sparse then the image or *disjoint* plane to be copied **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkCopyImageInfo2KHR-srcImageLayout-00128**
  `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-VkCopyImageInfo2KHR-srcImageLayout-01917**
  `srcImageLayout` **must** be `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`

- **VUID-VkCopyImageInfo2KHR-dstImage-01996**
  The **format features** of `dstImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`

- **VUID-VkCopyImageInfo2KHR-dstImage-00131**
  `dstImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag

- **VUID-VkCopyImageInfo2KHR-dstImage-01547**
  If `dstImage` is non-sparse then the image or *disjoint* plane that is the destination of the copy **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkCopyImageInfo2KHR-dstImageLayout-00133**
  `dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-VkCopyImageInfo2KHR-dstImageLayout-01395**
  `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`

- **VUID-VkCopyImageInfo2KHR-srcImage-01548**
  If the `VkFormat` of each of `srcImage` and `dstImage` is not a *multi-planar format*, the `VkFormat` of each of `srcImage` and `dstImage` **must** be compatible, as defined above

- **VUID-VkCopyImageInfo2KHR-None-01549**
  In a copy to or from a plane of a *multi-planar image*, the `VkFormat` of the image and plane **must** be compatible according to the **description of compatible planes** for the plane being copied

- **VUID-VkCopyImageInfo2KHR-srcImage-00136**
  The sample count of `srcImage` and `dstImage` **must** match

- **VUID-VkCopyImageInfo2KHR-srcSubresource-01696**
  The `srcSubresource.mipLevel` member of each element of `pRegions` **must** be less than the
• VUID-VkCopyImageInfo2KHR-dstImage-01697
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

• VUID-VkCopyImageInfo2KHR-srcImage-01699
  The srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

• VUID-VkCopyImageInfo2KHR-dstImage-01699
  The dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

• VUID-VkCopyImageInfo2KHR-srcOffset-01783
  The srcOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

• VUID-VkCopyImageInfo2KHR-dstOffset-01784
  The dstOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

• VUID-VkCopyImageInfo2KHR-dstImage-02542
  dstImage and srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

• VUID-VkCopyImageInfo2KHR-srcImage-01551
  If neither srcImage nor dstImage has a multi-planar image format then for each element of pRegions, srcSubresource.aspectMask and dstSubresource.aspectMask must match

• VUID-VkCopyImageInfo2KHR-srcImage-01552
  If srcImage has a VkFormat with two planes then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT

• VUID-VkCopyImageInfo2KHR-srcImage-01553
  If srcImage has a VkFormat with three planes then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT

• VUID-VkCopyImageInfo2KHR-dstImage-01554
  If dstImage has a VkFormat with two planes then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT

• VUID-VkCopyImageInfo2KHR-dstImage-01555
  If dstImage has a VkFormat with three planes then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT

• VUID-VkCopyImageInfo2KHR-srcImage-01556
  If srcImage has a multi-planar image format and the dstImage does not have a multi-planar
image format, then for each element of \( p\text{Regions} \), \( \text{dstSubresource.aspectMask} \) must be \( \text{VK_IMAGE_ASPECT_COLOR_BIT} \)

- VUID-VkCopyImageInfo2KHR-dstImage-01557
  If \( \text{dstImage} \) has a multi-planar image format and the \( \text{srcImage} \) does not have a multi-planar image format, then for each element of \( p\text{Regions} \), \( \text{srcSubresource.aspectMask} \) must be \( \text{VK_IMAGE_ASPECT_COLOR_BIT} \)

- VUID-VkCopyImageInfo2KHR-srcImage-04443
  If \( \text{srcImage} \) is of type \( \text{VK_IMAGE_TYPE_3D} \), then for each element of \( p\text{Regions} \), \( \text{srcSubresource.baseArrayLayer} \) must be \( 0 \) and \( \text{srcSubresource.layerCount} \) must be \( 1 \)

- VUID-VkCopyImageInfo2KHR-srcImage-01785
  If \( \text{srcImage} \) is of type \( \text{VK_IMAGE_TYPE_1D} \), then for each element of \( p\text{Regions} \), \( \text{srcOffset.z} \) must be \( 0 \) and \( \text{extent.depth} \) must be \( 1 \)

- VUID-VkCopyImageInfo2KHR-dstImage-01788
  If \( \text{dstImage} \) is of type \( \text{VK_IMAGE_TYPE_2D} \), then for each element of \( p\text{Regions} \), \( \text{dstOffset.z} \) must be \( 0 \)

- VUID-VkCopyImageInfo2KHR-dstImage-01786
  If \( \text{dstImage} \) is of type \( \text{VK_IMAGE_TYPE_1D} \), then for each element of \( p\text{Regions} \), \( \text{dstOffset.z} \) must be \( 0 \) and \( \text{extent.depth} \) must be \( 1 \)

- VUID-VkCopyImageInfo2KHR-dstImage-01787
  If \( \text{dstImage} \) is of type \( \text{VK_IMAGE_TYPE_2D} \), then for each element of \( p\text{Regions} \), \( \text{dstOffset.z} \) must be \( 0 \)
must be 0

- VUID-VkCopyImageInfo2KHR-srcImage-01790
  If `srcImage` and `dstImage` are both of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `extent.depth` must be 1

- VUID-VkCopyImageInfo2KHR-srcImage-01791
  If `srcImage` is of type `VK_IMAGE_TYPE_2D`, and `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` must equal `srcSubresource.layerCount`

- VUID-VkCopyImageInfo2KHR-dstImage-01792
  If `dstImage` is of type `VK_IMAGE_TYPE_2D`, and `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` must equal `dstSubresource.layerCount`

- VUID-VkCopyImageInfo2KHR-dstOffset-00150
  For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`

- VUID-VkCopyImageInfo2KHR-dstOffset-00151
  For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`

- VUID-VkCopyImageInfo2KHR-dstOffset-00153
  For each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`

- VUID-VkCopyImageInfo2KHR-srcImage-01727
  If `srcImage` is a blocked image, then for each element of `pRegions`, all members of `srcOffset` must be a multiple of the corresponding dimensions of the compressed texel block

- VUID-VkCopyImageInfo2KHR-srcImage-01728
  If `srcImage` is a blocked image, then for each element of `pRegions`, `extent.width` must be a multiple of the compressed texel block width or `(extent.width + srcOffset.x)` must equal the width of the specified `srcSubresource` of `srcImage`

- VUID-VkCopyImageInfo2KHR-srcImage-01729
  If `srcImage` is a blocked image, then for each element of `pRegions`, `extent.height` must be a multiple of the compressed texel block height or `(extent.height + srcOffset.y)` must equal the height of the specified `srcSubresource` of `srcImage`

- VUID-VkCopyImageInfo2KHR-srcImage-01730
  If `srcImage` is a blocked image, then for each element of `pRegions`, `extent.depth` must be a multiple of the compressed texel block depth or `(extent.depth + srcOffset.z)` must equal the depth of the specified `srcSubresource` of `srcImage`

- VUID-VkCopyImageInfo2KHR-dstImage-01731
  If `dstImage` is a blocked image, then for each element of `pRegions`, all members of `dstOffset` must be a multiple of the corresponding dimensions of the compressed texel block
If `dstImage` is a **blocked image**, then for each element of `pRegions`, `extent.width` **must** be a multiple of the compressed texel block width or (`extent.width + dstOffset.x`) **must** equal the width of the specified `dstSubresource` of `dstImage`

If `dstImage` is a **blocked image**, then for each element of `pRegions`, `extent.height` **must** be a multiple of the compressed texel block height or (`extent.height + dstOffset.y`) **must** equal the height of the specified `dstSubresource` of `dstImage`

If `dstImage` is a **blocked image**, then for each element of `pRegions`, `extent.depth` **must** be a multiple of the compressed texel block depth or (`extent.depth + dstOffset.z`) **must** equal the depth of the specified `dstSubresource` of `dstImage`

**Valid Usage (Implicit)**

- **VK_STRUCTURE_TYPE_COPY_IMAGE_INFO_2_KHR**
  - `sType` **must** be `VK_STRUCTURE_TYPE_COPY_IMAGE_INFO_2_KHR`

- `pNext` **must** be `NULL`

- `srcImage` **must** be a valid `VkImage` handle

- `srcImageLayout` **must** be a valid `VkImageLayout` value

- `dstImage` **must** be a valid `VkImage` handle

- `dstImageLayout` **must** be a valid `VkImageLayout` value

- `pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkImageCopy2KHR` structures

- `regionCount` **must** be greater than `0`

- `Both of dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice`

The `VkImageCopy2KHR` structure is defined as:
// Provided by VK_KHR_copy_commands2
typedef struct VkImageCopy2KHR {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageCopy2KHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcSubresource** and **dstSubresource** are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively.
- **srcOffset** and **dstOffset** select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- **extent** is the size in texels of the image to copy in width, height and depth.

## Valid Usage

- VUID-VkImageCopy2KHR-extent-00140
  The number of slices of the **extent** (for 3D) or layers of the **srcSubresource** (for non-3D) must match the number of slices of the **extent** (for 3D) or layers of the **dstSubresource** (for non-3D)

## Valid Usage (Implicit)

- VUID-VkImageCopy2KHR-sType-sType
  **sType** must be `VK_STRUCTURE_TYPE_IMAGE_COPY_2_KHR`
- VUID-VkImageCopy2KHR-pNext-pNext
  **pNext** must be NULL
- VUID-VkImageCopy2KHR-srcSubresource-parameter
  **srcSubresource** must be a valid `VkImageSubresourceLayers` structure
- VUID-VkImageCopy2KHR-dstSubresource-parameter
  **dstSubresource** must be a valid `VkImageSubresourceLayers` structure

### 20.4. Copying Data Between Buffers and Images

To copy data from a buffer object to an image object, call:
// Provided by VK_VERSION_1_0
void vkCmdCopyBufferToImage(
    VkCommandBuffer commandBuffer,
    VkBuffer srcBuffer,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkBufferImageCopy* pRegions);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcBuffer` is the source buffer.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the copy.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferImageCopy` structures specifying the regions to copy.

Each region in `pRegions` is copied from the specified region of the source buffer to the specified region of the destination image.

If `dstImage` has a multi-planar format, regions of each plane to be a target of a copy must be specified separately using the `pRegions` member of the `VkBufferImageCopy` structure. In this case, the `aspectMask` of `imageSubresource` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`. For the purposes of `vkCmdCopyBufferToImage`, each plane of a multi-planar image is treated as having the format listed in Compatible formats of planes of multi-planar formats for the plane identified by the `aspectMask` of the corresponding subresource. This applies both to `VkFormat` and to coordinates used in the copy, which correspond to texels in the `plane` rather than how these texels map to coordinates in the image as a whole.
Valid Usage

- VUID-vkCmdCopyBufferToImage-pRegions-06217
  The image region specified by each element of pRegions must be contained within the specified imageSubresource of dstImage.

- VUID-vkCmdCopyBufferToImage-pRegions-00171
  srcBuffer must be large enough to contain all buffer locations that are accessed according to Buffer and Image Addressing, for each element of pRegions.

- VUID-vkCmdCopyBufferToImage-pRegions-00173
  The union of all source regions, and the union of all destination regions, specified by the elements of pRegions, must not overlap in memory.

- VUID-vkCmdCopyBufferToImage-srcBuffer-00174
  srcBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_SRC_BIT usage flag.

- VUID-vkCmdCopyBufferToImage-dstImage-00175
  The format features of dstImage must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT.

- VUID-vkCmdCopyBufferToImage-srcBuffer-00176
  If srcBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- VUID-vkCmdCopyBufferToImage-dstImage-00177
  dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag.

- VUID-vkCmdCopyBufferToImage-dstImage-00178
  If dstImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- VUID-vkCmdCopyBufferToImage-dstImage-00179
  dstImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT.

- VUID-vkCmdCopyBufferToImage-dstImageLayout-00180
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice.

- VUID-vkCmdCopyBufferToImage-dstImageLayout-01396
  dstImageLayout must be VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, VK_IMAGE_LAYOUT_GENERAL, or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR.

- VUID-vkCmdCopyBufferToImage-imageSubresource-01701
  The imageSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created.

- VUID-vkCmdCopyBufferToImage-imageSubresource-01702
  The imageSubresource.baseArrayLayer + imageSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created.

- VUID-vkCmdCopyBufferToImage-imageOffset-01793
  The imageOffset and imageExtent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties.
VUID-vkCmdCopyBufferToImage-dstImage-02543

dstImage must not have been created with flags containing
VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

VUID-vkCmdCopyBufferToImage-commandBuffer-04477

If the queue family used to create the VkCommandPool which commandBuffer was allocated
from does not support VK_QUEUE_GRAPHICS_BIT, for each element of pRegions, the aspectMask
member of imageSubresource must not be VK_IMAGE_ASPECT_DEPTH_BIT or
VK_IMAGE_ASPECT_STENCIL_BIT

VUID-vkCmdCopyBufferToImage-pRegions-06218

For each element of pRegions, imageOffset.x and (imageExtent.width + imageOffset.x) must
both be greater than or equal to 0 and less than or equal to the width of the specified
imageSubresource of dstImage

VUID-vkCmdCopyBufferToImage-pRegions-06219

For each element of pRegions, imageOffset.y and (imageExtent.height + imageOffset.y) must
both be greater than or equal to 0 and less than or equal to the height of the specified
imageSubresource of dstImage

VUID-vkCmdCopyBufferToImage-bufferOffset-01558

If dstImage does not have either a depth/stencil or a multi-planar format, then for each
element of pRegions, bufferOffset must be a multiple of the format’s texel block size

VUID-vkCmdCopyBufferToImage-bufferOffset-01559

If dstImage has a multi-planar format, then for each element of pRegions, bufferOffset
must be a multiple of the element size of the compatible format for the format and the
aspectMask of the imageSubresource as defined in Compatible formats of planes of multi-
planar formats

VUID-vkCmdCopyBufferToImage-srcImage-00199

If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y
must be 0 and imageExtent.height must be 1

VUID-vkCmdCopyBufferToImage-imageOffset-00200

For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must
both be greater than or equal to 0 and less than or equal to the depth of the specified
imageSubresource of dstImage

VUID-vkCmdCopyBufferToImage-srcImage-00201

If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of
pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1

VUID-vkCmdCopyBufferToImage-bufferRowLength-00203

If dstImage is a blocked image, for each element of pRegions, bufferRowLength must be a
multiple of the compressed texel block width

VUID-vkCmdCopyBufferToImage-bufferImageHeight-00204

If dstImage is a blocked image, for each element of pRegions, bufferImageHeight must be a
multiple of the compressed texel block height

VUID-vkCmdCopyBufferToImage-imageOffset-00205

If dstImage is a blocked image, for each element of pRegions, all members of imageOffset
must be a multiple of the corresponding dimensions of the compressed texel block
If \( \text{dstImage} \) is a **blocked image**, for each element of \( \text{pRegions} \), \( \text{bufferOffset} \) **must** be a multiple of the compressed texel block size in bytes.

If \( \text{dstImage} \) is a **blocked image**, for each element of \( \text{pRegions} \), \( \text{imageExtent.width} \) **must** be a multiple of the compressed texel block width or \((\text{imageExtent.width + imageOffset.x})\) **must** equal the width of the specified \( \text{imageSubresource} \) of \( \text{dstImage} \).

If \( \text{dstImage} \) is a **blocked image**, for each element of \( \text{pRegions} \), \( \text{imageExtent.height} \) **must** be a multiple of the compressed texel block height or \((\text{imageExtent.height + imageOffset.y})\) **must** equal the height of the specified \( \text{imageSubresource} \) of \( \text{dstImage} \).

If \( \text{dstImage} \) is a **blocked image**, for each element of \( \text{pRegions} \), \( \text{imageExtent.depth} \) **must** be a multiple of the compressed texel block depth or \((\text{imageExtent.depth + imageOffset.z})\) **must** equal the depth of the specified \( \text{imageSubresource} \) of \( \text{dstImage} \).

For each element of \( \text{pRegions} \), \( \text{imageSubresource.aspectMask} \) **must** specify aspects present in \( \text{dstImage} \).

If \( \text{dstImage} \) has a **multi-planar format**, then for each element of \( \text{pRegions} \), \( \text{imageSubresource.aspectMask} \) **must** be \( \text{VK_IMAGE_ASPECT_PLANE_0_BIT} \), \( \text{VK_IMAGE_ASPECT_PLANE_1_BIT} \), or \( \text{VK_IMAGE_ASPECT_PLANE_2_BIT} \) (with \( \text{VK_IMAGE_ASPECT_PLANE_2_BIT} \) valid only for image formats with three planes).

If \( \text{dstImage} \) is of type \( \text{VK_IMAGE_TYPE_3D} \), for each element of \( \text{pRegions} \), \( \text{imageSubresource.baseArrayLayer} \) **must** be 0 and \( \text{imageSubresource.layerCount} \) **must** be 1.

If \( \text{dstImage} \) is not a **blocked image**, for each element of \( \text{pRegions} \), \( \text{bufferRowLength} \) multiplied by the texel block size of \( \text{dstImage} \) **must** be less than or equal to \( 2^{31}-1 \).

If \( \text{dstImage} \) is a **blocked image**, for each element of \( \text{pRegions} \), \( \text{bufferRowLength} \) divided by the compressed texel block width and then multiplied by the texel block size of \( \text{dstImage} \) **must** be less than or equal to \( 2^{31}-1 \).

If the queue family used to create the \( \text{VkCommandPool} \) which \( \text{commandBuffer} \) was allocated from does not support \( \text{VK_QUEUE_GRAPHICS_BIT} \) or \( \text{VK_QUEUE_COMPUTE_BIT} \), the \( \text{bufferOffset} \) member of any element of \( \text{pRegions} \) **must** be a multiple of 4.

If \( \text{dstImage} \) has a depth/stencil format, the \( \text{bufferOffset} \) member of any element of \( \text{pRegions} \) **must** be a multiple of 4.
Valid Usage (Implicit)

- **VUID-vkCmdCopyBufferToImage-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyBufferToImage-srcBuffer-parameter**
  `srcBuffer` must be a valid `VkBuffer` handle

- **VUID-vkCmdCopyBufferToImage-dstImage-parameter**
  `dstImage` must be a valid `VkImage` handle

- **VUID-vkCmdCopyBufferToImage-dstImageLayout-parameter**
  `dstImageLayout` must be a valid `VkImageLayout` value

- **VUID-vkCmdCopyBufferToImage-pRegions-parameter**
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy` structures

- **VUID-vkCmdCopyBufferToImage-commandBuffer-recording**
  `commandBuffer` must be in the `recording` state

- **VUID-vkCmdCopyBufferToImage-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- **VUID-vkCmdCopyBufferToImage-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdCopyBufferToImage-regionCount-arraylength**
  `regionCount` must be greater than 0

- **VUID-vkCmdCopyBufferToImage-commonparent**
  Each of `commandBuffer`, `dstImage`, and `srcBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

---

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

---

To copy data from an image object to a buffer object, call:
void vkCmdCopyImageToBuffer(
  VkCommandBuffer commandBuffer,
  VkImage srcImage,
  VkImageLayout srcImageLayout,
  VkBuffer dstBuffer,
  uint32_t regionCount,
  const VkBufferImageCopy* pRegions);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the copy.
- **dstBuffer** is the destination buffer.
- **regionCount** is the number of regions to copy.
- **pRegions** is a pointer to an array of `VkBufferImageCopy` structures specifying the regions to copy.

Each region in **pRegions** is copied from the specified region of the source image to the specified region of the destination buffer.

If **srcImage** has a **multi-planar format**, regions of each plane to be a source of a copy **must** be specified separately using the **pRegions** member of the `VkBufferImageCopy` structure. In this case, the **aspectMask** of **imageSubresource** **must** be **VK_IMAGE_ASPECT_PLANE_0_BIT**, **VK_IMAGE_ASPECT_PLANE_1_BIT**, or **VK_IMAGE_ASPECT_PLANE_2_BIT**. For the purposes of **vkCmdCopyBufferToImage**, each plane of a multi-planar image is treated as having the format listed in **Compatible formats of planes of multi-planar formats** for the plane identified by the **aspectMask** of the corresponding subresource. This applies both to **VkFormat** and to coordinates used in the copy, which correspond to texels in the **plane** rather than how these texels map to coordinates in the image as a whole.
Valid Usage

- VUID-vkCmdCopyImageToBuffer-pRegions-06220
  The image region specified by each element of `pRegions` must be contained within the specified `imageSubresource` of `srcImage`.

- VUID-vkCmdCopyImageToBuffer-pRegions-00183
  `dstBuffer` must be large enough to contain all buffer locations that are accessed according to Buffer and Image Addressing, for each element of `pRegions`.

- VUID-vkCmdCopyImageToBuffer-pRegions-00184
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory.

- VUID-vkCmdCopyImageToBuffer-srcImage-00186
  `srcImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag.

- VUID-vkCmdCopyImageToBuffer-srcImage-01998
  The `format features` of `srcImage` must contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`.

- VUID-vkCmdCopyImageToBuffer-srcImage-00187
  If `srcImage` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdCopyImageToBuffer-dstBuffer-00191
  `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag.

- VUID-vkCmdCopyImageToBuffer-dstBuffer-00192
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdCopyImageToBuffer-srcImage-00188
  `srcImage` must have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`.

- VUID-vkCmdCopyImageToBuffer-srcImageLayout-00189
  `srcImageLayout` must specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

- VUID-vkCmdCopyImageToBuffer-srcImageLayout-01397
  `srcImageLayout` must be `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`.

- VUID-vkCmdCopyImageToBuffer-imageSubresource-01703
  The `imageSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created.

- VUID-vkCmdCopyImageToBuffer-imageSubresource-01704
  The `imageSubresource.baseArrayLayer + imageSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

- VUID-vkCmdCopyImageToBuffer-imageOffset-01794
  The `imageOffset` and `imageExtent` members of each element of `pRegions` must respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`.
srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT.

For each element of pRegions, imageOffset.x and (imageExtent.width + imageOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified imageSubresource of srcImage.

For each element of pRegions, imageOffset.y and (imageExtent.height + imageOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified imageSubresource of srcImage.

If srcImage does not have either a depth/stencil or a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the format's texel block size.

If srcImage has a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the element size of the compatible format for the format and the aspectMask of the imageSubresource as defined in Compatible formats of planes of multi-planar formats.

If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y must be 0 and imageExtent.height must be 1.

For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of srcImage.

If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1.

If srcImage is a blocked image, for each element of pRegions, bufferRowLength must be a multiple of the compressed texel block width.

If srcImage is a blocked image, for each element of pRegions, bufferImageHeight must be a multiple of the compressed texel block height.

If srcImage is a blocked image, for each element of pRegions, all members of imageOffset must be a multiple of the corresponding dimensions of the compressed texel block.

If srcImage is a blocked image, for each element of pRegions, bufferOffset must be a multiple of the compressed texel block size in bytes.

If srcImage is a blocked image, for each element of pRegions, imageExtent.width must be a
multiple of the compressed texel block width or \((\text{imageExtent.width} + \text{imageOffset.x})\) must equal the width of the specified \text{imageSubresource} of \text{srcImage}

- **VUID-vkCmdCopyImageToBuffer-imageExtent-00208**
  
  If \text{srcImage} is a blocked image, for each element of \text{pRegions}, \text{imageExtent.height} must be a multiple of the compressed texel block height or \((\text{imageExtent.height} + \text{imageOffset.y})\) must equal the height of the specified \text{imageSubresource} of \text{srcImage}

- **VUID-vkCmdCopyImageToBuffer-imageExtent-00209**
  
  If \text{srcImage} is a blocked image, for each element of \text{pRegions}, \text{imageExtent.depth} must be a multiple of the compressed texel block depth or \((\text{imageExtent.depth} + \text{imageOffset.z})\) must equal the depth of the specified \text{imageSubresource} of \text{srcImage}

- **VUID-vkCmdCopyImageToBuffer-aspectMask-00211**
  
  For each element of \text{pRegions}, \text{imageSubresource.aspectMask} must specify aspects present in \text{srcImage}

- **VUID-vkCmdCopyImageToBuffer-aspectMask-01560**
  
  If \text{srcImage} has a multi-planar format, then for each element of \text{pRegions}, \text{imageSubresource.aspectMask} must be \text{VK_IMAGE_ASPECT_PLANE_0_BIT}, \text{VK_IMAGE_ASPECT_PLANE_1_BIT}, or \text{VK_IMAGE_ASPECT_PLANE_2_BIT} (with \text{VK_IMAGE_ASPECT_PLANE_2_BIT} valid only for image formats with three planes)

- **VUID-vkCmdCopyImageToBuffer-baseArrayLayer-00213**
  
  If \text{srcImage} is of type \text{VK_IMAGE_TYPE_3D}, for each element of \text{pRegions}, \text{imageSubresource.baseArrayLayer} must be 0 and \text{imageSubresource.layerCount} must be 1

- **VUID-vkCmdCopyImageToBuffer-pRegions-04725**
  
  If \text{srcImage} is not a blocked image, for each element of \text{pRegions}, \text{bufferRowLength} multiplied by the texel block size of \text{srcImage} must be less than or equal to \(2^{31}-1\)

- **VUID-vkCmdCopyImageToBuffer-pRegions-04726**
  
  If \text{srcImage} is a blocked image, for each element of \text{pRegions}, \text{bufferRowLength} divided by the compressed texel block width and then multiplied by the texel block size of \text{srcImage} must be less than or equal to \(2^{31}-1\)

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-04052**
  
  If the queue family used to create the \text{VkCommandPool} which \text{commandBuffer} was allocated from does not support \text{VK_QUEUE_GRAPHICS_BIT} or \text{VK_QUEUE_COMPUTE_BIT}, the \text{bufferOffset} member of any element of \text{pRegions} must be a multiple of 4

- **VUID-vkCmdCopyImageToBuffer-srcImage-04053**
  
  If \text{srcImage} has a depth/stencil format, the \text{bufferOffset} member of any element of \text{pRegions} must be a multiple of 4
Valid Usage (Implicit)

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyImageToBuffer-srcImage-parameter**
  
  `srcImage` must be a valid `VkImage` handle

- **VUID-vkCmdCopyImageToBuffer-srcImageLayout-parameter**
  
  `srcImageLayout` must be a valid `VkImageLayout` value

- **VUID-vkCmdCopyImageToBuffer-dstBuffer-parameter**
  
  `dstBuffer` must be a valid `VkBuffer` handle

- **VUID-vkCmdCopyImageToBuffer-pRegions-parameter**
  
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy` structures

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- **VUID-vkCmdCopyImageToBuffer-renderpass**
  
  This command must only be called outside of a render pass instance

- **VUID-vkCmdCopyImageToBuffer-regionCount-arraylength**
  
  `regionCount` must be greater than 0

- **VUID-vkCmdCopyImageToBuffer-commonparent**
  
  Each of `commandBuffer`, `dstBuffer`, and `srcImage` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Transfer</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Graphics</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Compute</td>
</tr>
</tbody>
</table>

For both `vkCmdCopyBufferToImage` and `vkCmdCopyImageToBuffer`, each element of `pRegions` is a
structure defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferImageCopy {
    VkDeviceSize bufferOffset;
    uint32_t bufferRowLength;
    uint32_t bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkBufferImageCopy;
```

- `bufferOffset` is the offset in bytes from the start of the buffer object where the image data is copied from or to.
- `bufferRowLength` and `bufferImageHeight` specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the `imageExtent`.
- `imageSubresource` is a `VkImageSubresourceLayers` used to specify the specific image subresources of the image used for the source or destination image data.
- `imageOffset` selects the initial `x`, `y`, `z` offsets in texels of the sub-region of the source or destination image data.
- `imageExtent` is the size in texels of the image to copy in `width`, `height` and `depth`.

When copying to or from a depth or stencil aspect, the data in buffer memory uses a layout that is a (mostly) tightly packed representation of the depth or stencil data. Specifically:

- data copied to or from the stencil aspect of any depth/stencil format is tightly packed with one `VK_FORMAT_S8_UINT` value per texel.
- data copied to or from the depth aspect of a `VK_FORMAT_D16_UNORM` or `VK_FORMAT_D16_UNORM_S8_UINT` format is tightly packed with one `VK_FORMAT_D16_UNORM` value per texel.
- data copied to or from the depth aspect of a `VK_FORMAT_D32_SFLOAT` or `VK_FORMAT_D32_SFLOAT_S8_UINT` format is tightly packed with one `VK_FORMAT_D32_SFLOAT` value per texel.
- data copied to or from the depth aspect of a `VK_FORMAT_X8_D24_UNORM_PACK32` or `VK_FORMAT_D24_UNORM_S8_UINT` format is packed with one 32-bit word per texel with the D24 value in the LSBs of the word, and undefined values in the eight MSBs.

```
Note
To copy both the depth and stencil aspects of a depth/stencil format, two entries in `pRegions` can be used, where one specifies the depth aspect in `imageSubresource`, and the other specifies the stencil aspect.
```

Because depth or stencil aspect buffer to image copies may require format conversions on some implementations, they are not supported on queues that do not support graphics.
When copying to a depth aspect, and the `VK_EXT_depth_range_unrestricted` extension is not enabled, the data in buffer memory must be in the range [0,1], or the resulting values are undefined.

Copies are done layer by layer starting with image layer `baseArrayLayer` member of `imageSubresource.layerCount` layers are copied from the source image or to the destination image.

For purpose of valid usage statements here and in related copy commands, a *blocked image* is defined as:

- an image with a single-plane, “_422” format, which is treated as a format with a 2 × 1 compressed texel block, or
- a compressed image.

### Valid Usage

- VUID-VkBufferImageCopy-bufferRowLength-00195
  bufferRowLength must be 0, or greater than or equal to the width member of `imageExtent`
- VUID-VkBufferImageCopy-bufferImageHeight-00196
  bufferImageHeight must be 0, or greater than or equal to the height member of `imageExtent`
- VUID-VkBufferImageCopy-aspectMask-00212
  The aspectMask member of `imageSubresource` must only have a single bit set

### Valid Usage (Implicit)

- VUID-VkBufferImageCopy-imageSubresource-parameter
  `imageSubresource` must be a valid `VkImageSubresourceLayers` structure

More extensible versions of the commands to copy between buffers and images are defined below.

To copy data from a buffer object to an image object, call:

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyBufferToImage2KHR(
    VkCommandBuffer commandBuffer, 
    const VkCopyBufferToImageInfo2KHR* pCopyBufferToImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyBufferToImageInfo` is a pointer to a `VkCopyBufferToImageInfo2KHR` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyBufferToImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.
Valid Usage

Valid Usage (Implicit)

- **VUID-vkCmdCopyBufferToImage2KHR-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyBufferToImage2KHR-pCopyBufferToImageInfo-parameter**
  - `pCopyBufferToImageInfo` must be a valid pointer to a valid `VkCopyBufferToImageInfo2KHR` structure

- **VUID-vkCmdCopyBufferToImage2KHR-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdCopyBufferToImage2KHR-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- **VUID-vkCmdCopyBufferToImage2KHR-renderpass**
  - This command must only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Transfer</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Graphics</td>
</tr>
<tr>

</tbody>
</table>

The `VkCopyBufferToImageInfo2KHR` structure is defined as:
typedef struct VkCopyBufferToImageInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkBuffer srcBuffer;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkBufferImageCopy2KHR* pRegions;
} VkCopyBufferToImageInfo2KHR;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• srcBuffer is the source buffer.
• dstImage is the destination image.
• dstImageLayout is the layout of the destination image subresources for the copy.
• regionCount is the number of regions to copy.
• pRegions is a pointer to an array of VkBufferImageCopy2KHR structures specifying the regions to copy.
Valid Usage

• VUID-VkCopyBufferToImageInfo2KHR-pRegions-04565
  If the image region specified by each element of \( p_{Regions} \) does not contain \( \text{VkCopyCommandTransformInfoQCOM} \) in its \( p_{Next} \) chain, it must be a region that is contained within the specified \( \text{imageSubresource} \) of \( \text{dstImage} \).

• VUID-VkCopyBufferToImageInfo2KHR-pRegions-04554
  If the image region specified by each element of \( p_{Regions} \) contains \( \text{VkCopyCommandTransformInfoQCOM} \) in its \( p_{Next} \) chain, the rotated destination region as described in Buffer and Image Addressing with Rotation must be contained within \( \text{dstImage} \).

• VUID-VkCopyBufferToImageInfo2KHR-pRegions-04555
  If any element of \( p_{Regions} \) contains \( \text{VkCopyCommandTransformInfoQCOM} \) in its \( p_{Next} \) chain, then \( \text{dstImage} \) must not be a blocked image.

• VUID-VkCopyBufferToImageInfo2KHR-pRegions-06203
  If any element of \( p_{Regions} \) contains \( \text{VkCopyCommandTransformInfoQCOM} \) in its \( p_{Next} \) chain, then \( \text{dstImage} \) must be of type \( \text{VK_IMAGE_TYPE_2D} \).

• VUID-VkCopyBufferToImageInfo2KHR-pRegions-06204
  If any element of \( p_{Regions} \) contains \( \text{VkCopyCommandTransformInfoQCOM} \) in its \( p_{Next} \) chain, then \( \text{dstImage} \) must not have a multi-planar format.

• VUID-VkCopyBufferToImageInfo2KHR-pRegions-00171
  \( \text{srcBuffer} \) must be large enough to contain all buffer locations that are accessed according to Buffer and Image Addressing, for each element of \( p_{Regions} \).

• VUID-VkCopyBufferToImageInfo2KHR-pRegions-00173
  The union of all source regions, and the union of all destination regions, specified by the elements of \( p_{Regions} \), must not overlap in memory.

• VUID-VkCopyBufferToImageInfo2KHR-srcBuffer-00174
  \( \text{srcBuffer} \) must have been created with \( \text{VK_BUFFER_USAGE_TRANSFER_SRC_BIT} \) usage flag.

• VUID-VkCopyBufferToImageInfo2KHR-dstImage-01997
  The format features of \( \text{dstImage} \) must contain \( \text{VK_FORMAT_FEATURE_TRANSFER_DST_BIT} \).

• VUID-VkCopyBufferToImageInfo2KHR-srcBuffer-00176
  If \( \text{srcBuffer} \) is non-sparse then it must be bound completely and contiguously to a single \( \text{VkDeviceMemory} \) object.

• VUID-VkCopyBufferToImageInfo2KHR-dstImage-00177
  \( \text{dstImage} \) must have been created with \( \text{VK_IMAGE_USAGE_TRANSFER_DST_BIT} \) usage flag.

• VUID-VkCopyBufferToImageInfo2KHR-dstImage-00178
  If \( \text{dstImage} \) is non-sparse then it must be bound completely and contiguously to a single \( \text{VkDeviceMemory} \) object.

• VUID-VkCopyBufferToImageInfo2KHR-dstImage-00179
  \( \text{dstImage} \) must have a sample count equal to \( \text{VK_SAMPLE_COUNT_1_BIT} \).

• VUID-VkCopyBufferToImageInfo2KHR-dstImageLayout-00180
  \( \text{dstImageLayout} \) must specify the layout of the image subresources of \( \text{dstImage} \) specified in
**pRegions** at the time this command is executed on a **VkDevice**

- **VUID-VkCopyBufferToImageInfo2KHR-dstImageLayout-01396**
  
  The **dstImageLayout** must be **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL**, **VK_IMAGE_LAYOUT_GENERAL**, or **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**

- **VUID-VkCopyBufferToImageInfo2KHR-imageSubresource-01701**
  
  The **imageSubresource.mipLevel** member of each element of **pRegions** must be less than the **mipLevels** specified in **VkImageCreateInfo** when **dstImage** was created.

- **VUID-VkCopyBufferToImageInfo2KHR-imageSubresource-01702**
  
  The **imageSubresource.baseArrayLayer + imageSubresource.layerCount** of each element of **pRegions** must be less than or equal to the **arrayLayers** specified in **VkImageCreateInfo** when **dstImage** was created.

- **VUID-VkCopyBufferToImageInfo2KHR-imageOffset-01793**
  
  The **imageOffset** and **imageExtent** members of each element of **pRegions** must respect the image transfer granularity requirements of **commandBuffer**’s command pool’s queue family, as described in **VkQueueFamilyProperties**.

- **VUID-VkCopyBufferToImageInfo2KHR-dstImage-02543**
  
  **dstImage** must not have been created with flags containing **VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT**.

- **VUID-VkCopyBufferToImageInfo2KHR-commandBuffer-04477**
  
  If the queue family used to create the **VkCommandPool** which **commandBuffer** was allocated from does not support **VK_QUEUE_GRAPHICS_BIT**, for each element of **pRegions**, the **aspectMask** member of **imageSubresource** must not be **VK_IMAGE_ASPECT_DEPTH_BIT** or **VK_IMAGE_ASPECT_STENCIL_BIT**.

- **VUID-VkCopyBufferToImageInfo2KHR-pRegions-06223**
  
  For each element of **pRegions** not containing **VkCopyCommandTransformInfoQCOM** in its **pNext** chain, **imageOffset.x** and **(imageExtent.width + imageOffset.x)** must both be greater than or equal to **0** and less than or equal to the width of the specified **imageSubresource** of **dstImage**.

- **VUID-VkCopyBufferToImageInfo2KHR-pRegions-06224**
  
  For each element of **pRegions** not containing **VkCopyCommandTransformInfoQCOM** in its **pNext** chain, **imageOffset.y** and **(imageExtent.height + imageOffset.y)** must both be greater than or equal to **0** and less than or equal to the height of the specified **imageSubresource** of **dstImage**.

- **VUID-VkCopyBufferToImageInfo2KHR-bufferOffset-01558**
  
  If **dstImage** does not have either a depth/stencil or a multi-planar format, then for each element of **pRegions**, **bufferOffset** must be a multiple of the format’s texel block size.

- **VUID-VkCopyBufferToImageInfo2KHR-bufferOffset-01559**
  
  If **dstImage** has a multi-planar format, then for each element of **pRegions**, **bufferOffset** must be a multiple of the element size of the compatible format for the format and the **aspectMask** of the **imageSubresource** as defined in Compatible formats of planes of multi-planar formats.

- **VUID-VkCopyBufferToImageInfo2KHR-srcImage-00199**
  
  If **dstImage** is of type **VK_IMAGE_TYPE_1D**, then for each element of **pRegions**, **imageOffset.y** must be **0** and **imageExtent.height** must be **1**.
For each element of $pRegions$, $imageOffset.z$ and $(imageExtent.depth + imageOffset.z)$ must both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of $dstImage$.

If $dstImage$ is of type $VK_IMAGE_TYPE_1D$ or $VK_IMAGE_TYPE_2D$, then for each element of $pRegions$, $imageOffset.z$ must be 0 and $imageExtent.depth$ must be 1.

If $dstImage$ is a blocked image, for each element of $pRegions$, $bufferRowLength$ must be a multiple of the compressed texel block width.

If $dstImage$ is a blocked image, for each element of $pRegions$, $bufferImageHeight$ must be a multiple of the compressed texel block height.

If $dstImage$ is a blocked image, for each element of $pRegions$, all members of $imageOffset$ must be a multiple of the corresponding dimensions of the compressed texel block.

If $dstImage$ is a blocked image, for each element of $pRegions$, $bufferOffset$ must be a multiple of the compressed texel block size in bytes.

If $dstImage$ is a blocked image, for each element of $pRegions$, $imageExtent.width$ must be a multiple of the compressed texel block width or $(imageExtent.width + imageOffset.x)$ must equal the width of the specified imageSubresource of $dstImage$.

If $dstImage$ is a blocked image, for each element of $pRegions$, $imageExtent.height$ must be a multiple of the compressed texel block height or $(imageExtent.height + imageOffset.y)$ must equal the height of the specified imageSubresource of $dstImage$.

If $dstImage$ is a blocked image, for each element of $pRegions$, $imageExtent.depth$ must be a multiple of the compressed texel block depth or $(imageExtent.depth + imageOffset.z)$ must equal the depth of the specified imageSubresource of $dstImage$.

For each element of $pRegions$, $imageSubresource.aspectMask$ must specify aspects present in $dstImage$.

If $dstImage$ has a multi-planar format, then for each element of $pRegions$, $imageSubresource.aspectMask$ must be $VK_IMAGE_ASPECT_PLANE_0_BIT$, $VK_IMAGE_ASPECT_PLANE_1_BIT$, or $VK_IMAGE_ASPECT_PLANE_2_BIT$ (with $VK_IMAGE_ASPECT_PLANE_2_BIT$ valid only for image formats with three planes).

If $dstImage$ is of type $VK_IMAGE_TYPE_3D$, for each element of $pRegions$, $imageSubresource.baseArrayLayer$ must be 0 and $imageSubresource.layerCount$ must be 1.

If $dstImage$ is of type $VK_IMAGE_TYPE_1D$ or $VK_IMAGE_TYPE_2D$, then for each element of $pRegions$, $imageOffset.z$ must be 0 and $imageExtent.depth$ must be 1.
If `dstImage` is not a blocked image, for each element of `pRegions`, `bufferRowLength` multiplied by the texel block size of `dstImage` must be less than or equal to $2^{31}$-1

- VUID-VkCopyBufferToImageInfo2KHR-pRegions-04726

If `dstImage` is a blocked image, for each element of `pRegions`, `bufferRowLength` divided by the compressed texel block width and then multiplied by the texel block size of `dstImage` must be less than or equal to $2^{31}$-1

- VUID-VkCopyBufferToImageInfo2KHR-commandBuffer-04052

If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4

- VUID-VkCopyBufferToImageInfo2KHR-srcImage-04053

If `dstImage` has a depth/stencil format, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4

Valid Usage (Implicit)

- VUID-VkCopyBufferToImageInfo2KHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_COPY_BUFFER_TO_IMAGE_INFO_2_KHR`

- VUID-VkCopyBufferToImageInfo2KHR-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkCopyBufferToImageInfo2KHR-srcBuffer-parameter
  `srcBuffer` must be a valid `VkBuffer` handle

- VUID-VkCopyBufferToImageInfo2KHR-dstImage-parameter
  `dstImage` must be a valid `VkImage` handle

- VUID-VkCopyBufferToImageInfo2KHR-dstImageLayout-parameter
  `dstImageLayout` must be a valid `VkImageLayout` value

- VUID-VkCopyBufferToImageInfo2KHR-pRegions-parameter
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy2KHR` structures

- VUID-VkCopyBufferToImageInfo2KHR-regionCount-arraylength
  `regionCount` must be greater than 0

- VUID-VkCopyBufferToImageInfo2KHR-commonparent
  Both of `dstImage`, and `srcBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

To copy data from an image object to a buffer object, call:

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImageToBuffer2KHR(
  VkCommandBuffer commandBuffer,
  const VkCopyImageToBufferInfo2KHR* pCopyImageToBufferInfo);
```
• `commandBuffer` is the command buffer into which the command will be recorded.
• `pCopyImageToBufferInfo` is a pointer to a `VkCopyImageToBufferInfo2KHR` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyImageToBuffer`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

#### Valid Usage (Implicit)

- `VUID-vkCmdCopyImageToBuffer2KHR-commandBuffer-parameter`  
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- `VUID-vkCmdCopyImageToBuffer2KHR-pCopyImageToBufferInfo-parameter`  
  `pCopyImageToBufferInfo` must be a valid pointer to a valid `VkCopyImageToBufferInfo2KHR` structure
- `VUID-vkCmdCopyImageToBuffer2KHR-commandBuffer-recording`  
  `commandBuffer` must be in the recording state
- `VUID-vkCmdCopyImageToBuffer2KHR-commandBuffer-cmdpool`  
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations
- `VUID-vkCmdCopyImageToBuffer2KHR-renderpass`  
  This command must only be called outside of a render pass instance

#### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

The `VkCopyImageToBufferInfo2KHR` structure is defined as:

---

1244 | Chapter 20. Copy Commands
// Provided by VK_KHR_copy_commands2

typedef struct VkCopyImageToBufferInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkBuffer dstBuffer;
    uint32_t regionCount;
    const VkBufferImageCopy2KHR* pRegions;
} VkCopyImageToBufferInfo2KHR;

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **srcImage** is the source image.
• **srcImageLayout** is the layout of the source image subresources for the copy.
• **dstBuffer** is the destination buffer.
• **regionCount** is the number of regions to copy.
• **pRegions** is a pointer to an array of **VkBufferImageCopy2KHR** structures specifying the regions to copy.
Valid Usage

• VUID-VkCopyImageToBufferInfo2KHR-pRegions-04556
  If the image region specified by each element of pRegions does not contain
  VkCopyCommandTransformInfoQCOM in its pNext chain, it must be contained within the
  specified imageSubresource of srcImage.

• VUID-VkCopyImageToBufferInfo2KHR-pRegions-04557
  If the image region specified by each element of pRegions contains
  VkCopyCommandTransformInfoQCOM in its pNext chain, the rotated source region as
  described in Buffer and Image Addressing with Rotation must be contained within
  srcImage.

• VUID-VkCopyImageToBufferInfo2KHR-pRegions-04558
  If any element of pRegions contains VkCopyCommandTransformInfoQCOM in its pNext
  chain, then srcImage must not be a blocked image.

• VUID-VkCopyImageToBufferInfo2KHR-pRegions-06205
  If any element of pRegions contains VkCopyCommandTransformInfoQCOM in its pNext
  chain, then srcImage must be of type VK_IMAGE_TYPE_2D.

• VUID-VkCopyImageToBufferInfo2KHR-pRegions-06206
  If any element of pRegions contains VkCopyCommandTransformInfoQCOM in its pNext
  chain, then srcImage must not have a multi-planar format.

• VUID-VkCopyImageToBufferInfo2KHR-pRegions-00183
  dstBuffer must be large enough to contain all buffer locations that are accessed according
  to Buffer and Image Addressing, for each element of pRegions.

• VUID-VkCopyImageToBufferInfo2KHR-pRegions-00184
  The union of all source regions, and the union of all destination regions, specified by the
  elements of pRegions, must not overlap in memory.

• VUID-VkCopyImageToBufferInfo2KHR-srcImage-00186
  srcImage must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag.

• VUID-VkCopyImageToBufferInfo2KHR-srcImage-01998
  The format features of srcImage must contain VK_FORMAT_FEATURE_TRANSFER_SRC_BIT.

• VUID-VkCopyImageToBufferInfo2KHR-srcImage-00187
  If srcImage is non-sparse then it must be bound completely and contiguously to a single
  VkDeviceMemory object.

• VUID-VkCopyImageToBufferInfo2KHR-dstBuffer-00191
  dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag.

• VUID-VkCopyImageToBufferInfo2KHR-dstBuffer-00192
  If dstBuffer is non-sparse then it must be bound completely and contiguously to a single
  VkDeviceMemory object.

• VUID-VkCopyImageToBufferInfo2KHR-srcImage-00188
  srcImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT.

• VUID-VkCopyImageToBufferInfo2KHR-srcImageLayout-00189
  srcImageLayout must specify the layout of the image subresources of srcImage specified in
**pRegions** at the time this command is executed on a **VkDevice**

- **VUID-VkCopyImageToBufferInfo2KHR-srcImageLayout-01397**
  
  `srcImageLayout must be VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL, VK_IMAGE_LAYOUT_GENERAL, or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`

- **VUID-VkCopyImageToBufferInfo2KHR-imageSubresource-01703**
  
  The `imageSubresource.mipLevel` member of each element of **pRegions** must be less than the `mipLevels` specified in **VkImageCreateInfo** when **srcImage** was created

- **VUID-VkCopyImageToBufferInfo2KHR-imageSubresource-01704**
  
  The `imageSubresource.baseArrayLayer + imageSubresource.layerCount` of each element of **pRegions** must be less than or equal to the `arrayLayers` specified in **VkImageCreateInfo** when **srcImage** was created

- **VUID-VkCopyImageToBufferInfo2KHR-imageOffset-01794**
  
  The `imageOffset` and `imageExtent` members of each element of **pRegions** must respect the image transfer granularity requirements of **commandBuffer**'s command pool's queue family, as described in **VkQueueFamilyProperties**

- **VUID-VkCopyImageToBufferInfo2KHR-srcImage-02544**
  
  `srcImage` must not have been created with flags containing **VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT**

- **VUID-VkCopyImageToBufferInfo2KHR-imageOffset-00197**
  
  For each element of **pRegions** not containing **VkCopyCommandTransformInfoQCOM** in its `pNext` chain, `imageOffset.x` and `(imageExtent.width + imageOffset.x)` must both be greater than or equal to `0` and less than or equal to the width of the specified `imageSubresource` of **srcImage**

- **VUID-VkCopyImageToBufferInfo2KHR-imageOffset-00198**
  
  For each element of **pRegions** not containing **VkCopyCommandTransformInfoQCOM** in its `pNext` chain, `imageOffset.y` and `(imageExtent.height + imageOffset.y)` must both be greater than or equal to `0` and less than or equal to the height of the specified `imageSubresource` of **srcImage**

- **VUID-VkCopyImageToBufferInfo2KHR-bufferOffset-01558**
  
  If **srcImage** does not have either a depth/stencil or a multi-planar format, then for each element of **pRegions**, `bufferOffset` must be a multiple of the format's texel block size

- **VUID-VkCopyImageToBufferInfo2KHR-bufferOffset-01559**
  
  If **srcImage** has a multi-planar format, then for each element of **pRegions**, `bufferOffset` must be a multiple of the element size of the compatible format for the format and the `aspectMask` of the `imageSubresource` as defined in **Compatible formats of planes of multi-planar formats**

- **VUID-VkCopyImageToBufferInfo2KHR-srcImage-00199**
  
  If **srcImage** is of type **VK_IMAGE_TYPE_1D**, then for each element of **pRegions**, `imageOffset.y` must be `0` and `imageExtent.height` must be `1`

- **VUID-VkCopyImageToBufferInfo2KHR-imageOffset-00200**
  
  For each element of **pRegions**, `imageOffset.z` and `(imageExtent.depth + imageOffset.z)` must both be greater than or equal to `0` and less than or equal to the depth of the specified `imageSubresource` of **srcImage**

- **VUID-VkCopyImageToBufferInfo2KHR-srcImage-00201**
If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `imageOffset.z` must be 0 and `imageExtent.depth` must be 1

- **VUID-VkCopyImageToBufferInfo2KHR-bufferRowLength-00203**
  
  If `srcImage` is a blocked image, for each element of `pRegions`, `bufferRowLength` must be a multiple of the compressed texel block width

- **VUID-VkCopyImageToBufferInfo2KHR-bufferImageHeight-00204**
  
  If `srcImage` is a blocked image, for each element of `pRegions`, `bufferImageHeight` must be a multiple of the compressed texel block height

- **VUID-VkCopyImageToBufferInfo2KHR-imageOffset-00205**
  
  If `srcImage` is a blocked image, for each element of `pRegions`, all members of `imageOffset` must be a multiple of the corresponding dimensions of the compressed texel block

- **VUID-VkCopyImageToBufferInfo2KHR-bufferOffset-00206**
  
  If `srcImage` is a blocked image, for each element of `pRegions`, `bufferOffset` must be a multiple of the compressed texel block size in bytes

- **VUID-VkCopyImageToBufferInfo2KHR-imageExtent-00207**
  
  If `srcImage` is a blocked image, for each element of `pRegions`, `imageExtent.width` must be a multiple of the compressed texel block width or `(imageExtent.width + imageOffset.x)` must equal the width of the specified `imageSubresource` of `srcImage`

- **VUID-VkCopyImageToBufferInfo2KHR-imageExtent-00208**
  
  If `srcImage` is a blocked image, for each element of `pRegions`, `imageExtent.height` must be a multiple of the compressed texel block height or `(imageExtent.height + imageOffset.y)` must equal the height of the specified `imageSubresource` of `srcImage`

- **VUID-VkCopyImageToBufferInfo2KHR-imageExtent-00209**
  
  If `srcImage` is a blocked image, for each element of `pRegions`, `imageExtent.depth` must be a multiple of the compressed texel block depth or `(imageExtent.depth + imageOffset.z)` must equal the depth of the specified `imageSubresource` of `srcImage`

- **VUID-VkCopyImageToBufferInfo2KHR-aspectMask-00211**
  
  For each element of `pRegions`, `imageSubresource.aspectMask` must specify aspects present in `srcImage`

- **VUID-VkCopyImageToBufferInfo2KHR-aspectMask-01560**
  
  If `srcImage` has a multi-planar format, then for each element of `pRegions`, `imageSubresource.aspectMask` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT` (with `VK_IMAGE_ASPECT_PLANE_2_BIT` valid only for image formats with three planes)

- **VUID-VkCopyImageToBufferInfo2KHR-baseArrayLayer-00213**
  
  If `srcImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `imageSubresource.baseArrayLayer` must be 0 and `imageSubresource.layerCount` must be 1

- **VUID-VkCopyImageToBufferInfo2KHR-pRegions-04725**
  
  If `srcImage` is not a blocked image, for each element of `pRegions`, `bufferRowLength` multiplied by the texel block size of `srcImage` must be less than or equal to 2^{31}-1

- **VUID-VkCopyImageToBufferInfo2KHR-pRegions-04726**
  
  If `srcImage` is a blocked image, for each element of `pRegions`, `bufferRowLength` divided by the compressed texel block width and then multiplied by the texel block size of `srcImage`
must be less than or equal to \(2^{31} - 1\)

- VUID-VkCopyImageToBufferInfo2KHR-commandBuffer-04052
  If the queue family used to create the VkCommandPool which commandBuffer was allocated from does not support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT, the bufferOffset member of any element of \(p\text{Regions}\) must be a multiple of 4

- VUID-VkCopyImageToBufferInfo2KHR-srcImage-04053
  If \(\text{srcImage}\) has a depth/stencil format, the bufferOffset member of any element of \(p\text{Regions}\) must be a multiple of 4

**Valid Usage (Implicit)**

- VUID-VkCopyImageToBufferInfo2KHR-sType-sType
  \(s\text{Type}\) must be VK_STRUCTURE_TYPE_COPY_IMAGE_TO_BUFFER_INFO_2_KHR

- VUID-VkCopyImageToBufferInfo2KHR-pNext-pNext
  \(p\text{Next}\) must be NULL

- VUID-VkCopyImageToBufferInfo2KHR-srcImage-parameter
  \(\text{srcImage}\) must be a valid \(Vk\text{Image}\) handle

- VUID-VkCopyImageToBufferInfo2KHR-srcImageLayout-parameter
  \(\text{srcImageLayout}\) must be a valid \(Vk\text{ImageLayout}\) value

- VUID-VkCopyImageToBufferInfo2KHR-dstBuffer-parameter
  \(\text{dstBuffer}\) must be a valid \(Vk\text{Buffer}\) handle

- VUID-VkCopyImageToBufferInfo2KHR-pRegions-parameter
  \(p\text{Regions}\) must be a valid pointer to an array of \(\text{regionCount}\) valid \(Vk\text{BufferImageCopy2KHR}\) structures

- VUID-VkCopyImageToBufferInfo2KHR-regionCount-arraylength
  \(\text{regionCount}\) must be greater than 0

- VUID-VkCopyImageToBufferInfo2KHR-commonparent
  Both of \(\text{dstBuffer}\), and \(\text{srcImage}\) must have been created, allocated, or retrieved from the same \(Vk\text{Device}\)

For both \(vk\text{CmdCopyBufferToImage2KHR}\) and \(vk\text{CmdCopyImageToBuffer2KHR}\), each element of \(p\text{Regions}\) is a structure defined as:
typedef struct VkBufferImageCopy2KHR {
    VkStructureType      sType;
    const void*          pNext;
    VkDeviceSize         bufferOffset;
    uint32_t             bufferRowLength;
    uint32_t             bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D           imageOffset;
    VkExtent3D           imageExtent;
} VkBufferImageCopy2KHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **bufferOffset** is the offset in bytes from the start of the buffer object where the image data is copied from or to.
- **bufferRowLength** and **bufferImageHeight** specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the **imageExtent**.
- **imageSubresource** is a **VkImageSubresourceLayers** used to specify the specific image subresources of the image used for the source or destination image data.
- **imageOffset** selects the initial $x$, $y$, $z$ offsets in texels of the sub-region of the source or destination image data.
- **imageExtent** is the size in texels of the image to copy in width, height and depth.

This structure is functionally identical to **VkBufferImageCopy**, but adds **sType** and **pNext** parameters, allowing it to be more easily extended.

### Valid Usage

- VUID-VkBufferImageCopy2KHR-bufferRowLength-00195
  - **bufferRowLength** must be 0, or greater than or equal to the width member of **imageExtent**

- VUID-VkBufferImageCopy2KHR-bufferImageHeight-00196
  - **bufferImageHeight** must be 0, or greater than or equal to the height member of **imageExtent**

- VUID-VkBufferImageCopy2KHR-aspectMask-00212
  - The **aspectMask** member of **imageSubresource** must only have a single bit set
Valid Usage (Implicit)

- VUID-VkBufferImageCopy2KHR-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_BUFFER_IMAGE_COPY_2_KHR`

- VUID-VkBufferImageCopy2KHR-pNext-pNext
  
  **pNext** must be `NULL` or a pointer to a valid instance of `VkCopyCommandTransformInfoQCOM`

- VUID-VkBufferImageCopy2KHR-sType-unique
  
  The **sType** value of each struct in the **pNext** chain must be unique

- VUID-VkBufferImageCopy2KHR-imageSubresource-parameter
  
  **imageSubresource** must be a valid `VkImageSubresourceLayers` structure

For both `vkCmdCopyBufferToImage2KHR` and `vkCmdCopyImageToBuffer2KHR`, each region copied can include a rotation. To specify a region with rotation, add the `VkCopyCommandTransformInfoQCOM` to the **pNext** chain of `VkBufferImageCopy2KHR`. When a rotation is specified, **Buffer and Image Addressing with Rotation** specifies how coordinates of texels in the source region are rotated by **transform** to produce texel coordinates in the destination region. When rotation is specified, the source and destination images must each be 2D images. They must not be blocked images or have a multi-planar format.

The `VkRenderPassTransformBeginInfoQCOM` structure is defined as:

```c
// Provided by VK_QCOM_rotated_copy_commands
typedef struct VkCopyCommandTransformInfoQCOM {
    VkStructureType  sType;
    const void*      pNext;
    VkSurfaceTransformFlagBitsKHR transform;
} VkCopyCommandTransformInfoQCOM;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **transform** is a `VkSurfaceTransformFlagBitsKHR` value describing the transform to be applied.

Valid Usage

- VUID-VkCopyCommandTransformInfoQCOM-transform-04560
  
  **transform** must be `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR, VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR, VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR, or VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR`
• VUID-VkCopyCommandTransformInfoQCOM-sType-sType

sType must be VK_STRUCTURE_TYPE_COPY_COMMAND_TRANSFORM_INFO_QCOM

20.4.1. Buffer and Image Addressing

Pseudocode for image/buffer addressing of uncompressed formats is:

```plaintext
rowLength = region->bufferRowLength;
if (rowLength == 0)
    rowLength = region->imageExtent.width;

imageHeight = region->bufferImageHeight;
if (imageHeight == 0)
    imageHeight = region->imageExtent.height;

texelBlockSize = <texel block size of the format of the src/dstImage>;

address of (x,y,z) = region->bufferOffset + ((z * imageHeight) + y) * rowLength + x) * texelBlockSize;

where x,y,z range from (0,0,0) to region->imageExtent.{width,height,depth}.
```

Note that imageOffset does not affect addressing calculations for buffer memory. Instead, bufferOffset can be used to select the starting address in buffer memory.

For block-compressed formats, all parameters are still specified in texels rather than compressed texel blocks, but the addressing math operates on whole compressed texel blocks. Pseudocode for compressed copy addressing is:
rowLength = region->bufferRowLength;
if (rowLength == 0)
  rowLength = region->imageExtent.width;

imageHeight = region->bufferImageHeight;
if (imageHeight == 0)
  imageHeight = region->imageExtent.height;

compressedTexelBlockSizeInBytes = <compressed texel block size taken from the src /dstImage>;
rowLength = (rowLength + compressedTexelBlockWidth - 1) / compressedTexelBlockWidth;
imageHeight = (imageHeight + compressedTexelBlockHeight - 1) / compressedTexelBlockHeight;

address of (x,y,z) = region->bufferOffset + ((z * imageHeight) + y) * rowLength + x) * compressedTexelBlockSizeInBytes;

where x,y,z range from (0,0,0) to region->imageExtent.{width/height/depth/compressedTexelBlock Length}.

Copying to or from block-compressed images is typically done in multiples of the compressed texel block size. For this reason the imageExtent must be a multiple of the compressed texel block dimension. There is one exception to this rule which is required to handle compressed images created with dimensions that are not a multiple of the compressed texel block dimensions:

- If imageExtent.width is not a multiple of the compressed texel block width, then (imageExtent.width + imageOffset.x) must equal the image subresource width.
- If imageExtent.height is not a multiple of the compressed texel block height, then (imageExtent.height + imageOffset.y) must equal the image subresource height.
- If imageExtent.depth is not a multiple of the compressed texel block depth, then (imageExtent.depth + imageOffset.z) must equal the image subresource depth.

This allows the last compressed texel block of the image in each non-multiple dimension to be included as a source or destination of the copy.

20.4.2. Buffer and Image Addressing with Rotation

When VkCopyCommandTransformInfoQCOM is in the pNext chain of VkBufferImageCopy2KHR, a rotated copy is specified. For both vkCmdCopyImageToBuffer2KHR and vkCmdCopyBufferToImage2KHR, a rotation is applied to the region used for image accesses, but a non-rotated region is used for buffer accesses. In the case of rotated vkCmdCopyImageToBuffer2KHR, the source image region is rotated. In the case of rotated vkCmdCopyBufferToImage2KHR, the destination image region is rotated.

For a rotated copy, the following description of rotated addressing replaces the description in Buffer and Image Addressing.
The following code computes rotation of unnormalized coordinates.

```c
// Forward rotation of unnormalized coordinates
VkOffset2D RotateUV(VkOffset2D in, VkSurfaceTransformFlagBitsKHR flags)
{
    VkOffset2D output;
    switch (flags)
    {
        case VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR:
            out.x = in.x;
            out.y = in.y;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR:
            out.x = -in.y;
            out.y = in.x;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR:
            out.x = -in.x;
            out.y = -in.y;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR:
            out.x = in.y;
            out.y = -in.x;
            break;
    }
    return out;
}
```

Pseudocode for image/buffer addressing of uncompressed formats with rotation is:
rowLength = region->bufferRowLength;
    if (rowLength == 0)
        rowLength = region->imageExtent.width;

imageHeight = region->bufferImageHeight;
    if (imageHeight == 0)
        imageHeight = region->imageExtent.height;

texelBlockSize = <texel block size of the format of the src/dstImage>;

    // Buffer addressing is unaffected by rotation:
    address of (x,y,z) = region->bufferOffset + (((z * imageHeight) + y) * rowLength + x) * texelBlockSize;

    // When copying from buffer to image, the source buffer coordinates x,y,z range from (0,0,0) to
    // region->imageExtent.{width,height,depth}. The source extent is rotated by the
    // specified
    // VK_SURFACE_TRANSFORM, centered on the imageOffset, to define a rotated destination
    // region.
    // For each source buffer texel with coordinates (x,y) the rotated destination image
texel has
    // coordinates (x',y') defined as:
    (x' ,y') = RotateUV(x,y) + ImageOffset.{x,y}

    // When copying from image to buffer, the the destination buffer coordinates x,y,z
    range from (0,0,0) to
    // region->imageExtent.{width,height,depth}. The destination extent is rotated by the
    specified
    // VK_SURFACE_TRANSFORM, centered on the imageOffset, to define a rotated source
    // region. For each destination
    // buffer texel with coordinates (x,y) the rotated source image texel has coordinates
    (x',y') defined as:
    (x' ,y') = RotateUV(x,y) + ImageOffset.{x,y}

Note that imageOffset does not affect addressing calculations for buffer memory. Instead, bufferOffset can be used to select the starting address in buffer memory.

20.5. Image Copies with Scaling

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:
void vkCmdBlitImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageBlit* pRegions,
    VkFilter filter);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the blit.
- **dstImage** is the destination image.
- **dstImageLayout** is the layout of the destination image subresources for the blit.
- **regionCount** is the number of regions to blit.
- **pRegions** is a pointer to an array of **VkImageBlit** structures specifying the regions to blit.
- **filter** is a **VkFilter** specifying the filter to apply if the blits require scaling.

**vkCmdBlitImage** must not be used for multisampled source or destination images. Use **vkCmdResolveImage** for this purpose.

As the sizes of the source and destination extents can differ in any dimension, texels in the source extent are scaled and filtered to the destination extent. Scaling occurs via the following operations:

- For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in **unnormalized to integer conversion**:

  \[
  u_{base} = i + \frac{1}{2} \\
  v_{base} = j + \frac{1}{2} \\
  w_{base} = k + \frac{1}{2}
  \]

- These base coordinates are then offset by the first destination offset:

  \[
  u_{offset} = u_{base} - x_{dst0} \\
  v_{offset} = v_{base} - y_{dst0}
  \]
\[ w_{\text{offset}} = w_{\text{base}} - z_{\text{dst0}} \]

\[ a_{\text{offset}} = a - \text{baseArrayCount}_{\text{dst}} \]

• The scale is determined from the source and destination regions, and applied to the offset coordinates:

\[ \text{scale}_u = \frac{(x_{\text{src1}} - x_{\text{src0}})}{(x_{\text{dst1}} - x_{\text{dst0}})} \]

\[ \text{scale}_v = \frac{(y_{\text{src1}} - y_{\text{src0}})}{(y_{\text{dst1}} - y_{\text{dst0}})} \]

\[ \text{scale}_w = \frac{(z_{\text{src1}} - z_{\text{src0}})}{(z_{\text{dst1}} - z_{\text{dst0}})} \]

\[ u_{\text{scaled}} = u_{\text{offset}} \times \text{scale}_u \]

\[ v_{\text{scaled}} = v_{\text{offset}} \times \text{scale}_v \]

\[ w_{\text{scaled}} = w_{\text{offset}} \times \text{scale}_w \]

• Finally the source offset is added to the scaled coordinates, to determine the final unnormalized coordinates used to sample from \textit{srcImage}:

\[ u = u_{\text{scaled}} + x_{\text{src0}} \]

\[ v = v_{\text{scaled}} + y_{\text{src0}} \]

\[ w = w_{\text{scaled}} + z_{\text{src0}} \]

\[ q = \text{mipLevel} \]

\[ a = a_{\text{offset}} + \text{baseArrayCount}_{\text{src}} \]

These coordinates are used to sample from the source image, as described in Image Operations chapter, with the filter mode equal to that of \textit{filter}, a mipmap mode of \texttt{VK_SAMPLER_MIPMAP_MODE_NEAREST} and an address mode of \texttt{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE}.
Implementations **must** clamp at the edge of the source image, and **may** additionally clamp to the edge of the source region.

---

**Note**

Due to allowable rounding errors in the generation of the source texture coordinates, it is not always possible to guarantee exactly which source texels will be sampled for a given blit. As rounding errors are implementation-dependent, the exact results of a blitting operation are also implementation-dependent.

---

Blits are done layer by layer starting with the `baseArrayLayer` member of `srcSubresource` for the source and `dstSubresource` for the destination. `layerCount` layers are blitted to the destination image.

When blitting 3D textures, slices in the destination region bounded by `dstOffsets[0].z` and `dstOffsets[1].z` are sampled from slices in the source region bounded by `srcOffsets[0].z` and `srcOffsets[1].z`. If the `filter` parameter is `VK_FILTER_LINEAR` then the value sampled from the source image is taken by doing linear filtering using the interpolated `z` coordinate represented by `w` in the previous equations. If the `filter` parameter is `VK_FILTER_NEAREST` then the value sampled from the source image is taken from the single nearest slice, with an implementation-dependent arithmetic rounding mode.

The following filtering and conversion rules apply:

- Integer formats **can** only be converted to other integer formats with the same signedness.
- No format conversion is supported between depth/stencil images. The formats **must** match.
- Format conversions on unorm, snorm, unscaled and packed float formats of the copied aspect of the image are performed by first converting the pixels to float values.
- For sRGB source formats, nonlinear RGB values are converted to linear representation prior to filtering.
- After filtering, the float values are first clamped and then cast to the destination image format. In case of sRGB destination format, linear RGB values are converted to nonlinear representation before writing the pixel to the image.

Signed and unsigned integers are converted by first clamping to the representable range of the destination format, then casting the value.
Valid Usage

- **VUID-vkCmdBlitImage-pRegions-00215**
  The source region specified by each element of `pRegions` must be a region that is contained within `srcImage`.

- **VUID-vkCmdBlitImage-pRegions-00216**
  The destination region specified by each element of `pRegions` must be a region that is contained within `dstImage`.

- **VUID-vkCmdBlitImage-pRegions-00217**
  The union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory with any texel that may be sampled during the blit operation.

- **VUID-vkCmdBlitImage-srcImage-01999**
  The format features of `srcImage` must contain `VK_FORMAT_FEATURE_BLIT_SRC_BIT`.

- **VUID-vkCmdBlitImage-srcImage-01561**
  `srcImage` must not use a format listed in Formats requiring sampler Y′C₈C₉ conversion for `VK_IMAGE_ASPECT_COLOR_BIT` image views.

- **VUID-vkCmdBlitImage-srcImage-00219**
  `srcImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag.

- **VUID-vkCmdBlitImage-srcImageLayout-00221**
  If `srcImage` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBlitImage-srcImageLayout-01398**
  `srcImageLayout` must specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

- **VUID-vkCmdBlitImage-srcImageLayout-01399**
  `srcImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`.

- **VUID-vkCmdBlitImage-dstImage-02000**
  The format features of `dstImage` must contain `VK_FORMAT_FEATURE_BLIT_DST_BIT`.

- **VUID-vkCmdBlitImage-dstImage-01562**
  `dstImage` must not use a format listed in Formats requiring sampler Y′C₈C₉ conversion for `VK_IMAGE_ASPECT_COLOR_BIT` image views.

- **VUID-vkCmdBlitImage-dstImage-00224**
  `dstImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag.

- **VUID-vkCmdBlitImage-dstImageLayout-00226**
  `dstImageLayout` must specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

- **VUID-vkCmdBlitImage-dstImageLayout-01399**
  `dstImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`.
If either of `srcImage` or `dstImage` was created with a signed integer `VkFormat`, the other must also have been created with a signed integer `VkFormat`.

If either of `srcImage` or `dstImage` was created with an unsigned integer `VkFormat`, the other must also have been created with an unsigned integer `VkFormat`.

If either of `srcImage` or `dstImage` was created with a depth/stencil format, the other must have exactly the same format.

If `srcImage` was created with a depth/stencil format, `filter` must be `VK_FILTER_NEAREST`.

`srcImage` must have been created with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`.

`dstImage` must have been created with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`.

If `filter` is `VK_FILTER_LINEAR`, then the `format features` of `srcImage` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

If `filter` is `VK_FILTER_CUBIC_EXT`, then the `format features` of `srcImage` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

If `filter` is `VK_FILTER_CUBIC_EXT`, `srcImage` must be of type `VK_IMAGE_TYPE_2D`.

The `srcSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created.

The `dstSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created.

The `srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

The `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

`dstImage` and `srcImage` must not have been created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

If either `srcImage` or `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of...
pRegions, srcSubresource.baseArrayLayer and dstSubresource.baseArrayLayer must each be 0, and srcSubresource.layerCount and dstSubresource.layerCount must each be 1

- VUID-vkCmdBlitImage-aspectMask-00241
  For each element of pRegions, srcSubresource.aspectMask must specify aspects present in srcImage

- VUID-vkCmdBlitImage-aspectMask-00242
  For each element of pRegions, dstSubresource.aspectMask must specify aspects present in dstImage

- VUID-vkCmdBlitImage-srcOffset-00243
  For each element of pRegions, srcOffsets[0].x and srcOffsets[1].x must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage

- VUID-vkCmdBlitImage-srcOffset-00244
  For each element of pRegions, srcOffsets[0].y and srcOffsets[1].y must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage

- VUID-vkCmdBlitImage-srcImage-00245
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffsets[0].y must be 0 and srcOffsets[1].y must be 1

- VUID-vkCmdBlitImage-srcOffset-00246
  For each element of pRegions, srcOffsets[0].z and srcOffsets[1].z must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

- VUID-vkCmdBlitImage-srcImage-00247
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, srcOffsets[0].z must be 0 and srcOffsets[1].z must be 1

- VUID-vkCmdBlitImage-dstOffset-00248
  For each element of pRegions, dstOffsets[0].x and dstOffsets[1].x must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage

- VUID-vkCmdBlitImage-dstOffset-00249
  For each element of pRegions, dstOffsets[0].y and dstOffsets[1].y must both be greater than or equal to 0 and less than or equal to the height of the specified dstSubresource of dstImage

- VUID-vkCmdBlitImage-dstImage-00250
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffsets[0].y must be 0 and dstOffsets[1].y must be 1

- VUID-vkCmdBlitImage-dstOffset-00251
  For each element of pRegions, dstOffsets[0].z and dstOffsets[1].z must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage

- VUID-vkCmdBlitImage-dstImage-00252
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffsets[0].z must be 0 and dstOffsets[1].z must be 1
Valid Usage (Implicit)

- VUID-vkCmdBlitImage-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBlitImage-srcImage-parameter
  srcImage must be a valid VkImage handle

- VUID-vkCmdBlitImage-srcImageLayout-parameter
  srcImageLayout must be a valid VkImageLayout value

- VUID-vkCmdBlitImage-dstImage-parameter
  dstImage must be a valid VkImage handle

- VUID-vkCmdBlitImage-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

- VUID-vkCmdBlitImage-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkImageBlit structures

- VUID-vkCmdBlitImage-filter-parameter
  filter must be a valid VkFilter value

- VUID-vkCmdBlitImage-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBlitImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBlitImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBlitImage-regionCount-arraylength
  regionCount must be greater than 0

- VUID-vkCmdBlitImage-commonparent
  Each of commandBuffer, dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkImageBlit` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageBlit {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffsets[2];
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffsets[2];
} VkImageBlit;
```

- `srcSubresource` is the subresource to blit from.
- `srcOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the source region within `srcSubresource`.
- `dstSubresource` is the subresource to blit into.
- `dstOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the destination region within `dstSubresource`.

For each element of the `pRegions` array, a blit operation is performed for the specified source and destination regions.

### Valid Usage

- VUID-VkImageBlit-aspectMask-00238
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must match

- VUID-VkImageBlit-layerCount-00239
  The `layerCount` member of `srcSubresource` and `dstSubresource` must match

### Valid Usage (Implicit)

- VUID-VkImageBlit-srcSubresource-parameter
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure

- VUID-VkImageBlit-dstSubresource-parameter
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure

A more extensible version of the blit image command is defined below.
To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```c
// Provided by VK_KHR_copy_commands2
void vkCmdBlitImage2KHR(
    VkCommandBuffer commandBuffer,  // Provided by VK_KHR_copy_commands2
    const VkBlitImageInfo2KHR* pBlitImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pBlitImageInfo` is a pointer to a `VkBlitImageInfo2KHR` structure describing the blit parameters.

This command is functionally identical to `vkCmdBlitImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

**Valid Usage**

### Valid Usage (Implicit)

- VUID-vkCmdBlitImage2KHR-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBlitImage2KHR-pBlitImageInfo-parameter
  
  `pBlitImageInfo` must be a valid pointer to a valid `VkBlitImageInfo2KHR` structure

- VUID-vkCmdBlitImage2KHR-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdBlitImage2KHR-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdBlitImage2KHR-renderpass
  
  This command must only be called outside of a render pass instance

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
The `VkBlitImageInfo2KHR` structure is defined as:

```c
// Provided by VK_KHR_copy_commands2
typedef struct VkBlitImageInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageBlit2KHR* pRegions;
    VkFilter filter;
} VkBlitImageInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the blit.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the blit.
- `regionCount` is the number of regions to blit.
- `pRegions` is a pointer to an array of `VkImageBlit2KHR` structures specifying the regions to blit.
- `filter` is a `VkFilter` specifying the filter to apply if the blits require scaling.
Valid Usage

- **VUID-VkBlitImageInfo2KHR-pRegions-00215**
  The source region specified by each element of `pRegions` must be a region that is contained within `srcImage`.

- **VUID-VkBlitImageInfo2KHR-pRegions-00216**
  The destination region specified by each element of `pRegions` must be a region that is contained within `dstImage`.

- **VUID-VkBlitImageInfo2KHR-pRegions-00217**
  The union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory with any texel that may be sampled during the blit operation.

- **VUID-VkBlitImageInfo2KHR-srcImage-01999**
  The format features of `srcImage` must contain `VK_FORMAT_FEATURE_BLIT_SRC_BIT`.

- **VUID-VkBlitImageInfo2KHR-srcImage-01561**
  `srcImage` must not use a format listed in Formats requiring sampler YC_bC_r conversion for `VK_IMAGE_ASPECT_COLOR_BIT` image views.

- **VUID-VkBlitImageInfo2KHR-srcImage-00219**
  `srcImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag.

- **VUID-VkBlitImageInfo2KHR-srcImage-00220**
  If `srcImage` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkBlitImageInfo2KHR-srcImageLayout-00221**
  `srcImageLayout` must specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

- **VUID-VkBlitImageInfo2KHR-srcImageLayout-01398**
  `srcImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`.

- **VUID-VkBlitImageInfo2KHR-dstImage-02000**
  The format features of `dstImage` must contain `VK_FORMAT_FEATURE_BLIT_DST_BIT`.

- **VUID-VkBlitImageInfo2KHR-dstImage-01562**
  `dstImage` must not use a format listed in Formats requiring sampler YC_bC_r conversion for `VK_IMAGE_ASPECT_COLOR_BIT` image views.

- **VUID-VkBlitImageInfo2KHR-dstImage-00224**
  `dstImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag.

- **VUID-VkBlitImageInfo2KHR-dstImage-00225**
  If `dstImage` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkBlitImageInfo2KHR-dstImageLayout-00226**
  `dstImageLayout` must specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

- **VUID-VkBlitImageInfo2KHR-dstImageLayout-01399**
  `dstImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`,
VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- VUID-VkBlitImageInfo2KHR-srcImage-00229
  If either of srcImage or dstImage was created with a signed integer VkFormat, the other
  must also have been created with a signed integer VkFormat

- VUID-VkBlitImageInfo2KHR-srcImage-00230
  If either of srcImage or dstImage was created with an unsigned integer VkFormat, the other
  must also have been created with an unsigned integer VkFormat

- VUID-VkBlitImageInfo2KHR-srcImage-00231
  If either of srcImage or dstImage was created with a depth/stencil format, the other must
  have exactly the same format

- VUID-VkBlitImageInfo2KHR-srcImage-00232
  If srcImage was created with a depth/stencil format, filter must be VK_FILTER_NEAREST

- VUID-VkBlitImageInfo2KHR-srcImage-00233
  srcImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

- VUID-VkBlitImageInfo2KHR-dstImage-00234
  dstImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

- VUID-VkBlitImageInfo2KHR-filter-02001
  If filter is VK_FILTER_LINEAR, then the format features of srcImage must contain
  VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-VkBlitImageInfo2KHR-filter-02002
  If filter is VK_FILTER_CUBIC_EXT, then the format features of srcImage must contain
  VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-VkBlitImageInfo2KHR-filter-00237
  If filter is VK_FILTER_CUBIC_EXT, srcImage must be of type VK_IMAGE_TYPE_2D

- VUID-VkBlitImageInfo2KHR-srcSubresource-01705
  The srcSubresource.mipLevel member of each element of pRegions must be less than the
  mipLevels specified in VkImageCreateInfo when srcImage was created

- VUID-VkBlitImageInfo2KHR-dstSubresource-01706
  The dstSubresource.mipLevel member of each element of pRegions must be less than the
  mipLevels specified in VkImageCreateInfo when dstImage was created

- VUID-VkBlitImageInfo2KHR-srcSubresource-01707
  The srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of
  pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo
  when srcImage was created

- VUID-VkBlitImageInfo2KHR-dstSubresource-01708
  The dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of
  pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo
  when dstImage was created

- VUID-VkBlitImageInfo2KHR-dstImage-02545
  dstImage and srcImage must not have been created with flags containing
  VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

- VUID-VkBlitImageInfo2KHR-srcImage-00240
  If either srcImage or dstImage is of type VK_IMAGE_TYPE_3D, then for each element of
pRegions, srcSubresource.baseArrayLayer and dstSubresource.baseArrayLayer must each be 0, and srcSubresource.layerCount and dstSubresource.layerCount must each be 1

• VUID-VkBlitImageInfo2KHR-aspectMask-00241
  For each element of pRegions, srcSubresource.aspectMask must specify aspects present in srcImage

• VUID-VkBlitImageInfo2KHR-aspectMask-00242
  For each element of pRegions, dstSubresource.aspectMask must specify aspects present in dstImage

• VUID-VkBlitImageInfo2KHR-srcOffset-00243
  For each element of pRegions, srcOffsets[0].x and srcOffsets[1].x must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage

• VUID-VkBlitImageInfo2KHR-srcOffset-00244
  For each element of pRegions, srcOffsets[0].y and srcOffsets[1].y must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage

• VUID-VkBlitImageInfo2KHR-srcImage-00245
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffsets[0].y must be 0 and srcOffsets[1].y must be 1

• VUID-VkBlitImageInfo2KHR-srcOffset-00246
  For each element of pRegions, srcOffsets[0].z and srcOffsets[1].z must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

• VUID-VkBlitImageInfo2KHR-dstOffset-00248
  For each element of pRegions, dstOffsets[0].x and dstOffsets[1].x must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage

• VUID-VkBlitImageInfo2KHR-dstOffset-00249
  For each element of pRegions, dstOffsets[0].y and dstOffsets[1].y must both be greater than or equal to 0 and less than or equal to the height of the specified dstSubresource of dstImage

• VUID-VkBlitImageInfo2KHR-dstImage-00250
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffsets[0].y must be 0 and dstOffsets[1].y must be 1

• VUID-VkBlitImageInfo2KHR-dstOffset-00251
  For each element of pRegions, dstOffsets[0].z and dstOffsets[1].z must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage

• VUID-VkBlitImageInfo2KHR-dstImage-00252
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffsets[0].z must be 0 and dstOffsets[1].z must be 1
If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `srcImage` and `dstImage` must not be block-compressed images

- VUID-VkBlitImageInfo2KHR-pRegions-06207

If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `srcImage` must be of type `VK_IMAGE_TYPE_2D`

- VUID-VkBlitImageInfo2KHR-pRegions-06208

If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `srcImage` must not have a multi-planar format

**Valid Usage (Implicit)**

- VUID-VkBlitImageInfo2KHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_BLIT_IMAGE_INFO_2_KHR`

- VUID-VkBlitImageInfo2KHR-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkBlitImageInfo2KHR-srcImage-parameter
  
  `srcImage` must be a valid `VkImage` handle

- VUID-VkBlitImageInfo2KHR-srcImageLayout-parameter
  
  `srcImageLayout` must be a valid `VkImageLayout` value

- VUID-VkBlitImageInfo2KHR-dstImage-parameter
  
  `dstImage` must be a valid `VkImage` handle

- VUID-VkBlitImageInfo2KHR-dstImageLayout-parameter
  
  `dstImageLayout` must be a valid `VkImageLayout` value

- VUID-VkBlitImageInfo2KHR-pRegions-parameter
  
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkImageBlit2KHR` structures

- VUID-VkBlitImageInfo2KHR-filter-parameter
  
  `filter` must be a valid `VkFilter` value

- VUID-VkBlitImageInfo2KHR-regionCount-arraylength
  
  `regionCount` must be greater than 0

- VUID-VkBlitImageInfo2KHR-commonparent

  Both of `dstImage`, and `srcImage` must have been created, allocated, or retrieved from the same `VkDevice`

The `VkImageBlit2KHR` structure is defined as:
// Provided by VK_KHR_copy_commands2

typedef struct VkImageBlit2KHR {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffsets[2];
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffsets[2];
} VkImageBlit2KHR;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• srcSubresource is the subresource to blit from.
• srcOffsets is a pointer to an array of two VkOffset3D structures specifying the bounds of the source region within srcSubresource.
• dstSubresource is the subresource to blit into.
• dstOffsets is a pointer to an array of two VkOffset3D structures specifying the bounds of the destination region within dstSubresource.

For each element of the pRegions array, a blit operation is performed for the specified source and destination regions.

Valid Usage

• VUID-VkImageBlit2KHR-aspectMask-00238
  The aspectMask member of srcSubresource and dstSubresource must match

• VUID-VkImageBlit2KHR-layerCount-00239
  The layerCount member of srcSubresource and dstSubresource must match
Valid Usage (Implicit)

- VUID-VkImageBlit2KHR-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_IMAGE_BLIT_2_KHR**

- VUID-VkImageBlit2KHR-pNext-pNext
  
  **pNext** must be **NULL** or a pointer to a valid instance of **VkCopyCommandTransformInfoQCOM**

- VUID-VkImageBlit2KHR-sType-unique
  
  The **sType** value of each struct in the **pNext** chain must be unique

- VUID-VkImageBlit2KHR-srcSubresource-parameter
  
  **srcSubresource** must be a valid **VkImageSubresourceLayers** structure

- VUID-VkImageBlit2KHR-dstSubresource-parameter
  
  **dstSubresource** must be a valid **VkImageSubresourceLayers** structure

For **vkCmdBlitImage2KHR**, each region copied can include a rotation. To specify a rotated region, add **VkCopyCommandTransformInfoQCOM** to the **pNext** chain of **VkImageBlit2KHR**. For each region with a rotation specified, **Image Blits with Scaling and Rotation** specifies how coordinates are rotated prior to sampling from the source image. When rotation is specified, the source and destination images must each be 2D images. They must not be blocked images or have a multi-planar format.

### 20.5.1. Image Blits with Scaling and Rotation

When **VkCopyCommandTransformInfoQCOM** is in the **pNext** chain of **VkImageBlit2KHR**, the specified region is rotated during the blit. The following description of rotated addressing replaces the description in **vkCmdBlitImage**.

The following code computes rotation of normalized coordinates.
// rotation of normalized coordinates
VkOffset2D RotateNormUV(VkOffset2D in, VkSurfaceTransformFlagBitsKHR flags)
{
    VkOffset2D output;
    switch (flags)
    {
        case VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR:
            out.x = in.x;
            out.y = in.y;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR:
            out.x = in.y;
            out.y = 1.0 - in.x;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR:
            out.x = 1.0 - in.x;
            out.y = 1.0 - in.y;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR:
            out.x = 1.0 - in.y;
            out.y = in.x;
            break;
    }
    return out;
}

• For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in unnormalized to integer conversion:

\[
\begin{align*}
    u_{\text{base}} &= i + \frac{1}{2} \\
    v_{\text{base}} &= j + \frac{1}{2} \\
    w_{\text{base}} &= k + \frac{1}{2}
\end{align*}
\]

• These base coordinates are then offset by the first destination offset:

\[
\begin{align*}
    u_{\text{offset}} &= u_{\text{base}} - x_{\text{dst0}} \\
    v_{\text{offset}} &= v_{\text{base}} - y_{\text{dst0}} \\
    w_{\text{offset}} &= w_{\text{base}} - z_{\text{dst0}}
\end{align*}
\]
\[ a_{\text{offset}} = a - \text{baseArrayCount}_{\text{dst}} \]

- The UV destination coordinates are scaled by the destination region, rotated, and scaled by the source region.

\[ u_{\text{dest\_scaled}} = u_{\text{offset}} / (x_{\text{dst1}} - x_{\text{dst0}}) \]

\[ v_{\text{dest\_scaled}} = v_{\text{offset}} / (y_{\text{dst1}} - y_{\text{dst0}}) \]

\[(u_{\text{src\_scaled}}, v_{\text{src\_scaled}}) = \text{RotateNormUV}(u_{\text{dest\_scaled}}, v_{\text{dest\_scaled}}, \text{transform})\]

\[ u_{\text{scaled}} = u_{\text{src\_scaled}} \times (x_{\text{Src1}} - x_{\text{Src0}}) \]

\[ v_{\text{scaled}} = v_{\text{src\_scaled}} \times (y_{\text{Src1}} - y_{\text{Src0}}) \]

- The \( W \) coordinate is unaffected by rotation. The scale is determined from the ratio of source and destination regions, and applied to the offset coordinate:

\[ \text{scale}_w = (z_{\text{Src1}} - z_{\text{Src0}}) / (z_{\text{dst1}} - z_{\text{dst0}}) \]

\[ w_{\text{scaled}} = w_{\text{offset}} \times \text{scale}_w \]

- Finally the source offset is added to the scaled source coordinates, to determine the final unnormalized coordinates used to sample from \( \text{srcImage} \):

\[ u = u_{\text{scaled}} + x_{\text{Src0}} \]

\[ v = v_{\text{scaled}} + y_{\text{Src0}} \]

\[ w = w_{\text{scaled}} + z_{\text{Src0}} \]

\[ q = \text{mipLevel} \]

\[ a = a_{\text{offset}} + \text{baseArrayCount}_{\text{src}} \]

These coordinates are used to sample from the source image as described for Image Operations,
with the filter mode equal to that of filter; a mipmap mode of VK_SAMPLER_MIPMAP_MODE_NEAREST; and an address mode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE. Implementations must clamp at the edge of the source image, and may additionally clamp to the edge of the source region.

20.6. Resolving Multisample Images

To resolve a multisample color image to a non-multisample color image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdResolveImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageResolve* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the resolve.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the resolve.
- `regionCount` is the number of regions to resolve.
- `pRegions` is a pointer to an array of VkImageResolve structures specifying the regions to resolve.

During the resolve the samples corresponding to each pixel location in the source are converted to a single sample before being written to the destination. If the source formats are floating-point or normalized types, the sample values for each pixel are resolved in an implementation-dependent manner. If the source formats are integer types, a single sample's value is selected for each pixel.

`srcOffset` and `dstOffset` select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data. `extent` is the size in texels of the source image to resolve in width, height and depth. Each element of `pRegions` must be a region that is contained within its corresponding image.

Resolves are done layer by layer starting with `baseArrayLayer` member of `srcSubresource` for the source and `dstSubresource` for the destination. `layerCount` layers are resolved to the destination image.
Valid Usage

- VUID-vkCmdResolveImage-pRegions-00255
  The union of all source regions, and the union of all destination regions, specified by the elements of pRegions, must not overlap in memory

- VUID-vkCmdResolveImage-srcImage-00256
  If srcImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdResolveImage-srcImage-00257
  srcImage must have a sample count equal to any valid sample count value other than VK_SAMPLE_COUNT_1_BIT

- VUID-vkCmdResolveImage-dstImage-00258
  If dstImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdResolveImage-dstImage-00259
  dstImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

- VUID-vkCmdResolveImage-srcImageLayout-00260
  srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice

- VUID-vkCmdResolveImage-dstImageLayout-00262
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice

- VUID-vkCmdResolveImage-srcImageLayout-01400
  srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- VUID-vkCmdResolveImage-dstImageLayout-00262
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice

- VUID-vkCmdResolveImage-dstImageLayout-01401
  dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- VUID-vkCmdResolveImage-dstImage-02003
  The format features of dstImage must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-vkCmdResolveImage-srcImage-01386
  srcImage and dstImage must have been created with the same image format

- VUID-vkCmdResolveImage-srcSubresource-01709
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

- VUID-vkCmdResolveImage-dstSubresource-01710
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

- VUID-vkCmdResolveImage-srcSubresource-01711
  The srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created
The `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

`dstImage` and `srcImage` must not have been created with flags containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

If either `srcImage` or `dstImage` are of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` must be 0 and `srcSubresource.layerCount` must be 1.

For each element of `pRegions`, `srcOffset.x` and `(extent.width + srcOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` must be 0 and `extent.height` must be 1.

For each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffset.z` must be 0 and `extent.depth` must be 1.

For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`.

If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.y` must be 0 and `extent.height` must be 1.
For each element of $pRegions$, $dstOffset.z$ and $(extent.depth + dstOffset.z)$ must both be greater than or equal to 0 and less than or equal to the depth of the specified $dstSubresource$ of $dstImage$.

If $dstImage$ is of type $VK_IMAGE_TYPE_1D$ or $VK_IMAGE_TYPE_2D$, then for each element of $pRegions$, $dstOffset.z$ must be 0 and $extent.depth$ must be 1.

**Valid Usage (Implicit)**

- **VUID-vkCmdResolveImage-commandBuffer-parameter**  
  $commandBuffer$ must be a valid $VkCommandBuffer$ handle.

- **VUID-vkCmdResolveImage-srcImage-parameter**  
  $srcImage$ must be a valid $VkImage$ handle.

- **VUID-vkCmdResolveImage-srcImageLayout-parameter**  
  $srcImageLayout$ must be a valid $VkImageLayout$ value.

- **VUID-vkCmdResolveImage-dstImage-parameter**  
  $dstImage$ must be a valid $VkImage$ handle.

- **VUID-vkCmdResolveImage-dstImageLayout-parameter**  
  $dstImageLayout$ must be a valid $VkImageLayout$ value.

- **VUID-vkCmdResolveImage-pRegions-parameter**  
  $pRegions$ must be a valid pointer to an array of $regionCount$ valid $VkImageResolve$ structures.

- **VUID-vkCmdResolveImage-commandBuffer-recording**  
  $commandBuffer$ must be in the recording state.

- **VUID-vkCmdResolveImage-commandBuffer-cmdpool**  
  The $VkCommandPool$ that $commandBuffer$ was allocated from must support graphics operations.

- **VUID-vkCmdResolveImage-renderpass**  
  This command must only be called outside of a render pass instance.

- **VUID-vkCmdResolveImage-regionCount-arraylength**  
  $regionCount$ must be greater than 0.

- **VUID-vkCmdResolveImage-commonparent**  
  Each of $commandBuffer$, $dstImage$, and $srcImage$ must have been created, allocated, or retrieved from the same $VkDevice$. 
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkImageResolve` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageResolve {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageResolve;
```

- `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.
- `srcOffset` and `dstOffset` select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the source image to resolve in width, height and depth.

Valid Usage

- VUID-VkImageResolve-aspectMask-00266
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must only contain `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-VkImageResolve-layerCount-00267
  The `layerCount` member of `srcSubresource` and `dstSubresource` must match
### Valid Usage (Implicit)

- **VUID-VkImageResolve-srcSubresource-parameter**
  - `srcSubresource` **must** be a valid `VkImageSubresourceLayers` structure

- **VUID-VkImageResolve-dstSubresource-parameter**
  - `dstSubresource` **must** be a valid `VkImageSubresourceLayers` structure

### 20.7. Buffer Markers

To write a 32-bit marker value into a buffer as a pipelined operation, call:

```c
// Provided by VK_KHR_synchronization2 with VK_AMD_buffer_marker
void vkCmdWriteBufferMarker2AMD(
  VkCommandBuffer commandBuffer,
  VkPipelineStageFlags2KHR stage,
  VkBuffer dstBuffer,
  VkDeviceSize dstOffset,
  uint32_t marker);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **stage** specifies the pipeline stage whose completion triggers the marker write.
- **dstBuffer** is the buffer where the marker will be written.
- **dstOffset** is the byte offset into the buffer where the marker will be written.
- **marker** is the 32-bit value of the marker.

The command will write the 32-bit marker value into the buffer only after all preceding commands have finished executing up to at least the specified pipeline stage. This includes the completion of other preceding `vkCmdWriteBufferMarker2AMD` commands so long as their specified pipeline stages occur either at the same time or earlier than this command’s specified `stage`.

While consecutive buffer marker writes with the same `stage` parameter implicitly complete in submission order, memory and execution dependencies between buffer marker writes and other operations **must** still be explicitly ordered using synchronization commands. The access scope for buffer marker writes falls under the `VK_ACCESS_TRANSFER_WRITE_BIT`, and the pipeline stages for identifying the synchronization scope **must** include both `stage` and `VK_PIPELINE_STAGE_TRANSFER_BIT`.

#### Note
Similar to `vkCmdWriteTimestamp2KHR`, if an implementation is unable to write a marker at any specific pipeline stage, it **may** instead do so at any logically later stage.
Note

Implementations *may* only support a limited number of pipelined marker write operations in flight at a given time. Thus an excessive number of marker write operations *may* degrade command execution performance.
Valid Usage

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03929**
  If the geometry shaders feature is not enabled, stage must not contain
  `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03930**
  If the tessellation shaders feature is not enabled, stage must not contain
  `VK_PIPELINE_STAGE_2_TESSellation_CONTROL_SHADER_BIT_KHR`
  or
  `VK_PIPELINE_STAGE_2_TESSellation_EVALUATION_SHADER_BIT_KHR`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03931**
  If the conditional rendering feature is not enabled, stage must not contain
  `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03932**
  If the fragment density map feature is not enabled, stage must not contain
  `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03933**
  If the transform feedback feature is not enabled, stage must not contain
  `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03934**
  If the mesh shaders feature is not enabled, stage must not contain
  `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_NV`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03935**
  If the task shaders feature is not enabled, stage must not contain
  `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_NV`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-04956**
  If the shading rate image feature is not enabled, stage must not contain
  `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-04957**
  If the subpass shading feature is not enabled, stage must not contain
  `VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-04955**
  If the invocation mask image feature is not enabled, stage must not contain
  `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`

- **VUID-vkCmdWriteBufferMarker2AMD-synchronization2-03893**
  The synchronization2 feature must be enabled

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03894**
  stage must include only a single pipeline stage

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03895**
  stage must include only stages that are valid for the queue family that was used to create
  the command pool that commandBuffer was allocated from

- **VUID-vkCmdWriteBufferMarker2AMD-dstOffset-03896**
  dstOffset must be less than or equal to the size of dstBuffer minus 4

- **VUID-vkCmdWriteBufferMarker2AMD-dstBuffer-03897**
  dstBuffer must have been created with the `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag
If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

dstOffset **must** be a multiple of 4

### Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `stage` **must** be a valid combination of `VkPipelineStageFlagBits2KHR` values
- `stage` **must not** be 0
- `dstBuffer` **must** be a valid `VkBuffer` handle
- `commandBuffer` **must be in the recording state**
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations
- Both of `commandBuffer`, and `dstBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</table>

To write a 32-bit marker value into a buffer as a pipelined operation, call:
void vkCmdWriteBufferMarkerAMD(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlagBits pipelineStage,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    uint32_t marker);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **pipelineStage** is a VkPipelineStageFlagBits value specifying the pipeline stage whose completion triggers the marker write.
- **dstBuffer** is the buffer where the marker will be written to.
- **dstOffset** is the byte offset into the buffer where the marker will be written to.
- **marker** is the 32-bit value of the marker.

The command will write the 32-bit marker value into the buffer only after all preceding commands have finished executing up to at least the specified pipeline stage. This includes the completion of other preceding `vkCmdWriteBufferMarkerAMD` commands so long as their specified pipeline stages occur either at the same time or earlier than this command's specified `pipelineStage`.

While consecutive buffer marker writes with the same `pipelineStage` parameter are implicitly complete in submission order, memory and execution dependencies between buffer marker writes and other operations must still be explicitly ordered using synchronization commands. The access scope for buffer marker writes falls under the `VK_ACCESS_TRANSFER_WRITE_BIT`, and the pipeline stages for identifying the synchronization scope must include both `pipelineStage` and `VK_PIPELINE_STAGE_TRANSFER_BIT`.

**Note**

Similar to `vkCmdWriteTimestamp`, if an implementation is unable to write a marker at any specific pipeline stage, it *may* instead do so at any logically later stage.

**Note**

Implementations *may* only support a limited number of pipelined marker write operations in flight at a given time, thus excessive number of marker write operations *may* degrade command execution performance.
Valid Usage

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04074
  
  `pipelineStage` must be a valid stage for the queue family that was used to create the command pool that `commandBuffer` was allocated from.

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04075
  
  If the `geometry shaders` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04076
  
  If the `tessellation shaders` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04077
  
  If the `conditional rendering` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`.

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04078
  
  If the `fragment density map` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04079
  
  If the `transform feedback` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04080
  
  If the `mesh shaders` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV` or `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`.

- VUID-vkCmdWriteBufferMarkerAMD-dstOffset-01798
  
  `dstOffset` must be less than or equal to the size of `dstBuffer` minus 4.

- VUID-vkCmdWriteBufferMarkerAMD-dstBuffer-01799
  
  `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag.

- VUID-vkCmdWriteBufferMarkerAMD-dstBuffer-01800
  
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdWriteBufferMarkerAMD-dstOffset-01801
  
  `dstOffset` must be a multiple of 4.
Valid Usage (Implicit)

- VUID-vkCmdWriteBufferMarkerAMD-commandBuffer-parameter
  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-parameter
  
  `pipelineStage` **must** be a valid `VkPipelineStageFlagBits` value

- VUID-vkCmdWriteBufferMarkerAMD-dstBuffer-parameter
  
  `dstBuffer` **must** be a valid `VkBuffer` handle

- VUID-vkCmdWriteBufferMarkerAMD-commandBuffer-recording
  
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdWriteBufferMarkerAMD-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations

- VUID-vkCmdWriteBufferMarkerAMD-commonparent
  
  Both of `commandBuffer`, and `dstBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

A more extensible version of the resolve image command is defined below.

To resolve a multisample image to a non-multisample image, call:

```c
// Provided by VK_KHR_copy_commands2
void vkCmdResolveImage2KHR( vkCommandBuffer commandBuffer, const VkResolveImageInfo2KHR* pResolveImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
• **pResolveImageInfo** is a pointer to a **VkResolveImageInfo2KHR** structure describing the resolve parameters.

This command is functionally identical to **vkCmdResolveImage**, but includes extensible substructures that include **sType** and **pNext** parameters, allowing them to be more easily extended.

### Valid Usage

#### Valid Usage (Implicit)

- **VUID-vkCmdResolveImage2KHR-commandBuffer-parameter**
  
  *commandBuffer* **must** be a valid **VkCommandBuffer** handle

- **VUID-vkCmdResolveImage2KHR-pResolveImageInfo-parameter**
  
  *pResolveImageInfo* **must** be a valid pointer to a valid **VkResolveImageInfo2KHR** structure

- **VUID-vkCmdResolveImage2KHR-commandBuffer-recording**
  
  *commandBuffer** must be in the **recording state**

- **VUID-vkCmdResolveImage2KHR-commandBuffer-cmdpool**
  
  The **VkCommandPool** that **commandBuffer** was allocated from **must** support graphics operations

- **VUID-vkCmdResolveImage2KHR-renderpass**
  
  This command **must** only be called outside of a render pass instance

### Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized

- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>

The **VkResolveImageInfo2KHR** structure is defined as:
// Provided by VK_KHR_copy_commands2

typedef struct VkResolveImageInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageResolve2KHR* pRegions;
} VkResolveImageInfo2KHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the resolve.
- **dstImage** is the destination image.
- **dstImageLayout** is the layout of the destination image subresources for the resolve.
- **regionCount** is the number of regions to resolve.
- **pRegions** is a pointer to an array of VkImageResolve2KHR structures specifying the regions to resolve.
Valid Usage

- VUID-VkResolveImageInfo2KHR-pRegions-00255
  The union of all source regions, and the union of all destination regions, specified by the elements of pRegions, must not overlap in memory

- VUID-VkResolveImageInfo2KHR-srcImage-00256
  If srcImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkResolveImageInfo2KHR-srcImage-00257
  srcImage must have a sample count equal to any valid sample count value other than VK_SAMPLE_COUNT_1_BIT

- VUID-VkResolveImageInfo2KHR-dstImage-00258
  If dstImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkResolveImageInfo2KHR-dstImage-00259
  dstImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

- VUID-VkResolveImageInfo2KHR-srcImageLayout-00260
  srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice

- VUID-VkResolveImageInfo2KHR-srcImageLayout-01400
  srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- VUID-VkResolveImageInfo2KHR-dstImageLayout-00262
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice

- VUID-VkResolveImageInfo2KHR-dstImageLayout-01401
  dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- VUID-VkResolveImageInfo2KHR-dstImage-02003
  The format features of dstImage must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-VkResolveImageInfo2KHR-srcImage-01386
  srcImage and dstImage must have been created with the same image format

- VUID-VkResolveImageInfo2KHR-srcSubresource-01709
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

- VUID-VkResolveImageInfo2KHR-dstSubresource-01710
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

- VUID-VkResolveImageInfo2KHR-srcSubresource-01711
  The srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created
The dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created.

dstImage and srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT.

If either srcImage or dstImage are of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer must be 0 and srcSubresource.layerCount must be 1.

If either srcImage or dstImage are of type VK_IMAGE_TYPE_3D, then for each element of pRegions, dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1.

For each element of pRegions, srcOffset.x and (extent.width + srcOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage.

For each element of pRegions, srcOffset.y and (extent.height + srcOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage.

If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.y must be 0 and extent.height must be 1.

For each element of pRegions, srcOffset.z and (extent.depth + srcOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage.

If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, srcOffset.z must be 0 and extent.depth must be 1.

For each element of pRegions, dstOffset.x and (extent.width + dstOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage.

For each element of pRegions, dstOffset.y and (extent.height + dstOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified dstSubresource of dstImage.

If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.y must be 0 and extent.height must be 1.
For each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)` **must** both be greater than or equal to `0` and less than or equal to the depth of the specified `dstSubresource` of `dstImage`.

If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `dstOffset.z` **must** be `0` and `extent.depth` **must** be `1`.

### Valid Usage (Implicit)

- **VUID-VkResolveImageInfo2KHR-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_RESOLVE_IMAGE_INFO_2_KHR`

- **VUID-VkResolveImageInfo2KHR-pNext-pNext**
  
  `pNext` **must** be `NULL`

- **VUID-VkResolveImageInfo2KHR-srcImage-parameter**
  
  `srcImage` **must** be a valid `VkImage` handle

- **VUID-VkResolveImageInfo2KHR-srcImageLayout-parameter**
  
  `srcImageLayout` **must** be a valid `VkImageLayout` value

- **VUID-VkResolveImageInfo2KHR-dstImage-parameter**
  
  `dstImage` **must** be a valid `VkImage` handle

- **VUID-VkResolveImageInfo2KHR-dstImageLayout-parameter**
  
  `dstImageLayout` **must** be a valid `VkImageLayout` value

- **VUID-VkResolveImageInfo2KHR-pRegions-parameter**
  
  `pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkImageResolve2KHR` structures

- **VUID-VkResolveImageInfo2KHR-regionCount-arraylength**
  
  `regionCount` **must** be greater than `0`

- **VUID-VkResolveImageInfo2KHR-commonparent**

  Both of `dstImage`, and `srcImage` **must** have been created, allocated, or retrieved from the same `VkDevice`.

The `VkImageResolve2KHR` structure is defined as:
// Provided by VK_KHR_copy_commands2

typedef struct VkImageResolve2KHR {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageResolve2KHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcSubresource** and **dstSubresource** are *VkImageSubresourceLayers* structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.
- **srcOffset** and **dstOffset** select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- **extent** is the size in texels of the source image to resolve in width, height and depth.

### Valid Usage

- VUID-VkImageResolve2KHR-aspectMask-00266
  The *aspectMask* member of **srcSubresource** and **dstSubresource** must only contain VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkImageResolve2KHR-layerCount-00267
  The *layerCount* member of **srcSubresource** and **dstSubresource** must match

### Valid Usage (Implicit)

- VUID-VkImageResolve2KHR-sType-sType
  *sType* must be VK_STRUCTURE_TYPE_IMAGE_RESOLVE_2_KHR

- VUID-VkImageResolve2KHR-pNext-pNext
  *pNext* must be NULL

- VUID-VkImageResolve2KHR-srcSubresource-parameter
  **srcSubresource** must be a valid *VkImageSubresourceLayers* structure

- VUID-VkImageResolve2KHR-dstSubresource-parameter
  **dstSubresource** must be a valid *VkImageSubresourceLayers* structure
Chapter 21. Drawing Commands

*Drawing commands* (commands with *Draw* in the name) provoke work in a graphics pipeline. Drawing commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound graphics pipeline. A graphics pipeline *must* be bound to a command buffer before any drawing commands are recorded in that command buffer.

Drawing can be achieved in two modes:

- **Programmable Mesh Shading**, the mesh shader assembles primitives, or
- **Programmable Primitive Shading**, the input primitives are assembled

as follows.

Each draw is made up of zero or more vertices and zero or more instances, which are processed by the device and result in the assembly of primitives. Primitives are assembled according to the `pInputAssemblyState` member of the `VkGraphicsPipelineCreateInfo` structure, which is of type `VkPipelineInputAssemblyStateCreateInfo`:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineInputAssemblyStateCreateInfo {
    VkStructureType              sType;
    const void*                  pNext;
    VkPipelineInputAssemblyStateCreateFlags flags;
    VkPrimitiveTopology          topology;
    VkBool32                     primitiveRestartEnable;
} VkPipelineInputAssemblyStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `topology` is a `VkPrimitiveTopology` defining the primitive topology, as described below.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. This enable only applies to indexed draws (`vkCmdDrawIndexed`, `vkCmdDrawMultiIndexedEXT`, and `vkCmdDrawIndexedIndirect`), and the special index value is either `0xFFFFFFFF` when the `indexType` parameter of `vkCmdBindIndexBuffer` is equal to `VK_INDEX_TYPE_UINT32`, `0xFF` when `indexType` is equal to `VK_INDEX_TYPE_UINT8_EXT`, or `0xFFFF` when `indexType` is equal to `VK_INDEX_TYPE_UINT16`. Primitive restart is not allowed for “list” topologies.

Restarting the assembly of primitives discards the most recent index values if those elements formed an incomplete primitive, and restarts the primitive assembly using the subsequent indices, but only assembling the immediately following element through the end of the originally specified elements. The primitive restart index value comparison is performed before adding the `vertexOffset` value to the index value.
Valid Usage

- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00428
  If `topology` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, `primitiveRestartEnable` must be `VK_FALSE`

- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00429
  If the `geometry shaders` feature is not enabled, `topology` must not be any of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`

- VUID-VkpipelineInputAssemblyStateCreateInfo-triangleFans-04452
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans` is `VK_FALSE`, `topology` must not be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`

- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-parameter
  `topology` must be a valid `VkPrimitiveTopology` value

Valid Usage (Implicit)

- VUID-VkPipelineInputAssemblyStateCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO`

- VUID-VkPipelineInputAssemblyStateCreateInfo-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkPipelineInputAssemblyStateCreateInfo-flags-zerobitmask
  `flags` must be `0`

- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-parameter
  `topology` must be a valid `VkPrimitiveTopology` value

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineInputAssemblyStateCreateFlags;

`VkPipelineInputAssemblyStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To dynamically control whether a special vertex index value is treated as restarting the assembly of primitives:
void vkCmdSetPrimitiveRestartEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 primitiveRestartEnable);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. It behaves in the same way as `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable`

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

### Valid Usage

- VUID-vkCmdSetPrimitiveRestartEnableEXT-None-04866
  The `extendedDynamicState2` feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetPrimitiveRestartEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetPrimitiveRestartEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetPrimitiveRestartEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
21.1. Primitive Topologies

*Primitive topology* determines how consecutive vertices are organized into primitives, and determines the type of primitive that is used at the beginning of the graphics pipeline. The effective topology for later stages of the pipeline is altered by tessellation or geometry shading (if either is in use) and depends on the execution modes of those shaders. In the case of mesh shading the only effective topology is defined by the execution mode of the mesh shader.

The primitive topologies defined by `VkPrimitiveTopology` are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPrimitiveTopology {
    VK_PRIMITIVE_TOPOLOGY_POINT_LIST = 0,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST = 1,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP = 2,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST = 3,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP = 4,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN = 5,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY = 6,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY = 7,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY = 8,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY = 9,
    VK_PRIMITIVE_TOPOLOGY_PATCH_LIST = 10,
} VkPrimitiveTopology;
```

- **VK_PRIMITIVE_TOPOLOGY_POINT_LIST** specifies a series of *separate point primitives*.
- **VK_PRIMITIVE_TOPOLOGY_LINE_LIST** specifies a series of *separate line primitives*.
- **VK_PRIMITIVE_TOPOLOGY_LINE_STRIP** specifies a series of *connected line primitives* with consecutive lines sharing a vertex.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST** specifies a series of *separate triangle primitives*.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP** specifies a series of *connected triangle primitives* with consecutive triangles sharing an edge.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN** specifies a series of *connected triangle primitives* with all triangles sharing a common vertex. If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans` is `VK_FALSE`, then triangle fans are not supported by the implementation, and **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN** must not be used.
- **VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY** specifies a series of *separate line primitives with adjacency*.
- **VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY** specifies a series of *connected line primitives with adjacency*, with consecutive primitives sharing three vertices.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY** specifies a series of *separate triangle primitives with adjacency*.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY** specifies *connected triangle primitives*...
with adjacency, with consecutive triangles sharing an edge.

- **VK_PRIMITIVE_TOPOLOGY_PATCH_LIST** specifies separate patch primitives.

Each primitive topology, and its construction from a list of vertices, is described in detail below with a supporting diagram, according to the following key:

<table>
<thead>
<tr>
<th></th>
<th>Vertex</th>
<th>A point in 3-dimensional space. Positions chosen within the diagrams are arbitrary and for illustration only.</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Vertex Number</td>
<td>Sequence position of a vertex within the provided vertex data.</td>
</tr>
<tr>
<td></td>
<td>Provoking Vertex</td>
<td>Provoking vertex within the main primitive. The tail is angled towards the relevant primitive. Used in flat shading.</td>
</tr>
<tr>
<td></td>
<td>Primitive Edge</td>
<td>An edge connecting the points of a main primitive.</td>
</tr>
<tr>
<td></td>
<td>Adjacency Edge</td>
<td>Points connected by these lines do not contribute to a main primitive, and are only accessible in a geometry shader.</td>
</tr>
<tr>
<td></td>
<td>Winding Order</td>
<td>The relative order in which vertices are defined within a primitive, used in the facing determination. This ordering has no specific start or end point.</td>
</tr>
</tbody>
</table>

The diagrams are supported with mathematical definitions where the vertices (v) and primitives (p) are numbered starting from 0; v₀ is the first vertex in the provided data and p₀ is the first primitive in the set of primitives defined by the vertices and topology.

The primitive topology is specified by the **VkPipelineInputAssemblyStateCreateInfo::topology** property of the currently active pipeline, if the pipeline was not created with **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT** enabled.

Otherwise, the primitive topology is set by calling:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetPrimitiveTopologyEXT(
    VkCommandBuffer commandBuffer,                
    VkPrimitiveTopology primitiveTopology);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **topology** specifies the primitive topology to use for drawing.

**Valid Usage**

- **VUID-vkCmdSetPrimitiveTopologyEXT-None-03347**
  
  The extendedDynamicState feature **must** be enabled
Valid Usage (Implicit)

- **VUID-vkCmdSetPrimitiveTopologyEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetPrimitiveTopologyEXT-primitiveTopology-parameter**
  `primitiveTopology` must be a valid `VkPrimitiveTopology` value

- **VUID-vkCmdSetPrimitiveTopologyEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetPrimitiveTopologyEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

21.1.1. Topology Class

The primitive topologies are grouped into the following topology classes:

*Table 29. Topology classes*

<table>
<thead>
<tr>
<th>Topology Class</th>
<th>Primitive Topology</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td><code>VK_PRIMITIVE_TOPOLOGY_POINT_LIST</code></td>
</tr>
<tr>
<td>Line</td>
<td><code>VK_PRIMITIVE_TOPOLOGY_LINE_LIST</code>, <code>VK_PRIMITIVE_TOPOLOGY_LINE_STRIP</code>, <code>VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY</code>, <code>VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY</code></td>
</tr>
</tbody>
</table>
21.1.2. Point Lists

When the topology is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, each consecutive vertex defines a single point primitive, according to the equation:

\[ p_i = \{v_i\} \]

As there is only one vertex, that vertex is the provoking vertex. The number of primitives generated is equal to `vertexCount`.

21.1.3. Line Lists

When the topology is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, each consecutive pair of vertices defines a single line primitive, according to the equation:

\[ p_i = \{v_{2i}, v_{2i+1}\} \]

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/2 \rfloor \).

When the provokingVertexMode is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{2i} \).
When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{2i+1} \).

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, one line primitive is defined by each vertex and the following vertex, according to the equation:

\[
p_i = \{v_i, v_{i+1}\}
\]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-1) \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_i \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+1} \).

### 21.1.5. Triangle Lists

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, each consecutive set of three vertices defines a single triangle primitive, according to the equation:

\[
p_i = \{v_{3i}, v_{3i+1}, v_{3i+2}\}
\]

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/3 \rfloor \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{3i} \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{3i+2} \).
21.1.6. Triangle Strips

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, one triangle primitive is defined by each vertex and the two vertices that follow it, according to the equation:

\[ p_i = \{ v_i, v_{i+(1+i \% 2)}, v_{i+(2-i \% 2)} \} \]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-2) \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_i \).

![Diagram of Triangle Strips]

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+2} \).

![Diagram of Triangle Strips]

**Note**
The ordering of the vertices in each successive triangle is reversed, so that the winding order is consistent throughout the strip.

21.1.7. Triangle Fans

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`, triangle primitives are defined around a shared common vertex, according to the equation:

\[ p_i = \{ v_{i+1}, v_{i+2}, v_0 \} \]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-2) \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex
for \( p_i \) is \( v_{i+1} \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+2} \).

---

**Note**

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans` is `VK_FALSE`, then triangle fans are not supported by the implementation, and `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN` must not be used.

### 21.1.8. Line Lists With Adjacency

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, each consecutive set of four vertices defines a single line primitive with adjacency, according to the equation:

\[
p_i = \{ v_{4i}, v_{4i+1}, v_{4i+2}, v_{4i+3} \}
\]

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a geometry shader.

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/4 \rfloor \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{4i+1} \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{4i+2} \).
21.1.9. Line Strips With Adjacency

When the topology is VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY, one line primitive with adjacency is defined by each vertex and the following vertex, according to the equation:

\[ p_i = \{v_i, v_{i+1}, v_{i+2}, v_{i+3}\} \]

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a geometry shader.

The number of primitives generated is equal to \(\max(0, \text{vertexCount}-3)\).

When the provokingVertexMode is VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT, the provoking vertex for \(p_i\) is \(v_{i+1}\).

When the provokingVertexMode is VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT, the provoking vertex for \(p_i\) is \(v_{i+2}\).

21.1.10. Triangle Lists With Adjacency

When the topology is VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY, each consecutive set of six vertices defines a single triangle primitive with adjacency, according to the equations:

\[ p_i = \{v_{6i}, v_{6i+1}, v_{6i+2}, v_{6i+3}, v_{6i+4}, v_{6i+5}\} \]

A triangle primitive is described by the first, third, and fifth vertices of the total primitive, with the remaining three vertices only accessible in a geometry shader.

The number of primitives generated is equal to \(\lfloor \text{vertexCount}/6 \rfloor\).

When the provokingVertexMode is VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT, the provoking vertex for \(p_i\) is \(v_{6i}\).
When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{6i+4} \).

### 21.1.11. Triangle Strips With Adjacency

When the topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`, one triangle primitive with adjacency is defined by each vertex and the following 5 vertices.

The number of primitives generated, \( n \), is equal to \( \lceil \max(0, \text{vertexCount} - 4)/2 \rceil \).

If \( n=1 \), the primitive is defined as:

\[
p = \{v_0, v_1, v_2, v_5, v_4, v_3\}
\]

If \( n>1 \), the total primitive consists of different vertices according to where it is in the strip:

\[
p_i = \{v_{2i}, v_{2i+1}, v_{2i+2}, v_{2i+6}, v_{2i+4}, v_{2i+3}\} \text{ when } i=0
\]

\[
p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+6}, v_{2i+2}, v_{2i+1}\} \text{ when } i>0, i<n-1, \text{ and } i\%2=1
\]

\[
p_i = \{v_{2i}, v_{2i+2}, v_{2i+5}, v_{2i+6}, v_{2i+1}, v_{2i+3}\} \text{ when } i>0, i<n-1, \text{ and } i\%2=0
\]

\[
p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+5}, v_{2i+2}, v_{2i+1}\} \text{ when } i=n-1 \text{ and } i\%2=1
\]

\[
p_i = \{v_{2i}, v_{2i+2}, v_{2i+5}, v_{2i+4}, v_{2i+3}\} \text{ when } i=n-1 \text{ and } i\%2=0
\]
A triangle primitive is described by the first, third, and fifth vertices of the total primitive in all cases, with the remaining three vertices only accessible in a geometry shader.

**Note**
The ordering of the vertices in each successive triangle is altered so that the winding order is consistent throughout the strip.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is always \( v_{2i} \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is always \( v_{2i+4} \).
21.1.12. Patch Lists

When the topology is VK_PRIMITIVE_TOPOLOGY_PATCH_LIST, each consecutive set of m vertices defines a single patch primitive, according to the equation:

\[ p_i = \{ v_{mi}, v_{mi+1}, \ldots, v_{mi+(m-2)}, v_{mi+(m-1)} \} \]

where m is equal to VkPipelineTessellationStateCreateInfo::patchControlPoints.

Patch lists are never passed to vertex post-processing, and as such no provoking vertex is defined for patch primitives. The number of primitives generated is equal to \( \lfloor \text{vertexCount}/m \rfloor \).

The vertices comprising a patch have no implied geometry, and are used as inputs to tessellation shaders and the fixed-function tessellator to generate new point, line, or triangle primitives.

21.2. Primitive Order

Primitives generated by drawing commands progress through the stages of the graphics pipeline in primitive order. Primitive order is initially determined in the following way:

1. Submission order determines the initial ordering
2. For indirect drawing commands, the order in which accessed instances of the VkDrawIndirectCommand are stored in buffer, from lower indirect buffer addresses to higher addresses.
3. If a drawing command includes multiple instances, the order in which instances are executed, from lower numbered instances to higher.

4. The order in which primitives are specified by a drawing command:
   - For non-indexed draws, from vertices with a lower numbered `vertexIndex` to a higher numbered `vertexIndex`.
   - For indexed draws, vertices sourced from a lower index buffer addresses to higher addresses.
   - For draws using mesh shaders, the order is provided by mesh shading.

   Within this order implementations further sort primitives:

5. If tessellation shading is active, by an implementation-dependent order of new primitives generated by tessellation.

6. If geometry shading is active, by the order new primitives are generated by geometry shading.

7. If the polygon mode is not `VK_POLYGON_MODE_FILL`, or `VK_POLYGON_MODE_FILL_RECTANGLE_NV`, by an implementation-dependent ordering of the new primitives generated within the original primitive.

Primitive order is later used to define rasterization order, which determines the order in which fragments output results to a framebuffer.

### 21.3. Programmable Primitive Shading

Once primitives are assembled, they proceed to the vertex shading stage of the pipeline. If the draw includes multiple instances, then the set of primitives is sent to the vertex shading stage multiple times, once for each instance.

It is implementation-dependent whether vertex shading occurs on vertices that are discarded as part of incomplete primitives, but if it does occur then it operates as if they were vertices in complete primitives and such invocations can have side effects.

Vertex shading receives two per-vertex inputs from the primitive assembly stage - the `vertexIndex` and the `instanceIndex`. How these values are generated is defined below, with each command.

Drawing commands fall roughly into two categories:

- Non-indexed drawing commands present a sequential `vertexIndex` to the vertex shader. The sequential index is generated automatically by the device (see Fixed-Function Vertex Processing for details on both specifying the vertex attributes indexed by `vertexIndex`, as well as binding vertex buffers containing those attributes to a command buffer). These commands are:
  - `vkCmdDraw`
  - `vkCmdDrawIndirect`
  - `vkCmdDrawIndirectCountKHR`
  - `vkCmdDrawIndirectCountAMD`
  - `vkCmdDrawMultiEXT`
Indexed drawing commands read index values from an index buffer and use this to compute the vertexIndex value for the vertex shader. These commands are:

- `vkCmdDrawIndexed`
- `vkCmdDrawIndexedIndirect`
- `vkCmdDrawIndexedIndirectCountKHR`
- `vkCmdDrawIndexedIndirectCountAMD`
- `vkCmdDrawMultiIndexedEXT`

To bind an index buffer to a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindIndexBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkIndexType indexType);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **buffer** is the buffer being bound.
- **offset** is the starting offset in bytes within buffer used in index buffer address calculations.
- **indexType** is a `VkIndexType` value specifying whether indices are treated as 16 bits or 32 bits.

### Valid Usage

- **VUID-vkCmdBindIndexBuffer-offset-00431**
  
  Offset **must** be less than the size of buffer

- **VUID-vkCmdBindIndexBuffer-offset-00432**
  
  The sum of offset and the address of the range of VkDeviceMemory object that is backing buffer, **must** be a multiple of the type indicated by indexType

- **VUID-vkCmdBindIndexBuffer-buffer-00433**
  
  Buffer **must** have been created with the VK_BUFFER_USAGE_INDEX_BUFFER_BIT flag

- **VUID-vkCmdBindIndexBuffer-buffer-00434**
  
  If buffer is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdBindIndexBuffer-indexType-02507**
  
  IndexType **must** not be VK_INDEX_TYPE_NONE_KHR

- **VUID-vkCmdBindIndexBuffer-indexType-02765**
  
  If indexType is VK_INDEX_TYPE_UINT8_EXT, the indexTypeUint8 feature **must** be enabled
Valid Usage (Implicit)

- **VUID-vkCmdBindIndexBuffer-commandBuffer-parameter**
  
  `commandBuffer must be a valid VkCommandBuffer handle`

- **VUID-vkCmdBindIndexBuffer-buffer-parameter**
  
  `buffer must be a valid VkBuffer handle`

- **VUID-vkCmdBindIndexBuffer-indexType-parameter**
  
  `indexType must be a valid VkIndexType value`

- **VUID-vkCmdBindIndexBuffer-commandBuffer-recording**
  
  `commandBuffer must be in the recording state`

- **VUID-vkCmdBindIndexBuffer-commandBuffer-cmdpool**
  
  The VkCommandPool that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdBindIndexBuffer-commonparent**
  
  Both of `buffer`, and `commandBuffer must` have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to `commandBuffer must` be externally synchronized

- Host access to the VkCommandPool that `commandBuffer` was allocated from `must` be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Possible values of `vkCmdBindIndexBuffer::indexType`, specifying the size of indices, are:
// Provided by VK_VERSION_1_0
typedef enum VkIndexType {
    VK_INDEX_TYPE_UINT16 = 0,
    VK_INDEX_TYPE_UINT32 = 1,
    // Provided by VK_KHR_acceleration_structure
    VK_INDEX_TYPE_NONE_KHR = 1000165000,
    // Provided by VK_EXT_index_type_uint8
    VK_INDEX_TYPE_UINT8_EXT = 1000265000,
    // Provided by VK_NV_ray_tracing
    VK_INDEX_TYPE_NONE_NV = VK_INDEX_TYPE_NONE_KHR,
} VkIndexType;

• VK_INDEX_TYPE_UINT16 specifies that indices are 16-bit unsigned integer values.
• VK_INDEX_TYPE_UINT32 specifies that indices are 32-bit unsigned integer values.
• VK_INDEX_TYPE_NONE_KHR specifies that no indices are provided.
• VK_INDEX_TYPE_UINT8_EXT specifies that indices are 8-bit unsigned integer values.

The parameters for each drawing command are specified directly in the command or read from buffer memory, depending on the command. Drawing commands that source their parameters from buffer memory are known as indirec drawing commands.

All drawing commands interact with the Robust Buffer Access feature.

To record a non-indexed draw, call:

// Provided by VK_VERSION_1_0
void vkCmdDraw(
    VkCommandBuffer commandBuffer,
    uint32_t vertexCount,
    uint32_t instanceCount,
    uint32_t firstVertex,
    uint32_t firstInstance);

• commandBuffer is the command buffer into which the command is recorded.
• vertexCount is the number of vertices to draw.
• instanceCount is the number of instances to draw.
• firstVertex is the index of the first vertex to draw.
• firstInstance is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and vertexCount consecutive vertex indices with the first vertexIndex value equal to firstVertex. The primitives are drawn instanceCount times with instanceIndex starting with firstInstance and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.
Valid Usage

- **VUID-vkCmdDraw-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDraw-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDraw-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDraw-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdDraw-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDraw-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDraw-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdDraw-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in `Pipeline Layout Compatibility`

- **VUID-vkCmdDraw-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in `Pipeline Layout Compatibility`
Compatibility

- VUID-vkCmdDraw-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- VUID-vkCmdDraw-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdDraw-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdDraw-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDraw-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- VUID-vkCmdDraw-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- VUID-vkCmdDraw-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDraw-None-02705
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDraw-None-02706
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDraw-None-04115
If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format

- VUID-vkCmdDraw-OpImageWrite-04469
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdDraw-SampledType-04470
  If a `VkImageView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdDraw-SampledType-04471
  If a `VkImageView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdDraw-SampledType-04472
  If a `VkBufferView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdDraw-SampledType-04473
  If a `VkBufferView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdDraw-sparseImageInt64Atomics-04474
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDraw-sparseImageInt64Atomics-04475
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDraw-renderPass-02684
  The current render pass **must** be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdDraw-subpass-02685
  The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdDraw-None-02686
  Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set

- VUID-vkCmdDraw-None-04584
  Image subresources used as attachments in the current render pass **must** not be accessed
in any way other than as an attachment by this command, except for cases involving read-only access to depth/stencil attachments as described in the Render Pass chapter

- **VUID-vkCmdDraw-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- **VUID-vkCmdDraw-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- **VUID-vkCmdDraw-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` dynamic state enabled, then `vkCmdSetViewportWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- **VUID-vkCmdDraw-scissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, then `vkCmdSetScissorWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT` **must** match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- **VUID-vkCmdDraw-viewportCount-03419**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic states enabled then both `vkCmdSetViewportWithCountEXT` and `vkCmdSetScissorWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT`

- **VUID-vkCmdDraw-viewportCount-04137**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline **must** have been created with `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDraw-viewportCount-04138**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV`
dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

• VUID-vkCmdDraw-viewportCount-04139

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

• VUID-vkCmdDraw-viewportCount-04140

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

• VUID-vkCmdDraw-VkPipelineViewportCreateInfo-04141

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and an instance of `VkPipelineViewportSwizzleStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

• VUID-vkCmdDraw-VkPipelineViewportCreateInfo-04142

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

• VUID-vkCmdDraw-primitiveTopology-03420

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

• VUID-vkCmdDraw-None-04875

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-04876
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled then `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-04877
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-logicOp-04878
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value

- VUID-vkCmdDraw-None-04879
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1

- VUID-vkCmdDraw-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`

- VUID-vkCmdDraw-rasterizationSamples-04740
  If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdDraw-None-04912
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDraw-pStrides-04913
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the
VK_DYNAMIC_STATE_VERTEX_INPUT_EXT  dynamic state enabled, then vkCmdBindVertexBuffer2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffer2EXT must not be NULL

- VUID-vkCmdDraw-None-04914
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDraw-None-04007
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound

- VUID-vkCmdDraw-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be VK_NULL_HANDLE

- VUID-vkCmdDraw-None-02721
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

### Valid Usage (Implicit)

- VUID-vkCmdDraw-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDraw-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDraw-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdDraw-renderpass
  This command must only be called inside of a render pass instance

### Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To record an indexed draw, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexed(
    VkCommandBuffer commandBuffer,
    uint32_t indexCount,
    uint32_t instanceCount,
    uint32_t firstIndex,
    int32_t vertexOffset,
    uint32_t firstInstance);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
- `firstInstance` is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and `indexCount` vertices whose indices are retrieved from the index buffer. The index buffer is treated as an array of tightly packed unsigned integers of size defined by the `vkCmdBindIndexBuffer ::indexType` parameter with which the buffer was bound.

The first vertex index is at an offset of `firstIndex × indexSize + offset` within the bound index buffer, where `offset` is the offset specified by `vkCmdBindIndexBuffer` and `indexSize` is the byte size of the type specified by `indexType`. Subsequent index values are retrieved from consecutive locations in the index buffer. Indices are first compared to the primitive restart value, then zero extended to 32 bits (if the `indexType` is `VK_INDEX_TYPE_UINT8_EXT` or `VK_INDEX_TYPE_UINT16`) and have `vertexOffset` added to them, before being supplied as the `vertexIndex` value.

The primitives are drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.
Valid Usage

- **VUID-vkCmdDrawIndexed-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndexed-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndexed-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDrawIndexed-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdDrawIndexed-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDrawIndexed-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDrawIndexed-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdDrawIndexed-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDrawIndexed-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility
Compatibility

- VUID-vkCmdDrawIndexed-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawIndexed-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawIndexed-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdDrawIndexed-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDrawIndexed-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- VUID-vkCmdDrawIndexed-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- VUID-vkCmdDrawIndexed-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDrawIndexed-None-02705
  If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawIndexed-None-02706
  If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawIndexed-None-04115
If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- VUID-vkCmdDrawIndexed-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- VUID-vkCmdDrawIndexed-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawIndexed-SampledType-04471
  If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawIndexed-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawIndexed-SampledType-04473
  If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawIndexed-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawIndexed-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawIndexed-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdDrawIndexed-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdDrawIndexed-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

- VUID-vkCmdDrawIndexed-None-04584
  Image subresources used as attachments in the current render pass must not be accessed.
in any way other than as an attachment by this command, except for cases involving read-only access to depth/stencil attachments as described in the Render Pass chapter

- **VUID-vkCmdDrawIndexed-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- **VUID-vkCmdDrawIndexed-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with
  `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and
  the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- **VUID-vkCmdDrawIndexed-viewportCount-03417**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the
  `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` dynamic state enabled, then
  `vkCmdSetViewportWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of
  `vkCmdSetViewportWithCountEXT` **must** match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- **VUID-vkCmdDrawIndexed-scissorCount-03418**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` dynamic state enabled, but not the
  `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, then
  `vkCmdSetScissorWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of
  `vkCmdSetScissorWithCountEXT` **must** match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- **VUID-vkCmdDrawIndexed-viewportCount-04137**
  If the bound graphics pipeline state was created with both the
  `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic states enabled then both
  `vkCmdSetViewportWithCountEXT` and
  `vkCmdSetScissorWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of
  `vkCmdSetViewportWithCountEXT` **must** match the `scissorCount` parameter of
  `vkCmdSetScissorWithCountEXT`

- **VUID-vkCmdDrawIndexed-viewportCount-04138**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the
  `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline **must** have been created with
  `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to
  `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawIndexed-viewportCount-04139**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the
  `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline **must** have been created with
  `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to
  `vkCmdSetViewportWithCountEXT`
dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawIndexed-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawIndexed-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawIndexed-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportSwizzleStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawIndexed-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawIndexed-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state

- **VUID-vkCmdDrawIndexed-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-04876**
If the bound graphics pipeline state was created with the `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-04877**

If the bound graphics pipeline state was created with the `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-logicOp-04878**

If the bound graphics pipeline state was created with the `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

- **VUID-vkCmdDrawIndexed-None-04879**

If the bound graphics pipeline state was created with the `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-blendEnable-04727**

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

- **VUID-vkCmdDrawIndexed-rasterizationSamples-04740**

If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDrawIndexed-None-04912**

If the bound graphics pipeline was created with both the `vkCmdSetVertexInputEXT` and `vkCmdSetVertexInputBindingStrideEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawIndexed-pStrides-04913**

If the bound graphics pipeline was created with the `vkCmdSetVertexInputBindingStrideEXT` dynamic state enabled, but not the...
VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then **vkCmdBindVertexBuffers2EXT** must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of **vkCmdBindVertexBuffers2EXT** must not be NULL

- **VUID-vkCmdDrawIndexed-None-04914**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then **vkCmdSetVertexInputEXT** must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawIndexed-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must have either valid or VK_NULL_HANDLE buffers bound

- **VUID-vkCmdDrawIndexed-None-04008**
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be VK_NULL_HANDLE

- **VUID-vkCmdDrawIndexed-None-02721**
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- **VUID-vkCmdDrawIndexed-firstIndex-04932**
  \[(\text{indexSize} \times (\text{firstIndex} + \text{indexCount}) + \text{offset})\] must be less than or equal to the size of the bound index buffer, with indexSize being based on the type specified by indexType, where the index buffer, indexType, and offset are specified via **vkCmdBindIndexBuffer**

---

**Valid Usage (Implicit)**

- **VUID-vkCmdDrawIndexed-commandBuffer-parameter**
  commandBuffer must be a valid VkCommandBuffer handle

- **VUID-vkCmdDrawIndexed-commandBuffer-recording**
  commandBuffer must be in the recording state

- **VUID-vkCmdDrawIndexed-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- **VUID-vkCmdDrawIndexed-renderpass**
  This command must only be called inside of a render pass instance

---

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To record an ordered sequence of drawing operations which have no state changes between them, call:

```c
// Provided by VK_EXT_multi_draw
void vkCmdDrawMultiEXT(
    VkCommandBuffer commandBuffer,
    uint32_t drawCount,
    const VkMultiDrawInfoEXT* pVertexInfo,
    uint32_t instanceCount,
    uint32_t firstInstance,
    uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `drawCount` is the number of draws to execute, and can be zero.
- `pVertexInfo` is a pointer to an array of `VkMultiDrawInfoEXT` with vertex information to be drawn.
- `instanceCount` is the number of instances to draw.
- `firstInstance` is the instance ID of the first instance to draw.
- `stride` is the byte stride between consecutive elements of `pVertexInfo`.

`drawCount` draws are executed with parameters taken from `pVertexInfo`. The number of draw commands recorded is `drawCount`, with each command reading, sequentially, a `firstVertex` and a `vertexCount` from `pVertexInfo.`
Valid Usage

- **VUID-vkCmdDrawMultiEXT-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawMultiEXT-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawMultiEXT-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDrawMultiEXT-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdDrawMultiEXT-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDrawMultiEXT-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDrawMultiEXT-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdDrawMultiEXT-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDrawMultiEXT-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout
Compatibility

- **VUID-vkCmdDrawMultiEXT-None-02699**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawMultiEXT-None-02700**
  A valid pipeline **must** be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawMultiEXT-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- **VUID-vkCmdDrawMultiEXT-None-02859**
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDrawMultiEXT-None-02702**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDrawMultiEXT-None-02703**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDrawMultiEXT-None-02704**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDrawMultiEXT-None-02705**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawMultiEXT-None-02706**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawMultiEXT-None-04115**
If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- VUID-vkCmdDrawMultiEXT-OpImageWrite-04469

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- VUID-vkCmdDrawMultiEXT-SampledType-04470

If a `VkImageView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawMultiEXT-SampledType-04471

If a `VkImageView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawMultiEXT-SampledType-04472

If a `VkBufferView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawMultiEXT-SampledType-04473

If a `VkBufferView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawMultiEXT-sparseImageInt64Atomics-04474

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawMultiEXT-sparseImageInt64Atomics-04475

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawMultiEXT-renderPass-02684

The current render pass must be compatible with the renderPass member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- VUID-vkCmdDrawMultiEXT-subpass-02685

The subpass index of the current render pass must be equal to the subpass member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- VUID-vkCmdDrawMultiEXT-None-02686

Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

- VUID-vkCmdDrawMultiEXT-None-04584

Image subresources used as attachments in the current render pass must not be accessed.
in any way other than as an attachment by this command, except for cases involving read-only access to depth/stencil attachments as described in the Render Pass chapter.

- **VUID-vkCmdDrawMultiEXT-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.

- **VUID-vkCmdDrawMultiEXT-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

- **VUID-vkCmdDrawMultiEXT-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` dynamic state enabled, then `vkCmdSetViewportWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

- **VUID-vkCmdDrawMultiEXT-scissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, then `vkCmdSetScissorWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT` **must** match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

- **VUID-vkCmdDrawMultiEXT-viewportCount-03419**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic states enabled, then both `vkCmdSetViewportWithCountEXT` and `vkCmdSetScissorWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT`.

- **VUID-vkCmdDrawMultiEXT-viewportCount-04137**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline **must** have been created with `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawMultiEXT-viewportCount-04138**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV`
dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- VUID-vkCmdSetMultiEXT-viewportCount-04139
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_ShadingRatePalette_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- VUID-vkCmdSetMultiEXT-viewportCount-04140
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_ShadingRatePalette_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- VUID-vkCmdSetMultiEXT-VkPipelineViewportCreateInfo-04141
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportSwizzleStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- VUID-vkCmdSetMultiEXT-VkPipelineViewportCreateInfo-04142
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- VUID-vkCmdSetMultiEXT-primitiveTopology-03420
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state

- VUID-vkCmdSetMultiEXT-None-04875
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdSetMultiEXT-None-04876
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled then `vkCmdSetRasterizerDiscardEnableEXT must` have been called in the current command buffer prior to this drawing command

- `VUID-vkCmdDrawMultiEXT-None-04877`

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT must` have been called in the current command buffer prior to this drawing command

- `VUID-vkCmdDrawMultiEXT-logicOp-04878`

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT must` have been called in the current command buffer prior to this drawing command and the `logicOp must` be a valid `VkLogicOp` value

- `VUID-vkCmdDrawMultiEXT-None-04879`

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT must` have been called in the current command buffer prior to this drawing command

- `VUID-vkCmdDrawMultiEXT-primitiveFragmentShadingRateWithMultipleViewports-04552`

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT must` have been called in the current command buffer prior to this drawing command, and the `viewportCount parameter of vkCmdSetViewportWithCountEXT must` be `1`

- `VUID-vkCmdDrawMultiEXT-blendEnable-04727`

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must` be `VK_FALSE`

- `VUID-vkCmdDrawMultiEXT-rasterizationSamples-04740`

If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples must` be the same as the current subpass color and/or depth/stencil attachments

- `VUID-vkCmdDrawMultiEXT-None-04912`

If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT must` have been called in the current command buffer prior to this draw command

- `VUID-vkCmdDrawMultiEXT-pStrides-04913`

If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be `VK_NULL_HANDLE`.

For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

The multiDraw feature must be enabled.

drawCount must be less than `VkPhysicalDeviceMultiDrawPropertiesEXT::maxMultiDrawCount`.

If drawCount is greater than zero, pVertexInfo must be a valid pointer to memory containing one or more valid instances of `VkMultiDrawInfoEXT` structures.

Valid Usage (Implicit)

commandBuffer must be a valid `VkCommandBuffer` handle

commandBuffer must be in the recording state

The `VkCommandPool` that commandBuffer was allocated from must support graphics operations

This command must only be called inside of a render pass instance.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To record an ordered sequence of indexed drawing operations which have no state changes between them, call:

```c
// Provided by VK_EXT_multi_draw
void vkCmdDrawMultiIndexedEXT(
    VkCommandBuffer commandBuffer,
    uint32_t drawCount,
    const VkMultiDrawIndexedInfoEXT* pIndexInfo,
    uint32_t instanceCount,
    uint32_t firstInstance,
    uint32_t stride,
    const int32_t* pVertexOffset);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `drawCount` is the number of draws to execute, and can be zero.
- `pIndexInfo` is a pointer to an array of `VkMultiDrawIndexedInfoEXT` with index information to be drawn.
- `instanceCount` is the number of instances to draw.
- `firstInstance` is the instance ID of the first instance to draw.
- `stride` is the byte stride between consecutive elements of `pIndexInfo`.
- `pVertexOffset` is NULL or a pointer to the value added to the vertex index before indexing into the vertex buffer. When specified, `VkMultiDrawIndexedInfoEXT::offset` is ignored.

`drawCount` indexed draws are executed with parameters taken from `pIndexInfo`. The number of draw commands recorded is `drawCount`, with each command reading, sequentially, a `firstIndex` and an `indexCount` from `pIndexInfo`. If `pVertexOffset` is NULL, a `vertexOffset` is also read from `pIndexInfo`, otherwise the value from dereferencing `pVertexOffset` is used.
Valid Usage

- **VUID-vkCmdDrawMultiIndexedEXT-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawMultiIndexedEXT-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawMultiIndexedEXT-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDrawMultiIndexedEXT-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdDrawMultiIndexedEXT-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDrawMultiIndexedEXT-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDrawMultiIndexedEXT-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdDrawMultiIndexedEXT-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDrawMultiIndexedEXT-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility
Compatiblity

- VUID-vkCmdDrawMultiIndexedEXT-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawMultiIndexedEXT-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdDrawMultiIndexedEXT-None-02702
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDrawMultiIndexedEXT-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- VUID-vkCmdDrawMultiIndexedEXT-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- VUID-vkCmdDrawMultiIndexedEXT-None-02705
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDrawMultiIndexedEXT-None-02706
  If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawMultiIndexedEXT-None-02707
  If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the image view’s format

- **VUID-vkCmdDrawMultiIndexedEXT-OpImageWrite-04469**

  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the buffer view’s format

- **VUID-vkCmdDrawMultiIndexedEXT-SampledType-04470**

  If a `VkImageView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the **SampledType** of the `OpTypeImage` operand of that instruction **must** have a **Width** of 64

- **VUID-vkCmdDrawMultiIndexedEXT-SampledType-04471**

  If a `VkBufferView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the **SampledType** of the `OpTypeImage` operand of that instruction **must** have a **Width** of 32

- **VUID-vkCmdDrawMulti IndexedEXT-SampledType-04472**

  If a `VkImageView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the **SampledType** of the `OpTypeImage` operand of that instruction **must** have a **Width** of 64

- **VUID-vkCmdDrawMulti IndexedEXT-SampledType-04473**

  If a `VkBufferView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the **SampledType** of the `OpTypeImage` operand of that instruction **must** have a **Width** of 32

- **VUID-vkCmdDrawMultiIndexedEXT-sparseImageInt64Atomics-04474**

  If the **sparseImageInt64Atomics** feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a **SampledType** with a **Width** of 64 by this command

- **VUID-vkCmdDrawMultiIndexedEXT-sparseImageInt64Atomics-04475**

  If the **sparseImageInt64Atomics** feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a **SampledType** with a **Width** of 64 by this command

- **VUID-vkCmdDrawMultiIndexedEXT-renderPass-02684**

  The current render pass **must** be compatible with the **renderPass** member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDrawMultiIndexedEXT-subpass-02685**

  The subpass index of the current render pass **must** be equal to the **subpass** member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDrawMultiIndexedEXT-None-02686**

  Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set

- **VUID-vkCmdDrawMultiIndexedEXT-None-04584**

  Image subresources used as attachments in the current render pass **must** not be accessed
in any way other than as an attachment by this command, except for cases involving read-only access to depth/stencil attachments as described in the Render Pass chapter

- **VUID-vkCmdDrawMultiIndexedEXT-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- **VUID-vkCmdDrawMultiIndexedEXT-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- **VUID-vkCmdDrawMultiIndexedEXT-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` dynamic state enabled, then `vkCmdSetViewportWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- **VUID-vkCmdDrawMultiIndexedEXT-scissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, then `vkCmdSetScissorWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT` **must** match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- **VUID-vkCmdDrawMultiIndexedEXT-viewportCount-03419**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic states enabled then both `vkCmdSetViewportWithCountEXT` and `vkCmdSetScissorWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT`

- **VUID-vkCmdDrawMultiIndexedEXT-viewportCount-04137**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline **must** have been created with `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawMultiIndexedEXT-viewportCount-04138**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV`
dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawMultiIndexedEXT-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV`::`viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawMultiIndexedEXT-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawMultiIndexedEXT-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportSwizzleStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV`::`viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawMultiIndexedEXT-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV`::`exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawMultiIndexedEXT-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo`::`topology` state.

- **VUID-vkCmdDrawMultiIndexedEXT-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled then `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMultiIndexedEXT-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMultiIndexedEXT-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command, and the `logicOp` must be a valid `VkLogicOp` value.

- **VUID-vkCmdDrawMultiIndexedEXT-None-04879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMultiIndexedEXT-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1.

- **VUID-vkCmdDrawMultiIndexedEXT-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawMultiIndexedEXT-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the
If the bound graphics pipeline state was created with the

\texttt{VK_DYNAMIC\_STATE\_VERTEX\_INPUT\_EXT} dynamic state enabled, then \texttt{vkCmdSetVertexInputEXT} must have been called in the current command buffer prior to this draw command.

- \textbf{VUID-vkCmdDrawMultiIndexedEXT-None-04914}
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC\_STATE\_VERTEX\_INPUT\_EXT} dynamic state enabled, then \texttt{vkCmdSetVertexInputEXT} must have been called in the current command buffer prior to this draw command.

- \textbf{VUID-vkCmdDrawMultiIndexedEXT-None-04907}
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or \texttt{VK\_NULL\_HANDLE} buffers bound.

- \textbf{VUID-vkCmdDrawMultiIndexedEXT-None-04908}
  If the \texttt{nullDescriptor} feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be \texttt{VK\_NULL\_HANDLE}.

- \textbf{VUID-vkCmdDrawMultiIndexedEXT-None-02721}
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in \texttt{Vertex Input Description}.

- \textbf{VUID-vkCmdDrawMultiIndexedEXT-None-04937}
  The \texttt{multiDraw} feature must be enabled.

- \textbf{VUID-vkCmdDrawMultiIndexedEXT-firstIndex-04938}
  \((\text{indexSize} \times (\text{firstIndex} + \text{indexCount}) + \text{offset})\) must be less than or equal to the size of the bound index buffer, with \text{indexSize} being based on the type specified by \text{indexType}, where the index buffer, \text{indexType}, and \text{offset} are specified via \texttt{vkCmdBindIndexBuffer}.

- \textbf{VUID-vkCmdDrawMultiIndexedEXT-drawCount-04939}
  \text{drawCount} must be less than \texttt{VkPhysicalDeviceMultiDrawPropertiesEXT::maxMultiDrawCount}.

- \textbf{VUID-vkCmdDrawMultiIndexedEXT-drawCount-04940}
  If \text{drawCount} is greater than zero, \text{pIndexInfo} must be a valid pointer to memory containing one or more valid instances of \texttt{VkMultiDrawIndexedInfoEXT} structures.

- \textbf{VUID-vkCmdDrawMultiIndexedEXT-stride-04941}
  \text{stride} must be a multiple of 4.
Valid Usage (Implicit)

- VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDrawMultiIndexedEXT-pVertexOffset-parameter
  If pVertexOffset is not NULL, pVertexOffset must be a valid pointer to a valid int32_t value

- VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdDrawMultiIndexedEXT-renderpass
  This command must only be called inside of a render pass instance

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkMultiDrawInfoEXT structure is defined as:

```c
// Provided by VK_EXT_multi_draw
typedef struct VkMultiDrawInfoEXT {
    uint32_t firstVertex;
    uint32_t vertexCount;
} VkMultiDrawInfoEXT;
```

- firstVertex is the first vertex to draw.
- vertexCount is the number of vertices to draw.

The members of VkMultiDrawInfoEXT have the same meaning as the firstVertex and vertexCount parameters in vkCmdDraw.

The VkMultiDrawIndexedInfoEXT structure is defined as:
typedef struct VkMultiDrawIndexedInfoEXT {
    uint32_t firstIndex;
    uint32_t indexCount;
    int32_t vertexOffset;
} VkMultiDrawIndexedInfoEXT;

- `firstIndex` is the first index to draw.
- `indexCount` is the number of vertices to draw.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer for indexed multidraws.

The `firstIndex`, `indexCount`, and `vertexOffset` members of `VkMultiDrawIndexedInfoEXT` have the same meaning as the `firstIndex`, `indexCount`, and `vertexOffset` parameters, respectively, of `vkCmdDrawIndexed`.

To record a non-indexed indirect drawing command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndirect(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command is recorded.
    VkBuffer buffer,                // buffer is the buffer containing draw parameters.
    VkDeviceSize offset,            // offset is the byte offset into buffer where parameters begin.
    uint32_t drawCount,             // drawCount is the number of draws to execute, and can be zero.
    uint32_t stride);               // stride is the byte stride between successive sets of draw parameters.
```

`vkCmdDrawIndirect` behaves similarly to `vkCmdDraw` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndirectCommand` structures. If `drawCount` is less than or equal to one, `stride` is ignored.
Valid Usage

- **VUID-vkCmdDrawIndirect-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndirect-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndirect-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDrawIndirect-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdDrawIndirect-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndirect-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndirect-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdDrawIndirect-None-02697**
  For each set $n$ that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set $n$, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDrawIndirect-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.
Compatibility

- **VUID-vkCmdDrawIndirect-None-02699**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndirect-None-02700**
  A valid pipeline **must** be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndirect-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- **VUID-vkCmdDrawIndirect-None-02859**
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDrawIndirect-None-02702**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDrawIndirect-None-02703**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDrawIndirect-None-02704**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDrawIndirect-None-02705**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndirect-None-02706**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndirect-None-04115**
If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the image view’s format

- **VUID-vkCmdDrawIndirect-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the buffer view’s format

- **VUID-vkCmdDrawIndirect-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction **must** have a **Width** of 64

- **VUID-vkCmdDrawIndirect-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction **must** have a **Width** of 32

- **VUID-vkCmdDrawIndirect-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction **must** have a **Width** of 64

- **VUID-vkCmdDrawIndirect-SampledType-04473**
  If a `VkBufferView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction **must** have a **Width** of 32

- **VUID-vkCmdDrawIndirect-sparseImageInt64Atomics-04474**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a SampledType with a **Width** of 64 by this command

- **VUID-vkCmdDrawIndirect-sparseImageInt64Atomics-04475**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a SampledType with a **Width** of 64 by this command

- **VUID-vkCmdDrawIndirect-renderPass-02684**
  The current render pass **must** be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDrawIndirect-subpass-02685**
  The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDrawIndirect-None-02686**
  Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set

- **VUID-vkCmdDrawIndirect-None-04584**
  Image subresources used as attachments in the current render pass **must** not be accessed
in any way other than as an attachment by this command, except for cases involving read-only access to depth/stencil attachments as described in the Render Pass chapter

- **VUID-vkCmdDrawIndirect-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties ::maxMultiviewInstanceIndex

- **VUID-vkCmdDrawIndirect-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT ::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- **VUID-vkCmdDrawIndirect-viewportCount-03417**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the VkPipelineViewportStateCreateInfo ::viewportCount of the pipeline

- **VUID-vkCmdDrawIndirect-scissorCount-03418**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT must match the VkPipelineViewportStateCreateInfo ::viewportCount of the pipeline

- **VUID-vkCmdDrawIndirect-viewportCount-03419**
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the scissorCount parameter of vkCmdSetScissorWithCountEXT

- **VUID-vkCmdDrawIndirect-viewportCount-04137**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV ::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- **VUID-vkCmdDrawIndirect-viewportCount-04138**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- VUID-vkCmdDrawIndirect-viewportCount-04139

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- VUID-vkCmdDrawIndirect-viewportCount-04140

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportSwizzleStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- VUID-vkCmdDrawIndirect-VkPipelineVieportCreateInfo-04141

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- VUID-vkCmdDrawIndirect-VkPipelineVieportCreateInfo-04142

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled and an instance of `VkPipelineInputAssemblyStateCreateInfo::topology` state.

- VUID-vkCmdDrawIndirect-primitiveTopology-03420

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirect-None-04875

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirect-None-04876
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled then `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawIndirect-None-04877**  
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawIndirect-logicOp-04878**  
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value

• **VUID-vkCmdDrawIndirect-None-04879**  
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawIndirect-primitiveFragmentShadingRateWithMultipleViewports-04552**  
If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1

• **VUID-vkCmdDrawIndirect-blendEnable-04727**  
If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`

• **VUID-vkCmdDrawIndirect-rasterizationSamples-04740**  
If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments

• **VUID-vkCmdDrawIndirect-None-04912**  
If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

• **VUID-vkCmdDrawIndirect-pStrides-04913**  
If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the
**VK_DYNAMIC_STATE_VERTEX_INPUT_EXT** dynamic state enabled, then *vkCmdBindVertexBuffers2EXT* must have been called in the current command buffer prior to this draw command, and the *pStrides* parameter of *vkCmdBindVertexBuffers2EXT* must not be NULL

- **VUID-vkCmdDrawIndirect-None-04914**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VERTEX_INPUT_EXT** dynamic state enabled, then *vkCmdSetVertexInputEXT* must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawIndirect-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must have either valid or **VK_NULL_HANDLE** buffers bound

- **VUID-vkCmdDrawIndirect-None-04008**
  If the *nullDescriptor* feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be **VK_NULL_HANDLE**

- **VUID-vkCmdDrawIndirect-None-02721**
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in **Vertex Input Description**

- **VUID-vkCmdDrawIndirect-buffer-02708**
  If *buffer* is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdDrawIndirect-buffer-02709**
  *buffer* must have been created with the **VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT** bit set

- **VUID-vkCmdDrawIndirect-offset-02710**
  *offset* must be a multiple of 4

- **VUID-vkCmdDrawIndirect-drawCount-02718**
  If the *multi-draw indirect* feature is not enabled, *drawCount* must be 0 or 1

- **VUID-vkCmdDrawIndirect-drawCount-02719**
  *drawCount* must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

- **VUID-vkCmdDrawIndirect-firstInstance-00478**
  If the *drawIndirectFirstInstance* feature is not enabled, all the *firstInstance* members of the *VkDrawIndirectCommand* structures accessed by this command must be 0

- **VUID-vkCmdDrawIndirect-drawCount-00476**
  If *drawCount* is equal to 1, *(offset + size*(VkDrawIndirectCommand)) must be less than or equal to the size of *buffer*

- **VUID-vkCmdDrawIndirect-drawCount-00487**
  If *drawCount* is greater than 1, *(stride × (drawCount - 1) + offset + size*(VkDrawIndirectCommand)) must be less than or equal to the size of *buffer*
Valid Usage (Implicit)

- **VUID-vkCmdDrawIndirect-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdDrawIndirect-buffer-parameter**
  
  `buffer` must be a valid `VkBuffer` handle.

- **VUID-vkCmdDrawIndirect-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdDrawIndirect-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdDrawIndirect-renderpass**
  
  This command must only be called inside of a render pass instance.

- **VUID-vkCmdDrawIndirect-commonparent**
  
  Both of `buffer`, and `commandBuffer` must have been created, allocated, or retrieved from the same `VkDevice`.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Graphics</td>

The `VkDrawIndirectCommand` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndirectCommand {
    uint32_t vertexCount;
    uint32_t instanceCount;
    uint32_t firstVertex;
    uint32_t firstInstance;
} VkDrawIndirectCommand;
```

- `vertexCount` is the number of vertices to draw.
• `instanceCount` is the number of instances to draw.
• `firstVertex` is the index of the first vertex to draw.
• `firstInstance` is the instance ID of the first instance to draw.

The members of `VkDrawIndirectCommand` have the same meaning as the similarly named parameters of `vkCmdDraw`.

### Valid Usage

- VUID-VkDrawIndirectCommand-None-00500
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in `Vertex Input Description`.

- VUID-VkDrawIndirectCommand-firstInstance-00501
  If the `drawIndirectFirstInstance` feature is not enabled, `firstInstance` must be 0.

To record a non-indexed draw call with a draw call count sourced from a buffer, call:

```c
// Provided by VK_KHR_draw_indirect_count
void vkCmdDrawIndirectCountKHR(
  VkCommandBuffer commandBuffer,  
  VkBuffer buffer,  
  VkDeviceSize offset,  
  VkBuffer countBuffer,  
  VkDeviceSize countBufferOffset,  
  uint32_t maxDrawCount,  
  uint32_t stride);
```

or the equivalent command:

```c
// Provided by VK_AMD_draw_indirect_count
void vkCmdDrawIndirectCountAMD(
  VkCommandBuffer commandBuffer,  
  VkBuffer buffer,  
  VkDeviceSize offset,  
  VkBuffer countBuffer,  
  VkDeviceSize countBufferOffset,  
  uint32_t maxDrawCount,  
  uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `countBuffer` is the buffer containing the draw count.
- `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
• **maxDrawCount** specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.

• **stride** is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirectCount` behaves similarly to `vkCmdDrawIndirect` except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.
Valid Usage

- **VUID-vkCmdDrawIndirectCount-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndirectCount-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndirectCount-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDrawIndirectCount-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdDrawIndirectCount-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDrawIndirectCount-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDrawIndirectCount-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdDrawIndirectCount-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in `Pipeline Layout Compatibility`

- **VUID-vkCmdDrawIndirectCount-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in `Pipeline Layout Compatibility`
Compatibility

- **VUID-vkCmdDrawIndirectCount-None-02699**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command

- **VUID-vkCmdDrawIndirectCount-None-02700**
  A valid pipeline must be bound to the pipeline bind point used by this command

- **VUID-vkCmdDrawIndirectCount-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- **VUID-vkCmdDrawIndirectCount-None-02859**
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDrawIndirectCount-None-02702**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

- **VUID-vkCmdDrawIndirectCount-None-02703**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- **VUID-vkCmdDrawIndirectCount-None-02704**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDrawIndirectCount-None-02705**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirectCount-None-02706**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirectCount-None-04115**
If a \texttt{VkImageView} is accessed using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that instruction \textbf{must} have at least as many components as the image view's format

- \textbf{VUID-vkCmdDrawIndirectCount-OpImageWrite-04469}
  If a \texttt{VkBufferView} is accessed using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that instruction \textbf{must} have at least as many components as the buffer view's format

- \textbf{VUID-vkCmdDrawIndirectCount-SampledType-04470}
  If a \texttt{VkImageView} with a \texttt{VkFormat} that has a 64-bit channel width is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction \textbf{must} have a \texttt{Width} of 64

- \textbf{VUID-vkCmdDrawIndirectCount-SampledType-04471}
  If a \texttt{VkImageView} with a \texttt{VkFormat} that has a channel width less than 64-bit is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction \textbf{must} have a \texttt{Width} of 32

- \textbf{VUID-vkCmdDrawIndirectCount-SampledType-04472}
  If a \texttt{VkBufferView} with a \texttt{VkFormat} that has a 64-bit channel width is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction \textbf{must} have a \texttt{Width} of 64

- \textbf{VUID-vkCmdDrawIndirectCount-SampledType-04473}
  If a \texttt{VkBufferView} with a \texttt{VkFormat} that has a channel width less than 64-bit is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction \textbf{must} have a \texttt{Width} of 32

- \textbf{VUID-vkCmdDrawIndirectCount-sparseImageInt64Atomics-04474}
  If the \texttt{spareImageInt64Atomics} feature is not enabled, \texttt{VkImage} objects created with the \texttt{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT} flag \textbf{must} not be accessed by atomic instructions through an \texttt{OpTypeImage} with a \texttt{SampledType} with a \texttt{Width} of 64 by this command

- \textbf{VUID-vkCmdDrawIndirectCount-sparseImageInt64Atomics-04475}
  If the \texttt{spareImageInt64Atomics} feature is not enabled, \texttt{VkBuffer} objects created with the \texttt{VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT} flag \textbf{must} not be accessed by atomic instructions through an \texttt{OpTypeImage} with a \texttt{SampledType} with a \texttt{Width} of 64 by this command

- \textbf{VUID-vkCmdDrawIndirectCount-renderPass-02684}
  The current render pass \textbf{must} be \texttt{compatible} with the \texttt{renderPass} member of the \texttt{VkGraphicsPipelineCreateInfo} structure specified when creating the \texttt{VkPipeline} bound to \texttt{VK_PIPELINE_BIND_POINT_GRAPHICS}

- \textbf{VUID-vkCmdDrawIndirectCount-subpass-02685}
  The subpass index of the current render pass \textbf{must} be equal to the \texttt{subpass} member of the \texttt{VkGraphicsPipelineCreateInfo} structure specified when creating the \texttt{VkPipeline} bound to \texttt{VK_PIPELINE_BIND_POINT_GRAPHICS}

- \textbf{VUID-vkCmdDrawIndirectCount-None-02686}
  Every input attachment used by the current subpass \textbf{must} be bound to the pipeline via a descriptor set

- \textbf{VUID-vkCmdDrawIndirectCount-None-04584}
  Image subresources used as attachments in the current render pass \textbf{must} not be accessed
in any way other than as an attachment by this command, except for cases involving read-only access to depth/stencil attachments as described in the Render Pass chapter

- **VUID-vkCmdDrawIndirectCount-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- **VUID-vkCmdDrawIndirectCount-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- **VUID-vkCmdDrawIndirectCount-viewportCount-03417**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- **VUID-vkCmdDrawIndirectCount-scissorCount-03418**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- **VUID-vkCmdDrawIndirectCount-viewportCount-03419**
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the scissorCount parameter of vkCmdSetScissorWithCountEXT

- **VUID-vkCmdDrawIndirectCount-viewportCount-04137**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- **VUID-vkCmdDrawIndirectCount-viewportCount-04138**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV
dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawIndirectCount-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndirectCount-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndirectCount-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportSwizzleStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndirectCount-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndirectCount-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

- **VUID-vkCmdDrawIndirectCount-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled then `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

- **VUID-vkCmdDrawIndirectCount-None-04879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1.

- **VUID-vkCmdDrawIndirectCount-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

- **VUID-vkCmdDrawIndirectCount-rasterizationSamples-04740**
  If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDrawIndirectCount-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawIndirectCount-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the
**VK_DYNAMIC_STATE_VERTEX_INPUT_EXT** dynamic state enabled, then **vkCmdBindVertexBuffers2EXT** must have been called in the current command buffer prior to this draw command, and the **pStrides** parameter of **vkCmdBindVertexBuffers2EXT** must not be **NULL**

- **VUID-vkCmdDrawIndirectCount-None-04914**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VERTEX_INPUT_EXT** dynamic state enabled, then **vkCmdSetVertexInputEXT** must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawIndirectCount-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or **VK_NULL_HANDLE** buffers bound

- **VUID-vkCmdDrawIndirectCount-None-04008**
  If the **nullDescriptor** feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be **VK_NULL_HANDLE**

- **VUID-vkCmdDrawIndirectCount-None-02721**
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in **Vertex Input Description**

- **VUID-vkCmdDrawIndirectCount-buffer-02708**
  If **buffer** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-vkCmdDrawIndirectCount-buffer-02709**
  **buffer** must have been created with the **VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT** bit set

- **VUID-vkCmdDrawIndirectCount-offset-02710**
  **offset** must be a multiple of 4

- **VUID-vkCmdDrawIndirectCount-countBuffer-02714**
  If **countBuffer** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-vkCmdDrawIndirectCount-countBuffer-02715**
  **countBuffer** must have been created with the **VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT** bit set

- **VUID-vkCmdDrawIndirectCount-countBufferOffset-02716**
  **countBufferOffset** must be a multiple of 4

- **VUID-vkCmdDrawIndirectCount-countBuffer-02717**
  The count stored in **countBuffer** must be less than or equal to **VkPhysicalDeviceLimits::maxDrawIndirectCount**

- **VUID-vkCmdDrawIndirectCount-countBufferOffset-04129**
  
  \[(**countBufferOffset** + sizeof(uint32_t))\] must be less than or equal to the size of **countBuffer**

- **VUID-vkCmdDrawIndirectCount-stride-03110**
  **stride** must be a multiple of 4 and must be greater than or equal to **sizeof(VkDrawIndirectCommand)**

---

Chapter 21. Drawing Commands | 1359
If `maxDrawCount` is greater than or equal to 1, \((\text{stride} \times (\text{maxDrawCount} - 1) + \text{offset}) + \text{sizeof(VkDrawIndirectCommand)})\) must be less than or equal to the size of `buffer`.

If the count stored in `countBuffer` is equal to 1, \((\text{offset} + \text{sizeof(VkDrawIndirectCommand)})\) must be less than or equal to the size of `buffer`.

If the count stored in `countBuffer` is greater than 1, \((\text{stride} \times (\text{drawCount} - 1) + \text{offset} + \text{sizeof(VkDrawIndirectCommand)})\) must be less than or equal to the size of `buffer`.

### Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `buffer` must be a valid `VkBuffer` handle.
- `countBuffer` must be a valid `VkBuffer` handle.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
- This command must only be called inside of a render pass instance.
- Each of `buffer, commandBuffer, and countBuffer` must have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.
To record an indexed indirect drawing command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexedIndirect(
    VkCommandBuffer commandBuffer,  // Provided by VK_VERSION_1_0
    VkBuffer buffer,               // Provided by VK_VERSION_1_0
    VkDeviceSize offset,           // Provided by VK_VERSION_1_0
    uint32_t drawCount,            // Provided by VK_VERSION_1_0
    uint32_t stride);             // Provided by VK_VERSION_1_0
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and can be zero.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndexedIndirect` behaves similarly to `vkCmdDrawIndexed` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndexedIndirectCommand` structures. If `drawCount` is less than or equal to one, `stride` is ignored.
Valid Usage

- **VUID-vkCmdDrawIndexedIndirect-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndexedIndirect-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndexedIndirect-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDrawIndexedIndirect-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdDrawIndexedIndirect-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDrawIndexedIndirect-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDrawIndexedIndirect-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdDrawIndexedIndirect-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDrawIndexedIndirect-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility
Compatibility

• VUID-vkCmdDrawIndexedIndirect-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command

• VUID-vkCmdDrawIndexedIndirect-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command

• VUID-vkCmdDrawIndexedIndirect-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

• VUID-vkCmdDrawIndexedIndirect-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

• VUID-vkCmdDrawIndexedIndirect-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

• VUID-vkCmdDrawIndexedIndirect-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

• VUID-vkCmdDrawIndexedIndirect-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

• VUID-vkCmdDrawIndexedIndirect-None-02705
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDrawIndexedIndirect-None-02706
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDrawIndexedIndirect-None-04115
If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format

- VUID-vkCmdDrawIndexedIndirect-OpImageWrite-04469
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format

- VUID-vkCmdDrawIndexedIndirect-SampledType-04470
  If a `VkImageView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 64

- VUID-vkCmdDrawIndexedIndirect-IndexedSampledType-04471
  If a `VkImageView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 32

- VUID-vkCmdDrawIndexedIndirect-SampledType-04472
  If a `VkBufferView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 64

- VUID-vkCmdDrawIndexedIndirect-IndexedSampledType-04473
  If a `VkBufferView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 32

- VUID-vkCmdDrawIndexedIndirect-sparseImageInt64Atomics-04474
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a Width of 64 by this command

- VUID-vkCmdDrawIndexedIndirect-sparseImageInt64Atomics-04475
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a Width of 64 by this command

- VUID-vkCmdDrawIndexedIndirect-renderPass-02684
  The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdDrawIndexedIndirect-subpass-02685
  The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdDrawIndexedIndirect-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set

- VUID-vkCmdDrawIndexedIndirect-None-04584
  Image subresources used as attachments in the current render pass must not be accessed
in any way other than as an attachment by this command, except for cases involving read-only access to depth/stencil attachments as described in the Render Pass chapter.

- **VUID-vkCmdDrawIndexedIndirect-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- **VUID-vkCmdDrawIndexedIndirect-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-03417**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- **VUID-vkCmdDrawIndexedIndirect-scissorCount-03418**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-03419**
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the scissorCount parameter of vkCmdSetScissorWithCountEXT

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-04137**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-04138**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV
dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndexedIndirect-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportSwizzleStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndexedIndirect-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndexedIndirect-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled then `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-None-04877**

  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-logicOp-04878**

  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value

- **VUID-vkCmdDrawIndexedIndirect-None-04879**

  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-primitiveFragmentShadingRateWithMultipleViewports-04552**

  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1

- **VUID-vkCmdDrawIndexedIndirect-blendEnable-04727**

  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`

- **VUID-vkCmdDrawIndexedIndirect-rasterizationSamples-04740**

  If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments

- **VUID-vkCmdDrawIndexedIndirect-None-04912**

  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawIndexedIndirect-pStrides-04913**

  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the
If the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state is enabled, then
*vkCmdBindVertexBuffers2EXT* must have been called in the current command buffer
prior to this draw command, and the `pStrides` parameter of
*vkCmdBindVertexBuffers2EXT* must not be `NULL`.

- **VUID-vkCmdDrawIndexedIndirect-None-04914**
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then
  *vkCmdSetVertexInputEXT* must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawIndexedIndirect-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound.

- **VUID-vkCmdDrawIndexedIndirect-None-04008**
  If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be VK_NULL_HANDLE.

- **VUID-vkCmdDrawIndexedIndirect-None-02721**
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

- **VUID-vkCmdDrawIndexedIndirect-buffer-02708**
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- **VUID-vkCmdDrawIndexedIndirect-buffer-02709**
  `buffer` must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set.

- **VUID-vkCmdDrawIndexedIndirect-offset-02710**
  `offset` must be a multiple of 4.

- **VUID-vkCmdDrawIndexedIndirect-drawCount-02718**
  If the multi-draw indirect feature is not enabled, `drawCount` must be 0 or 1.

- **VUID-vkCmdDrawIndexedIndirect-drawCount-02719**
  `drawCount` must be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`.

- **VUID-vkCmdDrawIndexedIndirect-drawCount-00528**
  If `drawCount` is equal to 1, `(offset + sizeof(VkDrawIndexedIndirectCommand))` must be less than or equal to the size of `buffer`.

- **VUID-vkCmdDrawIndexedIndirect-drawCount-00539**
  If `drawCount` is greater than 1, 
  \[
  \text{stride} \times (\text{drawCount} - 1) + \text{offset} + \text{sizeof(VkDrawIndexedIndirectCommand)}/2
  \]
  must be less than or equal to the size of `buffer`.

- **VUID-vkCmdDrawIndexedIndirect-firstInstance-00530**
  If the drawIndirectFirstInstance feature is not enabled, all the `firstInstance` members of the VkDrawIndexedIndirectCommand structures accessed by this command must be 0.

- **VUID-vkCmdDrawIndexedIndirect-drawCount-02720**
  If `drawCount` is equal to 1, `(offset + sizeof(VkDrawIndexedIndirectCommand))` must be less than or equal to the size of `buffer`.

- **VUID-vkCmdDrawIndexedIndirect-drawCount-00540**
  If `drawCount` is greater than 1, 
  \[
  \text{stride} \times (\text{drawCount} - 1) + \text{offset} + \text{sizeof(VkDrawIndexedIndirectCommand)}/2
  \]
  must be less than or equal to the size of `buffer`.
Valid Usage (Implicit)

- VUID-vkCmdDrawIndexedIndirect-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdDrawIndexedIndirect-buffer-parameter
  
  `buffer` must be a valid `VkBuffer` handle

- VUID-vkCmdDrawIndexedIndirect-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdDrawIndexedIndirect-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdDrawIndexedIndirect-renderpass
  
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawIndexedIndirect-commonparent
  
  Both of `buffer`, and `commandBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

The `VkDrawIndexedIndirectCommand` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndexedIndirectCommand {
    uint32_t indexCount;
    uint32_t instanceCount;
    uint32_t firstIndex;
    int32_t vertexOffset;
    uint32_t firstInstance;
} VkDrawIndexedIndirectCommand;
```

- `indexCount` is the number of vertices to draw.
• **instanceCount** is the number of instances to draw.
• **firstIndex** is the base index within the index buffer.
• **vertexOffset** is the value added to the vertex index before indexing into the vertex buffer.
• **firstInstance** is the instance ID of the first instance to draw.

The members of **VkDrawIndexedIndirectCommand** have the same meaning as the similarly named parameters of **vkCmdDrawIndexed**.

### Valid Usage

- **VUID-VkDrawIndexedIndirectCommand-None-00552**
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in **Vertex Input Description**

- **VUID-VkDrawIndexedIndirectCommand-indexSize-00553**
  \((\text{indexSize} \times (\text{firstIndex} + \text{indexCount}) + \text{offset})\) must be less than or equal to the size of the bound index buffer, with **indexSize** being based on the type specified by **indexType**, where the index buffer, **indexType**, and **offset** are specified via **vkCmdBindIndexBuffer**

- **VUID-VkDrawIndexedIndirectCommand-firstInstance-00554**
  If the **drawIndirectFirstInstance** feature is not enabled, **firstInstance** must be 0

To record an indexed draw call with a draw call count sourced from a buffer, call:

```c
// Provided by VK_KHR_draw_indirect_count
void vkCmdDrawIndexedIndirectCountKHR(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

or the equivalent command

```c
// Provided by VK_AMD_draw_indirect_count
void vkCmdDrawIndexedIndirectCountAMD(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```
• **commandBuffer** is the command buffer into which the command is recorded.

• **buffer** is the buffer containing draw parameters.

• **offset** is the byte offset into **buffer** where parameters begin.

• **countBuffer** is the buffer containing the draw count.

• **countBufferOffset** is the byte offset into **countBuffer** where the draw count begins.

• **maxDrawCount** specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in **countBuffer** and **maxDrawCount**.

• **stride** is the byte stride between successive sets of draw parameters.

**vkCmdDrawIndexedIndirectCount** behaves similarly to **vkCmdDrawIndexedIndirect** except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from **countBuffer** located at **countBufferOffset** and use this as the draw count.
Valid Usage

- VUID-vkCmdDrawIndexedIndirectCount-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDrawIndexedIndirectCount-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDrawIndexedIndirectCount-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdDrawIndexedIndirectCount-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-vkCmdDrawIndexedIndirectCount-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawIndexedIndirectCount-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawIndexedIndirectCount-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- VUID-vkCmdDrawIndexedIndirectCount-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexedIndirectCount-None-02698
  For each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout
Compatibility

- **VUID-vkCmdDrawIndexedIndirectCount-None-02699**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-02700**
  A valid pipeline must be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- **VUID-vkCmdDrawIndexedIndirectCount-None-02859**
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDrawIndexedIndirectCount-None-02702**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDrawIndexedIndirectCount-None-02703**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDrawIndexedIndirectCount-None-02704**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDrawIndexedIndirectCount-None-02705**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexedIndirectCount-None-02706**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexedIndirectCount-None-04115**

Chapter 21. Drawing Commands | 1373
If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

- VUID-vkCmdDrawIndexedIndirectCount-OpImageWrite-04469

If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04470

If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04471

If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04472

If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04473

If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDrawIndexedIndirectCount-sparseImageInt64Atomics-04474

If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDrawIndexedIndirectCount-sparseImageInt64Atomics-04475

If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDrawIndexedIndirectCount-renderPass-02684

  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdDrawIndexedIndirectCount-subpass-02685

  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdDrawIndexedIndirectCount-None-02686

  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

- VUID-vkCmdDrawIndexedIndirectCount-None-04584

  Image subresources used as attachments in the current render pass must not be accessed.
in any way other than as an attachment by this command, except for cases involving read-only access to depth/stencil attachments as described in the Render Pass chapter

- **VUID-vkCmdDrawIndexedIndirectCount-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- **VUID-vkCmdDrawIndexedIndirectCount-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- **VUID-vkCmdDrawIndexedIndirectCount-viewportCount-03417**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT **must** have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT **must** match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- **VUID-vkCmdDrawIndexedIndirectCount-scissorCount-03418**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT **must** have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT **must** match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- **VUID-vkCmdDrawIndexedIndirectCount-viewportCount-03419**
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT **must** have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT **must** match the scissorCount parameter of vkCmdSetScissorWithCountEXT

- **VUID-vkCmdDrawIndexedIndirectCount-viewportCount-04137**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline **must** have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- **VUID-vkCmdDrawIndexedIndirectCount-viewportCount-04138**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV
dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawIndexedIndirectCount-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawIndexedIndirectCount-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawIndexedIndirectCount-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportSwizzleStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawIndexedIndirectCount-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawIndexedIndirectCount-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state

- **VUID-vkCmdDrawIndexedIndirectCount-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-04876**
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled then `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value

- **VUID-vkCmdDrawIndexedIndirectCount-None-04879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1

- **VUID-vkCmdDrawIndexedIndirectCount-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`

- **VUID-vkCmdDrawIndexedIndirectCount-rasterizationSamples-04740**
  If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments

- **VUID-vkCmdDrawIndexedIndirectCount-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawIndexedIndirectCount-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be `VK_NULL_HANDLE`.

For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

If `countBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

The count stored in `countBuffer` must be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`.

`countBufferOffset` must be a multiple of 4.

`(countBufferOffset + sizeof(uint32_t))` must be less than or equal to the size of `countBuffer`.

`stride` must be a multiple of 4 and must be greater than or equal to `sizeof(VkDrawIndexedIndirectCommand)`.
If `maxDrawCount` is greater than or equal to 1, 
\[(\text{stride} \times (\text{maxDrawCount} - 1) + \text{offset} + \text{sizeof(VkDrawIndexedIndirectCommand}))\] must be less than or equal to the size of `buffer`.

If count stored in `countBuffer` is equal to 1, 
\[(\text{offset} + \text{sizeof(VkDrawIndexedIndirectCommand)})\] must be less than or equal to the size of `buffer`.

If count stored in `countBuffer` is greater than 1, 
\[(\text{stride} \times (\text{drawCount} - 1) + \text{offset} + \text{sizeof(VkDrawIndexedIndirectCommand}))\] must be less than or equal to the size of `buffer`.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `buffer` must be a valid `VkBuffer` handle.
- `countBuffer` must be a valid `VkBuffer` handle.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
- This command must only be called inside of a render pass instance.
- Each of `buffer`, `commandBuffer`, and `countBuffer` must have been created, allocated, or retrieved from the same `VkDevice`.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.
21.3.1. Drawing Transform Feedback

It is possible to draw vertex data that was previously captured during active transform feedback by binding one or more of the transform feedback buffers as vertex buffers. A pipeline barrier is required between using the buffers as transform feedback buffers and vertex buffers to ensure all writes to the transform feedback buffers are visible when the data is read as vertex attributes. The source access is `VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT` and the destination access is `VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT` for the pipeline stages `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` and `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` respectively. The value written to the counter buffer by `vkCmdEndTransformFeedbackEXT` can be used to determine the vertex count for the draw. A pipeline barrier is required between using the counter buffer for `vkCmdEndTransformFeedbackEXT` and `vkCmdDrawIndirectByteCountEXT` where the source access is `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT` and the destination access is `VK_ACCESS_INDIRECT_COMMAND_READ_BIT` for the pipeline stages `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` and `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT` respectively.

To record a non-indexed draw call, where the vertex count is based on a byte count read from a buffer and the passed in vertex stride parameter, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdDrawIndirectByteCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t instanceCount,
    uint32_t firstInstance,
    VkBuffer counterBuffer,
    VkDeviceSize counterBufferOffset,
    uint32_t counterOffset,
    uint32_t vertexStride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `instanceCount` is the number of instances to draw.
- `firstInstance` is the instance ID of the first instance to draw.
- `counterBuffer` is the buffer handle from where the byte count is read.
- `counterBufferOffset` is the offset into the buffer used to read the byte count, which is used to calculate the vertex count for this draw call.
- `counterOffset` is subtracted from the byte count read from the `counterBuffer` at the `counterBufferOffset`
• **vertexStride** is the stride in bytes between each element of the vertex data that is used to calculate the vertex count from the counter value. This value is typically the same value that was used in the graphics pipeline state when the transform feedback was captured as the XfbStride.

When the command is executed, primitives are assembled in the same way as done with **vkCmdDraw** except the **vertexCount** is calculated based on the byte count read from **counterBuffer** at offset **counterBufferOffset**. The assembled primitives execute the bound graphics pipeline.

The effective **vertexCount** is calculated as follows:

```c
const uint32_t * counterBufferPtr = (const uint8_t *)counterBuffer.address + counterBufferOffset;
vertexCount = floor(max(0, (*counterBufferPtr - counterOffset)) / vertexStride);
```

The effective **firstVertex** is zero.
Valid Usage

- **VUID-vkCmdDrawIndirectByteCountEXT-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndirectByteCountEXT-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdDrawIndirectByteCountEXT-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndirectByteCountEXT-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndirectByteCountEXT-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.
Compatibility

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02699**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02700**
  A valid pipeline must be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02859**
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02702**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02703**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02704**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02705**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02706**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view’s format

- **VUID-vkCmdDrawIndirectByteCountEXT-OpImageWrite-04469**

  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view’s format

- **VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04470**

  If a `VkImageView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- **VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04471**

  If a `VkImageView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- **VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04472**

  If a `VkBufferView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- **VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04473**

  If a `VkBufferView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- **VUID-vkCmdDrawIndirectByteCountEXT-sparseImageInt64Atomics-04474**

  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- **VUID-vkCmdDrawIndirectByteCountEXT-sparseImageInt64Atomics-04475**

  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- **VUID-vkCmdDrawIndirectByteCountEXT-renderPass-02684**

  The current render pass **must** be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDrawIndirectByteCountEXT-subpass-02685**

  The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02686**

  Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set

- **VUID-vkCmdDrawIndirectByteCountEXT-None-04584**

  Image subresources used as attachments in the current render pass **must** not be accessed
in any way other than as an attachment by this command, except for cases involving read-only access to depth/stencil attachments as described in the Render Pass chapter

- VUID-vkCmdDrawIndirectByteCountEXT-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- VUID-vkCmdDrawIndirectByteCountEXT-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawIndirectByteCountEXT-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the viewportCount parameter of vkCmdSetScissorWithCountEXT

- VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-04138
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV
dynamic states enabled then the viewportCount parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the viewportCount parameter in the last call to `vkCmdSetViewportWithCountEXT`

- VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-04139
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the viewportCount parameter in the last call to `vkCmdSetViewportWithCountEXT`

- VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-04140
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the viewportCount parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the viewportCount parameter in the last call to `vkCmdSetViewportWithCountEXT`

- VUID-vkCmdDrawIndirectByteCountEXT-VkPipelineViewportCreateInfo-04141
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportSwizzleStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the viewportCount parameter in the last call to `vkCmdSetViewportWithCountEXT`

- VUID-vkCmdDrawIndirectByteCountEXT-VkPipelineViewportCreateInfo-04142
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the viewportCount parameter in the last call to `vkCmdSetViewportWithCountEXT`

- VUID-vkCmdDrawIndirectByteCountEXT-primitiveTopology-03420
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state

- VUID-vkCmdDrawIndirectByteCountEXT-None-04875
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled then `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-04877
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-logicOp-04878
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

- VUID-vkCmdDrawIndirectByteCountEXT-None-04879
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1.

- VUID-vkCmdDrawIndirectByteCountEXT-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

- VUID-vkCmdDrawIndirectByteCountEXT-rasterizationSamples-04740
  If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

- VUID-vkCmdDrawIndirectByteCountEXT-None-04912
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

- VUID-vkCmdDrawIndirectByteCountEXT-pStrides-04913
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be `VK_NULL_HANDLE`.

For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

The implementation must support `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackDraw`.

If `counterBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

`counterBuffer` must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

`counterBufferOffset` must be a multiple of 4.
Valid Usage (Implicit)

- VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-parameter
  counterBuffer must be a valid VkBuffer handle
- VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdDrawIndirectByteCountEXT-renderpass
  This command must only be called inside of a render pass instance
- VUID-vkCmdDrawIndirectByteCountEXT-commonparent
  Both of commandBuffer, and counterBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

21.4. Conditional Rendering

Certain rendering commands can be executed conditionally based on a value in buffer memory. These rendering commands are limited to drawing commands, dispatching commands, and clearing attachments with vkCmdClearAttachments within a conditional rendering block which is defined by commands vkCmdBeginConditionalRenderingEXT and vkCmdEndConditionalRenderingEXT. Other rendering commands remain unaffected by conditional rendering.

After beginning conditional rendering, it is considered active within the command buffer it was called until it is ended with vkCmdEndConditionalRenderingEXT.
Conditional rendering **must** begin and end in the same command buffer. When conditional rendering is active, a primary command buffer **can** execute secondary command buffers if the inherited conditional rendering feature is enabled. For a secondary command buffer to be executed while conditional rendering is active in the primary command buffer, it **must** set the `conditionalRenderingEnable` flag of `VkCommandBufferInheritanceConditionalRenderingInfoEXT`, as described in the Command Buffer Recording section.

Conditional rendering **must** also either begin and end inside the same subpass of a render pass instance, or **must** both begin and end outside of a render pass instance (i.e. contain entire render pass instances).

To begin conditional rendering, call:

```c
// Provided by VK_EXT_conditional_rendering
void vkCmdBeginConditionalRenderingEXT(
    VkCommandBuffer commandBuffer,
    const VkConditionalRenderingBeginInfoEXT* pConditionalRenderingBegin);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `pConditionalRenderingBegin` is a pointer to a `VkConditionalRenderingBeginInfoEXT` structure specifying parameters of conditional rendering.

**Valid Usage**

- VUID-vkCmdBeginConditionalRenderingEXT-None-01980 Conditional rendering **must** not already be active

**Valid Usage (Implicit)**

- VUID-vkCmdBeginConditionalRenderingEXT-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBeginConditionalRenderingEXT-pConditionalRenderingBegin-parameter `pConditionalRenderingBegin` **must** be a valid pointer to a valid `VkConditionalRenderingBeginInfoEXT` structure
- VUID-vkCmdBeginConditionalRenderingEXT-commandBuffer-recording `commandBuffer` **must** be in the recording state
- VUID-vkCmdBeginConditionalRenderingEXT-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
</tr>
</tbody>
</table>

The `VkConditionalRenderingBeginInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_conditional_rendering
typedef struct VkConditionalRenderingBeginInfoEXT {
    VkStructureType sType;
    const void*   pNext;
    VkBuffer      buffer;
    VkDeviceSize  offset;
    VkConditionalRenderingFlagsEXT flags;
} VkConditionalRenderingBeginInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is a buffer containing the predicate for conditional rendering.
- `offset` is the byte offset into `buffer` where the predicate is located.
- `flags` is a bitmask of `VkConditionalRenderingFlagsEXT` specifying the behavior of conditional rendering.

If the 32-bit value at `offset` in `buffer` memory is zero, then the rendering commands are discarded, otherwise they are executed as normal. If the value of the predicate in buffer memory changes while conditional rendering is active, the rendering commands may be discarded in an implementation-dependent way. Some implementations may latch the value of the predicate upon beginning conditional rendering while others may read it before every rendering command.
Valid Usage

- VUID-VkConditionalRenderingBeginInfoEXT-buffer-01981
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkConditionalRenderingBeginInfoEXT-buffer-01982
  buffer must have been created with the VK_BUFFER_USAGE_CONDITIONAL_RENDERING_BIT_EXT bit set

- VUID-VkConditionalRenderingBeginInfoEXT-offset-01983
  offset must be less than the size of buffer by at least 32 bits

- VUID-VkConditionalRenderingBeginInfoEXT-offset-01984
  offset must be a multiple of 4

Valid Usage (Implicit)

- VUID-VkConditionalRenderingBeginInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_CONDITIONAL_RENDERING_BEGIN_INFO_EXT

- VUID-VkConditionalRenderingBeginInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkConditionalRenderingBeginInfoEXT-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-VkConditionalRenderingBeginInfoEXT-flags-parameter
  flags must be a valid combination of VkConditionalRenderingFlagBitsEXT values

Bits which can be set in VkCmdBeginConditionalRenderingEXT::flags specifying the behavior of conditional rendering are:

```c
// Provided by VK_EXT_conditional_rendering
typedef enum VkConditionalRenderingFlagBitsEXT {
    VK_CONDITIONAL_RENDERING_INVERTED_BIT_EXT = 0x00000001,
} VkConditionalRenderingFlagBitsEXT;
```

- VK_CONDITIONAL_RENDERING_INVERTED_BIT_EXT specifies the condition used to determine whether to discard rendering commands or not. That is, if the 32-bit predicate read from buffer memory at offset is zero, the rendering commands are not discarded, and if non zero, then they are discarded.

```c
// Provided by VK_EXT_conditional_rendering
typedef VkFlags VkConditionalRenderingFlagsEXT;
```

VkConditionalRenderingFlagsEXT is a bitmask type for setting a mask of zero or more VkConditionalRenderingFlagBitsEXT.
To end conditional rendering, call:

```c
// Provided by VK_EXT_conditional_rendering
void vkCmdEndConditionalRenderingEXT(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer into which this command will be recorded.

Once ended, conditional rendering becomes inactive.

**Valid Usage**

- `VUID-vkCmdEndConditionalRenderingEXT-None-01985`
  Conditional rendering **must** be active

- `VUID-vkCmdEndConditionalRenderingEXT-None-01986`
  If conditional rendering was made active outside of a render pass instance, it **must** not be ended inside a render pass instance

- `VUID-vkCmdEndConditionalRenderingEXT-None-01987`
  If conditional rendering was made active within a subpass it **must** be ended in the same subpass

**Valid Usage (Implicit)**

- `VUID-vkCmdEndConditionalRenderingEXT-commandBuffer-parameter`
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- `VUID-vkCmdEndConditionalRenderingEXT-commandBuffer-recording`
  `commandBuffer` **must** be in the recording state

- `VUID-vkCmdEndConditionalRenderingEXT-commandBuffer-cmdpool`
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
21.5. Programmable Mesh Shading

In this drawing approach, primitives are assembled by the mesh shader stage. Mesh shading operates similarly to dispatching compute as the shaders make use of workgroups.

To record a draw that uses the mesh pipeline, call:

```c
// Provided by VK_NV_mesh_shader
void vkCmdDrawMeshTasksNV(
    VkCommandBuffer commandBuffer,
    uint32_t taskCount,
    uint32_t firstTask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `taskCount` is the number of local workgroups to dispatch in the X dimension. Y and Z dimension are implicitly set to one.
- `firstTask` is the X component of the first workgroup ID.

When the command is executed, a global workgroup consisting of `taskCount` local workgroups is assembled.
Valid Usage

- **VUID-vkCmdDrawMeshTasksNV-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawMeshTasksNV-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawMeshTasksNV-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDrawMeshTasksNV-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdDrawMeshTasksNV-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawMeshTasksNV-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawMeshTasksNV-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdDrawMeshTasksNV-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDrawMeshTasksNV-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.
Compatibility

- VUID-vkCmdDrawMeshTasksNV-None-02699
  Descriptors in each bound descriptor set, specified via \texttt{vkCmdBindDescriptorSets}, \textbf{must} be valid if they are statically used by the \texttt{VkPipeline} bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawMeshTasksNV-None-02700
  A valid pipeline \textbf{must} be bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawMeshTasksNV-commandBuffer-02701
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command requires any dynamic state, that state \textbf{must} have been set or inherited (if the \texttt{VK_NV_inherited_viewport_scissor} extension is enabled) for \texttt{commandBuffer}, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdDrawMeshTasksNV-None-02859
  There \textbf{must} not have been any calls to dynamic state setting commands for any state not specified as dynamic in the \texttt{VkPipeline} object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDrawMeshTasksNV-None-02702
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used to sample from any \texttt{VkImage} with a \texttt{VkImageView} of the type \texttt{VK_IMAGE_VIEW_TYPE_3D}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE}, \texttt{VK_IMAGE_VIEW_TYPE_1D_ARRAY}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY} or \texttt{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY}, in any shader stage.

- VUID-vkCmdDrawMeshTasksNV-None-02703
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions with \texttt{ImplicitLod}, \texttt{Dref} or \texttt{Proj} in their name, in any shader stage.

- VUID-vkCmdDrawMeshTasksNV-None-02704
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDrawMeshTasksNV-None-02705
  If the \texttt{robust buffer access} feature is not enabled, and if the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a uniform buffer, it \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawMeshTasksNV-None-02706
  If the \texttt{robust buffer access} feature is not enabled, and if the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a storage buffer, it \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
If a \texttt{VkImageView} is accessed using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that instruction \textbf{must} have at least as many components as the image view's format.

- VUID-vkCmdDrawMeshTasksNV-OpImageWrite-04469

If a \texttt{VkBufferView} is accessed using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that instruction \textbf{must} have at least as many components as the buffer view's format.

- VUID-vkCmdDrawMeshTasksNV-SampledType-04470

If a \texttt{VkImageView} with a \texttt{VkFormat} that has a 64-bit channel width is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction \textbf{must} have a Width of 64.

- VUID-vkCmdDrawMeshTasksNV-SampledType-04471

If a \texttt{VkBufferView} with a \texttt{VkFormat} that has a channel width less than 64-bit is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction \textbf{must} have a Width of 32.

- VUID-vkCmdDrawMeshTasksNV-SampledType-04472

If a \texttt{VkImageView} with a \texttt{VkFormat} that has a 64-bit channel width is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction \textbf{must} have a Width of 64.

- VUID-vkCmdDrawMeshTasksNV-SampledType-04473

If a \texttt{VkBufferView} with a \texttt{VkFormat} that has a channel width less than 64-bit is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction \textbf{must} have a Width of 32.

- VUID-vkCmdDrawMeshTasksNV-SparseImageInt64Atomics-04474

If the \texttt{sparseImageInt64Atomics} feature is not enabled, \texttt{VkImage} objects created with the \texttt{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT} flag \textbf{must} not be accessed by atomic instructions through an \texttt{OpTypeImage} with a \texttt{SampledType} with a Width of 64 by this command.

- VUID-vkCmdDrawMeshTasksNV-SparseImageInt64Atomics-04475

If the \texttt{sparseImageInt64Atomics} feature is not enabled, \texttt{VkBuffer} objects created with the \texttt{VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT} flag \textbf{must} not be accessed by atomic instructions through an \texttt{OpTypeImage} with a \texttt{SampledType} with a Width of 64 by this command.

- VUID-vkCmdDrawMeshTasksNV-RenderPass-02684

The current render pass \textbf{must} be compatible with the \texttt{renderPass} member of the \texttt{VkGraphicsPipelineCreateInfo} structure specified when creating the \texttt{VkPipeline} bound to \texttt{VK_PIPELINE_BIND_POINT_GRAPHICS}.

- VUID-vkCmdDrawMeshTasksNV-Subpass-02685

The subpass index of the current render pass \textbf{must} be equal to the \texttt{subpass} member of the \texttt{VkGraphicsPipelineCreateInfo} structure specified when creating the \texttt{VkPipeline} bound to \texttt{VK_PIPELINE_BIND_POINT_GRAPHICS}.

- VUID-vkCmdDrawMeshTasksNV-None-02686

Every input attachment used by the current subpass \textbf{must} be bound to the pipeline via a descriptor set.

- VUID-vkCmdDrawMeshTasksNV-None-04584

Image subresources used as attachments in the current render pass \textbf{must} not be accessed.
in any way other than as an attachment by this command, except for cases involving read-only access to depth/stencil attachments as described in the Render Pass chapter

- **VUID-vkCmdDrawMeshTasksNV-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- **VUID-vkCmdDrawMeshTasksNV-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- **VUID-vkCmdDrawMeshTasksNV-viewportCount-03417**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT **must** have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT **must** match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- **VUID-vkCmdDrawMeshTasksNV-scissorCount-03418**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT **must** have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT **must** match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- **VUID-vkCmdDrawMeshTasksNV-viewportCount-03419**
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT **must** have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT **must** match the viewportCount parameter of vkCmdSetScissorWithCountEXT

- **VUID-vkCmdDrawMeshTasksNV-viewportCount-04137**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline **must** have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- **VUID-vkCmdDrawMeshTasksNV-viewportCount-04138**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled, then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- VUID-vkCmdDrawMeshTasksNV-VkPipelineViewportCreateInfo-04142

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- VUID-vkCmdDrawMeshTasksNV-None-04876

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled then `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksNV-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksNV-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value

- **VUID-vkCmdDrawMeshTasksNV-None-04879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksNV-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1

- **VUID-vkCmdDrawMeshTasksNV-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`

- **VUID-vkCmdDrawMeshTasksNV-rasterizationSamples-04740**
  If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments

- **VUID-vkCmdDrawMeshTasksNV-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawMeshTasksNV-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the
**Valid Usage (Implicit)**

- VUID-vkCmdDrawMeshTasksNV-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdDrawMeshTasksNV-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdDrawMeshTasksNV-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdDrawMeshTasksNV-renderpass
  
  This command must only be called inside of a render pass instance

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>

To record an indirect mesh tasks draw, call:
void vkCmdDrawMeshTasksIndirectNV(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    uint32_t drawCount,
    uint32_t stride);

• `commandBuffer` is the command buffer into which the command is recorded.
• `buffer` is the buffer containing draw parameters.
• `offset` is the byte offset into `buffer` where parameters begin.
• `drawCount` is the number of draws to execute, and can be zero.
• `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawMeshTasksIndirectNV` behaves similarly to `vkCmdDrawMeshTasksNV` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawMeshTasksIndirectCommandNV` structures. If `drawCount` is less than or equal to one, `stride` is ignored.
Valid Usage

• VUID-vkCmdDrawMeshTasksIndirectNV-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDrawMeshTasksIndirectNV-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDrawMeshTasksIndirectNV-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

• VUID-vkCmdDrawMeshTasksIndirectNV-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

• VUID-vkCmdDrawMeshTasksIndirectNV-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command **must** have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawMeshTasksIndirectNV-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command **must** have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawMeshTasksIndirectNV-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command **must** only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdDrawMeshTasksIndirectNV-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDrawMeshTasksIndirectNV-None-02698
  For each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility
Compatibility

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02699**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02700**
  A valid pipeline must be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02859**
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02702**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02703**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Deref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02704**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02705**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02706**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the *Type* of the *Texel* operand of that instruction **must** have at least as many components as the image view’s format

- **VUID-vkCmdDrawMeshTasksIndirectNV-OpImageWrite-04469**

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the *Type* of the *Texel* operand of that instruction **must** have at least as many components as the buffer view’s format

- **VUID-vkCmdDrawMeshTasksIndirectNV-OpImageWrite-04470**

If a `VkImageView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the *SampledType* of the `OpTypeImage` operand of that instruction **must** have a *Width* of 64

- **VUID-vkCmdDrawMeshTasksIndirectNV-SampledType-04471**

If a `VkImageView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the *SampledType* of the `OpTypeImage` operand of that instruction **must** have a *Width* of 32

- **VUID-vkCmdDrawMeshTasksIndirectNV-SampledType-04472**

If a `VkBufferView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the *SampledType* of the `OpTypeImage` operand of that instruction **must** have a *Width* of 64

- **VUID-vkCmdDrawMeshTasksIndirectNV-SampledType-04473**

If a `VkBufferView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the *SampledType* of the `OpTypeImage` operand of that instruction **must** have a *Width* of 32

- **VUID-vkCmdDrawMeshTasksIndirectNV-SampledType-04474**

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a *SampledType* with a *Width* of 64 by this command

- **VUID-vkCmdDrawMeshTasksIndirectNV-SparseImageInt64Atomics-04475**

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a *SampledType* with a *Width* of 64 by this command

- **VUID-vkCmdDrawMeshTasksIndirectNV-sparseImageInt64Atomics-04476**

The current render pass **must** be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDrawMeshTasksIndirectNV-renderPass-02684**

The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDrawMeshTasksIndirectNV-subpass-02685**

Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02686**

Image subresources used as attachments in the current render pass **must** not be accessed
in any way other than as an attachment by this command, except for cases involving read-only access to depth/stencil attachments as described in the Render Pass chapter

• VUID-vkCmdDrawMeshTasksIndirectNV-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties ::maxMultiviewInstanceIndex

• VUID-vkCmdDrawMeshTasksIndirectNV-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

• VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the VkPipelineViewportStateCreateInfo ::viewportCount of the pipeline

• VUID-vkCmdDrawMeshTasksIndirectNV-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT must match the VkPipelineViewportStateCreateInfo ::viewportCount of the pipeline

• VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the scissorCount parameter of vkCmdSetScissorWithCountEXT

• VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV ::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

• VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-04138
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV
dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportSwizzleStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-04876**
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled then `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectNV-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-04879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectNV-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1

- **VUID-vkCmdDrawMeshTasksIndirectNV-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`

- **VUID-vkCmdDrawMeshTasksIndirectNV-rasterizationSamples-04740**
  If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawMeshTasksIndirectNV-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the...
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-04914**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be `NULL`.

- **VUID-vkCmdDrawMeshTasksIndirectNV-buffer-02708**
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdDrawMeshTasksIndirectNV-buffer-02709**
  `buffer` must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

- **VUID-vkCmdDrawMeshTasksIndirectNV-offset-02710**
  `offset` must be a multiple of 4.

- **VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02718**
  If the multi-draw indirect feature is not enabled, `drawCount` must be 0 or 1.

- **VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02719**
  `drawCount` must be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`.

- **VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02146**
  If `drawCount` is greater than 1, `stride` must be a multiple of 4 and must be greater than or equal to `sizeof(VkDrawMeshTasksIndirectCommandNV)`.

- **VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02156**
  If `drawCount` is equal to 1, \((\text{offset} + \text{sizeof}(\text{VkDrawMeshTasksIndirectCommandNV}))\) must be less than or equal to the size of `buffer`.

- **VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02157**
  If `drawCount` is greater than 1, \((\text{stride} \times (\text{drawCount} - 1) + \text{offset} + \text{sizeof}(\text{VkDrawMeshTasksIndirectCommandNV}))\) must be less than or equal to the size of `buffer`.
Valid Usage (Implicit)

- VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdDrawMeshTasksIndirectNV-buffer-parameter
  `buffer` must be a valid `VkBuffer` handle
- VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdDrawMeshTasksIndirectNV-renderpass
  This command must only be called inside of a render pass instance
- VUID-vkCmdDrawMeshTasksIndirectNV-commonparent
  Both of `buffer`, and `commandBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkDrawMeshTasksIndirectCommandNV` structure is defined as:

```c
// Provided by VK_NV_mesh_shader
typedef struct VkDrawMeshTasksIndirectCommandNV {
    uint32_t taskCount;
    uint32_t firstTask;
} VkDrawMeshTasksIndirectCommandNV;
```

- `taskCount` is the number of local workgroups to dispatch in the X dimension. Y and Z dimension are implicitly set to one.
- `firstTask` is the X component of the first workgroup ID.
The members of \texttt{VkDrawMeshTasksIndirectCommandNV} have the same meaning as the similarly named parameters of \texttt{vkCmdDrawMeshTasksNV}.

**Valid Usage**

- \texttt{VUID-VkDrawMeshTasksIndirectCommandNV-taskCount-02175}
  - \texttt{taskCount} must be less than or equal to \texttt{VkPhysicalDeviceMeshShaderPropertiesNV::maxDrawMeshTasksCount}

To record an indirect mesh tasks draw with the draw count sourced from a buffer, call:

```c
// Provided by VK_NV_mesh_shader
void vkCmdDrawMeshTasksIndirectCountNV(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

- \texttt{commandBuffer} is the command buffer into which the command is recorded.
- \texttt{buffer} is the buffer containing draw parameters.
- \texttt{offset} is the byte offset into \texttt{buffer} where parameters begin.
- \texttt{countBuffer} is the buffer containing the draw count.
- \texttt{countBufferOffset} is the byte offset into \texttt{countBuffer} where the draw count begins.
- \texttt{maxDrawCount} specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in \texttt{countBuffer} and \texttt{maxDrawCount}.
- \texttt{stride} is the byte stride between successive sets of draw parameters.

\texttt{vkCmdDrawMeshTasksIndirectCountNV} behaves similarly to \texttt{vkCmdDrawMeshTasksIndirectNV} except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from \texttt{countBuffer} located at \texttt{countBufferOffset} and use this as the draw count.
Valid Usage

• VUID-vkCmdDrawMeshTasksIndirectCountNV-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDrawMeshTasksIndirectCountNV-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

• VUID-vkCmdDrawMeshTasksIndirectCountNV-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawMeshTasksIndirectCountNV-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawMeshTasksIndirectCountNV-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02698
  For each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout
Compatibility

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02705
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02706
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04115
If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view’s format

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-OpImageWrite-04469**

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view’s format

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-SampledType-04470**

If a `VkImageView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a **Width** of 64

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-SampledType-04471**

If a `VkImageView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a **Width** of 32

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-SampledType-04472**

If a `VkBufferView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a **Width** of 64

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-SampledType-04473**

If a `VkBufferView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a **Width** of 32

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-sparseImageInt64Atomics-04474**

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a **Width** of 64 by this command

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-sparseImageInt64Atomics-04475**

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a **Width** of 64 by this command

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-renderPass-02684**

The current render pass **must** be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-subpass-02685**

The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02686**

Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04584**

Image subresources used as attachments in the current render pass **must** not be accessed
in any way other than as an attachment by this command, except for cases involving 
read-only access to depth/stencil attachments as described in the Render Pass chapter

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum 
  instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties ::maxMultiviewInstanceIndex

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with 
  VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and 
  the current subpass has a depth/stencil attachment, then that attachment must have been 
  created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-03417**
  If the bound graphics pipeline state was created with the 
  VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the 
  VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then 
  vkCmdSetViewportWithCountEXT must have been called in the current command buffer 
  prior to this drawing command, and the viewportCount parameter of 
  vkCmdSetViewportWithCountEXT must match the VkPipelineViewportStateCreateInfo ::viewportCount of the pipeline

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-scissorCount-03418**
  If the bound graphics pipeline state was created with the 
  VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the 
  VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then 
  vkCmdSetScissorWithCountEXT must have been called in the current command buffer 
  prior to this drawing command, and the scissorCount parameter of 
  vkCmdSetScissorWithCountEXT must match the VkPipelineViewportStateCreateInfo ::viewportCount of the pipeline

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-03419**
  If the bound graphics pipeline state was created with both the 
  VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT 
  dynamic states enabled then both vkCmdSetViewportWithCountEXT and 
  vkCmdSetScissorWithCountEXT must have been called in the current command buffer 
  prior to this drawing command, and the viewportCount parameter of 
  vkCmdSetViewportWithCountEXT must match the scissorCount parameter of 
  vkCmdSetScissorWithCountEXT

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04137**
  If the bound graphics pipeline state was created with the 
  VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the 
  VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics 
  pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV ::viewportCount greater or equal to the viewportCount parameter in the last call to 
  vkCmdSetViewportWithCountEXT

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04138**
  If the bound graphics pipeline state was created with the 
  VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV
dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` **must** be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline **must** have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` **must** be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportSwizzleStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline **must** have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline **must** have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` **must** have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` **must** be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04876**
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled then `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-rasterizationSamples-04740**
  If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the
VK_DYNAMIC_STATE_VERTEX_INPUT_EXT  dynamic state enabled, then
vkCmdBindVertexBuffers2EXT must have been called in the current command buffer
prior to this draw command, and the pStrides parameter of
vkCmdBindVertexBuffers2EXT must not be NULL

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04914
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdSetVertexInputEXT
  must have been called in the current command buffer prior to this draw command

• VUID-vkCmdDrawMeshTasksIndirectCountNV-buffer-02708
  If buffer is non-sparse then it must be bound completely and contiguously to a single
  VkDeviceMemory object

• VUID-vkCmdDrawMeshTasksIndirectCountNV-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdDrawMeshTasksIndirectCountNV-offset-02710
  offset must be a multiple of 4

• VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-02714
  If countBuffer is non-sparse then it must be bound completely and contiguously to a
  single VkDeviceMemory object

• VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-02715
  countBuffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdDrawMeshTasksIndirectCountNV-countBufferOffset-02716
  countBufferOffset must be a multiple of 4

• VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-02717
  The count stored in countBuffer must be less than or equal to VkPhysicalDeviceLimits
  ::maxDrawIndirectCount

• VUID-vkCmdDrawMeshTasksIndirectCountNV-countBufferOffset-04129
  (countBufferOffset + sizeof(uint32_t)) must be less than or equal to the size of countBuffer

• VUID-vkCmdDrawMeshTasksIndirectCountNV-stride-02182
  stride must be a multiple of 4 and must be greater than or equal to sizeof
  (VkDrawMeshTasksIndirectCommandNV)

• VUID-vkCmdDrawMeshTasksIndirectCountNV-maxDrawCount-02183
  If maxDrawCount is greater than or equal to 1, (stride × (maxDrawCount - 1) + offset + sizeof
  (VkDrawMeshTasksIndirectCommandNV)) must be less than or equal to the size of buffer

• VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-02191
  If the count stored in countBuffer is equal to 1, (offset + sizeof
  (VkDrawMeshTasksIndirectCommandNV)) must be less than or equal to the size of buffer

• VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-02192
  If the count stored in countBuffer is greater than 1, (stride × (drawCount - 1) + offset +
  sizeof(VkDrawMeshTasksIndirectCommandNV)) must be less than or equal to the size of buffer
Valid Usage (Implicit)

- VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-parameter
  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdDrawMeshTasksIndirectCountNV-buffer-parameter
  \texttt{buffer} \textbf{must} be a valid \texttt{VkBuffer} handle

- VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-parameter
  \texttt{countBuffer} \textbf{must} be a valid \texttt{VkBuffer} handle

- VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-recording
  \texttt{commandBuffer} \textbf{must} be in the \textit{recording} state

- VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support graphics operations

- VUID-vkCmdDrawMeshTasksIndirectCountNV-renderpass
  This command \textbf{must} only be called inside of a render pass instance

- VUID-vkCmdDrawMeshTasksIndirectCountNV-commonparent
  Each of \texttt{buffer}, \texttt{commandBuffer}, and \texttt{countBuffer} \textbf{must} have been created, allocated, or retrieved from the same \texttt{VkDevice}

Host Synchronization

- Host access to \texttt{commandBuffer} \textbf{must} be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} be externally synchronized

Chapter 22. Fixed-Function Vertex Processing

Vertex fetching is controlled via configurable state, as a logically distinct graphics pipeline stage.

22.1. Vertex Attributes

Vertex shaders can define input variables, which receive vertex attribute data transferred from one or more VkBuffer(s) by drawing commands. Vertex shader input variables are bound to buffers via an indirect binding where the vertex shader associates a vertex input attribute number with each variable, vertex input attributes are associated to vertex input bindings on a per-pipeline basis, and vertex input bindings are associated with specific buffers on a per-draw basis via the vkCmdBindVertexBuffers command. Vertex input attribute and vertex input binding descriptions also contain format information controlling how data is extracted from buffer memory and converted to the format expected by the vertex shader.

There are VkPhysicalDeviceLimits::maxVertexInputAttributes number of vertex input attributes and VkPhysicalDeviceLimits::maxVertexInputBindings number of vertex input bindings (each referred to by zero-based indices), where there are at least as many vertex input attributes as there are vertex input bindings. Applications can store multiple vertex input attributes interleaved in a single buffer, and use a single vertex input binding to access those attributes.

In GLSL, vertex shaders associate input variables with a vertex input attribute number using the location layout qualifier. The component layout qualifier associates components of a vertex shader input variable with components of a vertex input attribute.

GLSL example

```glsl
// Assign location M to variableName
layout (location=M, component=2) in vec2 variableName;

// Assign locations [N,N+L) to the array elements of variableNameArray
layout (location=N) in vec4 variableNameArray[L];
```

In SPIR-V, vertex shaders associate input variables with a vertex input attribute number using the Location decoration. The Component decoration associates components of a vertex shader input variable with components of a vertex input attribute. The Location and Component decorations are specified via the OpDecorate instruction.
22.1.1. Attribute Location and Component Assignment

Vertex shaders allow Location and Component decorations on input variable declarations. The Location decoration specifies which vertex input attribute is used to read and interpret the data that a variable will consume. The Component decoration allows the location to be more finely specified for scalars and vectors, down to the individual components within a location that are consumed. The components within a location are 0, 1, 2, and 3. A variable starting at component N will consume components N, N+1, N+2, ... up through its size. For single precision types, it is invalid if the sequence of components gets larger than 3.

When a vertex shader input variable declared using a 16- or 32-bit scalar or vector data type is assigned a location, its value(s) are taken from the components of the input attribute specified with the corresponding VkVertexInputAttributeDescription::location. The components used depend on the type of variable and the Component decoration specified in the variable declaration, as identified in Input attribute components accessed by 16-bit and 32-bit input variables. Any 16-bit or 32-bit scalar or vector input will consume a single location. For 16-bit and 32-bit data types, missing components are filled in with default values as described below.

Table 30. Input attribute components accessed by 16-bit and 32-bit input variables
16-bit or 32-bit data type | Component decoration | Components consumed
--- | --- | ---
scalar | 0 or unspecified | (x, o, o, o)
scalar | 1 | (o, y, o, o)
scalar | 2 | (o, o, z, o)
scalar | 3 | (o, o, o, w)
two-component vector | 0 or unspecified | (x, y, o, o)
two-component vector | 1 | (o, y, z, o)
two-component vector | 2 | (o, o, z, w)
three-component vector | 0 or unspecified | (x, y, z, o)
three-component vector | 1 | (o, y, z, w)
four-component vector | 0 or unspecified | (x, y, z, w)

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a 32-bit floating point matrix type is assigned a location $i$, its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. Such matrices are treated as an array of column vectors with values taken from the input attributes identified in `Input attributes accessed by 32-bit input matrix variables`. The `VkVertexInputAttributeDescription::format` must be specified with a `VkFormat` that corresponds to the appropriate type of column vector. The `Component` decoration must not be used with matrix types.

**Table 31. Input attributes accessed by 32-bit input matrix variables**

</tr>
</tbody>
</table>
Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input (if present), or the default value.

When a vertex shader input variable declared using a scalar or vector 64-bit data type is assigned a location i, its values are taken from consecutive input attributes starting with the corresponding VkVertexInputAttributeDescription::location. The locations and components used depend on the type of variable and the Component decoration specified in the variable declaration, as identified in Input attribute locations and components accessed by 64-bit input variables. For 64-bit data types, no default attribute values are provided. Input variables must not use more components than provided by the attribute. Input attributes which have one- or two-component 64-bit formats will consume a single location. Input attributes which have three- or four-component 64-bit formats will consume two consecutive locations. A 64-bit scalar data type will consume two components, and a 64-bit two-component vector data type will consume all four components available within a location. A three- or four-component 64-bit data type must not specify a component. A three-component 64-bit data type will consume all four components of the first location and components 0 and 1 of the second location. This leaves components 2 and 3 available for other component-qualified declarations. A four-component 64-bit data type will consume all four components of the first location and all four components of the second location. It is invalid for a scalar or two-component 64-bit data type to specify a component of 1 or 3.

<td>two-component vector</td>
<td>i</td>
<td>0 or unspecified</td>
<td>(x, y, z, w)</td>
</tr>
</tbody>
</table>
Components indicated by “o” are available for use by other input variables which are sourced from the same attribute. Components indicated by “-” are not available for input variables as there are no default values provided for 64-bit data types, and there is no data provided by the input format.

When a vertex shader input variable declared using a 64-bit floating-point matrix type is assigned a location \( i \), its values are taken from consecutive input attribute locations. Such matrices are treated as an array of column vectors with values taken from the input attributes as shown in Input attribute locations and components accessed by 64-bit input variables. Each column vector starts at the location immediately following the last location of the previous column vector. The number of attributes and components assigned to each matrix is determined by the matrix dimensions and ranges from two to eight locations.
When a vertex shader input variable declared using an array type is assigned a location, its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. The number of attributes and components assigned to each element are determined according to the data type of the array elements and Component decoration (if any) specified in the declaration of the array, as described above. Each element of the array, in order, is assigned to consecutive locations, but all at the same specified component within each location.

Only input variables declared with the data types and component decorations as specified above are supported. Location aliasing is causing two variables to have the same location number. Component aliasing is assigning the same (or overlapping) component number for two location aliases. Location aliasing is allowed only if it does not cause component aliasing. Further, when location aliasing, the aliases sharing the location must all have the same SPIR-V floating-point component type or all have the same width integer-type components.

### 22.2. Vertex Input Description

Applications specify vertex input attribute and vertex input binding descriptions as part of graphics pipeline creation by setting the `VkGraphicsPipelineCreateInfo::pVertexInputState` pointer to a `VkPipelineVertexInputStateCreateInfo` structure. Alternatively, if the graphics pipeline is created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then the vertex input attribute and vertex input binding descriptions are specified dynamically with `vkCmdSetVertexInputEXT`, and the `VkGraphicsPipelineCreateInfo::pVertexInputState` pointer is ignored.

The `VkPipelineVertexInputStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineVertexInputStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineVertexInputStateCreateFlags flags;
    uint32_t vertexBindingDescriptionCount;
    const VkVertexInputBindingDescription* pVertexBindingDescriptions;
    uint32_t vertexAttributeDescriptionCount;
    const VkVertexInputAttributeDescription* pVertexAttributeDescriptions;
} VkPipelineVertexInputStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `vertexBindingDescriptionCount` is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.
- `pVertexBindingDescriptions` is a pointer to an array of `VkVertexInputBindingDescription` structures.
- `vertexAttributeDescriptionCount` is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.

Chapter 22. Fixed-Function Vertex Processing | 1425
• `pVertexAttributeDescriptions` is a pointer to an array of `VkVertexInputAttributeDescription` structures.

**Valid Usage**

- VUID-VkPipelineVertexInputStateCreateInfo-vertexBindingDescriptionCount-00613
  
  `vertexBindingDescriptionCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`.

- VUID-VkPipelineVertexInputStateCreateInfo-vertexAttributeDescriptionCount-00614
  
  `vertexAttributeDescriptionCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributes`.

- VUID-VkPipelineVertexInputStateCreateInfo-binding-00615
  
  For every binding specified by each element of `pVertexAttributeDescriptions`, a `VkVertexInputBindingDescription` must exist in `pVertexBindingDescriptions` with the same value of binding.

- VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-00616
  
  All elements of `pVertexBindingDescriptions` must describe distinct binding numbers.

- VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-00617
  
  All elements of `pVertexAttributeDescriptions` must describe distinct attribute locations.

**Valid Usage (Implicit)**

- VUID-VkPipelineVertexInputStateCreateInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO`.

- VUID-VkPipelineVertexInputStateCreateInfo-pNext-pNext
  
  `pNext` must be `NULL` or a pointer to a valid instance of `VkPipelineVertexInputDivisorStateCreateInfoEXT`.

- VUID-VkPipelineVertexInputStateCreateInfo-sType-unique
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- VUID-VkPipelineVertexInputStateCreateInfo-flags-zerobitmask
  
  `flags` must be 0.

- VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-parameter
  
  If `vertexBindingDescriptionCount` is not 0, `pVertexBindingDescriptions` must be a valid pointer to an array of `vertexBindingDescriptionCount` valid `VkVertexInputBindingDescription` structures.

- VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-parameter
  
  If `vertexAttributeDescriptionCount` is not 0, `pVertexAttributeDescriptions` must be a valid pointer to an array of `vertexAttributeDescriptionCount` valid `VkVertexInputAttributeDescription` structures.
VkPipelineVertexInputStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

Each vertex input binding is specified by the VkVertexInputBindingDescription structure, defined as:

```c
typedef struct VkVertexInputBindingDescription {
    uint32_t binding;
    uint32_t stride;
    VkVertexInputRate inputRate;
} VkVertexInputBindingDescription;
```

- **binding** is the binding number that this structure describes.
- **stride** is the byte stride between consecutive elements within the buffer.
- **inputRate** is a VkVertexInputRate value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.

### Valid Usage

- VUID-VkVertexInputBindingDescription-binding-00618
  binding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-VkVertexInputBindingDescription-stride-00619
  stride must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputBindingStride

- VUID-VkVertexInputBindingDescription-stride-04456
  If the VK_KHR_portability_subset extension is enabled, stride must be a multiple of, and at least as large as, VkPhysicalDevicePortabilitySubsetPropertiesKHR::minVertexInputBindingStrideAlignment

### Valid Usage (Implicit)

- VUID-VkVertexInputBindingDescription-inputRate-parameter
  inputRate must be a valid VkVertexInputRate value

Possible values of VkVertexInputBindingDescription::inputRate, specifying the rate at which vertex attributes are pulled from buffers, are:
• **VK_VERTEX_INPUT_RATE_VERTEX** specifies that vertex attribute addressing is a function of the vertex index.

• **VK_VERTEX_INPUT_RATE_INSTANCE** specifies that vertex attribute addressing is a function of the instance index.

Each vertex input attribute is specified by the `VkVertexInputAttributeDescription` structure, defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputAttributeDescription {
    uint32_t location;
    uint32_t binding;
    VkFormat format;
    uint32_t offset;
} VkVertexInputAttributeDescription;
```

• **location** is the shader input location number for this attribute.

• **binding** is the binding number which this attribute takes its data from.

• **format** is the size and type of the vertex attribute data.

• **offset** is a byte offset of this attribute relative to the start of an element in the vertex input binding.
Valid Usage

- **VUID-VkVertexInputAttributeDescription-location-00620**
  
  `location` must be less than `VkPhysicalDeviceLimits.maxVertexInputAttributes`

- **VUID-VkVertexInputAttributeDescription-binding-00621**
  
  `binding` must be less than `VkPhysicalDeviceLimits.maxVertexInputBindings`

- **VUID-VkVertexInputAttributeDescription-offset-00622**
  
  `offset` must be less than or equal to `VkPhysicalDeviceLimits.maxVertexInputAttributeOffset`

- **VUID-VkVertexInputAttributeDescription-format-00623**
  
  `format` must be allowed as a vertex buffer format, as specified by the `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT` flag in `VkFormatProperties.bufferFeatures` returned by `vkGetPhysicalDeviceFormatProperties`

- **VUID-VkVertexInputAttributeDescription-vertexAttributeAccessBeyondStride-04457**
  
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR.vertexAttributeAccessBeyondStride` is `VK_FALSE`, the sum of `offset` plus the size of the vertex attribute data described by `format` must not be greater than `stride` in the `VkVertexInputBindingDescription` referenced in `binding`.

Valid Usage (Implicit)

- **VUID-VkVertexInputAttributeDescription-format-parameter**
  
  `format` must be a valid `VkFormat` value

An alternative to specifying the vertex input attribute and vertex input binding descriptions as part of graphics pipeline creation, the pipeline can be created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, and for that state to be set dynamically with:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
void vkCmdSetVertexInputEXT(
    VkCommandBuffer commandBuffer, 
    uint32_t vertexBindingDescriptionCount, 
    const VkVertexInputBindingDescription2EXT* pVertexBindingDescriptions, 
    uint32_t vertexAttributeDescriptionCount, 
    const VkVertexInputAttributeDescription2EXT* pVertexAttributeDescriptions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `vertexBindingDescriptionCount` is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.
- `pVertexBindingDescriptions` is a pointer to an array of `VkVertexInputBindingDescription2EXT` structures.
• **vertexAttributeDescriptionCount** is the number of vertex attribute descriptions provided in **pVertexAttributeDescriptions**.

• **pVertexAttributeDescriptions** is a pointer to an array of **VkVertexInputAttributeDescription2EXT** structures.

This command sets the vertex input attribute and vertex input binding descriptions state for subsequent drawing commands.

### Valid Usage

- **VUID-vkCmdSetVertexInputEXT-None-04790**
  
  The **vertexInputDynamicState** feature **must** be enabled

- **VUID-vkCmdSetVertexInputEXT-vertexBindingDescriptionCount-04791**
  
  **vertexBindingDescriptionCount** **must** be less than or equal to **VkPhysicalDeviceLimits::maxVertexInputBindings**

- **VUID-vkCmdSetVertexInputEXT-vertexAttributeDescriptionCount-04792**
  
  **vertexAttributeDescriptionCount** **must** be less than or equal to **VkPhysicalDeviceLimits::maxVertexInputAttributes**

- **VUID-vkCmdSetVertexInputEXT-binding-04793**
  
  For every **binding** specified by each element of **pVertexAttributeDescriptions**, a **VkVertexInputBindingDescription2EXT** **must** exist in **pVertexBindingDescriptions** with the same value of **binding**

- **VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-04794**
  
  All elements of **pVertexBindingDescriptions** **must** describe distinct binding numbers

- **VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-04795**
  
  All elements of **pVertexAttributeDescriptions** **must** describe distinct attribute locations
Valid Usage (Implicit)

- VUID-vkCmdSetVertexInputEXT-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-parameter
  
  If `vertexBindingDescriptionCount` is not 0, `pVertexBindingDescriptions` must be a valid pointer to an array of `vertexBindingDescriptionCount` valid `VkVertexInputBindingDescription2EXT` structures

- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-parameter
  
  If `vertexAttributeDescriptionCount` is not 0, `pVertexAttributeDescriptions` must be a valid pointer to an array of `vertexAttributeDescriptionCount` valid `VkVertexInputAttributeDescription2EXT` structures

- VUID-vkCmdSetVertexInputEXT-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetVertexInputEXT-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkVertexInputBindingDescription2EXT` structure is defined as:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputBindingDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t binding;
    uint32_t stride;
    VkVertexInputRate inputRate;
    uint32_t divisor;
} VkVertexInputBindingDescription2EXT;
```
• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **binding** is the binding number that this structure describes.
• **stride** is the byte stride between consecutive elements within the buffer.
• **inputRate** is a **VkVertexInputRate** value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.
• **divisor** is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. This member can be set to a value other than 1 if the **vertexAttributeInstanceRateDivisor** feature is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of divisor is implementation-dependent and can be queried using **VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor**. A value of 0 can be used for the divisor if the **vertexAttributeInstanceRateZeroDivisor** feature is enabled. In this case, the same vertex attribute will be applied to all instances.

### Valid Usage

- **VUID-VkVertexInputBindingDescription2EXT-binding-04796**
  
  **binding** must be less than **VkPhysicalDeviceLimits::maxVertexInputBindings**

- **VUID-VkVertexInputBindingDescription2EXT-stride-04797**
  
  **stride** must be less than or equal to **VkPhysicalDeviceLimits::maxVertexInputBindingStride**

- **VUID-VkVertexInputBindingDescription2EXT-divisor-04798**
  
  If the **vertexAttributeInstanceRateZeroDivisor** feature is not enabled, **divisor** must not be 0

- **VUID-VkVertexInputBindingDescription2EXT-divisor-04799**
  
  If the **vertexAttributeInstanceRateDivisor** feature is not enabled, **divisor** must be 1

- **VUID-VkVertexInputBindingDescription2EXT-divisor-06226**
  
  **divisor** must be a value between 0 and **VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor**, inclusive

- **VUID-VkVertexInputBindingDescription2EXT-divisor-06227**
  
  If divisor is not 1 then **inputRate** must be of type **VK_VERTEX_INPUT_RATE_INSTANCE**

### Valid Usage (Implicit)

- **VUID-VkVertexInputBindingDescription2EXT-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_VERTEX_INPUT_BINDING_DESCRIPTION_2_EXT**

- **VUID-VkVertexInputBindingDescription2EXT-inputRate-parameter**
  
  **inputRate** must be a valid **VkVertexInputRate** value

The **VkVertexInputAttributeDescription2EXT** structure is defined as:
typedef struct VkVertexInputAttributeDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t location;
    uint32_t binding;
    VkFormat format;
    uint32_t offset;
} VkVertexInputAttributeDescription2EXT;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `location` is the shader input location number for this attribute.
- `binding` is the binding number which this attribute takes its data from.
- `format` is the size and type of the vertex attribute data.
- `offset` is a byte offset of this attribute relative to the start of an element in the vertex input binding.

### Valid Usage

- **VUID-VkVertexInputAttributeDescription2EXT-location-06228**
  `location` must be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- **VUID-VkVertexInputAttributeDescription2EXT-binding-06229**
  `binding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-VkVertexInputAttributeDescription2EXT-offset-06230**
  `offset` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributeOffset`

- **VUID-VkVertexInputAttributeDescription2EXT-format-04805**
  `format` must be allowed as a vertex buffer format, as specified by the `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT` flag in `VkFormatProperties::bufferFeatures` returned by `vkGetPhysicalDeviceFormatProperties`

- **VUID-VkVertexInputAttributeDescription2EXT-vertexAttributeAccessBeyondStride-04806**
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride` is `VK_FALSE`, the sum of `offset` plus the size of the vertex attribute data described by `format` must not be greater than `stride` in the `VkVertexInputBindingDescription2EXT` referenced in `binding`
Valid Usage (Implicit)

- VUID-VkVertexInputAttributeDescription2EXT-sType-sType
  
sType must be VK_STRUCTURE_TYPE_VERTEX_INPUT_ATTRIBUTE_DESCRIPTION_2_EXT

- VUID-VkVertexInputAttributeDescription2EXT-format-parameter
  
format must be a valid VkFormat value

To bind vertex buffers to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindVertexBuffers(
    VkCommandBuffer commandBuffer,          // commandBuffer is the command buffer into which the command is recorded.
    uint32_t firstBinding,                   // firstBinding is the index of the first vertex input binding whose state is updated by the command.
    uint32_t bindingCount,                   // bindingCount is the number of vertex input bindings whose state is updated by the command.
    const VkBuffer* pBuffers,               // pBuffers is a pointer to an array of buffer handles.
    const VkDeviceSize* pOffsets);         // pOffsets is a pointer to an array of buffer offsets.
```

The values taken from elements \( i \) of \( pBuffers \) and \( pOffsets \) replace the current state for the vertex input binding \( firstBinding + i \), for \( i \) in \( [0, bindingCount) \). The vertex input binding is updated to start at the offset indicated by \( pOffsets[i] \) from the start of the buffer \( pBuffers[i] \). All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the nullDescriptor feature is enabled, elements of \( pBuffers \) can be VK_NULL_HANDLE, and can be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is VK_NULL_HANDLE, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with \((0,0,1)\).
Valid Usage

- VUID-vkCmdBindVertexBuffers-firstBinding-00624
  `firstBinding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdBindVertexBuffers-firstBinding-00625
  The sum of `firstBinding` and `bindingCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdBindVertexBuffers-pOffsets-00626
  All elements of `pOffsets` must be less than the size of the corresponding element in `pBuffers`

- VUID-vkCmdBindVertexBuffers-pBuffers-00627
  All elements of `pBuffers` must have been created with the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` flag

- VUID-vkCmdBindVertexBuffers-pBuffers-00628
  Each element of `pBuffers` that is non-sparse must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdBindVertexBuffers-pBuffers-04001
  If the `nullDescriptor` feature is not enabled, all elements of `pBuffers` must not be `VK_NULL_HANDLE`

- VUID-vkCmdBindVertexBuffers-pBuffers-04002
  If an element of `pBuffers` is `VK_NULL_HANDLE`, then the corresponding element of `pOffsets` must be zero
Valid Usage (Implicit)

- VUID-vkCmdBindVertexBuffers-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBindVertexBuffers-pBuffers-parameter
  pBuffers must be a valid pointer to an array of bindingCount valid or VK_NULL_HANDLE VkBuffer handles

- VUID-vkCmdBindVertexBuffers-pOffsets-parameter
  pOffsets must be a valid pointer to an array of bindingCount VkDeviceSize values

- VUID-vkCmdBindVertexBuffers-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBindVertexBuffers-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBindVertexBuffers-bindingCount-arraylength
  bindingCount must be greater than 0

- VUID-vkCmdBindVertexBuffers-commonparent
  Both of commandBuffer, and the elements of pBuffers that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Alternatively, to bind vertex buffers, along with their sizes and strides, to a command buffer for use in subsequent drawing commands, call:
void vkCmdBindVertexBuffers2EXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes,
    const VkDeviceSize* pStrides);

- commandBuffer is the command buffer into which the command is recorded.
- firstBinding is the index of the first vertex input binding whose state is updated by the command.
- bindingCount is the number of vertex input bindings whose state is updated by the command.
- pBuffers is a pointer to an array of buffer handles.
- pOffsets is a pointer to an array of buffer offsets.
- pSizes is NULL or a pointer to an array of the size in bytes of vertex data bound from pBuffers.
- pStrides is NULL or a pointer to an array of buffer strides.

The values taken from elements i of pBuffers and pOffsets replace the current state for the vertex input binding firstBinding + i, for i in [0, bindingCount). The vertex input binding is updated to start at the offset indicated by pOffsets[i] from the start of the buffer pBuffers[i]. If pSizes is not NULL then pSizes[i] specifies the bound size of the vertex buffer starting from the corresponding elements of pBuffers[i] plus pOffsets[i]. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the nullDescriptor feature is enabled, elements of pBuffers can be VK_NULL_HANDLE, and can be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is VK_NULL_HANDLE, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with (0,0,1).

If the bound pipeline state object was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled then pStrides[i] specifies the byte stride between consecutive elements within the corresponding buffer. In this case the VkVertexInputBindingDescription::stride state from the pipeline state object is ignored.

If the bound pipeline state object was also created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then vkCmdSetVertexInputEXT can be used instead of vkCmdBindVertexBuffers2EXT to set the stride.
Valid Usage

- VUID-vkCmdBindVertexBuffers2EXT-firstBinding-03355
  firstBinding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-vkCmdBindVertexBuffers2EXT-firstBinding-03356
  The sum of firstBinding and bindingCount must be less than or equal to
  VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-vkCmdBindVertexBuffers2EXT-pOffsets-03357
  All elements of pOffsets must be less than the size of the corresponding element in
  pBuffers

- VUID-vkCmdBindVertexBuffers2EXT-pSizes-03358
  If pSizes is not NULL, all elements of pOffsets plus pSizes must be less than or equal to
  the size of the corresponding element in pBuffers

- VUID-vkCmdBindVertexBuffers2EXT-pBuffers-03359
  All elements of pBuffers must have been created with the
  VK_BUFFER_USAGE_VERTEX_BUFFER_BIT flag

- VUID-vkCmdBindVertexBuffers2EXT-pBuffers-03360
  Each element of pBuffers that is non-sparse must be bound completely and contiguously
  to a single VkDeviceMemory object

- VUID-vkCmdBindVertexBuffers2EXT-pBuffers-04111
  If the nullDescriptor feature is not enabled, all elements of pBuffers must not be
  VK_NULL_HANDLE

- VUID-vkCmdBindVertexBuffers2EXT-pBuffers-04112
  If an element of pBuffers is VK_NULL_HANDLE, then the corresponding element of
  pOffsets must be zero

- VUID-vkCmdBindVertexBuffers2EXT-pStrides-03362
  If pStrides is not NULL each element of pStrides must be less than or equal to
  VkPhysicalDeviceLimits::maxVertexInputBindingStride

- VUID-vkCmdBindVertexBuffers2EXT-pStrides-06209
  If pStrides is not NULL each element of pStrides must be either 0 or greater than or equal
  to the maximum extent of all vertex input attributes fetched from the corresponding
  binding, where the extent is calculated as the VkVertexInputAttributeDescription::offset
  plus VkVertexInputAttributeDescription::format size
Valid Usage (Implicit)

- VUID-vkCmdBindVertexBuffers2EXT-commandBuffer-parameter
  **commandBuffer** must be a valid **VkCommandBuffer** handle

- VUID-vkCmdBindVertexBuffers2EXT-pBuffers-parameter
  **pBuffers** must be a valid pointer to an array of **bindingCount** valid or **VK_NULL_HANDLE** **VkBuffer** handles

- VUID-vkCmdBindVertexBuffers2EXT-pOffsets-parameter
  **pOffsets** must be a valid pointer to an array of **bindingCount** **VkDeviceSize** values

- VUID-vkCmdBindVertexBuffers2EXT-pSizes-parameter
  If **pSizes** is not **NULL**, **pSizes** must be a valid pointer to an array of **bindingCount** **VkDeviceSize** values

- VUID-vkCmdBindVertexBuffers2EXT-pStrides-parameter
  If **pStrides** is not **NULL**, **pStrides** must be a valid pointer to an array of **bindingCount** **VkDeviceSize** values

- VUID-vkCmdBindVertexBuffers2EXT-commandBuffer-recording
  **commandBuffer** must be in the **recording** state

- VUID-vkCmdBindVertexBuffers2EXT-commandBuffer-cmdpool
  The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations

- VUID-vkCmdBindVertexBuffers2EXT-bindingCount-arraylength
  If any of **pSizes**, or **pStrides** are not **NULL**, **bindingCount** must be greater than **0**

- VUID-vkCmdBindVertexBuffers2EXT-commonparent
  Both of **commandBuffer**, and the elements of **pBuffers** that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same **VkDevice**

Host Synchronization

- Host access to **commandBuffer** must be externally synchronized

- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

22.3. Vertex Attribute Divisor in Instanced Rendering

If `vertexAttributeInstanceRateDivisor` feature is enabled and the `pNext` chain of `VkPipelineVertexInputStateCreateInfo` includes a `VkPipelineVertexInputDivisorStateCreateInfoEXT` structure, then that structure controls how vertex attributes are assigned to an instance when instanced rendering is enabled.

The `VkPipelineVertexInputDivisorStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkPipelineVertexInputDivisorStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t vertexBindingDivisorCount;
    const VkVertexInputBindingDivisorDescriptionEXT* pVertexBindingDivisors;
} VkPipelineVertexInputDivisorStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexBindingDivisorCount` is the number of elements in the `pVertexBindingDivisors` array.
- `pVertexBindingDivisors` is a pointer to an array of `VkVertexInputBindingDivisorDescriptionEXT` structures, which specifies the divisor value for each binding.

**Valid Usage (Implicit)**

- `VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_EXT`
- `VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-pVertexBindingDivisors-parameter` `pVertexBindingDivisors` must be a valid pointer to an array of `vertexBindingDivisorCount` `VkVertexInputBindingDivisorDescriptionEXT` structures
- `VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-vertexBindingDivisorCount-arraylength` `vertexBindingDivisorCount` must be greater than 0

The individual divisor values per binding are specified using the `VkVertexInputBindingDivisorDescriptionEXT` structure which is defined as:

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkVertexInputBindingDivisorDescriptionEXT {
    uint32_t binding;
    uint32_t divisor;
} VkVertexInputBindingDivisorDescriptionEXT;
```

- `binding` is the binding number for which the divisor is specified.
• **divisor** is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of divisor is implementation-dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`. A value of 0 can be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.

If this structure is not used to define a divisor value for an attribute, then the divisor has a logical default value of 1.

**Valid Usage**

- VUID-VkVertexInputBindingDivisorDescriptionEXT-binding-01869
  
  binding must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkVertexInputBindingDivisorDescriptionEXT-vertexAttributeInstanceRateZeroDivisor-02228
  
  If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, divisor must not be 0

- VUID-VkVertexInputBindingDivisorDescriptionEXT-vertexAttributeInstanceRateDivisor-02229
  
  If the `vertexAttributeInstanceRateDivisor` feature is not enabled, divisor must be 1

- VUID-VkVertexInputBindingDivisorDescriptionEXT-divisor-01870
  
  divisor must be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`, inclusive

- VUID-VkVertexInputBindingDivisorDescriptionEXT-inputRate-01871
  
  `VkVertexInputBindingDescription::inputRate` must be of type `VK_VERTEX_INPUT_RATE_INSTANCE` for this binding

The address of each attribute for each `vertexIndex` and `instanceIndex` is calculated as follows:

- Let `attribDesc` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexAttributeDescriptions` with `VkVertexInputAttributeDescription::location` equal to the vertex input attribute number.

- Let `bindingDesc` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexBindingDescriptions` with `VkVertexInputAttributeDescription::binding` equal to `attribDesc.binding`.

- Let `vertexIndex` be the index of the vertex within the draw (a value between `firstVertex` and `firstVertex+vertexCount` for `vkCmdDraw`, or a value taken from the index buffer for `vkCmdDrawIndexed`), and let `instanceIndex` be the instance number of the draw (a value between `firstInstance` and `firstInstance+instanceCount`).

- Let `divisor` be the member of `VkPipelineVertexInputDivisorStateCreateInfoEXT::pVertexBindingDivisors` with `VkVertexInputBindingDivisorDescriptionEXT::binding` equal to `attribDesc.binding`.

Chapter 22. Fixed-Function Vertex Processing | 1441
bufferBindingAddress = buffer[binding].baseAddress + offset[binding];

if (bindingDesc.inputRate == VK_VERTEX_INPUT_RATE_VERTEX)
    vertexOffset = vertexIndex * bindingDesc.stride;
else
    if (divisor == 0)
        vertexOffset = firstInstance * bindingDesc.stride;
    else
        vertexOffset = (firstInstance + ((instanceIndex - firstInstance) / divisor)) *
            bindingDesc.stride;

attribAddress = bufferBindingAddress + vertexOffset + attribDesc.offset;

For each attribute, raw data is extracted starting at attribAddress and is converted from the
VkVertexInputAttributeDescription's format to either floating-point, unsigned integer, or signed
integer based on the base type of the format; the base type of the format must match the base type
of the input variable in the shader. The input variable in the shader must be declared as a 64-bit
data type if and only if format is a 64-bit data type. If format is a packed format, attribAddress must
be a multiple of the size in bytes of the whole attribute data type as described in Packed Formats.
Otherwise, attribAddress must be a multiple of the size in bytes of the component type indicated by
format (see Formats). For attributes that are not 64-bit data types, each component is converted to
the format of the input variable based on its type and size (as defined in the Format Definition
section for each VkFormat), using the appropriate equations in 16-Bit Floating-Point Numbers,
Unsigned 11-Bit Floating-Point Numbers, Unsigned 10-Bit Floating-Point Numbers, Fixed-Point Data
Conversion, and Shared Exponent to RGB. Signed integer components smaller than 32 bits are sign-
extended. Attributes that are not 64-bit data types are expanded to four components in the same
way as described in conversion to RGBA. The number of components in the vertex shader input
variable need not exactly match the number of components in the format. If the vertex shader has
fewer components, the extra components are discarded.
Tessellation involves three pipeline stages. First, a **tessellation control shader** transforms control points of a patch and can produce per-patch data. Second, a fixed-function tessellator generates multiple primitives corresponding to a tessellation of the patch in \((u,v)\) or \((u,v,w)\) parameter space. Third, a **tessellation evaluation shader** transforms the vertices of the tessellated patch, for example to compute their positions and attributes as part of the tessellated surface. The tessellator is enabled when the pipeline contains both a tessellation control shader and a tessellation evaluation shader.

### 23.1. Tessellator

If a pipeline includes both tessellation shaders (control and evaluation), the tessellator consumes each input patch (after vertex shading) and produces a new set of independent primitives (points, lines, or triangles). These primitives are logically produced by subdividing a geometric primitive (rectangle or triangle) according to the per-patch outer and inner tessellation levels written by the tessellation control shader. These levels are specified using the built-in variables `TessLevelOuter` and `TessLevelInner`, respectively. This subdivision is performed in an implementation-dependent manner. If no tessellation shaders are present in the pipeline, the tessellator is disabled and incoming primitives are passed through without modification.

The type of subdivision performed by the tessellator is specified by an `OpExecutionMode` instruction in the tessellation evaluation or tessellation control shader using one of execution modes `Triangles`, `Quads`, and `IsoLines`. Other tessellation-related execution modes can also be specified in either the tessellation control or tessellation evaluation shaders, and if they are specified in both then the modes must be the same.

Tessellation execution modes include:

- **Triangles**, **Quads**, and **IsoLines**. These control the type of subdivision and topology of the output primitives. One mode must be set in at least one of the tessellation shader stages. If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines` is `VK_FALSE`, then isoline tessellation is not supported by the implementation, and `IsoLines` must not be used in either tessellation shader stage.

- **VertexOrderCw** and **VertexOrderCcw**. These control the orientation of triangles generated by the tessellator. One mode must be set in at least one of the tessellation shader stages.

- **PointMode**. Controls generation of points rather than triangles or lines. This functionality defaults to disabled, and is enabled if either shader stage includes the execution mode. If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode` is `VK_FALSE`, then point mode tessellation is not supported by the implementation, and `PointMode` must not be used in either tessellation shader stage.

- **SpacingEqual**, **SpacingFractionalEven**, and **SpacingFractionalOdd**. Controls the spacing of segments on the edges of tessellated primitives. One mode must be set in at least one of the tessellation shader stages.
• **OutputVertices.** Controls the size of the output patch of the tessellation control shader. One value **must** be set in at least one of the tessellation shader stages.

For triangles, the tessellator subdivides a triangle primitive into smaller triangles. For quads, the tessellator subdivides a rectangle primitive into smaller triangles. For isolines, the tessellator subdivides a rectangle primitive into a collection of line segments arranged in strips stretching across the rectangle in the u dimension (i.e. the coordinates in TessCoord are of the form (0,x) through (1,x) for all tessellation evaluation shader invocations that share a line).

Each vertex produced by the tessellator has an associated (u,v,w) or (u,v) position in a normalized parameter space, with parameter values in the range [0,1], as illustrated in figures **Domain parameterization for tessellation primitive modes (upper-left origin)** and **Domain parameterization for tessellation primitive modes (lower-left origin)**. The domain space can have either an upper-left or lower-left origin, selected by the `domainOrigin` member of `VkPipelineTessellationDomainOriginStateCreateInfo`.

![Domain parameterization for tessellation primitive modes](image)

*Figure 12. Domain parameterization for tessellation primitive modes (upper-left origin)*
In the domain parameterization diagrams, the coordinates illustrate the value of \textit{TessCoord} at the corners of the domain. The labels on the edges indicate the inner (IL0 and IL1) and outer (OL0 through OL3) tessellation level values used to control the number of subdivisions along each edge of the domain.

For triangles, the vertex’s position is a barycentric coordinate \((u,v,w)\), where \(u + v + w = 1.0\), and indicates the relative influence of the three vertices of the triangle on the position of the vertex. For quads and isolines, the position is a \((u,v)\) coordinate indicating the relative horizontal and vertical position of the vertex relative to the subdivided rectangle. The subdivision process is explained in more detail in subsequent sections.

### 23.2. Tessellator Patch Discard

A patch is discarded by the tessellator if any relevant outer tessellation level is less than or equal to zero.

Patches will also be discarded if any relevant outer tessellation level corresponds to a floating-point \textit{NaN} (not a number) in implementations supporting \textit{NaN}.

No new primitives are generated and the tessellation evaluation shader is not executed for patches that are discarded. For \textit{Quads}, all four outer levels are relevant. For \textit{Triangles} and \textit{Isolines}, only the first three or two outer levels, respectively, are relevant. Negative inner levels will not cause a patch to be discarded; they will be clamped as described below.
23.3. Tessellator Spacing

Each of the tessellation levels is used to determine the number and spacing of segments used to subdivide a corresponding edge. The method used to derive the number and spacing of segments is specified by an \texttt{OpExecutionMode} in the tessellation control or tessellation evaluation shader using one of the identifiers \texttt{SpacingEqual}, \texttt{SpacingFractionalEven}, or \texttt{SpacingFractionalOdd}.

If \texttt{SpacingEqual} is used, the floating-point tessellation level is first clamped to \([1, \text{maxLevel}]\), where \texttt{maxLevel} is the implementation-dependent maximum tessellation level (\texttt{VkPhysicalDeviceLimits::maxTessellationGenerationLevel}). The result is rounded up to the nearest integer \(n\), and the corresponding edge is divided into \(n\) segments of equal length in \((u,v)\) space.

If \texttt{SpacingFractionalEven} is used, the tessellation level is first clamped to \([2, \text{maxLevel}]\) and then rounded up to the nearest even integer \(n\). If \texttt{SpacingFractionalOdd} is used, the tessellation level is clamped to \([1, \text{maxLevel} - 1]\) and then rounded up to the nearest odd integer \(n\). If \(n\) is one, the edge will not be subdivided. Otherwise, the corresponding edge will be divided into \(n - 2\) segments of equal length, and two additional segments of equal length that are typically shorter than the other segments. The length of the two additional segments relative to the others will decrease monotonically with \(n - f\), where \(f\) is the clamped floating-point tessellation level. When \(n - f\) is zero, the additional segments will have equal length to the other segments. As \(n - f\) approaches 2.0, the relative length of the additional segments approaches zero. The two additional segments must be placed symmetrically on opposite sides of the subdivided edge. The relative location of these two segments is implementation-dependent, but must be identical for any pair of subdivided edges with identical values of \(f\).

When tessellating triangles or quads using \texttt{point mode} with fractional odd spacing, the tessellator may produce \textit{interior vertices} that are positioned on the edge of the patch if an inner tessellation level is less than or equal to one. Such vertices are considered distinct from vertices produced by subdividing the outer edge of the patch, even if there are pairs of vertices with identical coordinates.

23.4. Tessellation Primitive Ordering

Few guarantees are provided for the relative ordering of primitives produced by tessellation, as they pertain to \textit{primitive order}.

- The output primitives generated from each input primitive are passed to subsequent pipeline stages in an implementation-dependent order.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.

23.5. Tessellator Vertex Winding Order

When the tessellator produces triangles (in the \texttt{Triangles} or \texttt{Quads} modes), the orientation of all triangles is specified with an \texttt{OpExecutionMode} of \texttt{VertexOrderCw} or \texttt{VertexOrderCcw} in the tessellation control or tessellation evaluation shaders. If the order is \texttt{VertexOrderCw}, the vertices of all generated triangles will have clockwise ordering in \((u,v)\) or \((u,v,w)\) space. If the order is \texttt{VertexOrderCcw}, the
vertices will have counter-clockwise ordering in that space.

If the tessellation domain has an upper-left origin, the vertices of a triangle have counter-clockwise ordering if

\[ a = u_0 v_1 - u_1 v_0 + u_1 v_2 - u_2 v_1 + u_2 v_0 - u_0 v_2 \]

is negative, and clockwise ordering if \( a \) is positive. \( u_i \) and \( v_i \) are the \( u \) and \( v \) coordinates in normalized parameter space of the \( i \)th vertex of the triangle. If the tessellation domain has a lower-left origin, the vertices of a triangle have counter-clockwise ordering if \( a \) is positive, and clockwise ordering if \( a \) is negative.

**Note**

The value \( a \) is proportional (with a positive factor) to the signed area of the triangle.

In **Triangles** mode, even though the vertex coordinates have a \( w \) value, it does not participate directly in the computation of \( a \), being an affine combination of \( u \) and \( v \).

### 23.6. Triangle Tessellation

If the tessellation primitive mode is **Triangles**, an equilateral triangle is subdivided into a collection of triangles covering the area of the original triangle. First, the original triangle is subdivided into a collection of concentric equilateral triangles. The edges of each of these triangles are subdivided, and the area between each triangle pair is filled by triangles produced by joining the vertices on the subdivided edges. The number of concentric triangles and the number of subdivisions along each triangle except the outermost is derived from the first inner tessellation level. The edges of the outermost triangle are subdivided independently, using the first, second, and third outer tessellation levels to control the number of subdivisions of the \( u = 0 \) (left), \( v = 0 \) (bottom), and \( w = 0 \) (right) edges, respectively. The second inner tessellation level and the fourth outer tessellation level have no effect in this mode.

If the first inner tessellation level and all three outer tessellation levels are exactly one after clamping and rounding, only a single triangle with \((u,v,w)\) coordinates of \((0,0,1)\), \((1,0,0)\), and \((0,1,0)\) is generated. If the inner tessellation level is one and any of the outer tessellation levels is greater than one, the inner tessellation level is treated as though it were originally specified as \(1 + \varepsilon\) and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the triangle.

If any tessellation level is greater than one, tessellation begins by producing a set of concentric inner triangles and subdividing their edges. First, the three outer edges are temporarily subdivided using the clamped and rounded first inner tessellation level and the specified tessellation spacing, generating \( n \) segments. For the outermost inner triangle, the inner triangle is degenerate — a single point at the center of the triangle — if \( n \) is two. Otherwise, for each corner of the outer triangle, an inner triangle corner is produced at the intersection of two lines extended perpendicular to the
corner’s two adjacent edges running through the vertex of the subdivided outer edge nearest that corner. If \( n \) is three, the edges of the inner triangle are not subdivided and it is the final triangle in the set of concentric triangles. Otherwise, each edge of the inner triangle is divided into \( n - 2 \) segments, with the \( n - 1 \) vertices of this subdivision produced by intersecting the inner edge with lines perpendicular to the edge running through the \( n - 1 \) innermost vertices of the subdivision of the outer edge. Once the outermost inner triangle is subdivided, the previous subdivision process repeats itself, using the generated triangle as an outer triangle. This subdivision process is illustrated in Inner Triangle Tessellation.

![Inner Triangle Tessellation](image)

**Figure 14. Inner Triangle Tessellation**

### Caption

In the Inner Triangle Tessellation diagram, inner tessellation levels of (a) five and (b) four are shown (not to scale). Solid black circles depict vertices along the edges of the concentric triangles. The edges of inner triangles are subdivided by intersecting the edge with segments perpendicular to the edge passing through each inner vertex of the subdivided outer edge. Dotted lines depict edges connecting corresponding vertices on the inner and outer triangle edges.

Once all the concentric triangles are produced and their edges are subdivided, the area between each pair of adjacent inner triangles is filled completely with a set of non-overlapping triangles. In this subdivision, two of the three vertices of each triangle are taken from adjacent vertices on a subdivided edge of one triangle; the third is one of the vertices on the corresponding edge of the other triangle. If the innermost triangle is degenerate (i.e., a point), the triangle containing it is subdivided into six triangles by connecting each of the six vertices on that triangle with the center point. If the innermost triangle is not degenerate, that triangle is added to the set of generated triangles as-is.

After the area corresponding to any inner triangles is filled, the tessellator generates triangles to cover the area between the outermost triangle and the outermost inner triangle. To do this, the temporary subdivision of the outer triangle edge above is discarded. Instead, the \( u = 0, v = 0, \) and \( w = 0 \) edges are subdivided according to the first, second, and third outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the first inner triangle is retained. The area between the outer and first inner triangles is completely filled by non-overlapping triangles as described above. If the first (and only) inner triangle is degenerate, a set of triangles is produced by connecting each vertex on the outer triangle edges with the center point.
After all triangles are generated, each vertex in the subdivided triangle is assigned a barycentric 
(u,v,w) coordinate based on its location relative to the three vertices of the outer triangle.

The algorithm used to subdivide the triangular domain in (u,v,w) space into individual triangles is 
implementation-dependent. However, the set of triangles produced will completely cover the 
domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in 
which each triangle is generated, and the order in which the vertices are generated for each 
triangle, are implementation-dependent. However, the order of vertices in each triangle is 
consistent across the domain as described in Tessellator Vertex Winding Order.

23.7. Quad Tessellation

If the tessellation primitive mode is Quads, a rectangle is subdivided into a collection of triangles 
covering the area of the original rectangle. First, the original rectangle is subdivided into a regular 
mesh of rectangles, where the number of rectangles along the u = 0 and u = 1 (vertical) and v = 0 
and v = 1 (horizontal) edges are derived from the first and second inner tessellation levels, 
respectively. All rectangles, except those adjacent to one of the outer rectangle edges, are 
decomposed into triangle pairs. The outermost rectangle edges are subdivided independently, using 
the first, second, third, and fourth outer tessellation levels to control the number of subdivisions of 
the u = 0 (left), v = 0 (bottom), u = 1 (right), and v = 1 (top) edges, respectively. The area between the 
inner rectangles of the mesh and the outer rectangle edges are filled by triangles produced by 
joining the vertices on the subdivided outer edges to the vertices on the edge of the inner rectangle mesh.

If both clamped inner tessellation levels and all four clamped outer tessellation levels are exactly 
one, only a single triangle pair covering the outer rectangle is generated. Otherwise, if either 
clamped inner tessellation level is one, that tessellation level is treated as though it was originally 
specified as 1 + ε and will result in a two- or three-segment subdivision depending on the 
tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may 
produce inner vertices positioned on the edge of the rectangle.

If any tessellation level is greater than one, tessellation begins by subdividing the u = 0 and u = 1 
edges of the outer rectangle into m segments using the clamped and rounded first inner tessellation 
level and the tessellation spacing. The v = 0 and v = 1 edges are subdivided into n segments using 
the second inner tessellation level. Each vertex on the u = 0 and v = 0 edges are joined with the 
corresponding vertex on the u = 1 and v = 1 edges to produce a set of vertical and horizontal lines 
that divide the rectangle into a grid of smaller rectangles. The primitive generator emits a pair of 
non-overlapping triangles covering each such rectangle not adjacent to an edge of the outer 
rectangle. The boundary of the region covered by these triangles forms an inner rectangle, the 
edges of which are subdivided by the grid vertices that lie on the edge. If either m or n is two, the 
inner rectangle is degenerate, and one or both of the rectangle’s edges consist of a single point. This 
subdivision is illustrated in Figure Inner Quad Tessellation.
In the Inner Quad Tessellation diagram, inner quad tessellation levels of (a) (4,2) and (b) (7,4) are shown. The regions highlighted in red in figure (b) depict the 10 inner rectangles, each of which will be subdivided into two triangles. Solid black circles depict vertices on the boundary of the outer and inner rectangles, where the inner rectangle of figure (a) is degenerate (a single line segment). Dotted lines depict the horizontal and vertical edges connecting corresponding vertices on the inner and outer rectangle edges.

After the area corresponding to the inner rectangle is filled, the tessellator must produce triangles to cover the area between the inner and outer rectangles. To do this, the subdivision of the outer rectangle edge above is discarded. Instead, the $u = 0$, $v = 0$, $u = 1$, and $v = 1$ edges are subdivided according to the first, second, third, and fourth outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the inner rectangle is retained. The area between the outer and inner rectangles is completely filled by non-overlapping triangles. Two of the three vertices of each triangle are adjacent vertices on a subdivided edge of one rectangle; the third is one of the vertices on the corresponding edge of the other rectangle. If either edge of the innermost rectangle is degenerate, the area near the corresponding outer edges is filled by connecting each vertex on the outer edge with the single vertex making up the inner edge.

The algorithm used to subdivide the rectangular domain in $(u,v)$ space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is consistent across the domain as described in Tessellator Vertex Winding Order.

### 23.8. Isoline Tessellation

If the tessellation primitive mode is Isolines, a set of independent horizontal line segments is drawn. The segments are arranged into connected strips called isolines, where the vertices of each isoline have a constant $v$ coordinate and $u$ coordinates covering the full range $[0,1]$. The number of
isolines generated is derived from the first outer tessellation level; the number of segments in each isoline is derived from the second outer tessellation level. Both inner tessellation levels and the third and fourth outer tessellation levels have no effect in this mode.

As with quad tessellation above, isoline tessellation begins with a rectangle. The \( u = 0 \) and \( u = 1 \) edges of the rectangle are subdivided according to the first outer tessellation level. For the purposes of this subdivision, the tessellation spacing mode is ignored and treated as equal_spacing. An isoline is drawn connecting each vertex on the \( u = 0 \) rectangle edge to the corresponding vertex on the \( u = 1 \) rectangle edge, except that no line is drawn between \((0,1)\) and \((1,1)\). If the number of isolines on the subdivided \( u = 0 \) and \( u = 1 \) edges is \( n \), this process will result in \( n \) equally spaced lines with constant \( v \) coordinates of \( 0, \frac{1}{n}, \frac{2}{n}, ..., \frac{n-1}{n} \).

Each of the \( n \) isolines is then subdivided according to the second outer tessellation level and the tessellation spacing, resulting in \( m \) line segments. Each segment of each line is emitted by the tessellator. These line segments are generated with a topology similar to line lists, except that the order in which each line is generated, and the order in which the vertices are generated for each line segment, are implementation-dependent.

**Note**

If the \texttt{VK_KHR_portability_subset} extension is enabled, and \texttt{VkPhysicalDevicePortabilitySubsetFeaturesKHR:tessellationIsolines} is \texttt{VK_FALSE}, then isoline tessellation is not supported by the implementation.

### 23.9. Tessellation Point Mode

For all primitive modes, the tessellator is capable of generating points instead of lines or triangles. If the tessellation control or tessellation evaluation shader specifies the \texttt{OpExecutionMode PointMode}, the primitive generator will generate one point for each distinct vertex produced by tessellation, rather than emitting triangles or lines. Otherwise, the tessellator will produce a collection of line segments or triangles according to the primitive mode. These points are generated with a topology similar to point lists, except the order in which the points are generated for each input primitive is undefined.

**Note**

If the \texttt{VK_KHR_portability_subset} extension is enabled, and \texttt{VkPhysicalDevicePortabilitySubsetFeaturesKHR:tessellationPointMode} is \texttt{VK_FALSE}, then tessellation point mode is not supported by the implementation.

### 23.10. Tessellation Pipeline State

The \texttt{pTessellationState} member of \texttt{VkGraphicsPipelineCreateInfo} is a pointer to a \texttt{VkPipelineTessellationStateCreateInfo} structure.

The \texttt{VkPipelineTessellationStateCreateInfo} structure is defined as:
// Provided by VK_VERSION_1_0

typedef struct VkPipelineTessellationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineTessellationStateCreateFlags flags;
    uint32_t patchControlPoints;
} VkPipelineTessellationStateCreateInfo;

• **sType** is the type of this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **flags** is reserved for future use.
• **patchControlPoints** is the number of control points per patch.

### Valid Usage

- VUID-VkPipelineTessellationStateCreateInfo-patchControlPoints-01214
  
  `patchControlPoints` must be greater than zero and less than or equal to
  `VkPhysicalDeviceLimits::maxTessellationPatchSize`

### Valid Usage (Implicit)

- VUID-VkPipelineTessellationStateCreateInfo-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO`

- VUID-VkPipelineTessellationStateCreateInfo-pNext-pNext
  
  **pNext** must be `NULL` or a pointer to a valid instance of
  `VkPipelineTessellationDomainOriginStateCreateInfo`

- VUID-VkPipelineTessellationStateCreateInfo-sType-unique
  
  The **sType** value of each struct in the **pNext** chain must be unique

- VUID-VkPipelineTessellationStateCreateInfo-flags-zerobitmask
  
  **flags** must be 0

// Provided by VK_VERSION_1_0

typedef VkFlags VkPipelineTessellationStateCreateFlags;

**VkPipelineTessellationStateCreateFlags** is a bitmask type for setting a mask, but is currently reserved for future use.

The **VkPipelineTessellationDomainOriginStateCreateInfo** structure is defined as:
typedef struct VkPipelineTessellationDomainOriginStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkTessellationDomainOrigin domainOrigin;
} VkPipelineTessellationDomainOriginStateCreateInfo;

or the equivalent

// Provided by VK_KHR_maintenance2
typedef VkPipelineTessellationDomainOriginStateCreateInfo
VkPipelineTessellationDomainOriginStateCreateInfoKHR;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• domainOrigin is a VkTessellationDomainOrigin value controlling the origin of the tessellation domain space.

If the VkPipelineTessellationDomainOriginStateCreateInfo structure is included in the pNext chain of VkPipelineTessellationStateCreateInfo, it controls the origin of the tessellation domain. If this structure is not present, it is as if domainOrigin was VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT.

Valid Usage (Implicit)

• VUID-VkPipelineTessellationDomainOriginStateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_DOMAIN_ORIGIN_STATE_CREATE_INFO
• VUID-VkPipelineTessellationDomainOriginStateCreateInfo-domainOrigin-parameter
  domainOrigin must be a valid VkTessellationDomainOrigin value

The possible tessellation domain origins are specified by the VkTessellationDomainOrigin enumeration:

typedef enum VkTessellationDomainOrigin {
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT = 0,
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT = 1,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT_KHR =
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT_KHR =
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT,
} VkTessellationDomainOrigin;

or the equivalent
// Provided by VK_KHR_maintenance2

typedef VkTessellationDomainOrigin VkTessellationDomainOriginKHR;

- **VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT** specifies that the origin of the domain space is in the upper left corner, as shown in figure [Domain parameterization for tessellation primitive modes (upper-left origin)](figure).

- **VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT** specifies that the origin of the domain space is in the lower left corner, as shown in figure [Domain parameterization for tessellation primitive modes (lower-left origin)](figure).

This enum affects how the `VertexOrderCw` and `VertexOrderCcw` tessellation execution modes are interpreted, since the winding is defined relative to the orientation of the domain.
Chapter 24. Geometry Shading

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive. Geometry shading is enabled when a geometry shader is included in the pipeline.

24.1. Geometry Shader Input Primitives

Each geometry shader invocation has access to all vertices in the primitive (and their associated data), which are presented to the shader as an array of inputs.

The input primitive type expected by the geometry shader is specified with an OpExecutionMode instruction in the geometry shader, and must match the incoming primitive type specified by either the pipeline’s primitive topology if tessellation is inactive, or the tessellation mode if tessellation is active, as follows:

- An input primitive type of InputPoints must only be used with a pipeline topology of VK_PRIMITIVE_TOPOLOGY_POINT_LIST, or with a tessellation shader that specifies PointMode. The input arrays always contain one element, as described by the point list topology or tessellation in point mode.

- An input primitive type of InputLines must only be used with a pipeline topology of VK_PRIMITIVE_TOPOLOGY_LINE_LIST or VK_PRIMITIVE_TOPOLOGY_LINE_STRIP, or with a tessellation shader specifying IsoLines that does not specify PointMode. The input arrays always contain two elements, as described by the line list topology or line strip topology, or by isoline tessellation.

- An input primitive type of InputLinesAdjacency must only be used when tessellation is inactive, with a pipeline topology of VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY or VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY. The input arrays always contain four elements, as described by the line list with adjacency topology or line strip with adjacency topology.

- An input primitive type of Triangles must only be used with a pipeline topology of VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP, or VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN; or with a tessellation shader specifying Quads or Triangles that does not specify PointMode. The input arrays always contain three elements, as described by the triangle list topology, triangle strip topology, or triangle fan topology, or by triangle or quad tessellation. Vertices may be in a different absolute order to that specified by the topology, but must adhere to the specified winding order.

- An input primitive type of InputTrianglesAdjacency must only be used when tessellation is inactive, with a pipeline topology of VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY or VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY. The input arrays always contain six elements, as described by the triangle list with adjacency topology or triangle strip with adjacency topology. Vertices may be in a different absolute order to that specified by the topology, but must adhere to the specified winding order, and the vertices making up the main primitive must still occur at the first, third, and fifth index.
24.2. Geometry Shader Output Primitives

A geometry shader generates primitives in one of three output modes: points, line strips, or triangle strips. The primitive mode is specified in the shader using an `OpExecutionMode` instruction with the `OutputPoints`, `OutputLineStrip` or `OutputTriangleStrip` modes, respectively. Each geometry shader must include exactly one output primitive mode.

The vertices output by the geometry shader are assembled into points, lines, or triangles based on the output primitive type and the resulting primitives are then further processed as described in Rasterization. If the number of vertices emitted by the geometry shader is not sufficient to produce a single primitive, vertices corresponding to incomplete primitives are not processed by subsequent pipeline stages. The number of vertices output by the geometry shader is limited to a maximum count specified in the shader.

The maximum output vertex count is specified in the shader using an `OpExecutionMode` instruction with the mode set to `OutputVertices` and the maximum number of vertices that will be produced by the geometry shader specified as a literal. Each geometry shader must specify a maximum output vertex count.

24.3. Multiple Invocations of Geometry Shaders

Geometry shaders can be invoked more than one time for each input primitive. This is known as geometry shader instancing and is requested by including an `OpExecutionMode` instruction with mode specified as `Invocations` and the number of invocations specified as an integer literal.

In this mode, the geometry shader will execute at least \( n \) times for each input primitive, where \( n \) is the number of invocations specified in the `OpExecutionMode` instruction. The instance number is available to each invocation as a built-in input using `InvocationId`.

24.4. Geometry Shader Primitive Ordering

Limited guarantees are provided for the relative ordering of primitives produced by a geometry shader, as they pertain to primitive order.

- For instanced geometry shaders, the output primitives generated from each input primitive are passed to subsequent pipeline stages using the invocation number to order the primitives, from least to greatest.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.

24.5. Geometry Shader Passthrough

A geometry shader that uses the `PassthroughNV` decoration on a variable in its input interface is considered a passthrough geometry shader. Output primitives in a passthrough geometry shader must have the same topology as the input primitive and are not produced by emitting vertices. The vertices of the output primitive have two different types of attributes, per-vertex and per-primitive. Geometry shader input variables with `PassthroughNV` decoration are considered to produce per-
vertex outputs, where values for each output vertex are copied from the corresponding input vertex. Any built-in or user-defined geometry shader outputs are considered per-primitive in a passthrough geometry shader, where a single output value is copied to all output vertices.

The remainder of this section details the usage of the PassthroughNV decoration and modifications to the interface matching rules when using passthrough geometry shaders.

### 24.5.1. PassthroughNV Decoration

Decorating a geometry shader input variable with the PassthroughNV decoration indicates that values of this input are copied through to the corresponding vertex of the output primitive. Input variables and block members which do not have the PassthroughNV decoration are consumed by the geometry shader without being passed through to subsequent stages.

The PassthroughNV decoration must only be used within a geometry shader.

Any variable decorated with PassthroughNV must be declared using the Input storage class.

The PassthroughNV decoration must not be used with any of:

- an input primitive type other than InputPoints, InputLines, or Triangles, as specified by the mode for OpExecutionMode.
- an invocation count other than one, as specified by the Invocations mode for OpExecutionMode.
- an OpEntryPoint which statically uses the Op EmitVertex or OpEndPrimitive instructions.
- a variable decorated with the InvocationId built-in decoration.
- a variable decorated with the PrimitiveId built-in decoration that is declared using the Input storage class.

### 24.5.2. Passthrough Interface Matching

When a passthrough geometry shader is in use, the Interface Matching rules involving the geometry shader input and output interfaces operate as described in this section.

For the purposes of matching passthrough geometry shader inputs with outputs of the previous pipeline stages, the PassthroughNV decoration is ignored.

For the purposes of matching the outputs of the geometry shader with subsequent pipeline stages, each input variable with the PassthroughNV decoration is considered to add an equivalent output variable with the same type, decoration (other than PassthroughNV), number, and declaration order on the output interface. The output variable declaration corresponding to an input variable decorated with PassthroughNV will be identical to the input declaration, except that the outermost array dimension of such variables is removed. The output block declaration corresponding to an input block decorated with PassthroughNV or having members decorated with PassthroughNV will be identical to the input declaration, except that the outermost array dimension of such declaration is removed.

If an input block is decorated with PassthroughNV, the equivalent output block contains all the members of the input block. Otherwise, the equivalent output block contains only those input block
members decorated with `PassthroughNV`. All members of the corresponding output block are assigned `Location` and `Component` decorations identical to those assigned to the corresponding input block members.

Output variables and blocks generated from inputs decorated with `PassthroughNV` will only exist for the purposes of interface matching; these declarations are not available to geometry shader code or listed in the module interface.

For the purposes of component counting, passthrough geometry shaders count all statically used input variable components declared with the `PassthroughNV` decoration as output components as well, since their values will be copied to the output primitive produced by the geometry shader.
Chapter 25. Mesh Shading

Task and mesh shaders operate in workgroups to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline.

Work on the mesh pipeline is initiated by the application drawing a set of mesh tasks organized in global workgroups. If the optional task shader is active, each workgroup triggers the execution of task shader invocations that will create a new set of mesh workgroups upon completion. Each of these created workgroups, or each of the original workgroups if no task shader is present, triggers the execution of mesh shader invocations.

Each mesh shader workgroup emits zero or more output primitives along with the group of vertices and their associated data required for each output primitive.

25.1. Task Shader Input

For every workgroup issued via the drawing commands a group of task shader invocations is executed. There are no inputs other than the builtin workgroup identifiers.

25.2. Task Shader Output

The task shader can emit zero or more mesh workgroups to be generated using the built-in variable TaskCountNV. This value must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV::maxTaskOutputCount.

It can also output user-defined data that is passed as input to all mesh shader invocations that the task creates. These outputs are decorated as PerTaskNV.

25.3. Mesh Generation

If a task shader exists, the mesh assembler creates a variable amount of mesh workgroups depending on each task’s output. If there is no task shader, the drawing commands emit the mesh shader invocations directly.

25.4. Mesh Shader Input

The only inputs available to the mesh shader are variables identifying the specific workgroup and invocation and, if applicable, any outputs written as PerTaskNV by the task shader that spawned the mesh shader’s workgroup. The mesh shader can operate without a task shader as well.

25.5. Mesh Shader Output Primitives

A mesh shader generates primitives in one of three output modes: points, lines, or triangles. The primitive mode is specified in the shader using an OpExecutionMode instruction with the OutputPoints, OutputLinesNV, or OutputTrianglesNV modes, respectively. Each mesh shader must include exactly one output primitive mode.
The maximum output vertex count is specified as a literal in the shader using an `OpExecutionMode` instruction with the mode set to `OutputVertices` and must be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputVertices`.

The maximum output primitive count is specified as a literal in the shader using an `OpExecutionMode` instruction with the mode set to `OutputPrimitivesNV` and must be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputPrimitives`.

The number of primitives output by the mesh shader is provided via writing to the built-in variable `PrimitiveCountNV` and must be less than or equal to the maximum output primitive count specified in the shader. A variable decorated with `PrimitiveIndicesNV` is an output array of local index values into the vertex output arrays from which primitives are assembled according to the output primitive type. These resulting primitives are then further processed as described in Rasterization.

### 25.6. Mesh Shader Per-View Outputs

The mesh shader outputs decorated with the `PositionPerViewNV`, `ClipDistancePerViewNV`, `CullDistancePerViewNV`, `LayerPerViewNV`, and `ViewportMaskPerViewNV` built-in decorations are the per-view versions of the single-view variables with equivalent names (that is `Position`, `ClipDistance`, `CullDistance`, `Layer`, and `ViewportMaskNV`, respectively). If a shader statically assigns a value to any element of a per-view array it must not statically assign a value to the equivalent single-view variable.

Each of these outputs is considered arrayed, with separate values for each view. The view number is used to index the first dimension of these arrays.

The second dimension of the `ClipDistancePerViewNV`, and `CullDistancePerViewNV` arrays have the same requirements as the `ClipDistance`, and `CullDistance` arrays.

If a mesh shader output is per-view, the corresponding fragment shader input is taken from the element of the per-view output array that corresponds to the view that is currently being processed by the fragment shader.

### 25.7. Mesh Shader Primitive Ordering

Following guarantees are provided for the relative ordering of primitives produced by a mesh shader, as they pertain to primitive order.

- When a task shader is used, mesh workgroups spawned from lower tasks will be ordered prior to those workgroups from subsequent tasks.

- All output primitives generated from a given mesh workgroup are passed to subsequent pipeline stages before any output primitives generated from subsequent input workgroups.

- All output primitives within a mesh workgroup, will be generated in the ordering provided by the built-in primitive index buffer (from low address to high address).
Chapter 26. Fixed-Function Vertex Post-Processing

After pre-rasterization shader stages, the following fixed-function operations are applied to vertices of the resulting primitives:

- Transform feedback (see Transform Feedback)
- Viewport swizzle (see Viewport Swizzle)
- Flat shading (see Flat Shading).
- Primitive clipping, including client-defined half-spaces (see Primitive Clipping).
- Shader output attribute clipping (see Clipping Shader Outputs).
- Clip space W scaling (see Controlling Viewport W Scaling).
- Perspective division on clip coordinates (see Coordinate Transformations).
- Viewport mapping, including depth range scaling (see Controlling the Viewport).
- Front face determination for polygon primitives (see Basic Polygon Rasterization).

Next, rasterization is performed on primitives as described in chapter Rasterization.

26.1. Transform Feedback

Before any other fixed-function vertex post-processing, vertex outputs from the last shader in the pre-rasterization shader stage can be written out to one or more transform feedback buffers bound to the command buffer. To capture vertex outputs the last pre-rasterization shader stage shader must be declared with the Xfb execution mode. Outputs decorated with XfbBuffer will be written out to the corresponding transform feedback buffers bound to the command buffer when transform feedback is active. Transform feedback buffers are bound to the command buffer by using vkCmdBindTransformFeedbackBuffersEXT. Transform feedback is made active by calling vkCmdBeginTransformFeedbackEXT and made inactive by calling vkCmdEndTransformFeedbackEXT. After vertex data is written it is possible to use vkCmdDrawIndirectByteCountEXT to start a new draw where the vertexCount is derived from the number of bytes written by a previous transform feedback.

When an individual point, line, or triangle primitive reaches the transform feedback stage while transform feedback is active, the values of the specified output variables are assembled into primitives and appended to the bound transform feedback buffers. After activating transform feedback, the values of the first assembled primitive are written at the starting offsets of the bound transform feedback buffers, and subsequent primitives are appended to the buffer. If the optional pCounterBuffers and pCounterBufferOffsets parameters are specified, the starting points within the transform feedback buffers are adjusted so data is appended to the previously written values indicated by the value stored by the implementation in the counter buffer.

For multi-vertex primitives, all values for a given vertex are written before writing values for any other vertex. When transformFeedbackPreservesProvokingVertex is not enabled, implementations may write out any vertex within the primitive first, but all subsequent vertices for that primitive...
must be written out in a consistent winding order defined as follows:

- If neither geometry or tessellation shading is active, vertices within a primitive are appended according to the winding order described by the primitive topology defined by the VkPipelineInputAssemblyStateCreateInfo:topology used to execute the drawing command.

- If geometry shading is active, vertices within a primitive are appended according to the winding order described by the primitive topology defined by the OutputPoints, OutputLineStrips, or OutputTriangleStrips execution mode.

- If tessellation shading is active but geometry shading is not, vertices within a primitive are appended according to the winding order defined by triangle tessellation, quad tessellation, and isoline tessellation.

When transformFeedbackPreservesProvokingVertex is enabled, then in addition to writing vertices with a consistent winding order, the vertex order must preserve the provoking vertex of each primitive:

- When the pipeline’s provoking vertex mode is VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT, the primitive’s provoking vertex must be the first vertex written.

- When the pipeline’s provoking vertex mode is VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT, the primitive’s provoking vertex must be the last vertex written.

If transformFeedbackPreservesTriangleFanProvokingVertex is VK_FALSE, neither geometry nor tessellation shading is active, and the primitive topology is VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN, then the first vertex written from each primitive is implementation-defined even when transformFeedbackPreservesProvokingVertex is enabled.

When capturing vertices, the stride associated with each transform feedback buffer, as indicated by the XfbStride decoration, indicates the number of bytes of storage reserved for each vertex in the transform feedback buffer. For every vertex captured, each output attribute with a Offset decoration will be written to the storage reserved for the vertex at the associated transform feedback buffer. When writing output variables that are arrays or structures, individual array elements or structure members are written tightly packed in order. For vector types, individual components are written in order. For matrix types, outputs are written as an array of column vectors.

If any component of an output with an assigned transform feedback offset was not written to by its shader, the value recorded for that component is undefined. All components of an output variable must be written at an offset aligned to the size of the component. The size of each component of an output variable must be at least 32-bits. When capturing a vertex, any portion of the reserved storage not associated with an output variable with an assigned transform feedback offset will be unmodified.

When transform feedback is inactive, no vertices are recorded. If there is a valid counter buffer handle and counter buffer offset in the pCounterBuffers and pCounterBufferOffsets arrays, writes to the corresponding transform feedback buffer will start at the byte offset represented by the value stored in the counter buffer location.

Individual lines or triangles of a strip or fan primitive will be extracted and recorded separately.
Incomplete primitives are not recorded.

When using a geometry shader that emits vertices to multiple vertex streams, a primitive will be
assembled and output for each stream when there are enough vertices emitted for the output
primitive type. All outputs assigned to a given transform feedback buffer are required to come
from a single vertex stream.

The sizes of the transform feedback buffers are defined by the
\texttt{vkCmdBindTransformFeedbackBuffersEXT pSizes} parameter for each of the bound buffers, or the
size of the bound buffer, whichever is the lesser. If there is less space remaining in any of the
transform feedback buffers than the size of the all the vertex data for that primitive based on the
\texttt{XfbStride} for that \texttt{XfbBuffer} then no vertex data of that primitive is recorded in any transform
feedback buffer, and the value for the number of primitives written in the corresponding
\texttt{VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT} query for all transform feedback buffers is no longer
incremented.

Any outputs made to a \texttt{XfbBuffer} that is not bound to a transform feedback buffer is ignored.

To bind transform feedback buffers to a command buffer for use in subsequent drawing
commands, call:

```
// Provided by VK_EXT_transform_feedback

void vkCmdBindTransformFeedbackBuffersEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes);
```

- \texttt{commandBuffer} is the command buffer into which the command is recorded.
- \texttt{firstBinding} is the index of the first transform feedback binding whose state is updated by the
  command.
- \texttt{bindingCount} is the number of transform feedback bindings whose state is updated by the
  command.
- \texttt{pBuffers} is a pointer to an array of buffer handles.
- \texttt{pOffsets} is a pointer to an array of buffer offsets.
- \texttt{pSizes} is \texttt{NULL} or a pointer to an array of \texttt{VkDeviceSize} buffer sizes, specifying the maximum
  number of bytes to capture to the corresponding transform feedback buffer. If \texttt{pSizes} is \texttt{NULL}, or
  the value of the \texttt{pSizes} array element is \texttt{VK_WHOLE_SIZE}, then the maximum number of bytes
  captured will be the size of the corresponding buffer minus the buffer offset.

The values taken from elements \texttt{i} of \texttt{pBuffers}, \texttt{pOffsets} and \texttt{pSizes} replace the current state for the
transform feedback binding \texttt{firstBinding + i}, for \texttt{i} in \texttt{[0, bindingCount)}. The transform feedback
binding is updated to start at the offset indicated by \texttt{pOffsets[i]} from the start of the buffer
\texttt{pBuffers[i]}.

Chapter 26. Fixed-Function Vertex Post-Processing | 1463
Valid Usage

- VUID-vkCmdBindTransformFeedbackBuffersEXT-transformFeedback-02355
  
  `VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` must be enabled

- VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02356
  
  `firstBinding` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`

- VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02357
  
  The sum of `firstBinding` and `bindingCount` must be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02358
  
  All elements of `pOffsets` must be less than the size of the corresponding element in `pBuffers`

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02359
  
  All elements of `pOffsets` must be a multiple of 4

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02360
  
  All elements of `pBuffers` must have been created with the `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT` flag

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pSize-02361
  
  If the optional `pSize` array is specified, each element of `pSizes` must either be `VK_WHOLE_SIZE`, or be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferSize`

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pSizes-02362
  
  All elements of `pSizes` must be either `VK_WHOLE_SIZE`, or less than or equal to the size of the corresponding buffer in `pBuffers`

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02363
  
  All elements of `pOffsets` plus `pSizes`, where the `pSizes`, element is not `VK_WHOLE_SIZE`, must be less than or equal to the size of the corresponding buffer in `pBuffers`

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02364
  
  Each element of `pBuffers` that is non-sparse must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdBindTransformFeedbackBuffersEXT-None-02365
  
  Transform feedback must not be active when the `vkCmdBindTransformFeedbackBuffersEXT` command is recorded
Valid Usage (Implicit)

- VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-parameter
  pBuffer must be a valid pointer to an array of bindingCount valid VkBuffer handles
- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-parameter
  pOffsets must be a valid pointer to an array of bindingCount VkDeviceSize values
- VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdBindTransformFeedbackBuffersEXT-bindingCount-arraylength
  bindingCount must be greater than 0
- VUID-vkCmdBindTransformFeedbackBuffersEXT-commonparent
  Both of commandBuffer, and the elements of pBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>

<td></td>
<td></td>
</tr>
</tbody>
</table>

Transform feedback for specific transform feedback buffers is made active by calling:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBeginTransformFeedbackEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstCounterBuffer,
    uint32_t counterBufferCount,
    const VkBuffer* pCounterBuffers,
    const VkDeviceSize* pCounterBufferOffsets);
```
• `commandBuffer` is the command buffer into which the command is recorded.

• `firstCounterBuffer` is the index of the first transform feedback buffer corresponding to `pCounterBuffers[0]` and `pCounterBufferOffsets[0]`.

• `counterBufferCount` is the size of the `pCounterBuffers` and `pCounterBufferOffsets` arrays.

• `pCounterBuffers` is `NULL` or a pointer to an array of `VkBuffer` handles to counter buffers. Each buffer contains a 4 byte integer value representing the byte offset from the start of the corresponding transform feedback buffer from where to start capturing vertex data. If the byte offset stored to the counter buffer location was done using `vkCmdEndTransformFeedbackEXT` it can be used to resume transform feedback from the previous location. If `pCounterBuffers` is `NULL`, then transform feedback will start capturing vertex data to byte offset zero in all bound transform feedback buffers. For each element of `pCounterBuffers` that is `VK_NULL_HANDLE`, transform feedback will start capturing vertex data to byte zero in the corresponding bound transform feedback buffer.

• `pCounterBufferOffsets` is `NULL` or a pointer to an array of `VkDeviceSize` values specifying offsets within each of the `pCounterBuffers` where the counter values were previously written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. This data is the number of bytes captured by the previous transform feedback to this buffer. If `pCounterBufferOffsets` is `NULL`, then it is assumed the offsets are zero.

The active transform feedback buffers will capture primitives emitted from the corresponding `XfbBuffer` in the bound graphics pipeline. Any `XfbBuffer` emitted that does not output to an active transform feedback buffer will not be captured.
Valid Usage

- **VUID-vkCmdBeginTransformFeedbackEXT-transformFeedback-02366**
  
  `VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` must be enabled

- **VUID-vkCmdBeginTransformFeedbackEXT-None-02367**
  
  Transform feedback must not be active

- **VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02368**
  
  `firstCounterBuffer` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`

- **VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02369**
  
  The sum of `firstCounterBuffer` and `counterBufferCount` must be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`

- **VUID-vkCmdBeginTransformFeedbackEXT-counterBufferCount-02607**
  
  If `counterBufferCount` is not 0, and `pCounterBuffers` is not NULL, `pCounterBuffers` must be a valid pointer to an array of `counterBufferCount` `VkBuffer` handles that are either valid or `VK_NULL_HANDLE`

- **VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-02370**
  
  For each buffer handle in the array, if it is not `VK_NULL_HANDLE` it must reference a buffer large enough to hold 4 bytes at the corresponding offset from the `pCounterBufferOffsets` array

- **VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffer-02371**
  
  If `pCounterBuffer` is NULL, then `pCounterBufferOffsets` must also be NULL

- **VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffers-02372**
  
  For each buffer handle in the `pCounterBuffers` array that is not `VK_NULL_HANDLE` it must have been created with a `usage` value containing `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT`

- **VUID-vkCmdBeginTransformFeedbackEXT-None-06233**
  
  A valid graphics pipeline must be bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdBeginTransformFeedbackEXT-None-04128**
  
  The last pre-rasterization shader stage of the bound graphics pipeline must have been declared with the Xfb execution mode

- **VUID-vkCmdBeginTransformFeedbackEXT-None-02373**
  
  Transform feedback must not be made active in a render pass instance with multiview enabled
Valid Usage (Implicit)

- **VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-parameter**
  
  If `counterBufferCount` is not 0, and `pCounterBufferOffsets` is not NULL, `pCounterBufferOffsets` must be a valid pointer to an array of `counterBufferCount` `VkDeviceSize` values

- **VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdBeginTransformFeedbackEXT-renderpass**
  
  This command must only be called inside of a render pass instance

- **VUID-vkCmdBeginTransformFeedbackEXT-commonparent**
  
  Both of `commandBuffer`, and the elements of `pCounterBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>

Transform feedback for specific transform feedback buffers is made inactive by calling:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdEndTransformFeedbackEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstCounterBuffer,
    uint32_t counterBufferCount,
    const VkBuffer* pCounterBuffers,
    const VkDeviceSize* pCounterBufferOffsets);
```
• **commandBuffer** is the command buffer into which the command is recorded.

• **firstCounterBuffer** is the index of the first transform feedback buffer corresponding to `pCounterBuffers[0]` and `pCounterBufferOffsets[0]`.

• **counterBufferCount** is the size of the `pCounterBuffers` and `pCounterBufferOffsets` arrays.

• **pCounterBuffers** is `NULL` or a pointer to an array of `VkBuffer` handles to counter buffers. The counter buffers are used to record the current byte positions of each transform feedback buffer where the next vertex output data would be captured. This can be used by a subsequent `vkCmdBeginTransformFeedbackEXT` call to resume transform feedback capture from this position. It can also be used by `vkCmdDrawIndirectByteCountEXT` to determine the vertex count of the draw call.

• **pCounterBufferOffsets** is `NULL` or a pointer to an array of `VkDeviceSize` values specifying offsets within each of the `pCounterBuffers` where the counter values can be written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. The data stored at this location is the byte offset from the start of the transform feedback buffer binding where the next vertex data would be written. If `pCounterBufferOffsets` is `NULL`, then it is assumed the offsets are zero.

---

### Valid Usage

- **VUID-vkCmdEndTransformFeedbackEXT-transformFeedback-02374**
  
  *VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback* must be enabled

- **VUID-vkCmdEndTransformFeedbackEXT-None-02375**
  
  Transform feedback must be active

- **VUID-vkCmdEndTransformFeedbackEXT-firstCounterBuffer-02376**
  
  `firstCounterBuffer` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`

- **VUID-vkCmdEndTransformFeedbackEXT-firstCounterBuffer-02377**
  
  The sum of `firstCounterBuffer` and `counterBufferCount` must be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`

- **VUID-vkCmdEndTransformFeedbackEXT-counterBufferCount-02608**
  
  If `counterBufferCount` is not 0, and `pCounterBuffers` is not `NULL`, `pCounterBuffers` must be a valid pointer to an array of `counterBufferCount` `VkBuffer` handles that are either valid or `VK_NULL_HANDLE`

- **VUID-vkCmdEndTransformFeedbackEXT-pCounterBufferOffsets-02378**
  
  For each buffer handle in the array, if it is not `VK_NULL_HANDLE` it must reference a buffer large enough to hold 4 bytes at the corresponding offset from the `pCounterBufferOffsets` array

- **VUID-vkCmdEndTransformFeedbackEXT-pCounterBuffer-02379**
  
  If `pCounterBuffer` is `NULL`, then `pCounterBufferOffsets` must also be `NULL`

- **VUID-vkCmdEndTransformFeedbackEXT-pCounterBuffers-02380**
  
  For each buffer handle in the `pCounterBuffers` array that is not `VK_NULL_HANDLE` it must have been created with a `usage` value containing `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT`
Valid Usage (Implicit)

- **VUID-vkCmdEndTransformFeedbackEXT-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdEndTransformFeedbackEXT-pCounterBufferOffsets-parameter**
  
  If `counterBufferCount` is not 0, and `pCounterBufferOffsets` is not NULL, `pCounterBufferOffsets` must be a valid pointer to an array of `counterBufferCount` `VkDeviceSize` values

- **VUID-vkCmdEndTransformFeedbackEXT-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdEndTransformFeedbackEXT-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdEndTransformFeedbackEXT-renderpass**
  
  This command must only be called inside of a render pass instance

- **VUID-vkCmdEndTransformFeedbackEXT-commonparent**
  
  Both of `commandBuffer`, and the elements of `pCounterBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

26.2. Viewport Swizzle

Each primitive sent to a given viewport has a swizzle and **optional** negation applied to its clip coordinates. The swizzle that is applied depends on the viewport index, and is controlled by the `VkPipelineViewportSwizzleStateCreateInfoNV` pipeline state:
typedef struct VkPipelineViewportSwizzleStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportSwizzleStateCreateFlagsNV flags;
    uint32_t viewportCount;
    const VkViewportSwizzleNV* pViewportSwizzles;
} VkPipelineViewportSwizzleStateCreateInfoNV;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **viewportCount** is the number of viewport swizzles used by the pipeline.
- **pViewportSwizzles** is a pointer to an array of VkViewportSwizzleNV structures, defining the viewport swizzles.

### Valid Usage

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-viewportCount-01215
  viewportCount must be greater than or equal to the viewportCount set in VkPipelineViewportStateCreateInfo

### Valid Usage (Implicit)

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_SWIZZLE_STATE_CREATE_INFO_NV
- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-flags-zerobitmask
  flags must be 0
- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-pViewportSwizzles-parameter
  pViewportSwizzles must be a valid pointer to an array of viewportCount valid VkViewportSwizzleNV structures
- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-viewportCount-arraylength
  viewportCount must be greater than 0

// Provided by VK_NV_viewport_swizzle
typedef VkFlags VkPipelineViewportSwizzleStateCreateFlagsNV;

VkPipelineViewportSwizzleStateCreateFlagsNV is a bitmask type for setting a mask, but is currently reserved for future use.

The VkPipelineViewportSwizzleStateCreateInfoNV state is set by adding this structure to the pNext chain of a VkPipelineViewportStateCreateInfo structure and setting the graphics pipeline state with...
vkCreateGraphicsPipelines.

Each viewport specified from 0 to \texttt{viewportCount - 1} has its \(x,y,z,w\) swizzle state set to the corresponding \(x, y, z\) and \(w\) in the \texttt{VkViewportSwizzleNV} structure. Each component is of type \texttt{VkViewportCoordinateSwizzleNV}, which determines the type of swizzle for that component. The value of \(x\) computes the new \(x\) component of the position as:

```cpp
if (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV}) x' = x;
if (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_X_NV}) x' = -x;
if (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV}) x' = y;
if (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Y_NV}) x' = -y;
if (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV}) x' = z;
if (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Z_NV}) x' = -z;
if (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV}) x' = w;
if (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_W_NV}) x' = -w;
```

Similar selections are performed for the \(y, z,\) and \(w\) coordinates. This swizzling is applied before clipping and perspective divide. If the swizzle for an active viewport index is not specified, the swizzle for \(x\) is \texttt{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV}, \(y\) is \texttt{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV}, \(z\) is \texttt{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV} and \(w\) is \texttt{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV}.

Viewport swizzle parameters are specified by setting the \texttt{pNext} pointer of \texttt{VkGraphicsPipelineCreateInfo} to point to a \texttt{VkPipelineViewportSwizzleStateCreateInfoNV} structure. \texttt{VkPipelineViewportSwizzleStateCreateInfoNV} uses \texttt{VkViewportSwizzleNV} to set the viewport swizzle parameters.

The \texttt{VkViewportSwizzleNV} structure is defined as:

```cpp
// Provided by VK_NV_viewport_swizzle
typedef struct VkViewportSwizzleNV {
    VkViewportCoordinateSwizzleNV  x;
    VkViewportCoordinateSwizzleNV  y;
    VkViewportCoordinateSwizzleNV  z;
    VkViewportCoordinateSwizzleNV  w;
} VkViewportSwizzleNV;
```

- \(x\) is a \texttt{VkViewportCoordinateSwizzleNV} value specifying the swizzle operation to apply to the \(x\) component of the primitive
- \(y\) is a \texttt{VkViewportCoordinateSwizzleNV} value specifying the swizzle operation to apply to the \(y\) component of the primitive
- \(z\) is a \texttt{VkViewportCoordinateSwizzleNV} value specifying the swizzle operation to apply to the \(z\) component of the primitive
- \(w\) is a \texttt{VkViewportCoordinateSwizzleNV} value specifying the swizzle operation to apply to the \(w\) component of the primitive
Valid Usage (Implicit)

- **VUID-VkViewportSwizzleNV-x-parameter**
  
  *x* must be a valid *VkViewportCoordinateSwizzleNV* value

- **VUID-VkViewportSwizzleNV-y-parameter**
  
  *y* must be a valid *VkViewportCoordinateSwizzleNV* value

- **VUID-VkViewportSwizzleNV-z-parameter**
  
  *z* must be a valid *VkViewportCoordinateSwizzleNV* value

- **VUID-VkViewportSwizzleNV-w-parameter**
  
  *w* must be a valid *VkViewportCoordinateSwizzleNV* value

Possible values of the *VkViewportSwizzleNV::*x, y, z, and w* members, specifying swizzling of the corresponding components of primitives, are:

```c
// Provided by VK_NV_viewport_swizzle
typedef enum VkViewportCoordinateSwizzleNV {
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV = 0,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_X_NV = 1,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV = 2,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Y_NV = 3,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV = 4,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Z_NV = 5,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV = 6,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_W_NV = 7,
} VkViewportCoordinateSwizzleNV;
```

These values are described in detail in [Viewport Swizzle](#).

### 26.3. Flat Shading

*Flat shading* a vertex output attribute means to assign all vertices of the primitive the same value for that output. The output values assigned are those of the *provoking vertex* of the primitive. Flat shading is applied to those vertex attributes that match fragment input attributes which are decorated as *Flat*.

If neither *geometry* nor *tessellation shading* is active, the provoking vertex is determined by the *primitive topology* defined by *VkPipelineInputAssemblyStateCreateInfo::topology* used to execute the *drawing command*.

If *geometry shading* is active, the provoking vertex is determined by the *primitive topology* defined by the *OutputPoints*, *OutputLineStrips*, or *OutputTriangleStrips* execution mode.

If *tessellation shading* is active but *geometry shading* is not, the provoking vertex may be any of the vertices in each primitive.

For a given primitive topology, the pipeline’s provoking vertex mode determines which vertex is
the provoking vertex. To specify the provoking vertex mode, attach an instance of 
\texttt{VkPipelineRasterizationProvokingVertexStateCreateInfoEXT} to 
\texttt{VkPipelineRasterizationStateCreateInfo::pNext} when creating the pipeline.

The \texttt{VkPipelineRasterizationProvokingVertexStateCreateInfoEXT} structure is defined as:

```c
// Provided by VK_EXT_provoking_vertex
typedef struct VkPipelineRasterizationProvokingVertexStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkProvokingVertexModeEXT provokingVertexMode;
} VkPipelineRasterizationProvokingVertexStateCreateInfoEXT;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{provokingVertexMode} is a \texttt{VkProvokingVertexModeEXT} value selecting the provoking vertex mode.

If this struct is not provided when creating the pipeline, the pipeline will use the 
\texttt{VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT} mode.

If the \texttt{provokingVertexModePerPipeline} limit is \texttt{VK_FALSE}, then the all pipelines bound within a 
renderpass instance \textbf{must} have the same \texttt{provokingVertexMode}.

### Valid Usage

- \texttt{VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-04883}

  If \texttt{provokingVertexMode} is \texttt{VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT}, then the 
  \texttt{provokingVertexLast} feature \textbf{must} be enabled

### Valid Usage (Implicit)

- \texttt{VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-sType-sType}

  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_PROVOKING_VERTEX_STATE_CREATE_INFO_EXT}

- \texttt{VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-parameter}

  \texttt{provokingVertexMode} \textbf{must} be a valid \texttt{VkProvokingVertexModeEXT} value

Possible values of \texttt{VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode} are:
typedef enum VkProvokingVertexModeEXT {
    VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT = 0,
    VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT = 1,
} Vk Provoking Vertex Mode EXT;
The number of client-defined clip and cull half-spaces that are enabled is determined by the explicit size
of the built-in arrays ClipDistance and CullDistance, respectively, declared as an output in the
interface of the entry point of the final shader stage before clipping.

If VkPipelineRasterizationDepthClipStateCreateInfoEXT is present in the graphics pipeline state
then depth clipping is disabled if VkPipelineRasterizationDepthClipStateCreateInfoEXT ::depthClipEnable is VK_FALSE. Otherwise, if VkPipelineRasterizationDepthClipStateCreateInfoEXT is
not present, depth clipping is disabled when VkPipelineRasterizationStateCreateInfo ::depthClampEnable is VK_TRUE. When depth clipping is disabled, the plane equation

\[ 0 \leq z_c \leq w_c \]

(see the clip volume definition above) is ignored by view volume clipping (effectively, there is no
near or far plane clipping).

If the primitive under consideration is a point or line segment, then clipping passes it unchanged if
its vertices lie entirely within the clip volume.

Possible values of VkPhysicalDevicePointClippingProperties ::pointClippingBehavior, specifying
clipping behavior of a point primitive whose vertex lies outside the clip volume, are:

```c
typedef enum VkPointClippingBehavior {
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES = 0,
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY = 1,
    // Provided by VK_KHR_maintenance2
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES_KHR =
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES,
    // Provided by VK_KHR_maintenance2
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY_KHR =
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY,
} VkPointClippingBehavior;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2.
typedef VkPointClippingBehavior VkPointClippingBehaviorKHR;
```

- **VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES** specifies that the primitive is discarded if the vertex lies outside any clip plane, including the planes bounding the view volume.
- **VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY** specifies that the primitive is discarded only if the vertex lies outside any user clip plane.

If either of a line segment's vertices lie outside of the clip volume, the line segment may be clipped,
with new vertex coordinates computed for each vertex that lies outside the clip volume. A clipped line segment endpoint lies on both the original line segment and the boundary of the clip volume.

This clipping produces a value, \( 0 \leq t \leq 1 \), for each clipped vertex. If the coordinates of a clipped
vertex are $P$ and the unclipped line segment’s vertex coordinates are $P_1$ and $P_2$, then $t$ satisfies the following equation

$$P = tP_1 + (1-t)P_2.$$ 

$t$ is used to clip vertex output attributes as described in Clipping Shader Outputs.

If the primitive is a polygon, it passes unchanged if every one of its edges lies entirely inside the clip volume, and is either clipped or discarded otherwise. If the edges of the polygon intersect the boundary of the clip volume, the intersecting edges are reconnected by new edges that lie along the boundary of the clip volume - in some cases requiring the introduction of new vertices into a polygon.

If a polygon intersects an edge of the clip volume’s boundary, the clipped polygon must include a point on this boundary edge.

Primitives rendered with user-defined half-spaces must satisfy a complementarity criterion. Suppose a series of primitives is drawn where each vertex $i$ has a single specified clip distance $d_i$ (or a number of similarly specified clip distances, if multiple half-spaces are enabled). Next, suppose that the same series of primitives are drawn again with each such clip distance replaced by $-d_i$ (and the graphics pipeline is otherwise the same). In this case, primitives must not be missing any pixels, and pixels must not be drawn twice in regions where those primitives are cut by the clip planes.

### 26.5. Clipping Shader Outputs

Next, vertex output attributes are clipped. The output values associated with a vertex that lies within the clip volume are unaffected by clipping. If a primitive is clipped, however, the output values assigned to vertices produced by clipping are clipped.

Let the output values assigned to the two vertices $P_1$ and $P_2$ of an unclipped edge be $c_1$ and $c_2$. The value of $t$ (see Primitive Clipping) for a clipped point $P$ is used to obtain the output value associated with $P$ as

$$c = t c_1 + (1-t) c_2.$$ 

(Multiplying an output value by a scalar means multiplying each of $x, y, z,$ and $w$ by the scalar.)

Since this computation is performed in clip space before division by $w$, clipped output values are perspective-correct.

Polygon clipping creates a clipped vertex along an edge of the clip volume’s boundary. This situation is handled by noting that polygon clipping proceeds by clipping against one half-space at a time. Output value clipping is done in the same way, so that clipped points always occur at the intersection of polygon edges (possibly already clipped) with the clip volume’s boundary.

For vertex output attributes whose matching fragment input attributes are decorated with NoPerspective, the value of $t$ used to obtain the output value associated with $P$ will be adjusted to produce results that vary linearly in framebuffer space.
Output attributes of integer or unsigned integer type **must** always be flat shaded. Flat shaded attributes are constant over the primitive being rasterized (see Basic Line Segment Rasterization and Basic Polygon Rasterization), and no interpolation is performed. The output value \( c \) is taken from either \( c_1 \) or \( c_2 \), since flat shading has already occurred and the two values are identical.

### 26.6. Controlling Viewport \( W \) Scaling

If viewport \( W \) scaling is enabled, the \( W \) component of the clip coordinate is modified by the provided coefficients from the corresponding viewport as follows.

\[
w_c' = x_{\text{coeff}} x_c + y_{\text{coeff}} y_c + w_c
\]

The \texttt{VkPipelineViewportWScalingStateCreateInfoNV} structure is defined as:

```c
// Provided by VK_NV_clip_space_w_scaling
typedef struct VkPipelineViewportWScalingStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 viewportWScalingEnable;
    uint32_t viewportCount;
    const VkViewportWScalingNV* pViewportWScalings;
} VkPipelineViewportWScalingStateCreateInfoNV;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **viewportWScalingEnable** controls whether viewport \( W \) scaling is enabled.
- **viewportCount** is the number of viewports used by \( W \) scaling, and **must** match the number of viewports in the pipeline if viewport \( W \) scaling is enabled.
- **pViewportWScalings** is a pointer to an array of \texttt{VkViewportWScalingNV} structures defining the \( W \) scaling parameters for the corresponding viewports. If the viewport \( W \) scaling state is dynamic, this member is ignored.

#### Valid Usage (Implicit)

- VUID-VkPipelineViewportWScalingStateCreateInfoNV-sType-sType
  
  \( sType \) **must** be \texttt{VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_W_SCALING_STATE_CREATE_INFO_NV}

- VUID-VkPipelineViewportWScalingStateCreateInfoNV-viewportCount-arraylength
  
  \( \text{viewportCount} \) **must** be greater than 0

The \texttt{VkPipelineViewportWScalingStateCreateInfoNV} state is set by adding this structure to the \texttt{pNext} chain of a \texttt{VkPipelineViewportStateCreateInfo} structure and setting the graphics pipeline state with \texttt{vkCreateGraphicsPipelines}.

If the bound pipeline state object was not created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV}...
dynamic state enabled, viewport W scaling parameters are specified using the `pViewportWScalings` member of `VkPipelineViewportWScalingStateCreateInfoNV` in the pipeline state object. If the pipeline state object was created with the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, the viewport transformation parameters are dynamically set and changed with the command:

```c
// Provided by VK_NV_clip_space_w_scaling
void vkCmdSetViewportWScalingNV(
    VkCommandBuffer           commandBuffer,
    uint32_t                  firstViewport,
    uint32_t                  viewportCount,
    const VkViewportWScalingNV* pViewportWScalings);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstViewport` is the index of the first viewport whose parameters are updated by the command.
- `viewportCount` is the number of viewports whose parameters are updated by the command.
- `pViewportWScalings` is a pointer to an array of `VkViewportWScalingNV` structures specifying viewport parameters.

The viewport parameters taken from element \(i\) of `pViewportWScalings` replace the current state for the viewport index `firstViewport + i`, for \(i\) in \([0, \text{viewportCount})\).

### Valid Usage

- **VUID-vkCmdSetViewportWScalingNV-firstViewport-01324**
  The sum of `firstViewport` and `viewportCount` must be between \(1\) and `VkPhysicalDeviceLimits::maxViewports`, inclusive

### Valid Usage (Implicit)

- **VUID-vkCmdSetViewportWScalingNV-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetViewportWScalingNV-pViewportWScalings-parameter**
  `pViewportWScalings` must be a valid pointer to an array of `viewportCount` `VkViewportWScalingNV` structures
- **VUID-vkCmdSetViewportWScalingNV-commandBuffer-recording**
  `commandBuffer` must be in the recording state
- **VUID-vkCmdSetViewportWScalingNV-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- **VUID-vkCmdSetViewportWScalingNV-viewportCount-arraylength**
  `viewportCount` must be greater than \(0\)
.Host Synchronization.

- Host access to commandBuffer **must** be externally synchronized.
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized.

## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Both VkPipelineViewportWScalingStateCreateInfoNV and VkCmdSetViewportWScalingNV use VkViewportWScalingNV to set the viewport transformation parameters.

The VkViewportWScalingNV structure is defined as:

```c
// Provided by VK_NV_clip_space_w_scaling
typedef struct VkViewportWScalingNV {
    float xcoeff;
    float ycoeff;
} VkViewportWScalingNV;
```

- `xcoeff` and `ycoeff` are the viewport's W scaling factor for x and y respectively.

### 26.7. Coordinate Transformations

*Clip coordinates* for a vertex result from shader execution, which yields a vertex coordinate *Position*.

Perspective division on clip coordinates yields *normalized device coordinates*, followed by a *viewport* transformation (see *Controlling the Viewport*) to convert these coordinates into *framebuffer coordinates*.

If a vertex in clip coordinates has a position given by

$$
\begin{pmatrix}
    x_c \\
    y_c \\
    z_c \\
    w_c
\end{pmatrix}
$$

then the vertex's normalized device coordinates are...
26.8. Render Pass Transform

A render pass transform can be enabled for render pass instances. The clip coordinates \((x_c, y_c)\) that result from vertex shader execution are transformed by a rotation of 0, 90, 180, or 270 degrees in the XY plane, centered at the origin.

When Render pass transform is enabled, the transform applies to all primitives for all subpasses of the render pass. The transformed vertex in clip coordinates has a position given by

\[
\begin{pmatrix}
  x_{c\text{trans}} \\
  y_{c\text{trans}} \\
  z_{c\text{trans}}
\end{pmatrix} =
\begin{pmatrix}
  x_c \cos \theta - y_c \sin \theta \\
  x_c \sin \theta + y_c \cos \theta \\
  z_c
\end{pmatrix}
\]

where

- \(\theta\) is 0 degrees for VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR
- \(\theta\) is 90 degrees for VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR
- \(\theta\) is 180 degrees for VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR
- \(\theta\) is 270 degrees for VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR

The transformed vertex's normalized device coordinates are

\[
\begin{pmatrix}
  x_d \\
  y_d \\
  z_d
\end{pmatrix} =
\begin{pmatrix}
  x_{c\text{trans}}/w_c \\
  y_{c\text{trans}}/w_c \\
  z_{c\text{trans}}/w_c
\end{pmatrix}
\]

When render pass transform is enabled for a renderpass instance, the following additional features are enabled:

- Each VkViewport specified by either VkPipelineViewportStateCreateInfo::pViewports or vkCmdSetViewport will have its width/height \((p_x, p_y)\) and its center \((o_x, o_y)\) similarly transformed by the implementation.
- Each scissor specified by VkPipelineViewportStateCreateInfo::pScissors or vkCmdSetScissor will have its \((offset_x, offset_y)\) and \((extent_x, extent_y)\) similarly transformed by the implementation.
- The renderArea specified in VkCommandBufferInheritanceRenderPassTransformInfoQCOM and VkRenderPassBeginInfo will be similarly transformed by the implementation.
- The \((x, y)\) components of shader variables with built-in decorations FragCoord, SamplePosition, or PointCoord will be similarly transformed by the implementation.
- The \((x, y)\) components of the offset operand of the InterpolateAtOffset extended instruction will be similarly transformed by the implementation.
The values returned by SPIR-V derivative instructions OpDPdx, OpDPdy, OpDPdxCourse, OpDPdyCourse, OpDPdxFine, OpDPdyFine will be similarly transformed by the implementation.

The net result of the above, is that applications can act as if rendering to a framebuffer oriented with the VkSurfaceCapabilitiesKHR::currentTransform. In other words, applications can act as if the presentation engine will be performing the transformation of the swapchain image after rendering and prior to presentation to the user. In fact, the transformation of the various items cited above are being handled by the implementation as the rendering takes place.

26.9. Controlling the Viewport

The viewport transformation is determined by the selected viewport's width and height in pixels, px and py, respectively, and its center (ox, oy) (also in pixels), as well as its depth range min and max determining a depth range scale value p, and a depth range bias value o, (defined below). The vertex's framebuffer coordinates (xf, yf, zf) are given by

\[
xf = (px / 2) x + o_x
\]

\[
yf = (py / 2) y + o_y
\]

\[
zf = p z + o_z
\]

Multiple viewports are available, numbered zero up to VkPhysicalDeviceLimits::maxViewports minus one. The number of viewports used by a pipeline is controlled by the viewportCount member of the VkPipelineViewportStateCreateInfo structure used in pipeline creation.

xf and yf have limited precision, where the number of fractional bits retained is specified by VkPhysicalDeviceLimits::subPixelPrecisionBits. When rasterizing line segments, the number of fractional bits is specified by VkPhysicalDeviceLineRasterizationPropertiesEXT::lineSubPixelPrecisionBits.

The VkPipelineViewportStateCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineViewportStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportStateCreateFlags flags;
    uint32_t viewportCount;
    const VkViewport* pViewports;
    uint32_t scissorCount;
    const VkRect2D* pScissors;
} VkPipelineViewportStateCreateInfo;
```

- sType is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **viewportCount** is the number of viewports used by the pipeline.
- **pViewports** is a pointer to an array of **VkViewport** structures, defining the viewport transforms. If the viewport state is dynamic, this member is ignored.
- **scissorCount** is the number of **scissors** and must match the number of viewports.
- **pScissors** is a pointer to an array of **VkRect2D** structures defining the rectangular bounds of the scissor for the corresponding viewport. If the scissor state is dynamic, this member is ignored.
Valid Usage

• VUID-VkPipelineViewportStateCreateInfo-viewportCount-01216
  If the multiple viewports feature is not enabled, viewportCount must not be greater than 1

• VUID-VkPipelineViewportStateCreateInfo-scissorCount-01217
  If the multiple viewports feature is not enabled, scissorCount must not be greater than 1

• VUID-VkPipelineViewportStateCreateInfo-viewportCount-01218
  viewportCount must be less than or equal to VkPhysicalDeviceLimits::maxViewports

• VUID-VkPipelineViewportStateCreateInfo-scissorCount-01219
  scissorCount must be less than or equal to VkPhysicalDeviceLimits::maxViewports

• VUID-VkPipelineViewportStateCreateInfo-x-02821
  The x and y members of offset member of any element of pScissors must be greater than or equal to 0

• VUID-VkPipelineViewportStateCreateInfo-offset-02822
  Evaluation of (offset.x + extent.width) must not cause a signed integer addition overflow for any element of pScissors

• VUID-VkPipelineViewportStateCreateInfo-offset-02823
  Evaluation of (offset.y + extent.height) must not cause a signed integer addition overflow for any element of pScissors

• VUID-VkPipelineViewportStateCreateInfo-scissorCount-04134
  If the graphics pipeline is being created without VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT set then scissorCount and viewportCount must be identical

• VUID-VkPipelineViewportStateCreateInfo-viewportCount-04135
  If the graphics pipeline is being created with VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT set then viewportCount must be 0, otherwise it must be greater than 0

• VUID-VkPipelineViewportStateCreateInfo-scissorCount-04136
  If the graphics pipeline is being created with VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT set then scissorCount must be 0, otherwise it must be greater than 0

• VUID-VkPipelineViewportStateCreateInfo-viewportWScalingEnable-01726
  If the viewportWScalingEnable member of a VkPipelineViewportWScalingStateCreateInfoNV structure included in thepNext chain is VK_TRUE, the viewportCount member of the VkPipelineViewportWScalingStateCreateInfoNV structure must be greater than or equal to VkPipelineViewportStateCreateInfo::viewportCount
Valid Usage (Implicit)

- **VUID-VkPipelineViewportStateCreateInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO`

- **VUID-VkPipelineViewportStateCreateInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineViewportCoarseSampleOrderStateCreateInfoNV`, `VkPipelineViewportExclusiveScissorStateCreateInfoNV`, `VkPipelineViewportShadingRateImageStateCreateInfoNV`, `VkPipelineViewportSwizzleStateCreateInfoNV`, or `VkPipelineViewportWScalingStateCreateInfoNV`.

- **VUID-VkPipelineViewportStateCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkPipelineViewportStateCreateInfo-flags-zerobitmask**
  
  `flags` must be `0`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled then the viewport count and viewport transformation parameters are set dynamically by calling:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetViewportWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t viewportCount,
    const VkViewport* pViewports);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `viewportCount` specifies the viewport count.
- `pViewports` specifies the viewports to use for drawing.

Valid Usage

- **VUID-vkCmdSetViewportWithCountEXT-None-03393**
  
  The `extendedDynamicState` feature must be enabled.

- **VUID-vkCmdSetViewportWithCountEXT-viewportCount-03394**
  
  `viewportCount` must be between `1` and `VkPhysicalDeviceLimits::maxViewports`, inclusive.

- **VUID-vkCmdSetViewportWithCountEXT-viewportCount-03395**
  
  If the `multiple viewports` feature is not enabled, `viewportCount` must be `1`.

- **VUID-vkCmdSetViewportWithCountEXT-commandBuffer-04819**
  
  `commandBuffer` must not have `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled.
Valid Usage (Implicit)

- VUID-vkCmdSetViewportWithCountEXT-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetViewportWithCountEXT-pViewports-parameter
  
  `pViewports` must be a valid pointer to an array of `viewportCount` valid `VkViewport` structures

- VUID-vkCmdSetViewportWithCountEXT-commandBuffer-recording
  
  `commandBuffer` must be in the `recording state`

- VUID-vkCmdSetViewportWithCountEXT-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetViewportWithCountEXT-viewportCount-arraylength
  
  `viewportCount` must be greater than 0

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` dynamic state enabled then the scissor count and scissor rectangular bounds are set dynamically by calling:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetScissorWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D*pScissors);
```

- `(commandBuffer` is the command buffer into which the command will be recorded.
- `scissorCount` specifies the scissor count.
- `pScissors` specifies the scissors to use for drawing.
Valid Usage

- VUID-vkCmdSetScissorWithCountEXT-None-03396
  The `extendedDynamicState` feature **must** be enabled

- VUID-vkCmdSetScissorWithCountEXT-scissorCount-03397
  `scissorCount` **must** be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- VUID-vkCmdSetScissorWithCountEXT-scissorCount-03398
  If the `multiple viewports` feature is not enabled, `scissorCount` **must** be 1

- VUID-vkCmdSetScissorWithCountEXT-x-03399
  The `x` and `y` members of `offset` member of any element of `pScissors` **must** be greater than or equal to 0

- VUID-vkCmdSetScissorWithCountEXT-offset-03400
  Evaluation of `(offset.x + extent.width)` **must** not cause a signed integer addition overflow for any element of `pScissors`

- VUID-vkCmdSetScissorWithCountEXT-offset-03401
  Evaluation of `(offset.y + extent.height)` **must** not cause a signed integer addition overflow for any element of `pScissors`

- VUID-vkCmdSetScissorWithCountEXT-commandBuffer-04820
  `commandBuffer` **must** not have `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled

Valid Usage (Implicit)

- VUID-vkCmdSetScissorWithCountEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetScissorWithCountEXT-pScissors-parameter
  `pScissors` **must** be a valid pointer to an array of `scissorCount` `VkRect2D` structures

- VUID-vkCmdSetScissorWithCountEXT-commandBuffer-recording
  `commandBuffer` **must** be in the `recording state`

- VUID-vkCmdSetScissorWithCountEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetScissorWithCountEXT-scissorCount-arraylength
  `scissorCount` **must** be greater than 0

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

// Provided by VK_VERSION_1_0

typedef VkFlags VkPipelineViewportStateCreateFlags;

VkPipelineViewportStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

A **pre-rasterization shader stage** can direct each primitive to zero or more viewports. The destination viewports for a primitive are selected by the last active **pre-rasterization shader stage** that has an output variable decorated with ViewportIndex (selecting a single viewport) or ViewportMaskNV (selecting multiple viewports). The viewport transform uses the viewport corresponding to either the value assigned to ViewportIndex or one of the bits set in ViewportMaskNV, and taken from an implementation-dependent vertex of each primitive. If ViewportIndex or any of the bits in ViewportMaskNV are outside the range zero to viewportCount minus one for a primitive, or if the last active **pre-rasterization shader stage** did not assign a value to either ViewportIndex or ViewportMaskNV for all vertices of a primitive due to flow control, the values resulting from the viewport transformation of the vertices of such primitives are undefined. If the last pre-rasterization shader stage does not have an output decorated with ViewportIndex or ViewportMaskNV, the viewport numbered zero is used by the viewport transformation.

A single vertex can be used in more than one individual primitive, in primitives such as VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP. In this case, the viewport transformation is applied separately for each primitive.

If the bound pipeline state object was not created with the **VK_DYNAMIC_STATE_VIEWPORT** dynamic state enabled, viewport transformation parameters are specified using the pViewports member of VkPipelineViewportStateCreateInfo in the pipeline state object. If the pipeline state object was created with the **VK_DYNAMIC_STATE_VIEWPORT** dynamic state enabled, the viewport transformation parameters are dynamically set and changed with the command:

// Provided by VK_VERSION_1_0

void vkCmdSetViewport(
    VkCommandBuffer commandBuffer,  
    uint32_t firstViewport,         
    uint32_t viewportCount,         
    const VkViewport* pViewports); 

- **commandBuffer** is the command buffer into which the command will be recorded.
- **firstViewport** is the index of the first viewport whose parameters are updated by the command.
• `viewportCount` is the number of viewports whose parameters are updated by the command.
• `pViewports` is a pointer to an array of `VkViewport` structures specifying viewport parameters.

The viewport parameters taken from element `i` of `pViewports` replace the current state for the viewport index `firstViewport + i`, for `i` in `[0, viewportCount)`.

**Valid Usage**

- **VUID-vkCmdSetViewport-firstViewport-01223**
  The sum of `firstViewport` and `viewportCount` must be between `1` and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- **VUID-vkCmdSetViewport-firstViewport-01224**
  If the `multiple viewports` feature is not enabled, `firstViewport` must be `0`
- **VUID-vkCmdSetViewport-viewportCount-01225**
  If the `multiple viewports` feature is not enabled, `viewportCount` must be `1`
- **VUID-vkCmdSetViewport-commandBuffer-04821**
  `commandBuffer` must not have `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled

**Valid Usage (Implicit)**

- **VUID-vkCmdSetViewport-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetViewport-pViewports-parameter**
  `pViewports` must be a valid pointer to an array of `viewportCount` valid `VkViewport` structures
- **VUID-vkCmdSetViewport-commandBuffer-recording**
  `commandBuffer` must be in the recording state
- **VUID-vkCmdSetViewport-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- **VUID-vkCmdSetViewport-viewportCount-arraylength**
  `viewportCount` must be greater than `0`

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
Both `VkPipelineViewportStateCreateInfo` and `vkCmdSetViewport` use `VkViewport` to set the viewport transformation parameters.

The `VkViewport` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkViewport {
    float x;
    float y;
    float width;
    float height;
    float minDepth;
    float maxDepth;
} VkViewport;
```

- `x` and `y` are the viewport's upper left corner \((x,y)\).
- `width` and `height` are the viewport's width and height, respectively.
- `minDepth` and `maxDepth` are the depth range for the viewport.

**Note**

Despite their names, `minDepth` can be less than, equal to, or greater than `maxDepth`.

The framebuffer depth coordinate \(z\) may be represented using either a fixed-point or floating-point representation. However, a floating-point representation must be used if the depth/stencil attachment has a floating-point depth component. If an \(m\)-bit fixed-point representation is used, we assume that it represents each value \(\frac{k}{2^{m-1}}\), where \(k \in \{0, 1, ..., 2^m - 1\}\), as \(k\) (e.g. 1.0 is represented in binary as a string of all ones).

The viewport parameters shown in the above equations are found from these values as

\[
o_x = \frac{x + \text{width}}{2}
\]

\[
o_y = \frac{y + \text{height}}{2}
\]

\[
o_z = \text{minDepth}
\]
\[
p_x = \text{width}
\]

\[
p_y = \text{height}
\]

\[
p_z = \text{maxDepth} - \text{minDepth}.
\]

If a render pass transform is enabled, the values \((p_x, p_y)\) and \((o_x, o_y)\) defining the viewport are transformed as described in render pass transform before participating in the viewport transform.

The application can specify a negative term for \text{height}, which has the effect of negating the y coordinate in clip space before performing the transform. When using a negative \text{height}, the application should also adjust the y value to point to the lower left corner of the viewport instead of the upper left corner. Using the negative \text{height} allows the application to avoid having to negate the y component of the Position output from the last pre-rasterization shader stage.

The width and height of the implementation-dependent maximum viewport dimensions must be greater than or equal to the width and height of the largest image which can be created and attached to a framebuffer.

The floating-point viewport bounds are represented with an implementation-dependent precision.
Valid Usage

- VUID-VkViewport-width-01770
  
  width must be greater than 0.0

- VUID-VkViewport-width-01771
  
  width must be less than or equal to VkPhysicalDeviceLimits::maxViewportDimensions[0]

- VUID-VkViewport-height-01773
  
  The absolute value of height must be less than or equal to VkPhysicalDeviceLimits::maxViewportDimensions[1]

- VUID-VkViewport-x-01774
  
  x must be greater than or equal to viewportBoundsRange[0]

- VUID-VkViewport-x-01232
  
  (x + width) must be less than or equal to viewportBoundsRange[1]

- VUID-VkViewport-y-01775
  
  y must be greater than or equal to viewportBoundsRange[0]

- VUID-VkViewport-y-01776
  
  y must be less than or equal to viewportBoundsRange[1]

- VUID-VkViewport-y-01777
  
  (y + height) must be greater than or equal to viewportBoundsRange[0]

- VUID-VkViewport-y-01233
  
  (y + height) must be less than or equal to viewportBoundsRange[1]

- VUID-VkViewport-minDepth-01234
  
  Unless VK_EXT_depth_range_unrestricted extension is enabled minDepth must be between 0.0 and 1.0, inclusive

- VUID-VkViewport-maxDepth-01235
  
  Unless VK_EXT_depth_range_unrestricted extension is enabled maxDepth must be between 0.0 and 1.0, inclusive
Chapter 27. Rasterization

Rasterization is the process by which a primitive is converted to a two-dimensional image. Each discrete location of this image contains associated data such as depth, color, or other attributes.

Rasterizing a primitive begins by determining which squares of an integer grid in framebuffer coordinates are occupied by the primitive, and assigning one or more depth values to each such square. This process is described below for points, lines, and polygons.

A grid square, including its \((x,y)\) framebuffer coordinates, \(z\) (depth), and associated data added by fragment shaders, is called a fragment. A fragment is located by its upper left corner, which lies on integer grid coordinates.

Rasterization operations also refer to a fragment’s sample locations, which are offset by fractional values from its upper left corner. The rasterization rules for points, lines, and triangles involve testing whether each sample location is inside the primitive. Fragments need not actually be square, and rasterization rules are not affected by the aspect ratio of fragments. Display of non-square grids, however, will cause rasterized points and line segments to appear fatter in one direction than the other.

We assume that fragments are square, since it simplifies antialiasing and texturing. After rasterization, fragments are processed by fragment operations.

Several factors affect rasterization, including the members of \(\text{VkPipelineRasterizationStateCreateInfo}\) and \(\text{VkPipelineMultisampleStateCreateInfo}\).

The \(\text{VkPipelineRasterizationStateCreateInfo}\) structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineRasterizationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateCreateFlags flags;
    VkBool32 depthClampEnable;
    VkBool32 rasterizerDiscardEnable;
    VkPolygonMode polygonMode;
    VkCullModeFlags cullMode;
    VkFrontFace frontFace;
    float depthBiasConstantFactor;
    float depthBiasClamp;
    float depthBiasSlopeFactor;
    float lineWidth;
} VkPipelineRasterizationStateCreateInfo;
```

- \(\text{sType}\) is the type of this structure.
- \(\text{pNext}\) is \text{NULL} or a pointer to a structure extending this structure.
- \(\text{flags}\) is reserved for future use.
• `depthClampEnable` controls whether to clamp the fragment’s depth values as described in Depth Test. If the pipeline is not created with `VkPipelineRasterizationDepthClipStateCreateInfoEXT` present then enabling depth clamp will also disable clipping primitives to the z planes of the frustrum as described in Primitive Clipping. Otherwise depth clipping is controlled by the state set in `VkPipelineRasterizationDepthClipStateCreateInfoEXT`.

• `rasterizerDiscardEnable` controls whether primitives are discarded immediately before the rasterization stage.

• `polygonMode` is the triangle rendering mode. See `VkPolygonMode`.

• `cullMode` is the triangle facing direction used for primitive culling. See `VkCullModeFlagBits`.

• `frontFace` is a `VkFace` value specifying the front-facing triangle orientation to be used for culling.

• `depthBiasEnable` controls whether to bias fragment depth values.

• `depthBiasConstantFactor` is a scalar factor controlling the constant depth value added to each fragment.

• `depthBiasClamp` is the maximum (or minimum) depth bias of a fragment.

• `depthBiasSlopeFactor` is a scalar factor applied to a fragment’s slope in depth bias calculations.

• `lineWidth` is the width of rasterized line segments.

The application can also add a `VkPipelineRasterizationStateRasterizationOrderAMD` structure to the pNext chain of a `VkPipelineRasterizationStateCreateInfo` structure. This structure enables selecting the rasterization order to use when rendering with the corresponding graphics pipeline as described in Rasterization Order.

---

**Valid Usage**

- **VUID-VkPipelineRasterizationStateCreateInfo-depthClampEnable-00782**
  If the depth clamping feature is not enabled, `depthClampEnable` must be `VK_FALSE`.

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01507**
  If the non-solid fill modes feature is not enabled, `polygonMode` must be `VK_POLYGON_MODE_FILL` or `VK_POLYGON_MODE_FILL_RECTANGLE_NV`.

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01414**
  If the `VK_NV_fill_rectangle` extension is not enabled, `polygonMode` must not be `VK_POLYGON_MODE_FILL_RECTANGLE_NV`.

- **VUID-VkPipelineRasterizationStateCreateInfo-pointPolygons-04458**
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::pointPolygons` is `VK_FALSE`, and `rasterizerDiscardEnable` is `VK_FALSE`, `polygonMode` must not be `VK_POLYGON_MODE_POINT`.

---

1494 | Chapter 27. Rasterization
Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationStateCreateInfo-sType-sType**
  
  
  The `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO`

- **VUID-VkPipelineRasterizationStateCreateInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of
  
  - `VkPipelineRasterizationConservativeStateCreateInfoEXT`
  - `VkPipelineRasterizationDepthClipStateCreateInfoEXT`
  - `VkPipelineRasterizationLineStateCreateInfoEXT`
  - `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT`
  - `VkPipelineRasterizationStateRasterizationOrderAMD`
  - `VkPipelineRasterizationStateStreamCreateInfoEXT`

- **VUID-VkPipelineRasterizationStateCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkPipelineRasterizationStateCreateInfo-flags-zerobitmask**
  
  The `flags` must be `0`

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-parameter**
  
  The `polygonMode` must be a valid `VkPolygonMode` value

- **VUID-VkPipelineRasterizationStateCreateInfo-cullMode-parameter**
  
  The `cullMode` must be a valid combination of `VkCullModeFlagBits` values

- **VUID-VkPipelineRasterizationStateCreateInfo-frontFace-parameter**
  
  The `frontFace` must be a valid `VkFrontFace` value

---

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineRasterizationStateCreateFlags;

`VkPipelineRasterizationStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

If the `pNext` chain of `VkPipelineRasterizationStateCreateInfo` includes a `VkPipelineRasterizationDepthClipStateCreateInfoEXT` structure, then that structure controls whether depth clipping is enabled or disabled.

The `VkPipelineRasterizationDepthClipStateCreateInfoEXT` structure is defined as:

// Provided by VK_EXT_depth_clip_enable
typedef struct VkPipelineRasterizationDepthClipStateCreateInfoEXT {
    VkStructureType                     sType;
    const void*                         pNext;
    VkPipelineRasterizationDepthClipStateCreateFlagsEXT flags;
    VkBool32                             depthClipEnable;
} VkPipelineRasterizationDepthClipStateCreateInfoEXT;
• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• depthClipEnable controls whether depth clipping is enabled as described in Primitive Clipping.

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-sType-sType must be VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_DEPTH_CLIP_STATE_CREATE_INFO_EXT
- VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-flags-zerobitmask flags must be 0

// Provided by VK_EXT_depth_clip_enable
typedef VkFlags VkPipelineRasterizationDepthClipStateCreateFlagsEXT;

VkPipelineRasterizationDepthClipStateCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

The VkPipelineMultisampleStateCreateInfo structure is defined as:

// Provided by VK_VERSION_1_0
typedef struct VkPipelineMultisampleStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineMultisampleStateCreateFlags flags;
    VkSampleCountFlagBits rasterizationSamples;
    VkBool32 sampleShadingEnable;
    float minSampleShading;
    const VkSampleMask* pSampleMask;
    VkBool32 alphaToCoverageEnable;
    VkBool32 alphaToOneEnable;
} VkPipelineMultisampleStateCreateInfo;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• rasterizationSamples is a VkSampleCountFlagBits value specifying the number of samples used in rasterization.
• sampleShadingEnable can be used to enable Sample Shading.
• minSampleShading specifies a minimum fraction of sample shading if sampleShadingEnable is set to VK_TRUE.
• `pSampleMask` is a pointer to an array of `VkSampleMask` values used in the sample mask test.

• `alphaToCoverageEnable` controls whether a temporary coverage value is generated based on the alpha component of the fragment's first color output as specified in the Multisample Coverage section.

• `alphaToOneEnable` controls whether the alpha component of the fragment's first color output is replaced with one as described in Multisample Coverage.

Each bit in the sample mask is associated with a unique sample index as defined for the coverage mask. Each bit `b` for mask word `w` in the sample mask corresponds to sample index `i`, where `i = 32 × w + b`. `pSampleMask` has a length equal to `⌈rasterizationSamples / 32⌉` words.

If `pSampleMask` is `NULL`, it is treated as if the mask has all bits set to 1.

---

**Valid Usage**

- **VUID-VkPipelineMultisampleStateCreateInfo-sampleShadingEnable-00784**
  If the sample rate shading feature is not enabled, `sampleShadingEnable` must be `VK_FALSE`

- **VUID-VkPipelineMultisampleStateCreateInfo-alphaToOneEnable-00785**
  If the alpha to one feature is not enabled, `alphaToOneEnable` must be `VK_FALSE`

- **VUID-VkPipelineMultisampleStateCreateInfo-minSampleShading-00786**
  `minSampleShading` must be in the range `[0,1]`

- **VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-01415**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if the subpass has any color attachments and `rasterizationSamples` is greater than the number of color samples, then `sampleShadingEnable` must be `VK_FALSE`
Valid Usage (Implicit)

- **VUID-VkPipelineMultisampleStateCreateInfo-sType-sType**
  - The `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO`.

- **VUID-VkPipelineMultisampleStateCreateInfo-pNext-pNext**
  - Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineCoverageModulationStateCreateInfoNV`, `VkPipelineCoverageReductionStateCreateInfoNV`, `VkPipelineCoverageToColorStateCreateInfoNV`, or `VkPipelineSampleLocationsStateCreateInfoEXT`.

- **VUID-VkPipelineMultisampleStateCreateInfo-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkPipelineMultisampleStateCreateInfo-flags-zerobitmask**
  - The `flags` must be `0`.

- **VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-parameter**
  - The `rasterizationSamples` must be a valid `VkSampleCountFlagBits` value.

- **VUID-VkPipelineMultisampleStateCreateInfo-pSampleMask-parameter**
  - If `pSampleMask` is not `NULL`, `pSampleMask` must be a valid pointer to an array of `VkSampleMask` values.

---

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineMultisampleStateCreateFlags;
```

`VkPipelineMultisampleStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The elements of the sample mask array are of type `VkSampleMask`, each representing 32 bits of coverage information:

```c
// Provided by VK_VERSION_1_0
typedef uint32_t VkSampleMask;
```

Rasterization only generates fragments which cover one or more pixels inside the framebuffer. Pixels outside the framebuffer are never considered covered in the fragment. Fragments which would be produced by application of any of the primitive rasterization rules described below but which lie outside the framebuffer are not produced, nor are they processed by any later stage of the pipeline, including any of the fragment operations.

Surviving fragments are processed by fragment shaders. Fragment shaders determine associated data for fragments, and can also modify or replace their assigned depth values.
Primitives are discarded before rasterization if the `rasterizerDiscardEnable` member of `VkPipelineRasterizationStateCreateInfo` is enabled. When enabled, primitives are discarded after they are processed by the last active shader stage in the pipeline before rasterization.

To dynamically control whether primitives are discarded before the rasterization stage:

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetRasterizerDiscardEnableEXT(
    VkCommandBuffer commandBuffer,            
    VkBool32 rasterizerDiscardEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizerDiscardEnable` controls whether primitives are discarded immediately before the rasterization stage.

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

### Valid Usage

- VUID-vkCmdSetRasterizerDiscardEnableEXT-None-04871
  The `extendedDynamicState2` feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetRasterizerDiscardEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetRasterizerDiscardEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetRasterizerDiscardEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
27.2. Controlling the Vertex Stream Used for Rasterization

By default vertex data output from the last pre-rasterization shader stage are directed to vertex stream zero. Geometry shaders can emit primitives to multiple independent vertex streams. Each vertex emitted by the geometry shader is directed at one of the vertex streams. As vertices are received on each vertex stream, they are arranged into primitives of the type specified by the geometry shader output primitive type. The shading language instructions OpEndPrimitive and OpEndStreamPrimitive can be used to end the primitive being assembled on a given vertex stream and start a new empty primitive of the same type. An implementation supports up to VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams streams, which is at least 1. The individual streams are numbered 0 through maxTransformFeedbackStreams minus 1. There is no requirement on the order of the streams to which vertices are emitted, and the number of vertices emitted to each vertex stream can be completely independent, subject only to the VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreamDataSize and VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferDataSize limits. The primitives output from all vertex streams are passed to the transform feedback stage to be captured to transform feedback buffers in the manner specified by the last pre-rasterization shader stage shader’s XfbBuffer, XfbStride, and Offsets decorations on the output interface variables in the graphics pipeline. To use a vertex stream other than zero, or to use multiple streams, the GeometryStreams capability must be specified.

By default, the primitives output from vertex stream zero are rasterized. If the implementation supports the VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect property it is possible to rasterize a vertex stream other than zero.

By default, geometry shaders that emit vertices to multiple vertex streams are limited to using only the OutputPoints output primitive type. If the implementation supports the VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackStreamsLinesTriangles property it is possible to emit OutputLineStrip or OutputTriangleStrip in addition to OutputPoints.

The vertex stream used for rasterization is specified by adding a VkPipelineRasterizationStateStreamCreateInfoEXT structure to the pNext chain of a VkPipelineRasterizationStateCreateInfo structure.

The VkPipelineRasterizationStateStreamCreateInfoEXT structure is defined as:
```c
typedef struct VkPipelineRasterizationStateStreamCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateStreamCreateFlagsEXT flags;
    uint32_t rasterizationStream;
} VkPipelineRasterizationStateStreamCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **rasterizationStream** is the vertex stream selected for rasterization.

If this structure is not present, **rasterizationStream** is assumed to be zero.

### Valid Usage

- **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-geometryStreams-02324**
  
  `VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams` must be enabled

- **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02325**
  
  `rasterizationStream` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`

- **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02326**
  
  `rasterizationStream` must be zero if `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect` is `VK_FALSE`

### Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_STREAM_CREATE_INFO_EXT`

- **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-flags-zerobitmask**
  
  `flags` must be 0

```c
typedef VkFlags VkPipelineRasterizationStateStreamCreateFlagsEXT;
```

`VkPipelineRasterizationStateStreamCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.
27.3. Rasterization Order

Within a subpass of a render pass instance, for a given (x,y,layer,sample) sample location, the following operations are guaranteed to execute in rasterization order, for each separate primitive that includes that sample location:

1. **Fragment operations**, in the order defined
2. **Blending, logic operations**, and color writes

Execution of these operations for each primitive in a subpass occurs in an order determined by the application.

The rasterization order to use for a graphics pipeline is specified by adding a `VkPipelineRasterizationStateRasterizationOrderAMD` structure to the `pNext` chain of a `VkPipelineRasterizationStateCreateInfo` structure.

The `VkPipelineRasterizationStateRasterizationOrderAMD` structure is defined as:

```c
// Provided by VK_AMD_rasterization_order
typedef struct VkPipelineRasterizationStateRasterizationOrderAMD {
    VkStructureType sType;
    const void* pNext;
    VkRasterizationOrderAMD rasterizationOrder;
} VkPipelineRasterizationStateRasterizationOrderAMD;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **rasterizationOrder** is a `VkRasterizationOrderAMD` value specifying the primitive rasterization order to use.

**Valid Usage (Implicit)**

- `VUID-VkPipelineRasterizationStateRasterizationOrderAMD-sType-sType` _sType must be VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_RASTERIZATION_ORDER_AMD_
- `VUID-VkPipelineRasterizationStateRasterizationOrderAMD-rasterizationOrder-parameter` _rasterizationOrder must be a valid VkRasterizationOrderAMD value_

If the **VK_AMD_rasterization_order** device extension is not enabled or the application does not request a particular rasterization order through specifying a `VkPipelineRasterizationStateRasterizationOrderAMD` structure then the rasterization order used by the graphics pipeline defaults to **VK_RASTERIZATION_ORDER_STRICT_AMD**.

Possible values of `VkPipelineRasterizationStateRasterizationOrderAMD::rasterizationOrder`, specifying the primitive rasterization order, are:
typedef enum VkRasterizationOrderAMD {
    VK_RASTERIZATION_ORDER_STRICT_AMD = 0,
    VK_RASTERIZATION_ORDER_RELAXED_AMD = 1,
} VkRasterizationOrderAMD;

- **VK_RASTERIZATION_ORDER_STRICT_AMD** specifies that operations for each primitive in a subpass must occur in primitive order.
- **VK_RASTERIZATION_ORDER_RELAXED_AMD** specifies that operations for each primitive in a subpass may not occur in primitive order.

### 27.4. Multisampling

Multisampling is a mechanism to antialias all Vulkan primitives: points, lines, and polygons. The technique is to sample all primitives multiple times at each pixel. Each sample in each framebuffer attachment has storage for a color, depth, and/or stencil value, such that per-fragment operations apply to each sample independently. The color sample values can be later resolved to a single color (see Resolving Multisample Images and the Render Pass chapter for more details on how to resolve multisample images to non-multisample images).

Vulkan defines rasterization rules for single-sample modes in a way that is equivalent to a multisample mode with a single sample in the center of each fragment.

Each fragment includes a coverage mask with a single bit for each sample in the fragment, and a number of depth values and associated data for each sample. An implementation may choose to assign the same associated data to more than one sample. The location for evaluating such associated data may be anywhere within the fragment area including the fragment’s center location \((x_f, y_f)\) or any of the sample locations. When \(rasterizationSamples\) is \(VK\_SAMPLE\_COUNT\_1\_BIT\), the fragment’s center location must be used. The different associated data values need not all be evaluated at the same location.

It is understood that each pixel has \(rasterizationSamples\) locations associated with it. These locations are exact positions, rather than regions or areas, and each is referred to as a sample point. The sample points associated with a pixel must be located inside or on the boundary of the unit square that is considered to bound the pixel. Furthermore, the relative locations of sample points may be identical for each pixel in the framebuffer, or they may differ.

If the render pass has a fragment density map attachment, each fragment only has \(rasterizationSamples\) locations associated with it regardless of how many pixels are covered in the fragment area. Fragment sample locations are defined as if the fragment had an area of (1,1) and its sample points must be located within these bounds. Their actual location in the framebuffer is calculated by scaling the sample location by the fragment area. Attachments with storage for multiple samples per pixel are located at the pixel sample locations. Otherwise, the fragment’s sample locations are generally used for evaluation of associated data and fragment operations.

If the current pipeline includes a fragment shader with one or more variables in its interface decorated with **Sample** and **Input**, the data associated with those variables will be assigned...
independently for each sample. The values for each sample must be evaluated at the location of the sample. The data associated with any other variables not decorated with Sample and Input need not be evaluated independently for each sample.

A coverage mask is generated for each fragment, based on which samples within that fragment are determined to be within the area of the primitive that generated the fragment.

Single pixel fragments and multi-pixel fragments defined by a fragment density map have one set of samples. Multi-pixel fragments defined by a shading rate image have one set of samples per pixel. Multi-pixel fragments defined by setting the fragment shading rate have one set of samples per pixel. Each set of samples has a number of samples determined by VkPipelineMultisampleStateCreateInfo::rasterizationSamples. Each sample in a set is assigned a unique sample index i in the range [0, rasterizationSamples).

Each sample in a fragment is also assigned a unique coverage index j in the range [0, n × rasterizationSamples), where n is the number of sets in the fragment. If the fragment contains a single set of samples, the coverage index is always equal to the sample index. If a shading rate image is used and a fragment covers multiple pixels, the coverage index is determined as defined by VkPipelineViewportCoarseSampleOrderStateCreateInfoNV or vkCmdSetCoarseSampleOrderNV.

If the fragment shading rate is set, the coverage index j is determined as a function of the pixel index p, the sample index i, and the number of rasterization samples r as:

\[ j = i + r \times \left( (f_w \times f_h) - 1 - p \right) \]

where the pixel index p is determined as a function of the pixel’s framebuffer location (x,y) and the fragment size (f_w,f_h):

\[ p_x = x \% f_w \]

\[ p_y = y \% f_h \]

\[ p = p_x + (p_y \times f_w) \]

The table below illustrates the pixel index for multi-pixel fragments:

*Table 33. Pixel indices - 1 wide*
Table 34. Pixel indices - 2 wide

Table 35. Pixel indices - 4 wide

The coverage mask includes $B$ bits packed into $W$ words, defined as:

$$B = n \times \text{rasterizationSamples}$$
\[ W = \lceil B/32 \rceil \]

Bit \( b \) in coverage mask word \( w \) is 1 if the sample with coverage index \( j = 32w + b \) is covered, and 0 otherwise.

If the `standardSampleLocations` member of `VkPhysicalDeviceLimits` is `VK_TRUE`, then the sample counts `VK_SAMPLE_COUNT_1_BIT`, `VK_SAMPLE_COUNT_2_BIT`, `VK_SAMPLE_COUNT_4_BIT`, `VK_SAMPLE_COUNT_8_BIT`, and `VK_SAMPLE_COUNT_16_BIT` have sample locations as listed in the following table, with the \( i \)th entry in the table corresponding to sample index \( i \). `VK_SAMPLE_COUNT_32_BIT` and `VK_SAMPLE_COUNT_64_BIT` do not have standard sample locations. Locations are defined relative to an origin in the upper left corner of the fragment.
Table 36. Standard sample locations

<table>
<thead>
<tr>
<th>Sample count</th>
<th>Sample Locations</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SAMPLE_COUNT_1_BIT</td>
<td>(0.5,0.5)</td>
</tr>
<tr>
<td>VK_SAMPLE_COUNT_2_BIT</td>
<td>(0.75,0.75) (0.25,0.25)</td>
</tr>
<tr>
<td>VK_SAMPLE_COUNT_4_BIT</td>
<td>(0.375, 0.125) (0.875, 0.375) (0.125, 0.625) (0.625, 0.875)</td>
</tr>
<tr>
<td>VK_SAMPLE_COUNT_8_BIT</td>
<td>(0.5625, 0.3125) (0.4375, 0.6875) (0.8125, 0.5625) (0.3125, 0.1875) (0.1875, 0.8125) (0.0625, 0.4375) (0.6875, 0.9375) (0.9375, 0.0625)</td>
</tr>
<tr>
<td>VK_SAMPLE_COUNT_16_BIT</td>
<td>(0.5625, 0.5625) (0.4375, 0.3125) (0.3125, 0.625) (0.75, 0.4375) (0.1875, 0.375) (0.625, 0.8125) (0.8125, 0.6875) (0.6875, 0.1875) (0.375, 0.875) (0.5, 0.0625) (0.25, 0.125) (0.125, 0.75) (0.0, 0.5) (0.9375, 0.25) (0.875, 0.9375) (0.0625, 0.0)</td>
</tr>
</tbody>
</table>

Color images created with multiple samples per pixel use a compression technique where there are
two arrays of data associated with each pixel. The first array contains one element per sample where each element stores an index to the second array defining the fragment mask of the pixel. The second array contains one element per color fragment and each element stores a unique color value in the format of the image. With this compression technique it is not always necessary to actually use unique storage locations for each color sample: when multiple samples share the same color value the fragment mask may have two samples referring to the same color fragment. The number of color fragments is determined by the samples member of the VkImageCreateInfo structure used to create the image. The VK_AMD_shader_fragment_mask device extension provides shader instructions enabling the application to get direct access to the fragment mask and the individual color fragment values.

![Fragment Mask](image)

### Figure 16. Fragment Mask

#### 27.5. Custom Sample Locations

Applications can also control the sample locations used for rasterization.

If the pNext chain of the VkPipelineMultisampleStateCreateInfo structure specified at pipeline creation time includes a VkPipelineSampleLocationsStateCreateInfoEXT structure, then that structure controls the sample locations used when rasterizing primitives with the pipeline.

The VkPipelineSampleLocationsStateCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkPipelineSampleLocationsStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 sampleLocationsEnable;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkPipelineSampleLocationsStateCreateInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- sampleLocationsEnable controls whether custom sample locations are used. If sampleLocationsEnable is VK_FALSE, the default sample locations are used and the values specified in sampleLocationsInfo are ignored.
- sampleLocationsInfo is the sample locations to use during rasterization if sampleLocationsEnable is VK_TRUE and the graphics pipeline is not created with VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT.
Valid Usage (Implicit)

- **VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_SAMPLE_LOCATIONS_STATE_CREATE_INFO_EXT`

- **VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sampleLocationsInfo-parameter**
  - `sampleLocationsInfo` **must** be a valid `VkSampleLocationsInfoEXT` structure

The `VkSampleLocationsInfoEXT` structure is defined as:

```c
typedef struct VkSampleLocationsInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSampleCountFlagBits sampleLocationsPerPixel;
    VkExtent2D sampleLocationGridSize;
    uint32_t sampleLocationsCount;
    const VkSampleLocationEXT* pSampleLocations;
} VkSampleLocationsInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `sampleLocationsPerPixel` is a `VkSampleCountFlagBits` value specifying the number of sample locations per pixel.
- `sampleLocationGridSize` is the size of the sample location grid to select custom sample locations for.
- `sampleLocationsCount` is the number of sample locations in `pSampleLocations`.
- `pSampleLocations` is a pointer to an array of `sampleLocationsCount` `VkSampleLocationEXT` structures.

This structure **can** be used either to specify the sample locations to be used for rendering or to specify the set of sample locations an image subresource has been last rendered with for the purposes of layout transitions of depth/stencil images created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT`.

The sample locations in `pSampleLocations` specify `sampleLocationsPerPixel` number of sample locations for each pixel in the grid of the size specified in `sampleLocationGridSize`. The sample location for sample `i` at the pixel grid location `(x, y)` is taken from `pSampleLocations[(x + y × sampleLocationGridSize.width) × sampleLocationsPerPixel + i]`.

If the render pass has a fragment density map, the implementation will choose the sample locations for the fragment and the contents of `pSampleLocations` **may** be ignored.
Valid Usage

- VUID-VkSampleLocationsInfoEXT-sampleLocationsPerPixel-01526
  `sampleLocationsPerPixel` must be a bit value that is set in `VkPhysicalDeviceSampleLocationsPropertiesEXT::sampleLocationSampleCounts`

- VUID-VkSampleLocationsInfoEXT-sampleLocationsCount-01527
  `sampleLocationsCount` must equal `sampleLocationsPerPixel × sampleLocationGridSize.width × sampleLocationGridSize.height`

Valid Usage (Implicit)

- VUID-VkSampleLocationsInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SAMPLE_LOCATIONS_INFO_EXT`

- VUID-VkSampleLocationsInfoEXT-pSampleLocations-parameter
  If `sampleLocationsCount` is not 0, `pSampleLocations` must be a valid pointer to an array of `sampleLocationsCount` `VkSampleLocationEXT` structures

The `VkSampleLocationEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VK_EXT_sample_locations
    VkSampleLocationEXT {
    float x;
    float y;
} VkSampleLocationEXT;
```

- `x` is the horizontal coordinate of the sample's location.
- `y` is the vertical coordinate of the sample's location.

The domain space of the sample location coordinates has an upper-left origin within the pixel in framebuffer space.

The values specified in a `VkSampleLocationEXT` structure are always clamped to the implementation-dependent sample location coordinate range `[sampleLocationCoordinateRange[0], sampleLocationCoordinateRange[1]]` that can be queried using `VkPhysicalDeviceSampleLocationsPropertiesEXT`.

The custom sample locations used for rasterization when `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` is `VK_TRUE` are specified by the `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsInfo` property of the bound graphics pipeline, if the pipeline was not created with `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` enabled.

Otherwise, the sample locations used for rasterization are set by calling `vkCmdSetSampleLocationsEXT`.
void vkCmdSetSampleLocationsEXT(
    VkCommandBuffer commandBuffer,
    const VkSampleLocationsInfoEXT* pSampleLocationsInfo);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pSampleLocationsInfo` is the sample locations state to set.

### Valid Usage

- **VUID-vkCmdSetSampleLocationsEXT-sampleLocationsPerPixel-01529**
  The `sampleLocationsPerPixel` member of `pSampleLocationsInfo` must equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with.

- **VUID-vkCmdSetSampleLocationsEXT-variableSampleLocations-01530**
  If `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE` then the current render pass must have been begun by specifying a `VkRenderPassSampleLocationsBeginInfoEXT` structure whose `pPostSubpassSampleLocations` member contains an element with a `subpassIndex` matching the current subpass index and the `sampleLocationsInfo` member of that element must match the sample locations state pointed to by `pSampleLocationsInfo`.

### Valid Usage (Implicit)

- **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetSampleLocationsEXT-pSampleLocationsInfo-parameter**
  `pSampleLocationsInfo` must be a valid pointer to a valid `VkSampleLocationsInfoEXT` structure.

- **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.
27.6. Fragment Shading Rates

The features advertised by `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` allow an application to control the shading rate of a given fragment shader invocation. The fragment shading rate strongly interacts with Multisampling, and the set of available rates for an implementation may be restricted by sample rate.

To query available shading rates, call:

```c
// Provided by VK_KHR_fragment_shading_rate
VkResult vkGetPhysicalDeviceFragmentShadingRatesKHR(
    VkPhysicalDevice physicalDevice, uint32_t* pFragmentShadingRateCount,
    VkPhysicalDeviceFragmentShadingRateKHR* pFragmentShadingRates);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pFragmentShadingRateCount` is a pointer to an integer related to the number of fragment shading rates available or queried, as described below.
- `pFragmentShadingRates` is either NULL or a pointer to an array of `VkPhysicalDeviceFragmentShadingRateKHR` structures.

If `pFragmentShadingRates` is NULL, then the number of fragment shading rates available is returned in `pFragmentShadingRateCount`. Otherwise, `pFragmentShadingRateCount` must point to a variable set by the user to the number of elements in the `pFragmentShadingRates` array, and on return the variable is overwritten with the number of structures actually written to `pFragmentShadingRates`. If `pFragmentShadingRateCount` is less than the number of fragment shading rates available, at most `pFragmentShadingRateCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available fragment shading rates were returned.

The returned array of fragment shading rates must be ordered from largest `fragmentSize.width` value to smallest, and each set of fragment shading rates with the same `fragmentSize.width` value must be ordered from largest `fragmentSize.height` to smallest. Any two entries in the array must not have the same `fragmentSize` values.

For any entry in the array, the following rules also apply:

- The value of `fragmentSize.width` must be less than or equal to `maxFragmentSize.width`.
- The value of `fragmentSize.width` must be greater than or equal to 1.
• The value of `fragmentSize.width` must be a power-of-two.
• The value of `fragmentSize.height` must be less than or equal to `maxFragmentSize.height`.
• The value of `fragmentSize.height` must be greater than or equal to 1.
• The value of `fragmentSize.height` must be a power-of-two.
• The highest sample count in `sampleCounts` must be less than or equal to `maxFragmentShadingRateRasterizationSamples`.
• The product of `fragmentSize.width`, `fragmentSize.height`, and the highest sample count in `sampleCounts` must be less than or equal to `maxFragmentShadingRateCoverageSamples`.

Implementations must support at least the following shading rates:

<table>
<thead>
<tr>
<th><code>sampleCounts</code></th>
<th><code>fragmentSize</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>`VK_SAMPLE_COUNT_1_BIT</td>
<td>VK_SAMPLE_COUNT_4_BIT`</td>
</tr>
<tr>
<td>`VK_SAMPLE_COUNT_1_BIT</td>
<td>VK_SAMPLE_COUNT_4_BIT`</td>
</tr>
<tr>
<td>~0</td>
<td>(1,1)</td>
</tr>
</tbody>
</table>

If `framebufferColorSampleCounts` includes `VK_SAMPLE_COUNT_2_BIT`, the required rates must also include `VK_SAMPLE_COUNT_2_BIT`.

Note
Including the {1,1} fragment size is done for completeness; it has no actual effect on the support of rendering without setting the fragment size. All sample counts and render pass transforms are supported for this rate.

The returned set of fragment shading rates must be returned in the native (rotated) coordinate system. For rasterization using render pass transform not equal to `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, the application must transform the returned fragment shading rates into the current (unrotated) coordinate system to get the supported rates for that transform.

Note
For example, consider an implementation returning support for 4x2, but not 2x4 in the set of supported fragment shading rates. This means that for transforms `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR` and `VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR`, 2x4 is a supported rate, but 4x2 is an unsupported rate.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRateCount-parameter
  `pFragmentShadingRateCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRates-parameter
  If the value referenced by `pFragmentShadingRateCount` is not 0, and `pFragmentShadingRates` is not NULL, `pFragmentShadingRates` must be a valid pointer to an array of `VkPhysicalDeviceFragmentShadingRateKHR` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkPhysicalDeviceFragmentShadingRateKHR` structure is defined as

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateKHR {
    VkStructureType sType;
    void* pNext;
    VkSampleCountFlags sampleCounts;
    VkExtent2D fragmentSize;
} VkPhysicalDeviceFragmentShadingRateKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `sampleCounts` is a bitmask of sample counts for which the shading rate described by `fragmentSize` is supported.
- `fragmentSize` is a `VkExtent2D` describing the width and height of a supported shading rate.
Fragment shading rates can be set at three points, with the three rates combined to determine the final shading rate.

### 27.6.1. Pipeline Fragment Shading Rate

The pipeline fragment shading rate can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via `vkCmdSetFragmentShadingRateKHR`.

The `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPipelineFragmentShadingRateStateCreateInfoKHR {
    VkStructureType    sType;  
    const void*        pNext;  
    VkExtent2D         fragmentSize;  
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateStateCreateInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- fragmentSize specifies a VkExtent2D structure containing the fragment size used to define the pipeline fragment shading rate for drawing commands using this pipeline.
- combinerOps specifies a VkFragmentShadingRateCombinerOpKHR value determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the pNext chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure, then that structure includes parameters that control the pipeline fragment shading rate.

If this structure is not present, fragmentSize is considered to be equal to (1,1), and both elements of combinerOps are considered to be equal to `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.
Valid Usage (Implicit)

- **VUID-VkPipelineFragmentShadingRateStateCreateInfoKHR-sType-sType**
  
  *sType must be VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_STATE_CREATE_INFO_KHR*

- **VUID-VkPipelineFragmentShadingRateStateCreateInfoKHR-combinerOps-parameter**
  
  Any given element of `combinerOps` must be a valid `VkFragmentShadingRateCombinerOpKHR` value

If a pipeline state object is created with `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` enabled, the pipeline fragment shading rate and combiner operation is set by the command:

```c
// Provided by VK_KHR_fragment_shading_rate
void vkCmdSetFragmentShadingRateKHR(
    VkCommandBuffer commandBuffer,
    const VkExtent2D* pFragmentSize,
    const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pFragmentSize` specifies the pipeline fragment shading rate for subsequent drawing commands.
- `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by subsequent drawing commands.
Valid Usage

- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04507
  If `pipelineFragmentShadingRate` is not enabled, `pFragmentSize->width` must be 1

- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04508
  If `pipelineFragmentShadingRate` is not enabled, `pFragmentSize->height` must be 1

- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04509
  One of `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or `attachmentFragmentShadingRate` must be enabled

- VUID-vkCmdSetFragmentShadingRateKHR-primitiveFragmentShadingRate-04510
  If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- VUID-vkCmdSetFragmentShadingRateKHR-attachmentFragmentShadingRate-04511
  If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- VUID-vkCmdSetFragmentShadingRateKHR-fragmentSizeNonTrivialCombinerOps-04512
  If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps` must be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04513
  `pFragmentSize->width` must be greater than or equal to 1

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04514
  `pFragmentSize->height` must be greater than or equal to 1

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04515
  `pFragmentSize->width` must be a power-of-two value

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04516
  `pFragmentSize->height` must be a power-of-two value

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04517
  `pFragmentSize->width` must be less than or equal to 4

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04518
  `pFragmentSize->height` must be less than or equal to 4
Valid Usage (Implicit)

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-parameter
  
  `pFragmentSize` must be a valid pointer to a valid `VkExtent2D` structure

- VUID-vkCmdSetFragmentShadingRateKHR-combinerOps-parameter
  
  Any given element of `combinerOps` must be a valid `VkFragmentShadingRateCombinerOpKHR` value

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-recording
  
  `commandBuffer` must be in the `recording` state

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

27.6.2. Primitive Fragment Shading Rate

The *primitive fragment shading rate* can be set via the `PrimitiveShadingRateKHR` built-in in the last active pre-rasterization shader stage. The rate associated with a given primitive is sourced from the value written to `PrimitiveShadingRateKHR` by that primitive’s *provoking vertex*.

27.6.3. Attachment Fragment Shading Rate

The *attachment shading rate* can be set by including `VkFragmentShadingRateAttachmentInfoKHR` in a subpass to define a *fragment shading rate attachment*. Each pixel in the framebuffer is assigned an attachment fragment shading rate by the corresponding texel in the fragment shading rate attachment, according to:

\[ x' = \text{floor}(x / \text{region}_x) \]
\[ y' = \text{floor}(y / \text{region}_y) \]

where \( x' \) and \( y' \) are the coordinates of a texel in the fragment shading rate attachment, \( x \) and \( y \) are the coordinates of the pixel in the framebuffer, and \( \text{region}_x \) and \( \text{region}_y \) are the size of the region each texel corresponds to, as defined by the shadingRateAttachmentTexelSize member of \( \text{VkFragmentShadingRateAttachmentInfoKHR} \).

If multiview is enabled and the shading rate attachment has multiple layers, the shading rate attachment texel is selected from the layer determined by the ViewIndex built-in. If multiview is disabled, and both the shading rate attachment and the framebuffer have multiple layers, the shading rate attachment texel is selected from the layer determined by the Layer built-in. Otherwise, the texel is unconditionally selected from the first layer of the attachment.

The fragment size is encoded into the first component of the identified texel as follows:

\[
\begin{align*}
\text{size}_w &= 2^{((\text{texel} / 4) \& 3)} \\
\text{size}_h &= 2^{(\text{texel} \& 3)}
\end{align*}
\]

where texel is the value in the first component of the identified texel, and \( \text{size}_w \) and \( \text{size}_h \) are the width and height of the fragment size, decoded from the texel.

If no fragment shading rate attachment is specified, this size is calculated as \( \text{size}_w = \text{size}_h = 1 \). Applications must not specify a width or height greater than 4 by this method.

The Fragment Shading Rate enumeration in SPIR-V adheres to the above encoding.

27.6.4. Combining the Fragment Shading Rates

The final rate \( (C_{xy})' \) used for fragment shading must be one of the rates returned by \( \text{vkGetPhysicalDeviceFragmentShadingRatesKHR} \) for the sample count and render pass transform used by rasterization.

If any of the following conditions are met, \( C_{xy} \) must be set to \( \{1,1\} \):

- If Sample Shading is enabled.
- The fragmentShadingRateWithSampleMask limit is not supported, and \( \text{VkPipelineMultisampleStateCreateInfo}::\text{pSampleMask} \) contains a zero value in any bit used by fragment operations.
- The fragmentShadingRateWithShaderSampleMask is not supported, and the fragment shader has SampleMask in the input or output interface.
- The fragmentShadingRateWithShaderDepthStencilWrites limit is not supported, and the fragment shader declares the FragDepth or FragStencilRefEXT built-in.
- The fragmentShadingRateWithConservativeRasterization limit is not supported, and \( \text{VkPipelineRasterizationConservativeStateCreateInfoEXT}::\text{conservativeRasterizationMode} \) is not
• The `fragmentShadingRateWithFragmentShaderInterlock` limit is not supported, and the fragment shader declares any of the `fragment shader interlock` execution modes.

• The `fragmentShadingRateWithCustomSampleLocations` limit is not supported, and `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` is `VK_TRUE`.

Otherwise, each of the specified shading rates are combined and then used to derive the value of $C_{xy}$. As there are three ways to specify shading rates, two combiner operations are specified - between the pipeline and primitive shading rates, and between the result of that and the attachment shading rate.

The equation used for each combiner operation is defined by `VkFragmentShadingRateCombinerOpKHR`:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef enum VkFragmentShadingRateCombinerOpKHR {
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR = 0,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR = 1,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR = 2,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR = 3,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR = 4,
} VkFragmentShadingRateCombinerOpKHR;
```

- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = A_{xy}$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = B_{xy}$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = \min(A_{xy}, B_{xy})$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = \max(A_{xy}, B_{xy})$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = A_{xy} \cdot B_{xy}$.

where $\text{combine}(A_{xy}, B_{xy})$ is the combine operation, and $A_{xy}$ and $B_{xy}$ are the inputs to the operation.

If `fragmentShadingRateStrictMultiplyCombiner` is `VK_FALSE`, using `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR` with values of 1 for both A and B in the same dimension results in the value 2 being produced for that dimension. See the definition of `fragmentShadingRateStrictMultiplyCombiner` for more information.

These operations are performed in a component-wise fashion.

This is used to generate a combined fragment area using the equation:

$$C_{xy} = \text{combine}(A_{xy}, B_{xy})$$
where \( C_{xy} \) is the combined fragment area result, and \( A_{xy} \) and \( B_{xy} \) are the fragment areas of the fragment shading rates being combined.

Two combine operations are performed, first with \( A_{xy} \) equal to the pipeline fragment shading rate and \( B_{xy} \) equal to the primitive fragment shading rate, with the combine() operation selected by combinerOps[0]. A second combination is then performed, with \( A_{xy} \) equal to the result of the first combination and \( B_{xy} \) equal to the attachment fragment shading rate, with the combine() operation selected by combinerOps[1]. The result of the second combination is used as the final fragment shading rate, reported via the ShadingRateKHR built-in.

Implementations may clamp the \( C_{xy} \) result of each combiner operation separately, or only after the second combiner operation.

If the final combined rate is one of the rates returned by vkGetPhysicalDeviceFragmentShadingRatesKHR for the sample count and render pass transform used by rasterization, \( C_{xy}' = C_{xy} \). Otherwise, \( C_{xy}' \) is selected from the rates returned by vkGetPhysicalDeviceFragmentShadingRatesKHR for the sample count and render pass transform used by rasterization. From this list of supported rates, the following steps are applied in order, to select a single value:

1. Keep only rates where \( C'_x \leq C_x \) and \( C'_y \leq C_y \).
   - Implementations may also keep rates where \( C'_x \leq C_y \) and \( C'_y \leq C_x \).
2. Keep only rates with the highest area \((C'_x \times C'_y)\).
3. Keep only rates with the lowest aspect ratio \((C'_x + C'_y)\).
4. In cases where a wide (e.g. 4x1) and tall (e.g. 1x4) rate remain, the implementation may choose either rate. However, it must choose this rate consistently for the same shading rates, render pass transform, and combiner operations for the lifetime of the VkDevice.

### 27.6.5. Extended Fragment Shading Rates

The features advertised by VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV provide support for additional fragment shading rates beyond those specifying one fragment shader invocation covering all pixels in a fragment whose size is indicated by the fragment shading rate.

If the fragmentShadingRateEnums feature is enabled, fragment shading rates may be specified using the VkFragmentShadingRateNV enumerated type defined as:
typedef enum VkFragmentShadingRateNV {
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV = 0,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_1X2_PIXELS_NV = 1,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X1_PIXELS_NV = 4,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X2_PIXELS_NV = 5,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X4_PIXELS_NV = 6,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X2_PIXELS_NV = 9,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X4_PIXELS_NV = 10,
    VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV = 11,
    VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV = 12,
    VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV = 13,
    VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV = 14,
    VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV = 15,
} VkFragmentShadingRateNV;

- **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV** specifies a fragment size of 1x1 pixels.
- **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_1X2_PIXELS_NV** specifies a fragment size of 1x2 pixels.
- **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X1_PIXELS_NV** specifies a fragment size of 2x1 pixels.
- **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X2_PIXELS_NV** specifies a fragment size of 2x2 pixels.
- **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X4_PIXELS_NV** specifies a fragment size of 2x4 pixels.
- **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X2_PIXELS_NV** specifies a fragment size of 4x2 pixels.
- **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X4_PIXELS_NV** specifies a fragment size of 4x4 pixels.
- **VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV** specifies a fragment size of 1x1 pixels, with two fragment shader invocations per fragment.
- **VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV** specifies a fragment size of 1x1 pixels, with four fragment shader invocations per fragment.
- **VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV** specifies a fragment size of 1x1 pixels, with eight fragment shader invocations per fragment.
- **VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV** specifies a fragment size of 1x1 pixels, with sixteen fragment shader invocations per fragment.
- **VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV** specifies that any portions of a primitive that use that shading rate should be discarded without invoking any fragment shader.

To use the shading rates **VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV**, **VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV**, **VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV**, and
VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV as a pipeline, primitive, or attachment shading rate, the supersampleFragmentShadingRates feature must be enabled. To use the shading rate VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV as a pipeline, primitive, or attachment shading rate, the noInvocationFragmentShadingRates feature must be enabled.

When using fragment shading rate enums, the pipeline fragment shading rate can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via vkCmdSetFragmentShadingRateEnumNV.

The VkPipelineFragmentShadingRateEnumStateCreateInfoNV structure is defined as:

```
// Provided by VK_NV_fragment_shading_rate Enums

typedef struct VkPipelineFragmentShadingRateEnumStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkFragmentShadingRateTypeNV shadingRateType;
    VkFragmentShadingRateNV shadingRate;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateEnumStateCreateInfoNV;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- shadingRateType specifies a VkFragmentShadingRateTypeNV value indicating whether fragment shading rates are specified using fragment sizes or VkFragmentShadingRateNV enums.
- shadingRate specifies a VkFragmentShadingRateNV value indicating the pipeline fragment shading rate.
- combinerOps specifies VkFragmentShadingRateCombinerOpKHR values determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the pNext chain of VkGraphicsPipelineCreateInfo includes a VkPipelineFragmentShadingRateEnumStateCreateInfoNV structure, then that structure includes parameters that control the pipeline fragment shading rate.

If this structure is not present, shadingRateType is considered to be equal to VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV, shadingRate is considered to be equal to VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV, and both elements of combinerOps are considered to be equal to VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR.
Valid Usage (Implicit)

- **VUID-VkPipelineFragmentShadingRateEnumStateCreateInfoNV-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_ENUM_STATE_CREATE_INFO_NV`.

- **VUID-VkPipelineFragmentShadingRateEnumStateCreateInfoNV-shadingRateType-parameter**
  - `shadingRateType` must be a valid `VkFragmentShadingRateTypeNV` value.

- **VUID-VkPipelineFragmentShadingRateEnumStateCreateInfoNV-shadingRate-parameter**
  - `shadingRate` must be a valid `VkFragmentShadingRateNV` value.

- **VUID-VkPipelineFragmentShadingRateEnumStateCreateInfoNV-combinerOps-parameter**
  - Any given element of `combinerOps` must be a valid `VkFragmentShadingRateCombinerOpKHR` value.

The `VkFragmentShadingRateTypeNV` enumerated type specifies whether a graphics pipeline gets its pipeline fragment shading rates and combiners from the `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` structure or the `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure.

```c
// Provided by VK_NV_fragment_shading_rate_enums
typedef enum VkFragmentShadingRateTypeNV {
    VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV = 0,
    VK_FRAGMENT_SHADING_RATE_TYPE_ENUMS_NV = 1,
} VkFragmentShadingRateTypeNV;
```

- **VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV** specifies that a graphics pipeline should obtain its pipeline fragment shading rate and combiner state from the `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure and that any state specified by the `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` structure should be ignored.

- **VK_FRAGMENT_SHADING_RATE_TYPE_ENUMS_NV** specifies that a graphics pipeline should obtain its pipeline fragment shading rate and combiner state from the `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure and that any state specified by the `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` structure should be ignored.

If a pipeline state object is created with `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` enabled, the pipeline fragment shading rate and combiner operation **may** be set by the command:

```c
// Provided by VK_NV_fragment_shading_rate_enums
void vkCmdSetFragmentShadingRateEnumNV(
    VkCommandBuffer commandBuffer,
    VkFragmentShadingRateNV shadingRate,
    const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `shadingRate` specifies a `VkFragmentShadingRateNV` enum indicating the pipeline fragment
shading rate for subsequent drawing commands.

- **combinerOps** specifies a `VkFragmentShadingRateCombinerOpKHR` determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by subsequent drawing commands.

---

**Valid Usage**

- **VUID-vkCmdSetFragmentShadingRateEnumNV-pipelineFragmentShadingRate-04576**
  
  If `pipelineFragmentShadingRate` is not enabled, `shadingRate` **must** be `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV`.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-supersampleFragmentShadingRates-04577**
  
  If `supersampleFragmentShadingRates` is not enabled, `shadingRate` **must not** be `VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV`, `VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV`, `VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV`, or `VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV`.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-noInvocationFragmentShadingRates-04578**
  
  If `noInvocationFragmentShadingRates` is not enabled, `shadingRate` **must not** be `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-fragmentShadingRateEnums-04579**
  
  `fragmentShadingRateEnums` **must** be enabled.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-pipelineFragmentShadingRate-04580**
  
  One of `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or `attachmentFragmentShadingRate` **must** be enabled.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-primitiveFragmentShadingRate-04581**
  
  If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-attachmentFragmentShadingRate-04582**
  
  If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-fragmentSizeNonTrivialCombinerOps-04583**
  
  If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps` **must** be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`.
Valid Usage (Implicit)

• VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-parameter
  \(\text{commandBuffer} \text{ must be a valid } \text{VkCommandBuffer} \text{ handle}\)

When the \(\text{supersampleFragmentShadingRates}\) or \(\text{noInvocationFragmentShadingRates}\) features are enabled, the behavior of the \(\text{shading rate combiner operations}\) is extended to support the shading rates enabled by those features. Primitive and attachment shading rate values are interpreted as \(\text{VkFragmentShadingRateNV}\) values and the behavior of the combiners is modified as follows:

• For \(\text{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR, VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR,}\) and \(\text{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR}\), if either \(A_{xy}\) or \(B_{xy}\) is \(\text{VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV}\), \(\text{combine}(A_{xy},B_{xy})\) produces a shading rate of \(\text{VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV}\), regardless of the other input shading rate.

• For \(\text{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR}\), \(\text{combine}(A_{xy},B_{xy})\) produces a shading rate whose fragment size is the smaller of the fragment sizes of \(A_{xy}\) and \(B_{xy}\) and whose invocation count is the larger of the invocation counts of \(A_{xy}\) and \(B_{xy}\).

• For \(\text{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR}\), \(\text{combine}(A_{xy},B_{xy})\) produces a shading rate
whose fragment size is the larger of the fragment sizes of $A_{xy}$ and $B_{xy}$ and whose invocation count is the smaller of the invocation counts of $A_{xy}$ and $B_{xy}$.

- For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR`, `combine(A_{xy}, B_{xy})` produces a shading rate whose fragment size and invocation count is the product of the fragment sizes and invocation counts, respectively, of $A_{xy}$ and $B_{xy}$. If the resulting shading rate has both multiple pixels and multiple invocations per fragment, an implementation may adjust the shading rate by reducing both the pixel and invocation counts.

If the final shading rate from the combiners is `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`, no fragments will be generated for any portion of a primitive using that shading rate.

If the final shading rate from the combiners specifies multiple fragment shader invocations per fragment, the fragment will be processed with multiple unique samples as in sample shading, where the total number the total number of invocations is taken from the shading rate and then clamped to the value of `totalSamples` used by sample shading and to the value of `maxFragmentShadingRateInvocationCount`.

### 27.7. Shading Rate Image

The shading rate image feature allows pipelines to use a shading rate image to control the fragment area and the minimum number of fragment shader invocations launched for each fragment. When the shading rate image is enabled, the rasterizer determines a base shading rate for each region of the framebuffer covered by a primitive by fetching a value from the shading rate image and translating it to a shading rate using a per-viewport shading rate palette. This base shading rate is then adjusted to derive a final shading rate. The final shading rate specifies the fragment area and fragment shader invocation count to use for fragments generated in the region.

If the `pNext` chain of `VkPipelineViewportStateCreateInfo` includes a `VkPipelineViewportShadingRateImageStateCreateInfoNV` structure, then that structure includes parameters that control the shading rate.

The `VkPipelineViewportShadingRateImageStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkPipelineViewportShadingRateImageStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 shadingRateImageEnable;
    uint32_t viewportCount;
    const VkShadingRatePaletteNV* pShadingRatePalettes;
} VkPipelineViewportShadingRateImageStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shadingRateImageEnable` specifies whether shading rate image and palettes are used during rasterization.
• viewportCount specifies the number of per-viewport palettes used to translate values stored in shading rate images.

• pShadingRatePalettes is a pointer to an array of VkShadingRatePaletteNV structures defining the palette for each viewport. If the shading rate palette state is dynamic, this member is ignored.

If this structure is not present, shadingRateImageEnable is considered to be VK_FALSE, and the shading rate image and palettes are not used.

Valid Usage

• VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-viewportCount-02054
  If the multiple viewports feature is not enabled, viewportCount must be 0 or 1

• VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-viewportCount-02055
  viewportCount must be less than or equal to VkPhysicalDeviceLimits::maxViewports

• VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-shadingRateImageEnable-02056
  If shadingRateImageEnable is VK_TRUE, viewportCount must be greater or equal to the viewportCount member of VkPipelineViewportStateCreateInfo

Valid Usage (Implicit)

• VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_SHADING_RATE_IMAGE_STATE_CREATE_INFO_NV

When shading rate image usage is enabled in the bound pipeline, the pipeline uses a shading rate image specified by the command:

```c
// Provided by VK_NV_shading_rate_image
void vkCmdBindShadingRateImageNV(
    VkCommandBuffer       commandBuffer,
    VkImageView          imageView,
    VkImageLayout         imageLayout);
```

• commandBuffer is the command buffer into which the command will be recorded.

• imageView is an image view handle specifying the shading rate image. imageView may be set to VK_NULL_HANDLE, which is equivalent to specifying a view of an image filled with zero values.

• imageLayout is the layout that the image subresources accessible from imageView will be in when the shading rate image is accessed.
**Valid Usage**

- **VUID-vkCmdBindShadingRateImageNV-None-02058**
  The shading rate image feature must be enabled

- **VUID-vkCmdBindShadingRateImageNV-imageView-02059**
  If imageView is not VK_NULL_HANDLE, it must be a valid VkImageView handle of type VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

- **VUID-vkCmdBindShadingRateImageNV-imageView-02060**
  If imageView is not VK_NULL_HANDLE, it must have a format of VK_FORMAT_R8_UINT

- **VUID-vkCmdBindShadingRateImageNV-imageView-02061**
  If imageView is not VK_NULL_HANDLE, it must have been created with a usage value including VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV

- **VUID-vkCmdBindShadingRateImageNV-imageView-02062**
  If imageView is not VK_NULL_HANDLE, imageLayout must match the actual VkImageLayout of each subresource accessible from imageView at the time the subresource is accessed

- **VUID-vkCmdBindShadingRateImageNV-imageLayout-02063**
  If imageView is not VK_NULL_HANDLE, imageLayout must be VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV or VK_IMAGE_LAYOUT_GENERAL

**Valid Usage (Implicit)**

- **VUID-vkCmdBindShadingRateImageNV-commandBuffer-parameter**
  commandBuffer must be a valid VkCommandBuffer handle

- **VUID-vkCmdBindShadingRateImageNV-imageView-parameter**
  If imageView is not VK_NULL_HANDLE, imageView must be a valid VkImageView handle

- **VUID-vkCmdBindShadingRateImageNV-imageLayout-parameter**
  imageLayout must be a valid VkImageLayout value

- **VUID-vkCmdBindShadingRateImageNV-commandBuffer-recording**
  commandBuffer must be in the recording state

- **VUID-vkCmdBindShadingRateImageNV-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- **VUID-vkCmdBindShadingRateImageNV-commonparent**
  Both of commandBuffer, and imageView that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

When the shading rate image is enabled in the current pipeline, rasterizing a primitive covering the pixel with coordinates \((x,y)\) will fetch a shading rate index value from the shading rate image bound by `vkCmdBindShadingRateImageNV`. If the shading rate image view has a type of `VK_IMAGE_VIEW_TYPE_2D`, the lookup will use texel coordinates \((u,v)\) where \(u = \lfloor \frac{x}{\text{twIDTH}} \rfloor\), \(v = \lfloor \frac{y}{\text{theIGHT}} \rfloor\), and `twIDTH` and `theIGHT` are the width and height of the implementation-dependent shading rate texel size. If the shading rate image view has a type of `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, the lookup will use texel coordinates \((u,v)\) to extract a texel from the layer \(l\), where \(l\) is the layer of the framebuffer being rendered to. If \(l\) is greater than or equal to the number of layers in the image view, layer zero will be used.

If the bound shading rate image view is not `VK_NULL_HANDLE` and contains a texel with coordinates \((u,v)\) in layer \(l\) (if applicable), the single unsigned integer component for that texel will be used as the shading rate index. If the \((u,v)\) coordinate is outside the extents of the subresource used by the shading rate image view, or if the image view is `VK_NULL_HANDLE`, the shading rate index is zero. If the shading rate image view has multiple mipmap levels, the base level identified by `VkImageSubresourceRange::baseMipLevel` will be used.

A shading rate index is mapped to a base shading rate using a lookup table called the shading rate image palette. There is a separate palette for each viewport. The number of entries in each palette is given by the implementation-dependent shading rate image palette size.

If a pipeline state object is created with `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` enabled, the per-viewport shading rate image palettes are set by the command:

```c
// Provided by VK_NV_shading_rate_image
void vkCmdSetViewportShadingRatePaletteNV(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    uint32_t firstViewport,          //
    uint32_t viewportCount,          //
    const VkShadingRatePaletteNV* pShadingRatePalettes);
```
• \texttt{firstViewport} is the index of the first viewport whose shading rate palette is updated by the command.

• \texttt{viewportCount} is the number of viewports whose shading rate palettes are updated by the command.

• \texttt{pShadingRatePalettes} is a pointer to an array of \texttt{VkShadingRatePaletteNV} structures defining the palette for each viewport.

### Valid Usage

- \texttt{VUID-vkCmdSetViewportShadingRatePaletteNV-None-02064}
  - The shading rate image feature \texttt{must} be enabled

- \texttt{VUID-vkCmdSetViewportShadingRatePaletteNV-firstViewport-02067}
  - The sum of \texttt{firstViewport} and \texttt{viewportCount} \texttt{must} be between 1 and \texttt{VkPhysicalDeviceLimits::maxViewports}, inclusive

- \texttt{VUID-vkCmdSetViewportShadingRatePaletteNV-firstViewport-02068}
  - If the multiple viewports feature is not enabled, \texttt{firstViewport} \texttt{must} be 0

- \texttt{VUID-vkCmdSetViewportShadingRatePaletteNV-viewportCount-02069}
  - If the multiple viewports feature is not enabled, \texttt{viewportCount} \texttt{must} be 1

### Valid Usage (Implicit)

- \texttt{VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-parameter}
  - \texttt{commandBuffer} \texttt{must} be a valid \texttt{VkCommandBuffer} handle

- \texttt{VUID-vkCmdSetViewportShadingRatePaletteNV-pShadingRatePalettes-parameter}
  - \texttt{pShadingRatePalettes} \texttt{must} be a valid pointer to an array of \texttt{viewportCount} valid \texttt{VkShadingRatePaletteNV} structures

- \texttt{VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-recording}
  - \texttt{commandBuffer} \texttt{must} be in the recording state

- \texttt{VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-cmdpool}
  - The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \texttt{must} support graphics operations

- \texttt{VUID-vkCmdSetViewportShadingRatePaletteNV-viewportCount-arraylength}
  - \texttt{viewportCount} \texttt{must} be greater than 0

### Host Synchronization

- Host access to \texttt{commandBuffer} \texttt{must} be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \texttt{must} be externally synchronized
The `VkShadingRatePaletteNV` structure specifies the contents of a single shading rate image palette and is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkShadingRatePaletteNV {
    uint32_t shadingRatePaletteEntryCount;
    const VkShadingRatePaletteEntryNV* pShadingRatePaletteEntries;
} VkShadingRatePaletteNV;
```

- `shadingRatePaletteEntryCount` specifies the number of entries in the shading rate image palette.
- `pShadingRatePaletteEntries` is a pointer to an array of `VkShadingRatePaletteEntryNV` enums defining the shading rate for each palette entry.

### Valid Usage

- `VUID-VkShadingRatePaletteNV-shadingRatePaletteEntryCount-02071`
  
  `shadingRatePaletteEntryCount` must be between `1` and `VkPhysicalDeviceShadingRateImagePropertiesNV::shadingRatePaletteSize`, inclusive.

### Valid Usage (Implicit)

- `VUID-VkShadingRatePaletteNV-pShadingRatePaletteEntries-parameter`
  
  `pShadingRatePaletteEntries` must be a valid pointer to an array of `shadingRatePaletteEntryCount` valid `VkShadingRatePaletteEntryNV` values.

- `VUID-VkShadingRatePaletteNV-shadingRatePaletteEntryCount-arraylength`
  
  `shadingRatePaletteEntryCount` must be greater than `0`.

To determine the base shading rate image, a shading rate index `i` is mapped to array element `i` in the array `pShadingRatePaletteEntries` for the palette corresponding to the viewport used for the fragment. If `i` is greater than or equal to the palette size `shadingRatePaletteEntryCount`, the base shading rate is undefined.

The supported shading rate image palette entries are defined by `VkShadingRatePaletteEntryNV`:
typedef enum VkShadingRatePaletteEntryNV {
    VK_SHADING_RATE_PALETTE_ENTRY_NO_INVOCATIONS_NV = 0,
    VK_SHADING_RATE_PALETTE_ENTRY_16_INVOCATIONS_PER_PIXEL_NV = 1,
    VK_SHADING_RATE_PALETTE_ENTRY_8_INVOCATIONS_PER_PIXEL_NV = 2,
    VK_SHADING_RATE_PALETTE_ENTRY_4_INVOCATIONS_PER_PIXEL_NV = 3,
    VK_SHADING_RATE_PALETTE_ENTRY_2_INVOCATIONS_PER_PIXEL_NV = 4,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_PIXEL_NV = 5,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X1_PIXELS_NV = 6,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_1X2_PIXELS_NV = 7,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X2_PIXELS_NV = 8,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_4X2_PIXELS_NV = 9,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X4_PIXELS_NV = 10,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_4X4_PIXELS_NV = 11,
} VkShadingRatePaletteEntryNV;

The following table indicates the width and height (in pixels) of each fragment generated using the indicated shading rate, as well as the maximum number of fragment shader invocations launched for each fragment. When processing regions of a primitive that have a shading rate of VK_SHADING_RATE_PALETTE_ENTRY_NO_INVOCATIONS_NV, no fragments will be generated in that region.

</tbody>
</table>
When the shading rate image is disabled, a shading rate of `VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_PIXEL_NV` will be used as the base shading rate.

Once a base shading rate has been established, it is adjusted to produce a final shading rate. First, if the base shading rate uses multiple pixels for each fragment, the implementation may reduce the fragment area to ensure that the total number of coverage samples for all pixels in a fragment does not exceed an implementation-dependent maximum.

If sample shading is active in the current pipeline and would result in processing \( n \) (\( n > 1 \)) unique samples per fragment when the shading rate image is disabled, the shading rate is adjusted in an implementation-dependent manner to increase the number of fragment shader invocations spawned by the primitive. If the shading rate indicates \( f_s \) pixels per fragment and \( f_s \) is greater than \( n \), the fragment area is adjusted so each fragment has approximately \( \frac{f_s}{n} \) pixels. Otherwise, if the shading rate indicates \( ipf \) invocations per fragment, the fragment area will be adjusted to a single pixel with approximately \( ipf \times \frac{f_s}{n} \) invocations per fragment.

If sample shading occurs due to the use of a fragment shader input variable decorated with `SampleId` or `SamplePosition`, the shading rate is ignored. Each fragment will have a single pixel and will spawn up to `totalSamples` fragment shader invocations, as when using sample shading without a shading rate image.

Finally, if the shading rate specifies multiple fragment shader invocations per fragment, the total number of invocations in the shading rate is clamped to be no larger than the value of `totalSamples` used for sample shading.

When the final shading rate for a primitive covering pixel \((x,y)\) has a fragment area of \(fw \times fh\), the fragment for that pixel will cover all pixels with coordinates \((x',y')\) that satisfy the equations:

\[
\frac{x}{fw} = \frac{x'}{fw}
\]

\[
\frac{y}{fh} = \frac{y'}{fh}
\]

This combined fragment is considered to have multiple coverage samples; the total number of samples in this fragment is given by `samples = fw \times fh \times rs` where \( rs \) indicates the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` specified at pipeline creation time. The set of coverage samples in the fragment is the union of the per-pixel coverage samples in each of the fragment's pixels. The location and order of coverage samples within each pixel in the combined

<table>
<thead>

</tbody>
</table>
fragment are assigned as described in Multisampling and Custom Sample Locations. Each coverage sample in the set of pixels belonging to the combined fragment is assigned a unique coverage index in the range \([0, \text{samples}-1]\). If the shadingRateCoarseSampleOrder feature is supported, the order of coverage samples can be specified for each combination of fragment area and coverage sample count. If this feature is not supported, the sample order is implementation-dependent.

If the \texttt{pNext} chain of \texttt{VkPipelineViewportStateCreateInfo} includes a \texttt{VkPipelineViewportCoarseSampleOrderStateCreateInfoNV} structure, then that structure includes parameters that control the order of coverage samples in fragments larger than one pixel.

The \texttt{VkPipelineViewportCoarseSampleOrderStateCreateInfoNV} structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkPipelineViewportCoarseSampleOrderStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkCoarseSampleOrderTypeNV sampleOrderType;
    uint32_t customSampleOrderCount;
    const VkCoarseSampleOrderCustomNV* pCustomSampleOrders;
} VkPipelineViewportCoarseSampleOrderStateCreateInfoNV;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{sampleOrderType} specifies the mechanism used to order coverage samples in fragments larger than one pixel.
- \texttt{customSampleOrderCount} specifies the number of custom sample orderings to use when ordering coverage samples.
- \texttt{pCustomSampleOrders} is a pointer to an array of \texttt{customSampleOrderCount} \texttt{VkCoarseSampleOrderCustomNV} structures, each of which specifies the coverage sample order for a single combination of fragment area and coverage sample count.

If this structure is not present, \texttt{sampleOrderType} is considered to be \texttt{VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV}.

If \texttt{sampleOrderType} is \texttt{VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV}, the coverage sample order used for any combination of fragment area and coverage sample count not enumerated in \texttt{pCustomSampleOrders} will be identical to that used for \texttt{VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV}.

If the pipeline was created with \texttt{VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV}, the contents of this structure (if present) are ignored, and the coverage sample order is instead specified by \texttt{vkCmdSetCoarseSampleOrderNV}.
Valid Usage

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sampleOrderType-02072
  If `sampleOrderType` is not `VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV`, `customSamplerOrderCount` must be 0

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-pCustomSampleOrders-02234
  The array `pCustomSampleOrders` must not contain two structures with matching values for both the `shadingRate` and `sampleCount` members

Valid Usage (Implicit)

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_COARSE_SAMPLE_ORDER_STATE_CREATE_INFO_NV`

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sampleOrderType-parameter
  `sampleOrderType` must be a valid `VkCoarseSampleOrderTypeNV` value

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-pCustomSampleOrders-parameter
  If `customSampleOrderCount` is not 0, `pCustomSampleOrders` must be a valid pointer to an array of `customSampleOrderCount` valid `VkCoarseSampleOrderCustomNV` structures

The type `VkCoarseSampleOrderTypeNV` specifies the technique used to order coverage samples in fragments larger than one pixel, and is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef enum VkCoarseSampleOrderTypeNV {
    VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV = 0,
    VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV = 1,
    VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV = 2,
    VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV = 3,
} VkCoarseSampleOrderTypeNV;
```

- `VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV` specifies that coverage samples will be ordered in an implementation-dependent manner.
- `VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV` specifies that coverage samples will be ordered according to the array of custom orderings provided in either the `pCustomSampleOrders` member of `VkPipelineViewportCoarseSampleOrderStateCreateInfoNV` or the `pCustomSampleOrders` member of `vkCmdSetCoarseSampleOrderNV`.
- `VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV` specifies that coverage samples will be ordered sequentially, sorted first by pixel coordinate (in row-major order) and then by `sample index`.
- `VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV` specifies that coverage samples will be ordered sequentially, sorted first by `sample index` and then by pixel coordinate (in row-major order).

When using a coarse sample order of `VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV` for a fragment...
with an upper-left corner of \((fx, fy)\) with a width of \(fw \times fh\) and \(fsc\) samples per pixel, coverage index \(cs\) of the fragment will be assigned to sample index \(fs\) of pixel \((px, py)\) as follows:

\[
px = fx + \lfloor \frac{cs}{fsc} \rfloor \times fw \\
py = fy + \lfloor \frac{cs}{fsc \times fh} \rfloor \\
fs = cs \times fsc
\]

When using a coarse sample order of \(VK\_COARSE\_SAMPLE\_ORDER\_TYPE\_SAMPLE\_MAJOR\_NV\), coverage index \(cs\) will be assigned as follows:

\[
px = fx + cs \times fw \\
py = (fy + \lfloor \frac{cs}{fw} \rfloor) \times fh \\
fs = \lfloor \frac{cs}{fw \times fh} \rfloor
\]

The \(VkCoarseSampleOrderCustomNV\) structure is used with a coverage sample ordering type of \(VK\_COARSE\_SAMPLE\_ORDER\_TYPE\_CUSTOM\_NV\) to specify the order of coverage samples for one combination of fragment width, fragment height, and coverage sample count. The structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkCoarseSampleOrderCustomNV {
    VkShadingRatePaletteEntryNV shadingRate;
    uint32_t sampleCount;
    uint32_t sampleLocationCount;
    const VkCoarseSampleLocationNV* pSampleLocations;
} VkCoarseSampleOrderCustomNV;
```

- \(shadingRate\) is a shading rate palette entry that identifies the fragment width and height for the combination of fragment area and per-pixel coverage sample count to control.
- \(sampleCount\) identifies the per-pixel coverage sample count for the combination of fragment area and coverage sample count to control.
- \(sampleLocationCount\) specifies the number of sample locations in the custom ordering.
- \(pSampleLocations\) is a pointer to an array of \(VkCoarseSampleLocationNV\) structures specifying the location of each sample in the custom ordering.

When using a custom sample ordering, element \(j\) in \(pSampleLocations\) specifies a specific pixel location and sample index that corresponds to coverage index \(j\) in the multi-pixel fragment.
Valid Usage

• VUID-VkCoarseSampleOrderCustomNV-shadingRate-02073
  shadingRate must be a shading rate that generates fragments with more than one pixel

• VUID-VkCoarseSampleOrderCustomNV-sampleCount-02074
  sampleCount must correspond to a sample count enumerated in VkSampleCountFlags
  whose corresponding bit is set in VkPhysicalDeviceLimits
  ::framebufferNoAttachmentsSampleCounts

• VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-02075
  sampleLocationCount must be equal to the product of sampleCount, the fragment width for shadingRate,
  and the fragment height for shadingRate

• VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-02076
  sampleLocationCount must be less than or equal to the value of
  VkPhysicalDeviceShadingRateImagePropertiesNV::shadingRateMaxCoarseSamples

• VUID-VkCoarseSampleOrderCustomNV-pSampleLocations-02077
  The array pSampleLocations must contain exactly one entry for every combination of valid
  values for pixelX, pixelY, and sample in the structure VkCoarseSampleOrderCustomNV

Valid Usage (Implicit)

• VUID-VkCoarseSampleOrderCustomNV-shadingRate-parameter
  shadingRate must be a valid VkShadingRatePaletteEntryNV value

• VUID-VkCoarseSampleOrderCustomNV-pSampleLocations-parameter
  pSampleLocations must be a valid pointer to an array of sampleLocationCount
  VkCoarseSampleLocationNV structures

• VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-arraylength
  sampleLocationCount must be greater than 0

The VkCoarseSampleLocationNV structure identifies a specific pixel and sample index for one of the coverage samples in a fragment that is larger than one pixel. This structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkCoarseSampleLocationNV {
    uint32_t    pixelX;
    uint32_t    pixelY;
    uint32_t    sample;
} VkCoarseSampleLocationNV;
```

• pixelX is added to the x coordinate of the upper-leftmost pixel of each fragment to identify the pixel containing the coverage sample.

• pixelY is added to the y coordinate of the upper-leftmost pixel of each fragment to identify the pixel containing the coverage sample.
• **sample** is the number of the coverage sample in the pixel identified by **pixelX** and **pixelY**.

### Valid Usage

- **VUID-VkCoarseSampleLocationNV-pixelX-02078**
  
  **pixelX** must be less than the width (in pixels) of the fragment.

- **VUID-VkCoarseSampleLocationNV-pixelY-02079**
  
  **pixelY** must be less than the height (in pixels) of the fragment.

- **VUID-VkCoarseSampleLocationNV-sample-02080**
  
  **sample** must be less than the number of coverage samples in each pixel belonging to the fragment.

If a pipeline state object is created with **VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV** enabled, the order of coverage samples in fragments larger than one pixel is set by the command:

```c
// Provided by VK_NV_shading_rate_image

void vkCmdSetCoarseSampleOrderNV(
    VkCommandBuffer commandBuffer,
    VkCoarseSampleOrderTypeNV sampleOrderType,
    uint32_t customSampleOrderCount,
    const VkCoarseSampleOrderCustomNV* pCustomSampleOrders);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **sampleOrderType** specifies the mechanism used to order coverage samples in fragments larger than one pixel.
- **customSampleOrderCount** specifies the number of custom sample orderings to use when ordering coverage samples.
- **pCustomSampleOrders** is a pointer to an array of **VkCoarseSampleOrderCustomNV** structures, each of which specifies the coverage sample order for a single combination of fragment area and coverage sample count.

If **sampleOrderType** is **VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV**, the coverage sample order used for any combination of fragment area and coverage sample count not enumerated in **pCustomSampleOrders** will be identical to that used for **VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV**.

### Valid Usage

- **VUID-vkCmdSetCoarseSampleOrderNV-sampleOrderType-02081**
  
  If **sampleOrderType** is not **VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV**, **customSampleOrderCount** must be 0.

- **VUID-vkCmdSetCoarseSampleOrderNV-pCustomSampleOrders-02235**
  
  The array **pCustomSampleOrders** must not contain two structures with matching values for both the **shadingRate** and **sampleCount** members.
Valid Usage (Implicit)

- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetCoarseSampleOrderNV-sampleOrderType-parameter
  `sampleOrderType` must be a valid `VkCoarseSampleOrderTypeNV` value

- VUID-vkCmdSetCoarseSampleOrderNV-pCustomSampleOrders-parameter
  If `customSampleOrderCount` is not 0, `pCustomSampleOrders` must be a valid pointer to an array of `customSampleOrderCount` valid `VkCoarseSampleOrderCustomNV` structures

- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

</tbody>
</table>

If the final shading rate for a primitive covering pixel \((x,y)\) results in \(n\) invocations per pixel \((n > 1)\), \(n\) separate fragment shader invocations will be generated for the fragment. Each coverage sample in the fragment will be assigned to one of the \(n\) fragment shader invocations in an implementation-dependent manner. The outputs from the fragment output interface of each shader invocation will be broadcast to all of the framebuffer samples associated with the invocation. If none of the coverage samples associated with a fragment shader invocation is covered by a primitive, the implementation may discard the fragment shader invocation for those samples.

If the final shading rate for a primitive covering pixel \((x,y)\) results in a fragment containing multiple pixels, a single set of fragment shader invocations will be generated for all pixels in the combined fragment. Outputs from the fragment output interface will be broadcast to all covered framebuffer samples belonging to the fragment. If the fragment shader executes code discarding the fragment, none of the samples of the fragment will be updated.
27.8. Sample Shading

Sample shading can be used to specify a minimum number of unique samples to process for each fragment. If sample shading is enabled an implementation must provide a minimum of \( \max(\lceil \text{minSampleShadingFactor} \times \text{totalSamples} \rceil, 1) \) unique associated data for each fragment, where \text{minSampleShadingFactor} is the minimum fraction of sample shading. If the \text{VK_AMD_mixed_attachment_samples} extension is enabled and the subpass uses color attachments, \text{totalSamples} is the number of samples of the color attachments. Otherwise, \text{totalSamples} is the value of \text{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} specified at pipeline creation time. These are associated with the samples in an implementation-dependent manner. When \text{minSampleShadingFactor} is 1.0, a separate set of associated data are evaluated for each sample, and each set of values is evaluated at the sample location.

Sample shading is enabled for a graphics pipeline:

- If the interface of the fragment shader entry point of the graphics pipeline includes an input variable decorated with \text{SampleId} or \text{SamplePosition}. In this case \text{minSampleShadingFactor} takes the value 1.0.
- Else if the \text{sampleShadingEnable} member of the \text{VkPipelineMultisampleStateCreateInfo} structure specified when creating the graphics pipeline is set to \text{VK_TRUE}. In this case \text{minSampleShadingFactor} takes the value of \text{VkPipelineMultisampleStateCreateInfo::minSampleShading}.

Otherwise, sample shading is considered disabled.

27.9. Barycentric Interpolation

When the \text{fragmentShaderBarycentric} feature is enabled, the \text{PerVertexNV} interpolation decoration can be used with fragment shader inputs to indicate that the decorated inputs do not have associated data in the fragment. Such inputs can only be accessed in a fragment shader using an array index whose value (0, 1, or 2) identifies one of the vertices of the primitive that produced the fragment.

When tessellation, geometry shading, and mesh shading are not active, fragment shader inputs decorated with \text{PerVertexNV} will take values from one of the vertices of the primitive that produced the fragment, identified by the extra index provided in SPIR-V code accessing the input. If the \( n \) vertices passed to a draw call are numbered 0 through \( n-1 \), and the point, line, and triangle primitives produced by the draw call are numbered with consecutive integers beginning with zero, the following table indicates the original vertex numbers used when the provoking vertex mode is \text{VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT} for index values of 0, 1, and 2. If an input decorated with \text{PerVertexNV} is accessed with any other vertex index value, an undefined value is returned.

When geometry or mesh shading is active, primitives processed by fragment shaders are assembled from the vertices emitted by the geometry or mesh shader. In this case, the vertices used for fragment shader inputs decorated with `PerVertexNV` are derived by treating the primitives produced by the shader as though they were specified by a draw call and consulting the table above.

When using tessellation without geometry shading, the tessellator produces primitives in an implementation-dependent manner. While there is no defined vertex ordering for inputs decorated with `PerVertexNV`, the vertex ordering used in this case will be consistent with the ordering used to
derive the values of inputs decorated with \texttt{BaryCoordNV} or \texttt{BaryCoordNoPerspNV}.

Fragment shader inputs decorated with \texttt{BaryCoordNV} or \texttt{BaryCoordNoPerspNV} hold three-component vectors with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive. For point primitives, such variables are always assigned the value (1,0,0). For line primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0 and 1 are (1,0,0) and (0,1,0), respectively. For polygon primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0, 1, and 2 are (1,0,0), (0,1,0), and (0,0,1), respectively. For \texttt{BaryCoordNV}, the values are obtained using perspective interpolation. For \texttt{BaryCoordNoPerspNV}, the values are obtained using linear interpolation.

27.10. Points

A point is drawn by generating a set of fragments in the shape of a square centered around the vertex of the point. Each vertex has an associated point size that controls the width/height of that square. The point size is taken from the (potentially clipped) shader built-in \texttt{PointSize} written by:

- the geometry shader, if active;
- the tessellation evaluation shader, if active and no geometry shader is active;
- the vertex shader, otherwise

and clamped to the implementation-dependent point size range \([\text{pointSizeRange}[0], \text{pointSizeRange}[1]]\). The value written to \texttt{PointSize} must be greater than zero.

Not all point sizes need be supported, but the size 1.0 must be supported. The range of supported sizes and the size of evenly-spaced gradations within that range are implementation-dependent. The range and gradations are obtained from the \texttt{pointSizeRange} and \texttt{pointSizeGranularity} members of \texttt{VkPhysicalDeviceLimits}. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional point sizes may also be supported. There is no requirement that these sizes be equally spaced. If an unsupported size is requested, the nearest supported size is used instead.

Further, if the render pass has a fragment density map attachment, point size may be rounded by the implementation to a multiple of the fragment’s width or height.

27.10.1. Basic Point Rasterization

Point rasterization produces a fragment for each fragment area group of framebuffer pixels with one or more sample points that intersect a region centered at the point’s \((x_f, y_f)\). This region is a square with side equal to the current point size. Coverage bits that correspond to sample points that intersect the region are 1, other coverage bits are 0. All fragments produced in rasterizing a point are assigned the same associated data, which are those of the vertex corresponding to the point. However, the fragment shader built-in \texttt{PointCoord} contains point sprite texture coordinates. The \(s\) and \(t\) point sprite texture coordinates vary from zero to one across the point horizontally left-to-right and vertically top-to-bottom, respectively. The following formulas are used to evaluate \(s\) and \(t\):

\[
s = \frac{1}{2} + \frac{x_f - x_i}{\text{size}}
\]
where size is the point’s size; \((x_p, y_p)\) is the location at which the point sprite coordinates are evaluated - this may be the framebuffer coordinates of the fragment center, or the location of a sample; and \((x, y)\) is the exact, unrounded framebuffer coordinate of the vertex for the point.

### 27.11. Line Segments

Line segment rasterization options are controlled by the `VkPipelineRasterizationLineStateCreateInfoEXT` structure.

The `VkPipelineRasterizationLineStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_line_rasterization
typedef struct VkPipelineRasterizationLineStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkLineRasterizationModeEXT lineRasterizationMode;
    VkBool32 stippledLineEnable;
    uint32_t lineStippleFactor;
    uint16_t lineStipplePattern;
} VkPipelineRasterizationLineStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `lineRasterizationMode` is a `VkLineRasterizationModeEXT` value selecting the style of line rasterization.
- `stippledLineEnable` enables stippled line rasterization.
- `lineStippleFactor` is the repeat factor used in stippled line rasterization.
- `lineStipplePattern` is the bit pattern used in stippled line rasterization.

If `stippledLineEnable` is `VK_FALSE`, the values of `lineStippleFactor` and `lineStipplePattern` are ignored.
Valid Usage

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02768
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT, then the rectangularLines feature must be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02769
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT, then the bresenhamLines feature must be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02770
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT, then the smoothLines feature must be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02771
  If stippledLineEnable is VK_TRUE and lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT, then the stippledRectangularLines feature must be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02772
  If stippledLineEnable is VK_TRUE and lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT, then the stippledBresenhamLines feature must be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02773
  If stippledLineEnable is VK_TRUE and lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT, then the stippledSmoothLines feature must be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02774
  If stippledLineEnable is VK_TRUE and lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT, then the stippledRectangularLines feature must be enabled and VkPhysicalDeviceLimits::strictLines must be VK_TRUE

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_EXT

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-parameter
  lineRasterizationMode must be a valid VkLineRasterizationModeEXT value

Possible values of VkPipelineRasterizationLineStateCreateInfoEXT::lineRasterizationMode are:
// Provided by VK_EXT_line_rasterization

typedef enum VkLineRasterizationModeEXT {
    VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT = 0,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT = 1,
    VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT = 2,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT = 3,
} VkLineRasterizationModeEXT;

- **VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT** is equivalent to
  **VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT** if
  VkPhysicalDeviceLimits::strictLines is VK_TRUE, otherwise lines are drawn as non-strictLines parallelograms. Both of these modes are defined in Basic Line Segment Rasterization.

- **VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT** specifies lines drawn as if they were rectangles extruded from the line.

- **VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT** specifies lines drawn by determining which pixel diamonds the line intersects and exits, as defined in Bresenham Line Segment Rasterization.

- **VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT** specifies lines drawn if they were rectangles extruded from the line, with alpha falloff, as defined in Smooth Lines.

Each line segment has an associated width. The line width is specified by the
VkPipelineRasterizationStateCreateInfo::lineWidth property of the currently active pipeline, if the pipeline was not created with VK_DYNAMIC_STATE_LINE_WIDTH enabled.

Otherwise, the line width is set by calling **vkCmdSetLineWidth**:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetLineWidth(
    VkCommandBuffer
commandBuffer,
    float
lineWidth);
```

- **commandBuffer** is the command buffer into which the command will be recorded.

- **lineWidth** is the width of rasterized line segments.

### Valid Usage

- VUID-vkCmdSetLineWidth-lineWidth-00788

  If the wide lines feature is not enabled, **lineWidth must be 1.0**
Valid Usage (Implicit)

- VUID-vkCmdSetLineWidth-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetLineWidth-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetLineWidth-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>

</tbody>
</table>

Not all line widths need be supported for line segment rasterization, but width 1.0 antialiased segments must be provided. The range and gradations are obtained from the `lineWidthRange` and `lineWidthGranularity` members of `VkPhysicalDeviceLimits`. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional line widths may also be supported. There is no requirement that these widths be equally spaced. If an unsupported width is requested, the nearest supported width is used instead.

Further, if the render pass has a fragment density map attachment, line width may be rounded by the implementation to a multiple of the fragment's width or height.

27.11.1. Basic Line Segment Rasterization

If the `lineRasterizationMode` member of `VkPipelineRasterizationLineStateCreateInfoEXT` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT`, rasterized line segments produce fragments which intersect a rectangle centered on the line segment. Two of the edges are parallel to the specified line segment; each is at a distance of one-half the current width from that segment in directions perpendicular to the direction of the line. The other two edges pass through the line endpoints and are perpendicular to the direction of the specified line segment. Coverage bits that correspond to sample points that intersect the rectangle are 1, other coverage bits are 0.

Next we specify how the data associated with each rasterized fragment are obtained. Let \( p = (x_d, y_d) \)
be the framebuffer coordinates at which associated data are evaluated. This may be the center of a fragment or the location of a sample within the fragment. When \texttt{rasterizationSamples} is \texttt{VK\_SAMPLE\_COUNT\_1\_BIT}, the fragment center must be used. Let \( \mathbf{p}_a = (x_a, y_a) \) and \( \mathbf{p}_b = (x_b, y_b) \) be initial and final endpoints of the line segment, respectively. Set

\[
    t = \frac{(\mathbf{p}_r - \mathbf{p}_a) \cdot (\mathbf{p}_b - \mathbf{p}_a)}{\| \mathbf{p}_b - \mathbf{p}_a \|^2}
\]

(Note that \( t = 0 \) at \( \mathbf{p}_a \) and \( t = 1 \) at \( \mathbf{p}_b \). Also note that this calculation projects the vector from \( \mathbf{p}_a \) to \( \mathbf{p}_r \) onto the line, and thus computes the normalized distance of the fragment along the line.)

The value of an associated datum \( f \) for the fragment, whether it be a shader output or the clip \( w \) coordinate, must be determined using \textit{perspective interpolation}:

\[
    f = \frac{(1-t)f_a/w_a + tf_b/w_b}{(1-t)/w_a + t/w_b}
\]

where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively; \( w_a \) and \( w_b \) are the clip \( w \) coordinates of the starting and ending endpoints of the segment, respectively.

Depth values for lines must be determined using \textit{linear interpolation}:

\[
    z = (1 - t)z_a + t z_b
\]

where \( z_a \) and \( z_b \) are the depth values of the starting and ending endpoints of the segment, respectively.

The \texttt{NoPerspective} and \texttt{Flat} interpolation decorations can be used with fragment shader inputs to declare how they are interpolated. When neither decoration is applied, perspective interpolation is performed as described above. When the \texttt{NoPerspective} decoration is used, linear interpolation is performed in the same fashion as for depth values, as described above. When the \texttt{Flat} decoration is used, no interpolation is performed, and outputs are taken from the corresponding input value of the \texttt{provoking vertex} corresponding to that primitive.

When the \texttt{fragmentShaderBarycentric} feature is enabled, the \texttt{PerVertexNV} interpolation decoration can also be used with fragment shader inputs which indicate that the decorated inputs are not interpolated and can only be accessed using an extra array dimension, where the extra index identifies one of the vertices of the primitive that produced the fragment.

The above description documents the preferred method of line rasterization, and must be used when the implementation advertises the \texttt{strictLines} limit in \texttt{VkPhysicalDeviceLimits} as \texttt{VK\_TRUE}.

When \texttt{strictLines} is \texttt{VK\_FALSE}, the edges of the lines are generated as a parallelogram surrounding the original line. The major axis is chosen by noting the axis in which there is the greatest distance between the line start and end points. If the difference is equal in both directions then the X axis is chosen as the major axis. Edges 2 and 3 are aligned to the minor axis and are centered on the endpoints of the line as in \texttt{Non strict lines}, and each is \texttt{lineWidth} long. Edges 0 and 1 are parallel to the line and connect the endpoints of edges 2 and 3. Coverage bits that correspond to sample points that intersect the parallelogram are 1, other coverage bits are 0.
Samples that fall exactly on the edge of the parallelogram follow the polygon rasterization rules. Interpolation occurs as if the parallelogram was decomposed into two triangles where each pair of vertices at each end of the line has identical attributes.

![Diagram of parallelogram with edges labeled 0 to 3, and line segments labeled Original Line and Line Width.](image)

**Figure 17. Non strict lines**

Only when `strictLines` is `VK_FALSE` implementations may deviate from the non-strict line algorithm described above in the following ways:

- Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization using the original line segment endpoints.
- Rasterization of non-antialiased non-strict line segments may be performed using the rules defined in Bresenham Line Segment Rasterization.

### 27.11.2. Bresenham Line Segment Rasterization

If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`, then the following rules replace the line rasterization rules defined in Basic Line Segment Rasterization.

Non-strict lines may also follow these rasterization rules for non-antialiased lines.

Line segment rasterization begins by characterizing the segment as either `x-major` or `y-major`. `x-major` line segments have slope in the closed interval [-1,1]; all other line segments are `y-major` (slope is determined by the segment's endpoints). We specify rasterization only for `x-major` segments except in cases where the modifications for `y-major` segments are not self-evident.

Ideally, Vulkan uses a *diamond-exit* rule to determine those fragments that are produced by rasterizing a line segment. For each fragment `f` with center at framebuffer coordinates `x_f` and `y_f`, define a diamond-shaped region that is the intersection of four half planes:

\[
R_f = \{(x, y) | |x - x_f| + |y - y_f| \leq \frac{1}{2}\}
\]

Essentially, a line segment starting at `p_a` and ending at `p_b` produces those fragments `f` for which the segment intersects `R_b`, except if `p_b` is contained in `R_a`. 
To avoid difficulties when an endpoint lies on a boundary of $R_f$, we (in principle) perturb the supplied endpoints by a tiny amount. Let $p_a$ and $p_b$ have framebuffer coordinates $(x_a, y_a)$ and $(x_b, y_b)$, respectively. Obtain the perturbed endpoints $p_a'$ given by $(x_a, y_a) - (\varepsilon, \varepsilon)$ and $p_b'$ given by $(x_b, y_b) - (\varepsilon, \varepsilon)$. Rasterizing the line segment starting at $p_a$ and ending at $p_b$ produces those fragments $f$ for which the segment starting at $p_a'$ and ending on $p_b'$ intersects $R_f$, except if $p_b'$ is contained in $R_f$. $\varepsilon$ is chosen to be so small that rasterizing the line segment produces the same fragments when $\delta$ is substituted for $\varepsilon$ for any $0 < \delta \leq \varepsilon$.

When $p_a$ and $p_b$ lie on fragment centers, this characterization of fragments reduces to Bresenham’s algorithm with one modification: lines produced in this description are “half-open,” meaning that the final fragment (corresponding to $p_b$) is not drawn. This means that when rasterizing a series of connected line segments, shared endpoints will be produced only once rather than twice (as would occur with Bresenham’s algorithm).

Implementations may use other line segment rasterization algorithms, subject to the following rules:

- The coordinates of a fragment produced by the algorithm must not deviate by more than one unit in either x or y framebuffer coordinates from a corresponding fragment produced by the diamond-exit rule.
- The total number of fragments produced by the algorithm must not differ from that produced by the diamond-exit rule by no more than one.
- For an x-major line, two fragments that lie in the same framebuffer-coordinate column must not be produced (for a y-major line, two fragments that lie in the same framebuffer-coordinate row must not be produced).
- If two line segments share a common endpoint, and both segments are either x-major (both left-to-right or both right-to-left) or y-major (both bottom-to-top or both top-to-bottom), then rasterizing both segments must not produce duplicate fragments. Fragments also must not be omitted so as to interrupt continuity of the connected segments.
The actual width \( w \) of Bresenham lines is determined by rounding the line width to the nearest integer, clamping it to the implementation-dependent \( \text{lineWidthRange} \) (with both values rounded to the nearest integer), then clamping it to be no less than 1.

Bresenham line segments of width other than one are rasterized by offsetting them in the minor direction (for an \( x \)-major line, the minor direction is \( y \), and for a \( y \)-major line, the minor direction is \( x \)) and producing a row or column of fragments in the minor direction. If the line segment has endpoints given by \((x_0, y_0)\) and \((x_1, y_1)\) in framebuffer coordinates, the segment with endpoints \((x_0, y_0 - \frac{w-1}{2})\) and \((x_1, y_1 - \frac{w-1}{2})\) is rasterized, but instead of a single fragment, a column of fragments of height \( w \) (a row of fragments of length \( w \) for a \( y \)-major segment) is produced at each \( x \) (\( y \) for \( y \)-major) location. The lowest fragment of this column is the fragment that would be produced by rasterizing the segment of width 1 with the modified coordinates.

The preferred method of attribute interpolation for a wide line is to generate the same attribute values for all fragments in the row or column described above, as if the adjusted line was used for interpolation and those values replicated to the other fragments, except for \( \text{FragCoord} \) which is interpolated as usual. Implementations \( \text{may} \) instead interpolate each fragment according to the formula in Basic Line Segment Rasterization, using the original line segment endpoints.

When Bresenham lines are being rasterized, sample locations \( \text{may} \) all be treated as being at the pixel center (this \( \text{may} \) affect attribute and depth interpolation).

**Note**

The sample locations described above are \( \text{not} \) used for determining coverage, they are only used for things like attribute interpolation. The rasterization rules that determine coverage are defined in terms of whether the line intersects \( \text{pixels} \), as opposed to the point sampling rules used for other primitive types. So these rules are independent of the sample locations. One consequence of this is that Bresenham lines cover the same pixels regardless of the number of rasterization samples, and cover all samples in those pixels (unless masked out or killed).

### 27.11.3. Line Stipple

If the \( \text{stippledLineEnable} \) member of \( \text{VkPipelineRasterizationLineStateCreateInfoEXT} \) is \( \text{VK_TRUE} \), then lines are rasterized with a \( \text{line stipple} \) determined by \( \text{lineStippleFactor} \) and \( \text{lineStipplePattern} \). \( \text{lineStipplePattern} \) is an unsigned 16-bit integer that determines which fragments are to be drawn or discarded when the line is rasterized. \( \text{lineStippleFactor} \) is a count that is used to modify the effective line stipple by causing each bit in \( \text{lineStipplePattern} \) to be used \( \text{lineStippleFactor} \) times.

Line stippling discards certain fragments that are produced by rasterization. The masking is achieved using three parameters: the 16-bit line stipple pattern \( p \), the line stipple factor \( r \), and an integer stipple counter \( s \). Let

\[
    b = \lfloor \frac{s}{r} \rfloor \mod 16
\]

Then a fragment is produced if the \( b \)'th bit of \( p \) is 1, and discarded otherwise. The bits of \( p \) are numbered with 0 being the least significant and 15 being the most significant.
The initial value of \( s \) is zero. For \texttt{VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT} lines, \( s \) is incremented after production of each fragment of a line segment (fragments are produced in order, beginning at the starting point and working towards the ending point). For \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT} and \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT} lines, the rectangular region is subdivided into adjacent unit-length rectangles, and \( s \) is incremented once for each rectangle. Rectangles with a value of \( s \) such that the \( b \)'th bit of \( p \) is zero are discarded. If the last rectangle in a line segment is shorter than unit-length, then the remainder \textit{may} carry over to the next line segment in the line strip using the same value of \( s \) (this is the preferred behavior, for the stipple pattern to appear more consistent through the strip).

\( s \) is reset to 0 at the start of each strip (for line strips), and before every line segment in a group of independent segments.

If the line segment has been clipped, then the value of \( s \) at the beginning of the line segment is implementation-dependent.

The line stipple factor and pattern are specified by the \texttt{VkPipelineRasterizationLineStateCreateInfoEXT::lineStippleFactor} and \texttt{VkPipelineRasterizationLineStateCreateInfoEXT::lineStipplePattern} members of the currently active pipeline, if the pipeline was not created with \texttt{VK_DYNAMIC_STATE_LINE_STIPPLE_EXT} enabled.

Otherwise, the line stipple factor and pattern are set by calling \texttt{vkCmdSetLineStippleEXT}:

\begin{verbatim}
// Provided by VK_EXT_line_rasterization
void vkCmdSetLineStippleEXT(
    VkCommandBuffer commandBuffer,
    uint32_t lineStippleFactor,
    uint16_t lineStipplePattern);
\end{verbatim}

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.
- \texttt{lineStippleFactor} is the repeat factor used in stippled line rasterization.
- \texttt{lineStipplePattern} is the bit pattern used in stippled line rasterization.

\begin{verbatim}
Valid Usage
\end{verbatim}

- \texttt{VUID-vkCmdSetLineStippleEXT-lineStippleFactor-02776}
  \texttt{lineStippleFactor} \textbf{must} be in the range \([1,256]\)
Valid Usage (Implicit)

- VUID-vkCmdSetLineStippleEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetLineStippleEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetLineStippleEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

27.11.4. Smooth Lines

If the lineRasterizationMode member of VkPipelineRasterizationLineStateCreateInfoEXT is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT, then lines are considered to be rectangles using the same geometry as for VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT lines. The rules for determining which pixels are covered are implementation-dependent, and may include nearby pixels where no sample locations are covered or where the rectangle does not intersect the pixel at all. For each pixel that is considered covered, the fragment computes a coverage value that approximates the area of the intersection of the rectangle with the pixel square, and this coverage value is multiplied into the color location 0’s alpha value after fragment shading, as described in Multisample Coverage.

Note

The details of the rasterization rules and area calculation are left intentionally vague, to allow implementations to generate coverage and values that are aesthetically pleasing.
27.12. Polygons

A polygon results from the decomposition of a triangle strip, triangle fan or a series of independent triangles. Like points and line segments, polygon rasterization is controlled by several variables in the `VkPipelineRasterizationStateCreateInfo` structure.

27.12.1. Basic Polygon Rasterization

The first step of polygon rasterization is to determine whether the triangle is back-facing or front-facing. This determination is made based on the sign of the (clipped or unclipped) polygon’s area computed in framebuffer coordinates. One way to compute this area is:

\[
a = -\frac{1}{2} \sum_{i=0}^{n-1} x_i y_{i+1} - x_{i+1} y_i
\]

where \( x_i \) and \( y_i \) are the x and y framebuffer coordinates of the \( i \)th vertex of the \( n \)-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and \( i \oplus 1 \) is \((i + 1) \mod n\).

The interpretation of the sign of \( a \) is determined by the `VkPipelineRasterizationStateCreateInfo`::`frontFace` property of the currently active pipeline. Possible values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkFrontFace {
    VK_FRONT_FACE_COUNTER_CLOCKWISE = 0,
    VK_FRONT_FACE_CLOCKWISE = 1,
} VkFrontFace;
```

- **VK_FRONT_FACE_COUNTER_CLOCKWISE** specifies that a triangle with positive area is considered front-facing.
- **VK_FRONT_FACE_CLOCKWISE** specifies that a triangle with negative area is considered front-facing.

Any triangle which is not front-facing is back-facing, including zero-area triangles.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_FRONT_FACE_EXT` dynamic state enabled then the front face property is set dynamically by calling:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetFrontFaceEXT(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    VkFrontFace frontFace);        // frontFace specifies the front face property to use for drawing.
```
Valid Usage

- VUID-vkCmdSetFrontFaceEXT-None-03383
  The `extendedDynamicState` feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetFrontFaceEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetFrontFaceEXT-frontFace-parameter
  `frontFace` must be a valid `VkFrontFace` value
- VUID-vkCmdSetFrontFaceEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetFrontFaceEXT-commandBuffer-cmpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Once the orientation of triangles is determined, they are culled according to the `VkPipelineRasterizationStateCreateInfo::cullMode` property of the currently active pipeline. Possible values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCullModeFlagBits {
    VK_CULL_MODE_NONE = 0,
    VK_CULL_MODE_FRONT_BIT = 0x00000001,
    VK_CULL_MODE_BACK_BIT = 0x00000002,
    VK_CULL_MODE_FRONT_AND_BACK = 0x00000003,
} VkCullModeFlagBits;
```
• **VK_CULL_MODE_NONE** specifies that no triangles are discarded
• **VK_CULL_MODE_FRONT_BIT** specifies that front-facing triangles are discarded
• **VK_CULL_MODE_BACK_BIT** specifies that back-facing triangles are discarded
• **VK_CULL_MODE_FRONT_AND_BACK** specifies that all triangles are discarded.

Following culling, fragments are produced for any triangles which have not been discarded.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCullModeFlags;
```

**VkCullModeFlags** is a bitmask type for setting a mask of zero or more **VkCullModeFlagBits**.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_CULL_MODE_EXT** dynamic state enabled then the cull mode is set dynamically by calling:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetCullModeEXT(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);
```

• **commandBuffer** is the command buffer into which the command will be recorded.
• **cullMode** specifies the cull mode property to use for drawing.

**Valid Usage**

- **VUID-vkCmdSetCullModeEXT-None-03384**
  The extendedDynamicState feature must be enabled

**Valid Usage (Implicit)**

- **VUID-vkCmdSetCullModeEXT-commandBuffer-parameter**
  commandBuffer must be a valid VkCommandBuffer handle
- **VUID-vkCmdSetCullModeEXT-cullMode-parameter**
  cullMode must be a valid combination of VkCullModeFlagBits values
- **VUID-vkCmdSetCullModeEXT-commandBuffer-recording**
  commandBuffer must be in the recording state
- **VUID-vkCmdSetCullModeEXT-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

<table>

</tbody>
</table>

The rule for determining which fragments are produced by polygon rasterization is called point sampling. The two-dimensional projection obtained by taking the x and y framebuffer coordinates of the polygon’s vertices is formed. Fragments are produced for any fragment area groups of pixels for which any sample points lie inside of this polygon. Coverage bits that correspond to sample points that satisfy the point sampling criteria are 1, other coverage bits are 0. Special treatment is given to a sample whose sample location lies on a polygon edge. In such a case, if two polygons lie on either side of a common edge (with identical endpoints) on which a sample point lies, then exactly one of the polygons must result in a covered sample for that fragment during rasterization. As for the data associated with each fragment produced by rasterizing a polygon, we begin by specifying how these values are produced for fragments in a triangle.

**Barycentric coordinates** are a set of three numbers, a, b, and c, each in the range [0,1], with \(a + b + c = 1\). These coordinates uniquely specify any point \(p\) within the triangle or on the triangle’s boundary as

\[ p = a \, p_a + b \, p_b + c \, p_c \]

where \(p_a\), \(p_b\), and \(p_c\) are the vertices of the triangle. \(a\), \(b\), and \(c\) are determined by:

\[ a = \frac{A(lmn)}{A(p_a p_b p_c)}, \quad b = \frac{A(p_m p_n p_c)}{A(p_a p_b p_c)}, \quad c = \frac{A(p_m p_n p_a)}{A(p_a p_b p_c)}, \]

where \(A(lmn)\) denotes the area in framebuffer coordinates of the triangle with vertices \(l\), \(m\), and \(n\).

Denote an associated datum at \(p_a\), \(p_b\), or \(p_c\) as \(f_a\), \(f_b\), or \(f_c\), respectively.

The value of an associated datum \(f\) for a fragment produced by rasterizing a triangle, whether it be a shader output or the clip \(w\) coordinate, must be determined using perspective interpolation:

\[ f = \frac{af_a + bf_b + cf_c + wf_c}{aw_a + bw_b + cw_c} \]

where \(w_a\), \(w_b\), and \(w_c\) are the clip \(w\) coordinates of \(p_a\), \(p_b\), and \(p_c\) respectively. \(a\), \(b\), and \(c\) are the barycentric coordinates of the location at which the data are produced - this must be the location of...
the fragment center or the location of a sample. When `rasterizationSamples` is `VK_SAMPLE_COUNT_1_BIT`, the fragment center must be used.

Depth values for triangles must be determined using linear interpolation:

\[ z = a z_a + b z_b + c z_c \]

where \(z_a\), \(z_b\), and \(z_c\) are the depth values of \(p_a\), \(p_b\), and \(p_c\), respectively.

The `NoPerspective` and `Flat` interpolation decorations can be used with fragment shader inputs to declare how they are interpolated. When neither decoration is applied, perspective interpolation is performed as described above. When the `NoPerspective` decoration is used, linear interpolation is performed in the same fashion as for depth values, as described above. When the `Flat` decoration is used, no interpolation is performed, and outputs are taken from the corresponding input value of the provoking vertex corresponding to that primitive.

When the `VK_AMD_shader_explicit_vertex_parameter` device extension is enabled the `CustomInterpAMD` interpolation decoration can also be used with fragment shader inputs which indicate that the decorated inputs can only be accessed by the extended instruction `InterpolateAtVertexAMD` and allows accessing the value of the inputs for individual vertices of the primitive.

When the `fragmentShaderBarycentric` feature is enabled, the `PerVertexNV` interpolation decoration can also be used with fragment shader inputs which indicate that the decorated inputs are not interpolated and can only be accessed using an extra array dimension, where the extra index identifies one of the vertices of the primitive that produced the fragment.

For a polygon with more than three edges, such as are produced by clipping a triangle, a convex combination of the values of the datum at the polygon's vertices must be used to obtain the value assigned to each fragment produced by the rasterization algorithm. That is, it must be the case that

\[ f = \sum_{i=1}^{n} a_i f_i \]

where \(n\) is the number of vertices in the polygon and \(f_i\) is the value of \(f\) at vertex \(i\). For each \(i\), \(0 \leq a_i \leq 1\) and \(\sum_{i=1}^{n} a_i = 1\). The values of \(a_i\) may differ from fragment to fragment, but at vertex \(i\), \(a_i = 1\) and \(a_j = 0\) for \(j \neq i\).

**Note**

One algorithm that achieves the required behavior is to triangulate a polygon (without adding any vertices) and then treat each triangle individually as already discussed. A scan-line rasterizer that linearly interpolates data along each edge and then linearly interpolates data across each horizontal span from edge to edge also satisfies the restrictions (in this case the numerator and denominator of perspective interpolation are iterated independently, and a division is performed for each fragment).
27.12.2. Polygon Mode

Possible values of the VkPipelineRasterizationStateCreateInfo::polygonMode property of the currently active pipeline, specifying the method of rasterization for polygons, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPolygonMode {
    VK_POLYGON_MODE_FILL = 0,
    VK_POLYGON_MODE_LINE = 1,
    VK_POLYGON_MODE_POINT = 2,
    // Provided by VK_NV_fill_rectangle
    VK_POLYGON_MODE_FILL_RECTANGLE_NV = 1000153000
} VkPolygonMode;
```

- **VK_POLYGON_MODE_POINT** specifies that polygon vertices are drawn as points.
- **VK_POLYGON_MODE_LINE** specifies that polygon edges are drawn as line segments.
- **VK_POLYGON_MODE_FILL** specifies that polygons are rendered using the polygon rasterization rules in this section.
- **VK_POLYGON_MODE_FILL_RECTANGLE_NV** specifies that polygons are rendered using polygon rasterization rules, modified to consider a sample within the primitive if the sample location is inside the axis-aligned bounding box of the triangle after projection. Note that the barycentric weights used in attribute interpolation can extend outside the range [0,1] when these primitives are shaded. Special treatment is given to a sample position on the boundary edge of the bounding box. In such a case, if two rectangles lie on either side of a common edge (with identical endpoints) on which a sample position lies, then exactly one of the triangles must produce a fragment that covers that sample during rasterization.

Polygons rendered in **VK_POLYGON_MODE_FILL_RECTANGLE_NV** mode may be clipped by the frustum or by user clip planes. If clipping is applied, the triangle is culled rather than clipped.

Area calculation and facingness are determined for **VK_POLYGON_MODE_FILL_RECTANGLE_NV** mode using the triangle’s vertices.

These modes affect only the final rasterization of polygons: in particular, a polygon’s vertices are shaded and the polygon is clipped and possibly culled before these modes are applied.

27.12.3. Depth Bias

The depth values of all fragments generated by the rasterization of a polygon can be offset by a single value that is computed for that polygon. This behavior is controlled by the depthBiasEnable, depthBiasConstantFactor, depthBiasClamp, and depthBiasSlopeFactor members of VkPipelineRasterizationStateCreateInfo, or by the corresponding parameters to the vkCmdSetDepthBias and vkCmdSetDepthBiasEnableEXT command if depth bias state is dynamic.
void vkCmdSetDepthBias(
    VkCommandBuffer commandBuffer,
    float depthBiasConstantFactor,
    float depthBiasClamp,
    float depthBiasSlopeFactor);

- commandBuffer is the command buffer into which the command will be recorded.
- depthBiasConstantFactor is a scalar factor controlling the constant depth value added to each fragment.
- depthBiasClamp is the maximum (or minimum) depth bias of a fragment.
- depthBiasSlopeFactor is a scalar factor applied to a fragment's slope in depth bias calculations.

If depthBiasEnable is VK_FALSE at draw time, no depth bias is applied and the fragment's depth values are unchanged.

depthBiasSlopeFactor scales the maximum depth slope of the polygon, and depthBiasConstantFactor scales the minimum resolvable difference of the depth buffer. The resulting values are summed to produce the depth bias value which is then clamped to a minimum or maximum value specified by depthBiasClamp, depthBiasSlopeFactor, depthBiasConstantFactor, and depthBiasClamp can each be positive, negative, or zero.

The maximum depth slope \( m \) of a triangle is

\[
m = \sqrt{\left( \frac{\partial z_f}{\partial x_f} \right)^2 + \left( \frac{\partial z_f}{\partial y_f} \right)^2}
\]

where \((x_0, y_0, z_0)\) is a point on the triangle. \( m \) may be approximated as

\[
m = \max\left( \left| \frac{\partial z_f}{\partial x_f} \right|, \left| \frac{\partial z_f}{\partial y_f} \right| \right).
\]

The minimum resolvable difference \( r \) is a parameter that depends on the depth buffer representation. It is the smallest difference in framebuffer coordinate \( z \) values that is guaranteed to remain distinct throughout polygon rasterization and in the depth buffer. All pairs of fragments generated by the rasterization of two polygons with otherwise identical vertices, but \( z \) values that differ by \( r \), will have distinct depth values.

For fixed-point depth buffer representations, \( r \) is constant throughout the range of the entire depth buffer. Its value is implementation-dependent but must be at most

\[
r = 2 \times 2^n
\]

for an \( n \)-bit buffer. For floating-point depth buffers, there is no single minimum resolvable difference. In this case, the minimum resolvable difference for a given polygon is dependent on the maximum exponent, \( e \), in the range of \( z \) values spanned by the primitive. If \( n \) is the number of bits in the floating-point mantissa, the minimum resolvable difference, \( r \), for the given primitive is
If a triangle is rasterized using the `VK_POLYGON_MODE_FILL_RECTANGLE_NV` polygon mode, then this minimum resolvable difference may not be resolvable for samples outside of the triangle, where the depth is extrapolated.

If no depth buffer is present, \( r \) is undefined.

The bias value \( o \) for a polygon is

\[
o = \text{dbclamp}(m \times depthBiasSlopeFactor + r \times depthBiasConstantFactor) \\
\text{where } \text{dbclamp}(x) = \begin{cases} 
\min(x, depthBiasClamp) & \text{if } depthBiasClamp > 0 \\
\max(x, depthBiasClamp) & \text{if } depthBiasClamp < 0
\end{cases}
\]

\( m \) is computed as described above. If the depth buffer uses a fixed-point representation, \( m \) is a function of depth values in the range \([0,1]\), and \( o \) is applied to depth values in the same range.

### Valid Usage

- **VUID-vkCmdSetDepthBias-depthBiasClamp-00790**
  - If the depth bias clamping feature is not enabled, `depthBiasClamp` must be 0.0

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthBias-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetDepthBias-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdSetDepthBias-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
To dynamically control whether to bias fragment depth values:

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetDepthBiasEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBiasEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasEnable` controls whether to bias fragment depth values.

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

### Valid Usage

- `VUID-vkCmdSetDepthBiasEnableEXT-None-04872`
  The `extendedDynamicState2` feature must be enabled

### Valid Usage (Implicit)

- `VUID-vkCmdSetDepthBiasEnableEXT-commandBuffer-parameter`
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- `VUID-vkCmdSetDepthBiasEnableEXT-commandBuffer-recording`
  `commandBuffer` must be in the recording state

- `VUID-vkCmdSetDepthBiasEnableEXT-commandBuffer-cmdpool`
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
27.12.4. Conservative Rasterization

Polygon rasterization can be made conservative by setting `conservativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` or `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` in `VkPipelineRasterizationConservativeStateCreateInfoEXT`. The `VkPipelineRasterizationConservativeStateCreateInfoEXT` state is set by adding this structure to the `pNext` chain of a `VkPipelineRasterizationStateCreateInfo` structure when creating the graphics pipeline. Enabling these modes also affects line and point rasterization if the implementation sets `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization` to `VK_TRUE`.

`VkPipelineRasterizationConservativeStateCreateInfoEXT` is defined as:

```c
// Provided by VK_EXT_conservative_rasterization
typedef struct VkPipelineRasterizationConservativeStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationConservativeStateCreateFlagsEXT flags;
    VkConservativeRasterizationModeEXT conservativeRasterizationMode;
    float extraPrimitiveOverestimationSize;
} VkPipelineRasterizationConservativeStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `conservativeRasterizationMode` is the conservative rasterization mode to use.
- `extraPrimitiveOverestimationSize` is the extra size in pixels to increase the generating primitive during conservative rasterization at each of its edges in X and Y equally in screen space beyond the base overestimation specified in `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize`.
Valid Usage

- `extraPrimitiveOverestimationSize` must be in the range of `0.0` to `maxExtraPrimitiveOverestimationSize` inclusive.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_CONSERVATIVE_STATE_CREATE_INFO_EXT`.
- `flags` must be `0`.
- `conservativeRasterizationMode` must be a valid `VkConservativeRasterizationModeEXT` value.

// Provided by VK_EXT_conservative_rasterization
typedef VkFlags VkPipelineRasterizationConservativeStateCreateFlagsEXT;

VkPipelineRasterizationConservativeStateCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode`, specifying the conservative rasterization mode are:

// Provided by VK_EXT_conservative_rasterization
typedef enum VkConservativeRasterizationModeEXT {
  VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT = 0,
  VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT = 1,
  VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT = 2,
} VkConservativeRasterizationModeEXT;

- `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT` specifies that conservative rasterization is disabled and rasterization proceeds as normal.
- `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` specifies that conservative rasterization is enabled in overestimation mode.
- `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` specifies that conservative rasterization is enabled in underestimation mode.

When overestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made of whether any portion of the pixel (including
its edges and corners) is covered by the primitive. If any portion of the pixel is covered, then all bits of the coverage mask for the fragment corresponding to that pixel are enabled. If the render pass has a fragment density map attachment and any bit of the coverage mask for the fragment is enabled, then all bits of the coverage mask for the fragment are enabled.

If the implementation supports VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativeRasterizationPostDepthCoverage and the PostDepthCoverage execution mode is specified the SampleMask built-in input variable will reflect the coverage after the early per-fragment depth and stencil tests are applied.

For the purposes of evaluating which pixels are covered by the primitive, implementations can increase the size of the primitive by up to VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize pixels at each of the primitive edges. This may increase the number of fragments generated by this primitive and represents an overestimation of the pixel coverage.

This overestimation size can be increased further by setting the extraPrimitiveOverestimationSize value above 0.0 in steps of VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSizeGranularity up to and including VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSize. This will: further increase the number of fragments generated by this primitive.

The actual precision of the overestimation size used for conservative rasterization may vary between implementations and produce results that only approximate the primitiveOverestimationSize and extraPrimitiveOverestimationSizeGranularity properties. Implementations may especially vary these approximations when the render pass has a fragment density map and the fragment area covers multiple pixels.

For triangles if VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT is enabled, fragments will be generated if the primitive area covers any portion of any pixel inside the fragment area, including their edges or corners. The tie-breaking rule described in Basic Polygon Rasterization does not apply during conservative rasterization and coverage is set for all fragments generated from shared edges of polygons. Degenerate triangles that evaluate to zero area after rasterization, even for pixels containing a vertex or edge of the zero-area polygon, will be culled if VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateTrianglesRasterized is VK_FALSE or will generate fragments if degenerateTrianglesRasterized is VK_TRUE. The fragment input values for these degenerate triangles take their attribute and depth values from the provoking vertex. Degenerate triangles are considered backfacing and the application can enable backface culling if desired. Triangles that are zero area before rasterization may be culled regardless.

For lines if VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT is enabled, and the implementation sets VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization to VK_TRUE, fragments will be generated if the line covers any portion of any pixel inside the fragment area, including their edges or corners. Degenerate lines that evaluate to zero length after rasterization will be culled if VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateLinesRasterized is VK_FALSE or will generate fragments if degenerateLinesRasterized is VK_TRUE. The fragments input values for these degenerate lines take their attribute and depth values from the provoking vertex. Lines that are zero length before rasterization may be culled regardless.
For points if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, and the implementation sets `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization` to `VK_TRUE`, fragments will be generated if the point square covers any portion of any pixel inside the fragment area, including their edges or corners.

When underestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made of whether all of the pixel (including its edges and corners) is covered by the primitive. If the entire pixel is covered, then a fragment is generated with all bits of its coverage mask corresponding to the pixel enabled, otherwise the pixel is not considered covered even if some portion of the pixel is covered. The fragment is discarded if no pixels inside the fragment area are considered covered. If the render pass has a fragment density map attachment and any pixel inside the fragment area is not considered covered, then the fragment is discarded even if some pixels are considered covered.

If the implementation supports `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativeRasterizationPostDepthCoverage` and the PostDepthCoverage execution mode is specified the SampleMask built-in input variable will reflect the coverage after the early per-fragment depth and stencil tests are applied.

For triangles, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if any pixel inside the fragment area is fully covered by the generating primitive, including its edges and corners.

For lines, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will be generated if any pixel inside the fragment area, including its edges and corners, are entirely covered by the line.

For points, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if the point square covers the entirety of any pixel square inside the fragment area, including its edges or corners.

If the render pass has a fragment density map and `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if the entirety of all pixels inside the fragment area are covered by the generating primitive, line, or point.

For both overestimate and underestimate conservative rasterization modes a fragment has all of its pixel squares fully covered by the generating primitive must set `FullyCoveredEXT` to `VK_TRUE` if the implementation enables the `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::fullyCoveredFragmentShaderInputVariable` feature.

When the use of a shading rate image or setting the fragment shading rate results in fragments covering multiple pixels, coverage for conservative rasterization is still evaluated on a per-pixel basis and may result in fragments with partial coverage. For fragment shader inputs decorated with `FullyCoveredEXT`, a fragment is considered fully covered if and only if all pixels in the fragment are fully covered by the generating primitive.
Chapter 28. Fragment Operations

Fragments produced by rasterization go through a number of operations to determine whether or how values produced by fragment shading are written to the framebuffer.

The following fragment operations adhere to rasterization order, and are typically performed in this order:

1. Discard rectangles test
2. Scissor test
3. Exclusive scissor test
4. Sample mask test
5. Fragment shading
6. Multisample coverage
7. Depth bounds test
8. Stencil test
9. Depth test
10. Representative fragment test
11. Sample counting
12. Coverage to color
13. Coverage reduction
14. Coverage modulation

The coverage mask generated by rasterization describes the initial coverage of each sample covered by the fragment. Fragment operations will update the coverage mask to add or subtract coverage where appropriate. If a fragment operation results in all bits of the coverage mask being 0, the fragment is discarded, and no further operations are performed. Fragments can also be programmatically discarded in a fragment shader by executing one of

- `OpTerminateInvocation`
- `OpDemoteToHelperInvocationEXT`
- `OpKill`.

When one of the fragment operations in this chapter is described as “replacing” a fragment shader output, that output is replaced unconditionally, even if no fragment shader previously wrote to that output.

If post-depth coverage is enabled, the sample mask test is instead performed after the depth test.

If early per-fragment operations are enabled, fragment shading and multisample coverage operations are instead performed after sample counting.

Once all fragment operations have completed, fragment shader outputs for covered color
attachment samples pass through framebuffer operations.

28.1. Discard Rectangles Test

The discard rectangle test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a set of discard rectangles.

Each discard rectangle is defined by a VkRect2D. These values are either set by the VkPipelineDiscardRectangleStateCreateInfoEXT structure during pipeline creation, or dynamically by the vkCmdSetDiscardRectangleEXT command.

A given sample is considered inside a discard rectangle if the \(x_f\) is in the range \([\text{VkRect2D}::\text{offset}.x, \text{VkRect2D}::\text{offset}.x + \text{VkRect2D}::\text{extent}.x)\), and \(y_f\) is in the range \([\text{VkRect2D}::\text{offset}.y, \text{VkRect2D}::\text{offset}.y + \text{VkRect2D}::\text{extent}.y)\). If the test is set to be inclusive, samples that are not inside any of the discard rectangles will have their coverage set to 0. If the test is set to be exclusive, samples that are inside any of the discard rectangles will have their coverage set to 0.

If no discard rectangles are specified, the coverage mask is unmodified by this operation.

The VkPipelineDiscardRectangleStateCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_discard_rectangles
typedef struct VkPipelineDiscardRectangleStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDiscardRectangleStateCreateFlagsEXT flags;
    VkDiscardRectangleModeEXT discardRectangleMode;
    uint32_t discardRectangleCount;
    const VkRect2D* pDiscardRectangles;
} VkPipelineDiscardRectangleStateCreateInfoEXT;
```

- \(\text{sType}\) is the type of this structure.
- \(\text{pNext}\) is NULL or a pointer to a structure extending this structure.
- \(\text{flags}\) is reserved for future use.
- \(\text{discardRectangleMode}\) is a VkDiscardRectangleModeEXT value determining whether the discard rectangle test is inclusive or exclusive.
- \(\text{discardRectangleCount}\) is the number of discard rectangles to use.
- \(\text{pDiscardRectangles}\) is a pointer to an array of VkRect2D structures defining discard rectangles.

If the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT dynamic state is enabled for a pipeline, the \(\text{pDiscardRectangles}\) member is ignored.

When this structure is included in the \(\text{pNext}\) chain of VkGraphicsPipelineCreateInfo, it defines parameters of the discard rectangle test. If this structure is not included in the \(\text{pNext}\) chain, it is equivalent to specifying this structure with a \(\text{discardRectangleCount}\) of 0.
Valid Usage

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleCount-00582
discardRectangleCount must be less than or equal to 
VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles

Valid Usage (Implicit)

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_DISCARD_RECTANGLE_STATE_CREATE_INFO_EXT
- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-flags-zero bitmask
  flags must be 0
- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleMode-parameter
discardRectangleMode must be a valid VkDiscardRectangleModeEXT value

// Provided by VK_EXT_discard_rectangles
typedef VkFlags VkPipelineDiscardRectangleStateCreateFlagsEXT;

VkPipelineDiscardRectangleStateCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

VkDiscardRectangleModeEXT values are:

// Provided by VK_EXT_discard_rectangles
typedef enum VkDiscardRectangleModeEXT {
  VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT = 0,
  VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT = 1,
} VkDiscardRectangleModeEXT;

- VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT specifies that the discard rectangle test is inclusive.
- VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT specifies that the discard rectangle test is exclusive.

The discard rectangles can be set dynamically with the command:

// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEXT(
  VkCommandBuffer commandBuffer,
  uint32_t firstDiscardRectangle,
  uint32_t discardRectangleCount,
  const VkRect2D* pDiscardRectangles);

- commandBuffer is the command buffer into which the command will be recorded.
• **firstDiscardRectangle** is the index of the first discard rectangle whose state is updated by the command.

• **discardRectangleCount** is the number of discard rectangles whose state are updated by the command.

• **pDiscardRectangles** is a pointer to an array of *VkRect2D* structures specifying discard rectangles.

The discard rectangle taken from element *i* of **pDiscardRectangles** replace the current state for the discard rectangle at index **firstDiscardRectangle + i**, for *i* in [0, **discardRectangleCount**).

This command sets the state for a given draw when the graphics pipeline is created with **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT** set in *VkPipelineDynamicStateCreateInfo::pDynamicStates*.

### Valid Usage

- **VUID-vkCmdSetDiscardRectangleEXT-firstDiscardRectangle-00585**
  The sum of **firstDiscardRectangle** and **discardRectangleCount** must be less than or equal to **VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles**

- **VUID-vkCmdSetDiscardRectangleEXT-x-00587**
  The *x* and *y* member of **offset** in each *VkRect2D* element of **pDiscardRectangles** must be greater than or equal to 0

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00588**
  Evaluation of (**offset.x + extent.width**) in each *VkRect2D* element of **pDiscardRectangles** must not cause a signed integer addition overflow

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00589**
  Evaluation of (**offset.y + extent.height**) in each *VkRect2D* element of **pDiscardRectangles** must not cause a signed integer addition overflow

- **VUID-vkCmdSetDiscardRectangleEXT-viewportScissor2D-04788**
  If this command is recorded in a secondary command buffer with **VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D** enabled, then this function must not be called
28.2. Scissor Test

The scissor test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a scissor rectangle at the index equal to the fragment's ViewportIndex.

Each scissor rectangle is defined by a VkRect2D. These values are either set by the VkPipelineViewportStateCreateInfo structure during pipeline creation, or dynamically by the vkCmdSetScissor command.

A given sample is considered inside a scissor rectangle if \(x_f\) is in the range \([\text{VkRect2D}::\text{offset.x}, \text{VkRect2D}::\text{offset.x} + \text{VkRect2D}::\text{extent.x})\), and \(y_f\) is in the range \([\text{VkRect2D}::\text{offset.y}, \text{VkRect2D}::\text{offset.y} + \text{VkRect2D}::\text{extent.y})\). Samples with coordinates outside the scissor rectangle at the corresponding ViewportIndex will have their coverage set to 0.

If a render pass transform is enabled, the \((\text{offset.x} \text{ and } \text{offset.y})\) and \((\text{extent.width} \text{ and })
**extent.height** values are transformed as described in render pass transform before participating in the scissor test.

The scissor rectangles can be set dynamically with the command:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetScissor(
    VkCommandBuffer commandBuffer,
    uint32_t firstScissor,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **firstScissor** is the index of the first scissor whose state is updated by the command.
- **scissorCount** is the number of scissors whose rectangles are updated by the command.
- **pScissors** is a pointer to an array of **VkRect2D** structures defining scissor rectangles.

The scissor rectangles taken from element i of **pScissors** replace the current state for the scissor index **firstScissor + i**, for i in [0, **scissorCount**).

This command sets the state for a given draw when the graphics pipeline is created with **VK_DYNAMIC_STATE_SCISSOR** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**.
Valid Usage

- VUID-vkCmdSetScissor-firstScissor-00592
  The sum of firstScissor and scissorCount must be between 1 and
  VkPhysicalDeviceLimits::maxViewports, inclusive

- VUID-vkCmdSetScissor-firstScissor-00593
  If the multiple viewports feature is not enabled, firstScissor must be 0

- VUID-vkCmdSetScissor-scissorCount-00594
  If the multiple viewports feature is not enabled, scissorCount must be 1

- VUID-vkCmdSetScissor-x-00595
  The x and y members of offset member of any element of pScissors must be greater than or equal to 0

- VUID-vkCmdSetScissor-offset-00596
  Evaluation of (offset.x + extent.width) must not cause a signed integer addition overflow for any element of pScissors

- VUID-vkCmdSetScissor-offset-00597
  Evaluation of (offset.y + extent.height) must not cause a signed integer addition overflow for any element of pScissors

- VUID-vkCmdSetScissor-viewportScissor2D-04789
  If this command is recorded in a secondary command buffer with VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D enabled, then this function must not be called

Valid Usage (Implicit)

- VUID-vkCmdSetScissor-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetScissor-pScissors-parameter
  pScissors must be a valid pointer to an array of scissorCount VkRect2D structures

- VUID-vkCmdSetScissor-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetScissor-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetScissor-scissorCount-arraylength
  scissorCount must be greater than 0
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>

<td></td>
</tr>
</tbody>
</table>

28.3. Exclusive Scissor Test

The exclusive scissor test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against an exclusive scissor rectangle at the index equal to the fragment’s ViewportIndex.

Each exclusive scissor rectangle is defined by a VkRect2D. These values are either set by the VkPipelineViewportExclusiveScissorStateCreateInfoNV structure during pipeline creation, or dynamically by the vkCmdSetExclusiveScissorNV command.

A given sample is considered inside an exclusive scissor rectangle if \(x_f\) is in the range \([VkRect2D::offset.x, VkRect2D::offset.x + VkRect2D::extent.x)\), and \(y_f\) is in the range \([VkRect2D::offset.y, VkRect2D::offset.y + VkRect2D::extent.y)\). Samples with coordinates inside the exclusive scissor rectangle at the corresponding ViewportIndex will have their coverage set to 0.

If no exclusive scissor rectangles are specified, the coverage mask is unmodified by this operation.

The VkPipelineViewportExclusiveScissorStateCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_scissor_exclusive
typedef struct VkPipelineViewportExclusiveScissorStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t exclusiveScissorCount;
    const VkRect2D* pExclusiveScissors;
} VkPipelineViewportExclusiveScissorStateCreateInfoNV;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **exclusiveScissorCount** is the number of exclusive scissor rectangles.
- **pExclusiveScissors** is a pointer to an array of VkRect2D structures defining exclusive scissor rectangles.
If the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` dynamic state is enabled for a pipeline, the `pExclusiveScissors` member is ignored.

When this structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it defines parameters of the exclusive scissor test. If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with a `exclusiveScissorCount` of 0.

### Valid Usage

- **VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02027**
  
  If the `multiple viewports` feature is not enabled, `exclusiveScissorCount` must be 0 or 1.

- **VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02028**
  
  `exclusiveScissorCount` must be less than or equal to `VkPhysicalDeviceLimits::maxViewports`.

- **VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02029**
  
  `exclusiveScissorCount` must be 0 or greater than or equal to the `viewportCount` member of `VkPipelineViewportStateCreateInfo`.

### Valid Usage (Implicit)

- **VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_EXCLUSIVE_SCISSOR_STATE_CREATE_INFO_NV`.

The exclusive scissor rectangles can be set dynamically with the command:

```c
// Provided by VK_NV_scissor_exclusive
void vkCmdSetExclusiveScissorNV(  
    VkCommandBuffer commandBuffer,  
    uint32_t firstExclusiveScissor,  
    uint32_t exclusiveScissorCount,  
    const VkRect2D* pExclusiveScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstExclusiveScissor` is the index of the first exclusive scissor rectangle whose state is updated by the command.
- `exclusiveScissorCount` is the number of exclusive scissor rectangles updated by the command.
- `pExclusiveScissors` is a pointer to an array of `VkRect2D` structures defining exclusive scissor rectangles.

The scissor rectangles taken from element `i` of `pExclusiveScissors` replace the current state for the scissor index `firstExclusiveScissor + i`, for `i` in `[0, exclusiveScissorCount)`.

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. 

---

Chapter 28. Fragment Operations | 1575
### Valid Usage

- **VUID-vkCmdSetExclusiveScissorNV-None-02031**  
  The **exclusive scissor** feature **must** be enabled

- **VUID-vkCmdSetExclusiveScissorNV-firstExclusiveScissor-02034**  
  The sum of `firstExclusiveScissor` and `exclusiveScissorCount` **must** be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- **VUID-vkCmdSetExclusiveScissorNV-firstExclusiveScissor-02035**  
  If the **multiple viewports** feature is not enabled, `firstExclusiveScissor` **must** be 0

- **VUID-vkCmdSetExclusiveScissorNV-exclusiveScissorCount-02036**  
  If the **multiple viewports** feature is not enabled, `exclusiveScissorCount` **must** be 1

- **VUID-vkCmdSetExclusiveScissorNV-x-02037**  
  The `x` and `y` members of `offset` in each member of `pExclusiveScissors` **must** be greater than or equal to 0

- **VUID-vkCmdSetExclusiveScissorNV-offset-02038**  
  Evaluation of `(offset.x + extent.width)` for each member of `pExclusiveScissors` **must** not cause a signed integer addition overflow

- **VUID-vkCmdSetExclusiveScissorNV-offset-02039**  
  Evaluation of `(offset.y + extent.height)` for each member of `pExclusiveScissors` **must** not cause a signed integer addition overflow

### Valid Usage (Implicit)

- **VUID-vkCmdSetExclusiveScissorNV-commandBuffer-parameter**  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetExclusiveScissorNV-pExclusiveScissors-parameter**  
  `pExclusiveScissors` **must** be a valid pointer to an array of `exclusiveScissorCount` `VkRect2D` structures

- **VUID-vkCmdSetExclusiveScissorNV-commandBuffer-recording**  
  `commandBuffer` **must** be in the **recording state**

- **VUID-vkCmdSetExclusiveScissorNV-commandBuffer-cmdpool**  
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdSetExclusiveScissorNV-exclusiveScissorCount-arraylength**  
  `exclusiveScissorCount` **must** be greater than 0
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

28.4. Sample Mask Test

The sample mask test compares the coverage mask for a fragment with the sample mask defined by VkPipelineMultisampleStateCreateInfo::pSampleMask.

Each bit of the coverage mask is associated with a sample index as described in the rasterization chapter. If the bit in VkPipelineMultisampleStateCreateInfo::pSampleMask which is associated with that same sample index is set to 0, the coverage mask bit is set to 0.

28.5. Multisample Coverage

If a fragment shader is active and its entry point’s interface includes a built-in output variable decorated with SampleMask, but not OverrideCoverageNV, the coverage mask is ANDed with the bits of the SampleMask built-in to generate a new coverage mask. If the SampleMask built-in is also decorated with OverrideCoverageNV, the coverage mask is replaced with the mask bits set in the shader. If sample shading is enabled, bits written to SampleMask corresponding to samples that are not being shaded by the fragment shader invocation are ignored. If no fragment shader is active, or if the active fragment shader does not include SampleMask in its interface, the coverage mask is not modified.

Next, the fragment alpha value and coverage mask are modified based on the line coverage factor if the lineRasterizationMode member of the VkPipelineRasterizationStateCreateInfo structure is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT, and the alphaToCoverageEnable and alphaToOneEnable members of the VkPipelineMultisampleStateCreateInfo structure.

All alpha values in this section refer only to the alpha component of the fragment shader output that has a Location and Index decoration of zero (see the Fragment Output Interface section). If that shader output has an integer or unsigned integer type, then these operations are skipped.

If the lineRasterizationMode member of the VkPipelineRasterizationStateCreateInfo structure is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT and the fragment came from a line segment, then the alpha value is replaced by multiplying it by the coverage factor for the fragment computed
During smooth line rasterization.

If alphaToCoverageEnable is enabled, a temporary coverage mask is generated where each bit is determined by the fragment's alpha value, which is ANDed with the fragment coverage mask.

No specific algorithm is specified for converting the alpha value to a temporary coverage mask. It is intended that the number of 1's in this value be proportional to the alpha value (clamped to [0,1]), with all 1's corresponding to a value of 1.0 and all 0's corresponding to 0.0. The algorithm may be different at different framebuffer coordinates.

**Note**
Using different algorithms at different framebuffer coordinates may help to avoid artifacts caused by regular coverage sample locations.

Finally, if alphaToOneEnable is enabled, each alpha value is replaced by the maximum representable alpha value for fixed-point color buffers, or by 1.0 for floating-point buffers. Otherwise, the alpha values are not changed.

### 28.6. Depth and Stencil Operations

Pipeline state controlling the depth bounds tests, stencil test, and depth test is specified through the members of the VkPipelineDepthStencilStateCreateInfo structure.

The VkPipelineDepthStencilStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDepthStencilStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDepthStencilStateCreateFlags flags;
    VkBool32 depthTestEnable;
    VkBool32 depthWriteEnable;
    VkCompareOp depthCompareOp;
    VkBool32 depthBoundsTestEnable;
    VkStencilOpState front;
    VkStencilOpState back;
    float minDepthBounds;
    float maxDepthBounds;
} VkPipelineDepthStencilStateCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **depthTestEnable** controls whether depth testing is enabled.
- **depthWriteEnable** controls whether depth writes are enabled when depthTestEnable is VK_TRUE.
Depth writes are always disabled when `depthTestEnable` is `VK_FALSE`.

- `depthCompareOp` is the comparison operator used in the depth test.
- `depthBoundsTestEnable` controls whether depth bounds testing is enabled.
- `stencilTestEnable` controls whether stencil testing is enabled.
- `front` and `back` control the parameters of the stencil test.
- `minDepthBounds` is the minimum depth bound used in the depth bounds test.
- `maxDepthBounds` is the maximum depth bound used in the depth bounds test.

**Valid Usage**

- **VUID-VkPipelineDepthStencilStateCreateInfo-depthBoundsTestEnable-00598**
  
  If the depth bounds testing feature is not enabled, `depthBoundsTestEnable` must be `VK_FALSE`.

- **VUID-VkPipelineDepthStencilStateCreateInfo-separateStencilMaskRef-04453**
  
  If the VK_KHR_portability_subset extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::separateStencilMaskRef` is `VK_FALSE`, and the value of `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable` is `VK_TRUE`, and the value of `VkPipelineRasterizationStateCreateInfo::cullMode` is `VK_CULL_MODE_NONE`, the value of `reference` in each of the `VkStencilOpState` structs in `front` and `back` must be the same.

**Valid Usage (Implicit)**

- **VUID-VkPipelineDepthStencilStateCreateInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO`.

- **VUID-VkPipelineDepthStencilStateCreateInfo-pNext-pNext**
  
  `pNext` must be `NULL`.

- **VUID-VkPipelineDepthStencilStateCreateInfo-flags-zerobitmask**
  
  `flags` must be `0`.

- **VUID-VkPipelineDepthStencilStateCreateInfo-depthCompareOp-parameter**
  
  `depthCompareOp` must be a valid `VkCompareOp` value.

- **VUID-VkPipelineDepthStencilStateCreateInfo-front-parameter**
  
  `front` must be a valid `VkStencilOpState` structure.

- **VUID-VkPipelineDepthStencilStateCreateInfo-back-parameter**
  
  `back` must be a valid `VkStencilOpState` structure.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDepthStencilStateCreateFlags;
```

`VkPipelineDepthStencilStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.
28.7. Depth Bounds Test

The depth bounds test compares the depth value \( z \) in the depth/stencil attachment at each sample’s framebuffer coordinates \((x_f, y_f)\) and sample index \(i\) against a set of depth bounds.

The depth bounds are determined by two floating point values defining a minimum (\( \text{minDepthBounds} \)) and maximum (\( \text{maxDepthBounds} \)) depth value. These values are either set by the \text{VkPipelineDepthStencilStateCreateInfo} structure during pipeline creation, or dynamically by \text{vkCmdSetDepthBoundsTestEnableEXT} and \text{vkCmdSetDepthBounds}.

A given sample is considered within the depth bounds if \( z \) is in the range \([\text{minDepthBounds}, \text{maxDepthBounds}]\). Samples with depth attachment values outside of the depth bounds will have their coverage set to 0.

If the depth bounds test is disabled, or if there is no depth attachment, the coverage mask is unmodified by this operation.

To dynamically enable or disable the depth bounds test:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthBoundsTestEnableEXT(
    VkCommandBuffer commandBuffer,            // commandBuffer is the command buffer into which the command will be recorded.
    VkBool32 depthBoundsTestEnable);          // depthBoundsTestEnable specifies if the depth bounds test is enabled.
```

This command sets the state for a given draw when the graphics pipeline is created with \text{VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE_EXT} set in \text{VkPipelineDynamicStateCreateInfo} ::\text{pDynamicStates}.

### Valid Usage

- VUID-vkCmdSetDepthBoundsTestEnableEXT-None-03349
  The \text{extendedDynamicState} feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthBoundsTestEnableEXT-commandBuffer-parameter
  \text{commandBuffer} must be a valid \text{VkCommandBuffer} handle
- VUID-vkCmdSetDepthBoundsTestEnableEXT-commandBuffer-recording
  \text{commandBuffer} must be in the recording state
- VUID-vkCmdSetDepthBoundsTestEnableEXT-commandBuffer-cmdpool
  The \text{VkCommandPool} that \text{commandBuffer} was allocated from must support graphics operations
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the depth bounds range values call:

```c
// Provided by VK_VERSION_1_0
def void vkCmdSetDepthBounds(
    VkCommandBuffer commandBuffer,
    float minDepthBounds,
    float maxDepthBounds);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `minDepthBounds` is the minimum depth bound.
- `maxDepthBounds` is the maximum depth bound.

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BOUNDS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

Valid Usage

- VUID-vkCmdSetDepthBounds-minDepthBounds-00600
  Unless the `VK_EXT_depth_range_unrestricted` extension is enabled `minDepthBounds` must be between `0.0` and `1.0`, inclusive
- VUID-vkCmdSetDepthBounds-maxDepthBounds-00601
  Unless the `VK_EXT_depth_range_unrestricted` extension is enabled `maxDepthBounds` must be between `0.0` and `1.0`, inclusive
28.8. Stencil Test

The stencil test compares the stencil attachment value $s_a$ in the depth/stencil attachment at each sample’s framebuffer coordinates ($x_f, y_f$) and sample index $i$ against a stencil reference value.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of coverage samples to stencil attachment samples within the fragment. However, if all samples in the fragment are covered, and the stencil attachment value is updated as a result of this test, all stencil attachment samples will be updated.

If the stencil test is not enabled, as specified by `vkCmdSetStencilTestEnableEXT` or `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable`, or if there is no stencil attachment, the coverage mask is unmodified by this operation.

The stencil test is controlled by one of two sets of stencil-related state, the front stencil state and the back stencil state. Stencil tests and writes use the back stencil state when processing fragments generated by back-facing polygons, and the front stencil state when processing fragments generated by front-facing polygons or any other primitives.

The comparison performed is based on the `VkCompareOp`, compare mask $s_c$, and stencil reference value $s_r$ of the relevant state set. The compare mask and stencil reference value are set by either the
VkPipelineDepthStencilStateCreateInfo structure during pipeline creation, or by the
vkCmdSetStencilCompareMask and vkCmdSetStencilReference commands respectively. The
compare operation is set by VkStencilOpState::compareOp during pipeline creation.

The stencil reference and attachment values \( s_r \) and \( s_a \) are each independently combined with the
compare mask \( s_c \) using a logical AND operation to create masked reference and attachment values \( s'\),
and \( s'_r \), \( s'_a \), and \( s'_a \) are used as A and B, respectively, in the operation specified by VkCompareOp.

If the comparison evaluates to false, the coverage for the sample is set to 0.

A new stencil value \( s_g \) is generated according to a stencil operation defined by VkStencilOp
parameters set by vkCmdSetStencilOpEXT or VkPipelineDepthStencilStateCreateInfo. If the stencil
test fails, failOp defines the stencil operation used. If the stencil test passes however, the stencil op
used is based on the depth test - if it passes, VkPipelineDepthStencilStateCreateInfo::passOp is used, otherwise VkPipelineDepthStencilStateCreateInfo::depthFailOp is used.

The stencil attachment value \( s_a \) is then updated with the generated stencil value \( s_g \) according to the
write mask \( s_w \) defined by VkPipelineDepthStencilStateCreateInfo::writeMask as:

\[
s_a = (s_a \& \neg s_w) \mid (s_g \& s_w)
\]

To dynamically enable or disable the stencil test, call:

```c
// Provided by VK_EXT_extended_dynamic_state
define vkCmdSetStencilTestEnableEXT(
    VkCommandBuffer commandBuffer,         commandBuffer,
    VkBool32 stencilTestEnable);            stencilTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stencilTestEnable` specifies if the stencil test is enabled.

This command sets the state for a given draw when the graphics pipeline is created with
VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::
pDynamicStates.

### Valid Usage

- VUID-vkCmdSetStencilTestEnableEXT-None-0350
  The extendedDynamicState feature must be enabled
Valid Usage (Implicit)

- VUID-vkCmdSetStencilTestEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetStencilTestEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetStencilTestEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the stencil operations, call:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetStencilOpEXT(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    VkStencilOp failOp,
    VkStencilOp passOp,
    VkStencilOp depthFailOp,
    VkCompareOp compareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the stencil operation.
- `failOp` is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- `passOp` is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
• **depthFailOp** is a VkStencilOp value specifying the action performed on samples that pass the stencil test and fail the depth test.

• **compareOp** is a VkCompareOp value specifying the comparison operator used in the stencil test.

This command sets the state for a given draw when the graphics pipeline is created with VK_DYNAMIC_STATE_STENCIL_OP_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates.

### Valid Usage

- **VUID-vkCmdSetStencilOpEXT-None-03351**
  The extendedDynamicState feature must be enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetStencilOpEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid VkCommandBuffer handle

- **VUID-vkCmdSetStencilOpEXT-faceMask-parameter**
  `faceMask` must be a valid combination of VkStencilFaceFlagBits values

- **VUID-vkCmdSetStencilOpEXT-faceMask-requiredbitmask**
  `faceMask` must not be 0

- **VUID-vkCmdSetStencilOpEXT-failOp-parameter**
  `failOp` must be a valid VkStencilOp value

- **VUID-vkCmdSetStencilOpEXT-passOp-parameter**
  `passOp` must be a valid VkStencilOp value

- **VUID-vkCmdSetStencilOpEXT-depthFailOp-parameter**
  `depthFailOp` must be a valid VkStencilOp value

- **VUID-vkCmdSetStencilOpEXT-compareOp-parameter**
  `compareOp` must be a valid VkCompareOp value

- **VUID-vkCmdSetStencilOpEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetStencilOpEXT-commandBuffer-cmdpool**
  The VkCommandPool that `commandBuffer` was allocated from must support graphics operations

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the VkCommandPool that `commandBuffer` was allocated from must be externally synchronized
The `VkStencilOpState` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkStencilOpState {
    VkStencilOp failOp;
    VkStencilOp passOp;
    VkStencilOp depthFailOp;
    VkCompareOp compareOp;
    uint32_t compareMask;
    uint32_t writeMask;
    uint32_t reference;
} VkStencilOpState;
```

- `failOp` is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- `passOp` is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
- `depthFailOp` is a `VkStencilOp` value specifying the action performed on samples that pass the stencil test and fail the depth test.
- `compareOp` is a `VkCompareOp` value specifying the comparison operator used in the stencil test.
- `compareMask` selects the bits of the unsigned integer stencil values participating in the stencil test.
- `writeMask` selects the bits of the unsigned integer stencil values updated by the stencil test in the stencil framebuffer attachment.
- `reference` is an integer reference value that is used in the unsigned stencil comparison.

### Valid Usage (Implicit)

- `VUID-VkStencilOpState-failOp-parameter failOp must be a valid VkStencilOp value`
- `VUID-VkStencilOpState-passOp-parameter passOp must be a valid VkStencilOp value`
- `VUID-VkStencilOpState-depthFailOp-parameter depthFailOp must be a valid VkStencilOp value`
- `VUID-VkStencilOpState-compareOp-parameter compareOp must be a valid VkCompareOp value`
To dynamically set the stencil compare mask call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilCompareMask(
    VkCommandBuffer commandBuffer,  // Provided by VK_VERSION_1_0
    VkStencilFaceFlags faceMask,    // Provided by VK_VERSION_1_0
    uint32_t compareMask);          // Provided by VK_VERSION_1_0
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the compare mask.
- `compareMask` is the new value to use as the stencil compare mask.

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

**Valid Usage (Implicit)**

- VUID-vkCmdSetStencilCompareMask-commandBuffer-parameter
  - `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetStencilCompareMask-faceMask-parameter
  - `faceMask` **must** be a valid combination of `VkStencilFaceFlagBits` values
- VUID-vkCmdSetStencilCompareMask-faceMask-requiredbitmask
  - `faceMask` **must** not be 0
- VUID-vkCmdSetStencilCompareMask-commandBuffer-recording
  - `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetStencilCompareMask-commandBuffer-cmdpool
  - The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
VkStencilFaceFlagBits values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilFaceFlagBits {
    VK_STENCIL_FACE_FRONT_BIT = 0x00000001,
    VK_STENCIL_FACE_BACK_BIT = 0x00000002,
    VK_STENCIL_FACE_FRONT_AND_BACK = 0x00000003,
    VK_STENCIL_FRONT_AND_BACK = VK_STENCIL_FACE_FRONT_AND_BACK,
} VkStencilFaceFlagBits;
```

- `VK_STENCIL_FACE_FRONT_BIT` specifies that only the front set of stencil state is updated.
- `VK_STENCIL_FACE_BACK_BIT` specifies that only the back set of stencil state is updated.
- `VK_STENCIL_FACE_FRONT_AND_BACK` is the combination of `VK_STENCIL_FACE_FRONT_BIT` and `VK_STENCIL_FACE_BACK_BIT`, and specifies that both sets of stencil state are updated.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkStencilFaceFlags;
```

`VkStencilFaceFlags` is a bitmask type for setting a mask of zero or more `VkStencilFaceFlagBits`.

To dynamically set the stencil write mask call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilWriteMask(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    VkStencilFaceFlags faceMask,    // faceMask is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the write mask, as described above for `vkCmdSetStencilCompareMask`.
    uint32_t writeMask);             // writeMask is the new value to use as the stencil write mask.
```

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. 

---

1588 | Chapter 28. Fragment Operations
Valid Usage (Implicit)

- VUID-vkCmdSetStencilWriteMask-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetStencilWriteMask-faceMask-parameter
  faceMask must be a valid combination of VkStencilFaceFlagBits values

- VUID-vkCmdSetStencilWriteMask-faceMask-requiredbitmask
  faceMask must not be 0

- VUID-vkCmdSetStencilWriteMask-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetStencilWriteMask-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the stencil reference value call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilReference(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t reference);
```

- commandBuffer is the command buffer into which the command will be recorded.
- faceMask is a bitmask of VkStencilFaceFlagBits specifying the set of stencil state for which to update the reference value, as described above for vkCmdSetStencilCompareMask.
- reference is the new value to use as the stencil reference value.

This command sets the state for a given draw when the graphics pipeline is created with VK_DYNAMIC_STATE_STENCIL_REFERENCE set in VkPipelineDynamicStateCreateInfo::pDynamicStates.
Valid Usage (Implicit)

- VUID-vkCmdSetStencilReference-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetStencilReference-faceMask-parameter
  
  `faceMask` must be a valid combination of `VkStencilFaceFlagBits` values

- VUID-vkCmdSetStencilReference-faceMask-requiredbitmask
  
  `faceMask` must not be 0

- VUID-vkCmdSetStencilReference-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetStencilReference-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Possible values of `VkStencilOpState::compareOp`, specifying the stencil comparison function, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCompareOp {
    VK_COMPARE_OP_NEVER = 0,
    VK_COMPARE_OP_LESS = 1,
    VK_COMPARE_OP_EQUAL = 2,
    VK_COMPARE_OP_LESS_OR_EQUAL = 3,
    VK_COMPARE_OP_GREATER = 4,
    VK_COMPARE_OP_NOT_EQUAL = 5,
    VK_COMPARE_OP_GREATER_OR_EQUAL = 6,
    VK_COMPARE_OP_ALWAYS = 7,
} VkCompareOp;
```

- `VK_COMPARE_OP_NEVER` specifies that the test evaluates to false.
• **VK_COMPARE_OP_LESS** specifies that the test evaluates $A < B$.
• **VK_COMPARE_OP_EQUAL** specifies that the test evaluates $A = B$.
• **VK_COMPARE_OP_LESS_OR_EQUAL** specifies that the test evaluates $A \leq B$.
• **VK_COMPARE_OP_GREATER** specifies that the test evaluates $A > B$.
• **VK_COMPARE_OP_NOT_EQUAL** specifies that the test evaluates $A \neq B$.
• **VK_COMPARE_OP_GREATER_OR_EQUAL** specifies that the test evaluates $A \geq B$.
• **VK_COMPARE_OP_ALWAYS** specifies that the test evaluates to true.

Possible values of the *failOp*, *passOp*, and *depthFailOp* members of *VkStencilOpState*, specifying what happens to the stored stencil value if this or certain subsequent tests fail or pass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilOp {
    VK_STENCIL_OP_KEEP = 0,
    VK_STENCIL_OP_ZERO = 1,
    VK_STENCIL_OP_REPLACE = 2,
    VK_STENCIL_OP_INCREMENT_AND_CLAMP = 3,
    VK_STENCIL_OP_DECREMENT_AND_CLAMP = 4,
    VK_STENCIL_OP_INVERT = 5,
    VK_STENCIL_OP_INCREMENT_AND_WRAP = 6,
    VK_STENCIL_OP_DECREMENT_AND_WRAP = 7,
} VkStencilOp;
```

• **VK_STENCIL_OP_KEEP** keeps the current value.
• **VK_STENCIL_OP_ZERO** sets the value to 0.
• **VK_STENCIL_OP_REPLACE** sets the value to reference.
• **VK_STENCIL_OP_INCREMENT_AND_CLAMP** increments the current value and clamps to the maximum representable unsigned value.
• **VK_STENCIL_OP_DECREMENT_AND_CLAMP** decrements the current value and clamps to 0.
• **VK_STENCIL_OP_INVERT** bitwise-inverts the current value.
• **VK_STENCIL_OP_INCREMENT_AND_WRAP** increments the current value and wraps to 0 when the maximum value would have been exceeded.
• **VK_STENCIL_OP_DECREMENT_AND_WRAP** decrements the current value and wraps to the maximum possible value when the value would go below 0.

For purposes of increment and decrement, the stencil bits are considered as an unsigned integer.

### 28.9. Depth Test

The depth test compares the depth value $z_a$ in the depth/stencil attachment at each sample’s framebuffer coordinates $(x_f, y_f)$ and *sample index* $i$ against the sample’s depth value $z_r$. If there is no depth attachment then the depth test is skipped.
If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of rasterization samples to depth attachment samples within the fragment. However, if all samples in the fragment are covered, and the depth attachment value is updated as a result of this test, all depth attachment samples will be updated.

The depth test occurs in three stages, as detailed in the following sections.

### 28.9.1. Depth Clamping and Range Adjustment

If `VkPipelineRasterizationStateCreateInfo::depthClampEnable` is enabled, before the sample’s \( z_f \) is compared to \( z_a \), \( z_f \) is clamped to \([\min(n,f),\max(n,f)]\), where \( n \) and \( f \) are the `minDepth` and `maxDepth` depth range values of the viewport used by this fragment, respectively.

If depth clamping is not enabled and \( z_f \) is not in the range \([0, 1]\) and either `VK_EXT_depth_range_unrestricted` is not enabled, or the depth attachment has a fixed-point format, then \( z_f \) is undefined following this step.

### 28.9.2. Depth Comparison

If the depth test is not enabled, as specified by `vkCmdSetDepthTestEnableEXT` or `VkPipelineDepthStencilStateCreateInfo::depthTestEnable`, then this step is skipped.

The comparison performed is based on the `VkCompareOp`, set by `vkCmdSetDepthCompareOpEXT` or `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` during pipeline creation. \( z_f \) and \( z_a \) are used as \( A \) and \( B \), respectively, in the operation specified by the `VkCompareOp`.

If the comparison evaluates to false, the coverage for the sample is set to \( 0 \).

### 28.9.3. Depth Buffer Writes

If depth writes are enabled, as specified by `vkCmdSetDepthWriteEnableEXT` or `VkPipelineDepthStencilStateCreateInfo::depthWriteEnable`, and the comparison evaluated to true, the depth attachment value \( z_a \) is set to the sample’s depth value \( z_f \).

To dynamically enable or disable the depth test, call:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthTestEnableEXT(
    VkCommandBuffer commandBuffer, 
    VkBool32 depthTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthTestEnable` specifies if the depth test is enabled.

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. 

1592 | Chapter 28. Fragment Operations
Valid Usage

• VUID-vkCmdSetDepthTestEnableEXT-None-03352
  The extendedDynamicState feature must be enabled

Valid Usage (Implicit)

• VUID-vkCmdSetDepthTestEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
• VUID-vkCmdSetDepthTestEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state
• VUID-vkCmdSetDepthTestEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>

</tbody>
</table>

To dynamically set the depth compare operations, call:

```c
// Provided by VK_EXT_extended_dynamic_state
def void vkCmdSetDepthCompareOpEXT(VkCommandBuffer commandBuffer, VkCompareOp depthCompareOp);
```

• commandBuffer is the command buffer into which the command will be recorded.
• depthCompareOp specifies the depth comparison operator.

This command sets the state for a given draw when the graphics pipeline is created with VK_DYNAMIC_STATE_DEPTH_COMPARE_OP_EXT set in VkPipelineDynamicStateCreateInfo:pDynamicStates.
Valid Usage

- VUID-vkCmdSetDepthCompareOpEXT-None-03353
  The extendedDynamicState feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetDepthCompareOpEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthCompareOpEXT-depthCompareOp-parameter
  depthCompareOp must be a valid VkCompareOp value
- VUID-vkCmdSetDepthCompareOpEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetDepthCompareOpEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

</table>

To dynamically enable or disable depth writes, call:

```c
// Provided by VK_EXT_extended_dynamic_state
define void vkCmdSetDepthWriteEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthWriteEnable);
```

- commandBuffer is the command buffer into which the command will be recorded.
- depthWriteEnable specifies if depth writes are enabled.

This command sets the state for a given draw when the graphics pipeline is created with
VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates.

Valid Usage

- VUID-vkCmdSetDepthWriteEnableEXT-None-03354
  The extendedDynamicState feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetDepthWriteEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetDepthWriteEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetDepthWriteEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

</table>

28.10. Representative Fragment Test

The representative fragment test allows implementations to reduce the amount of rasterization and fragment processing work performed for each point, line, or triangle primitive. For any primitive that produces one or more fragments that pass all prior early fragment tests, the implementation may choose one or more “representative” fragments for processing and discard all other fragments. For draw calls rendering multiple points, lines, or triangles arranged in lists, strips, or fans, the representative fragment test is performed independently for each of those primitives. The set of fragments discarded by the representative fragment test is implementation-dependent. In some cases, the representative fragment test may not discard any fragments for a given primitive.

If the pNext chain of VkGraphicsPipelineCreateInfo includes a
 VkPipelineRepresentativeFragmentTestStateCreateInfoNV structure, then that structure includes parameters that control the representative fragment test.

The VkPipelineRepresentativeFragmentTestStateCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_representative_fragment_test
typedef struct VkPipelineRepresentativeFragmentTestStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 representativeFragmentTestEnable;
} VkPipelineRepresentativeFragmentTestStateCreateInfoNV;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **representativeFragmentTestEnable** controls whether the representative fragment test is enabled.

If this structure is not included in the `pNext` chain, `representativeFragmentTestEnable` is considered to be `VK_FALSE`, and the representative fragment test is disabled.

If **early fragment tests** are not enabled in the active fragment shader, the representative fragment shader test has no effect, even if enabled.

### Valid Usage (Implicit)

- VUID-VkPipelineRepresentativeFragmentTestStateCreateInfoNV-sType-sType
  
  `sType` must be
  
  VK_STRUCTURE_TYPE_PIPELINE_REPRESENTATIVE_FRAGMENT_TEST_STATE_CREATE_INFO_NV

### 28.11. Sample Counting

Occlusion queries use query pool entries to track the number of samples that pass all the per-fragment tests. The mechanism of collecting an occlusion query value is described in **Occlusion Queries**.

The occlusion query sample counter increments by one for each sample with a coverage value of 1 in each fragment that survives all the per-fragment tests, including scissor, exclusive scissor, sample mask, alpha to coverage, stencil, and depth tests.

### 28.12. Fragment Coverage To Color

The VkPipelineCoverageToColorStateCreateInfoNV structure is defined as:
// Provided by VK_NV_fragment_coverage_to_color

typedef struct VkPipelineCoverageToColorStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageToColorStateCreateFlagsNV flags;
    VkBool32 coverageToColorEnable;
    uint32_t coverageToColorLocation;
} VkPipelineCoverageToColorStateCreateInfoNV;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **coverageToColorEnable** controls whether the fragment coverage value replaces a fragment color output.
- **coverageToColorLocation** controls which fragment shader color output value is replaced.

If the **pNext** chain of **VkPipelineMultisampleStateCreateInfo** includes a **VkPipelineCoverageToColorStateCreateInfoNV** structure, then that structure controls whether the fragment coverage is substituted for a fragment color output and, if so, which output is replaced.

If **coverageToColorEnable** is **VK_TRUE**, the **coverage mask** replaces the first component of the color value corresponding to the fragment shader output location with **Location** equal to **coverageToColorLocation** and **Index** equal to zero. If the color attachment format has fewer bits than the coverage mask, the low bits of the sample coverage mask are taken without any clamping. If the color attachment format has more bits than the coverage mask, the high bits of the sample coverage mask are filled with zeros.

If **coverageToColorEnable** is **VK_FALSE**, these operations are skipped. If this structure is not included in the **pNext** chain, it is as if **coverageToColorEnable** is **VK_FALSE**.

### Valid Usage

- **VUID-VkPipelineCoverageToColorStateCreateInfoNV-coverageToColorEnable-01404**
  If **coverageToColorEnable** is **VK_TRUE**, then the render pass subpass indicated by **VkGraphicsPipelineCreateInfo::renderPass** and **VkGraphicsPipelineCreateInfo::subpass** must have a color attachment at the location selected by **coverageToColorLocation**, with a **VkFormat** of **VK_FORMAT_R8_UINT**, **VK_FORMAT_R8_SINT**, **VK_FORMAT_R16_UINT**, **VK_FORMAT_R16_SINT**, **VK_FORMAT_R32_UINT**, **VK_FORMAT_R32_SINT**, or **VK_FORMAT_R32_SINT**.
Valid Usage (Implicit)

- **VUID-VkPipelineCoverageToColorStateCreateInfoNV-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_TO_COLOR_STATE_CREATE_INFO_NV`

- **VUID-VkPipelineCoverageToColorStateCreateInfoNV-flags-zerobitmask**
  
  *flags* must be 0

```c
// Provided by VK_NV_fragment_coverage_to_color
typedef VkFlags VkPipelineCoverageToColorStateCreateFlagsNV;
```

VkPipelineCoverageToColorStateCreateFlagsNV is a bitmask type for setting a mask, but is currently reserved for future use.

## 28.13. Coverage Reduction

Coverage reduction takes the coverage information for a fragment and converts that to a boolean coverage value for each color sample in each pixel covered by the fragment.

### 28.13.1. Pixel Coverage

Coverage for each pixel is first extracted from the total fragment coverage mask. This consists of `rasterizationSamples` unique coverage samples for each pixel in the fragment area, each with a unique sample index. If the fragment only contains a single pixel, coverage for the pixel is equivalent to the fragment coverage.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, pixel coverage is generated in an implementation-dependent manner. If all samples in the fragment are covered, all samples will be covered in each pixel coverage.

If a shading rate image is used, and the fragment covers multiple pixels, each pixel's coverage consists of the coverage samples corresponding to that pixel, and each sample retains its unique sample index `i`.

If the fragment shading rate is set, and the fragment covers multiple pixels, each pixel's coverage consists of the coverage samples with a pixel index matching that pixel, and each sample retains its unique sample index `i`.

### 28.13.2. Color Sample Coverage

Once pixel coverage is determined, coverage for each individual color sample corresponding to that pixel is determined.

If the number of `rasterizationSamples` is identical to the number of samples in the color attachments. A color sample is covered if the pixel coverage sample with the same sample index `i` is covered.
Otherwise, the coverage for each color sample is computed from the pixel coverage as follows.

If the `VK_AMD_mixed_attachment_samples` extension is enabled, for color samples present in the color attachments, a color sample is covered if the pixel coverage sample with the same sample index $i$ is covered; additional pixel coverage samples are discarded.

When the `VK_NV_coverage_reduction_mode` extension is enabled, the pipeline state controlling coverage reduction is specified through the members of the `VkPipelineCoverageReductionStateCreateInfoNV` structure.

The `VkPipelineCoverageReductionStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_coverage_reduction_mode
typedef struct VkPipelineCoverageReductionStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageReductionStateCreateFlagsNV flags;
    VkCoverageReductionModeNV coverageReductionMode;
} VkPipelineCoverageReductionStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `coverageReductionMode` is a `VkCoverageReductionModeNV` value controlling how color sample coverage is generated from pixel coverage.

If this structure is not included in the `pNext` chain, or if the extension is not enabled, the default coverage reduction mode is inferred as follows:

- If the `VK_NV_framebuffer_mixed_samples` extension is enabled, then it is as if the `coverageReductionMode` is `VK_COVERAGE_REDUCTION_MODE_MERGE_NV`.
- If the `VK_AMD_mixed_attachment_samples` extension is enabled, then it is as if the `coverageReductionMode` is `VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV`.
- If both `VK_NV_framebuffer_mixed_samples` and `VK_AMD_mixed_attachment_samples` are enabled, then the default coverage reduction mode is implementation-dependent.

**Valid Usage (Implicit)**

- `VUID-VkPipelineCoverageReductionStateCreateInfoNV-sType-sType` 
  sType **must** be `VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_REDUCTION_STATE_CREATE_INFO_NV`
- `VUID-VkPipelineCoverageReductionStateCreateInfoNV-flags-zerobitmask` 
  flags **must** be $0$
- `VUID-VkPipelineCoverageReductionStateCreateInfoNV-coverageReductionMode-parameter` 
  coverageReductionMode **must** be a valid `VkCoverageReductionModeNV` value
VkPipelineCoverageReductionStateCreateFlagsNV is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode, specifying how color sample coverage is generated from pixel coverage, are:

- VK_COVERAGE_REDUCTION_MODE_MERGE_NV specifies that each color sample will be associated with an implementation-dependent subset of samples in the pixel coverage. If any of those associated samples are covered, the color sample is covered.
- VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV specifies that for color samples present in the color attachments, a color sample is covered if the pixel coverage sample with the same sample index \( i \) is covered; other pixel coverage samples are discarded.

To query the set of mixed sample combinations of coverage reduction mode, rasterization samples and color, depth, stencil attachment sample counts that are supported by a physical device, call:

- physicalDevice is the physical device from which to query the set of combinations.
- pCombinationCount is a pointer to an integer related to the number of combinations available or queried, as described below.
- pCombinations is either NULL or a pointer to an array of VkFramebufferMixedSamplesCombinationNV values, indicating the supported combinations of coverage reduction mode, rasterization samples, and color, depth, stencil attachment sample counts.

If pCombinations is NULL, then the number of supported combinations for the given physicalDevice is returned in pCombinationCount. Otherwise, pCombinationCount must point to a variable set by the user to the number of elements in the pCombinations array, and on return the variable is overwritten with the number of values actually written to pCombinations. If the value of pCombinationCount is less than the number of combinations supported for the given physicalDevice, at most pCombinationCount values will be written to pCombinations, and VK_INCOMPLETE will be
returned instead of **VK_SUCCESS**, to indicate that not all the supported values were returned.

---

**Valid Usage (Implicit)**

- **VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-physicalDevice-parameter**
  
  *physicalDevice* must be a valid *VkPhysicalDevice* handle

- **VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-pCombinationCount-parameter**
  
  *pCombinationCount* must be a valid pointer to a *uint32_t* value

- **VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-pCombinations-parameter**
  
  If the value referenced by *pCombinationCount* is not 0, and *pCombinations* is not NULL, *pCombinations* must be a valid pointer to an array of *pCombinationCount* *VkFramebufferMixedSamplesCombinationNV* structures

---

**Return Codes**

**Success**

- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The *VkFramebufferMixedSamplesCombinationNV* structure is defined as:

```c
// Provided by VK_NV_coverage_reduction_mode
typedef struct VkFramebufferMixedSamplesCombinationNV {
    VkStructureType sType;
    void* pNext;
    VkCoverageReductionModeNV coverageReductionMode;
    VkSampleCountFlagBits rasterizationSamples;
    VkSampleCountFlags depthStencilSamples;
    VkSampleCountFlags colorSamples;
} VkFramebufferMixedSamplesCombinationNV;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **coverageReductionMode** is a *VkCoverageReductionModeNV* value specifying the coverage reduction mode.
- **rasterizationSamples** is a *VkSampleCountFlagBits* specifying the number of rasterization samples in the supported combination.
- **depthStencilSamples** specifies the number of samples in the depth stencil attachment in the...
supported combination. A value of 0 indicates the combination does not have a depth stencil attachment.

- **colorSamples** specifies the number of color samples in a color attachment in the supported combination. A value of 0 indicates the combination does not have a color attachment.

### Valid Usage (Implicit)

- VUID-VkFramebufferMixedSamplesCombinationNV-sType-sType
  
  - `sType` must be `VK_STRUCTURE_TYPE_FRAMEBUFFER_MIXED_SAMPLES_COMBINATION_NV`

- VUID-VkFramebufferMixedSamplesCombinationNV-pNext-pNext
  
  - `pNext` must be `NULL`

### 28.13.3. Coverage Modulation

As part of coverage reduction, fragment color values can also be modulated (multiplied) by a value that is a function of fraction of covered rasterization samples associated with that color sample.

Pipeline state controlling coverage modulation is specified through the members of the `VkPipelineCoverageModulationStateCreateInfoNV` structure.

The `VkPipelineCoverageModulationStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_framebuffer_mixed_samples
typedef struct VkPipelineCoverageModulationStateCreateInfoNV {
  VkStructureType sType;
  const void* pNext;
  VkPipelineCoverageModulationStateCreateFlagsNV flags;
  VkCoverageModulationModeNV coverageModulationMode;
  VkBool32 coverageModulationTableEnable;
  uint32_t coverageModulationTableCount;
  const float* pCoverageModulationTable;
} VkPipelineCoverageModulationStateCreateInfoNV;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **coverageModulationMode** is a `VkCoverageModulationModeNV` value controlling which color components are modulated.
- **coverageModulationTableEnable** controls whether the modulation factor is looked up from a table in `pCoverageModulationTable`.
- **coverageModulationTableCount** is the number of elements in `pCoverageModulationTable`.
- **pCoverageModulationTable** is a table of modulation factors containing a value for each number of covered samples.
If `coverageModulationTableEnable` is `VK_FALSE`, then for each color sample the associated bits of the pixel coverage are counted and divided by the number of associated bits to produce a modulation factor $R$ in the range $(0,1]$ (a value of zero would have been killed due to a color coverage of 0). Specifically:

- $N =$ value of `rasterizationSamples`
- $M =$ value of `VkAttachmentDescription::samples` for any color attachments
- $R = \text{popcount(associated coverage bits)}/(N/M)$

If `coverageModulationTableEnable` is `VK_TRUE`, the value $R$ is computed using a programmable lookup table. The lookup table has $N/M$ elements, and the element of the table is selected by:

- $R = pCoverageModulationTable[\text{popcount(associated coverage bits)}-1]$

Note that the table does not have an entry for \text{popcount(associated coverage bits)} = 0, because such samples would have been killed.

The values of `pCoverageModulationTable` may be rounded to an implementation-dependent precision, which is at least as fine as $1/N$, and clamped to $[0,1]$.

For each color attachment with a floating point or normalized color format, each fragment output color value is replicated to $M$ values which can each be modulated (multiplied) by that color sample's associated value of $R$. Which components are modulated is controlled by `coverageModulationMode`.

If this structure is not included in the `pNext` chain, it is as if `coverageModulationMode` is `VK_COVERAGE_MODULATION_MODE_NONE_NV`.

If the `coverage reduction mode` is `VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV`, each color sample is associated with only a single coverage sample. In this case, it is as if `coverageModulationMode` is `VK_COVERAGE_MODULATION_MODE_NONE_NV`.

**Valid Usage**

- **VUID-VkPipelineCoverageModulationStateCreateInfoNV-coverageModulationTableEnable-01405**
  If `coverageModulationTableEnable` is `VK_TRUE`, `coverageModulationTableCount` must be equal to the number of rasterization samples divided by the number of color samples in the subpass.
Valid Usage (Implicit)

- VUID-VkPipelineCoverageModulationStateCreateInfoNV:sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_MODULATION_STATE_CREATE_INFO_NV

- VUID-VkPipelineCoverageModulationStateCreateInfoNV-flags-zerobitmask
  flags must be 0

- VUID-VkPipelineCoverageModulationStateCreateInfoNV-coverageModulationMode-parameter
  coverageModulationMode must be a valid VkCoverageModulationModeNV value

```c
// Provided by VK_NV_framebuffer_mixed_samples
typedef VkFlags VkPipelineCoverageModulationStateCreateFlagsNV;
```

VkPipelineCoverageModulationStateCreateFlagsNV is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkPipelineCoverageModulationStateCreateInfoNV:coverageModulationMode, specifying which color components are modulated, are:

```c
// Provided by VK_NV_framebuffer_mixed_samples
typedef enum VkCoverageModulationModeNV {
    VK_COVERAGE_MODULATION_MODE_NONE_NV = 0,
    VK_COVERAGE_MODULATION_MODE_RGB_NV = 1,
    VK_COVERAGE_MODULATION_MODE_ALPHA_NV = 2,
    VK_COVERAGE_MODULATION_MODE_RGBA_NV = 3,
} VkCoverageModulationModeNV;
```

- VK_COVERAGE_MODULATION_MODE_NONE_NV specifies that no components are multiplied by the modulation factor.
- VK_COVERAGE_MODULATION_MODE_RGB_NV specifies that the red, green, and blue components are multiplied by the modulation factor.
- VK_COVERAGE_MODULATION_MODE_ALPHA_NV specifies that the alpha component is multiplied by the modulation factor.
- VK_COVERAGE_MODULATION_MODE_RGBA_NV specifies that all components are multiplied by the modulation factor.
Chapter 29. The Framebuffer

29.1. Blending

Blending combines the incoming source fragment's R, G, B, and A values with the destination R, G, B, and A values of each sample stored in the framebuffer at the fragment's \((x_f, y_f)\) location. Blending is performed for each color sample covered by the fragment, rather than just once for each fragment.

Source and destination values are combined according to the blend operation, quadruplets of source and destination weighting factors determined by the blend factors, and a blend constant, to obtain a new set of R, G, B, and A values, as described below.

Blending is computed and applied separately to each color attachment used by the subpass, with separate controls for each attachment.

Prior to performing the blend operation, signed and unsigned normalized fixed-point color components undergo an implied conversion to floating-point as specified by Conversion from Normalized Fixed-Point to Floating-Point. Blending computations are treated as if carried out in floating-point, and basic blend operations are performed with a precision and dynamic range no lower than that used to represent destination components. Advanced blending operations are performed with a precision and dynamic range no lower than the smaller of that used to represent destination components or that used to represent 16-bit floating-point values.

**Note**

Blending is only defined for floating-point, UNORM, SNORM, and sRGB formats. Within those formats, the implementation may only support blending on some subset of them. Which formats support blending is indicated by VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT.

The pipeline blend state is included in the VkPipelineColorBlendStateCreateInfo structure during graphics pipeline creation:

The VkPipelineColorBlendStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineColorBlendStateCreateFlags flags;
    VkBool32 logicOpEnable;
    VkLogicOp logicOp;
    uint32_t attachmentCount;
    const VkPipelineColorBlendAttachmentState* pAttachments;
    float blendConstants[4];
} VkPipelineColorBlendStateCreateInfo;
```

- `sType` is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **flags** is reserved for future use.

• **logicOpEnable** controls whether to apply Logical Operations.

• **logicOp** selects which logical operation to apply.

• **attachmentCount** is the number of *VkPipelineColorBlendAttachmentState* elements in **pAttachments**.

• **pAttachments** is a pointer to an array of per target attachment states.

• **blendConstants** is a pointer to an array of four values used as the R, G, B, and A components of the blend constant that are used in blending, depending on the **blend factor**.

Each element of the **pAttachments** array is a *VkPipelineColorBlendAttachmentState* structure specifying per-target blending state for each individual color attachment. If the independent blending feature is not enabled on the device, all *VkPipelineColorBlendAttachmentState* elements in the **pAttachments** array must be identical.

The value of **attachmentCount** must be greater than the index of all color attachments that are not **VK_ATTACHMENT_UNUSED** in *VkSubpassDescription::pColorAttachments* or *VkSubpassDescription2::pColorAttachments* for the subpass in which this pipeline is used.

---

### Valid Usage

- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-00605**
  If the independent blending feature is not enabled, all elements of **pAttachments** must be identical.

- **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00606**
  If the logic operations feature is not enabled, **logicOpEnable must be VK_FALSE**

- **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00607**
  If **logicOpEnable** is **VK_TRUE**, **logicOp must be a valid VkLogicOp value**
Valid Usage (Implicit)

- VUID-VkPipelineColorBlendStateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO

- VUID-VkPipelineColorBlendStateCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkPipelineColorBlendAdvancedStateCreateInfoEXT or VkPipelineColorWriteCreateInfoEXT

- VUID-VkPipelineColorBlendStateCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkPipelineColorBlendStateCreateInfo-flags-zerobitmask
  flags must be 0

- VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-parameter
  If attachmentCount is not 0, pAttachments must be a valid pointer to an array of attachmentCount valid VkPipelineColorBlendAttachmentState structures

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineColorBlendStateCreateFlags;

VkPipelineColorBlendStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The VkPipelineColorBlendAttachmentState structure is defined as:

// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendAttachmentState {
    VkBool32 blendEnable;
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
    VkColorComponentFlags colorWriteMask;
} VkPipelineColorBlendAttachmentState;

- blendEnable controls whether blending is enabled for the corresponding color attachment. If blending is not enabled, the source fragment's color for that attachment is passed through unmodified.
- srcColorBlendFactor selects which blend factor is used to determine the source factors (S_r,S_g,S_b).
- dstColorBlendFactor selects which blend factor is used to determine the destination factors (D_r,D_g,D_b).
- colorBlendOp selects which blend operation is used to calculate the RGB values to write to the
color attachment.

- `srcAlphaBlendFactor` selects which blend factor is used to determine the source factor $S_a$.
- `dstAlphaBlendFactor` selects which blend factor is used to determine the destination factor $D_a$.
- `alphaBlendOp` selects which blend operation is use to calculate the alpha values to write to the color attachment.
- `colorWriteMask` is a bitmask of `VkColorComponentFlagBits` specifying which of the R, G, B, and/or A components are enabled for writing, as described for the Color Write Mask.
Valid Usage

- **VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-00608**
  If the dual source blending feature is not enabled, srcColorBlendFactor must not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA.

- **VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-00609**
  If the dual source blending feature is not enabled, dstColorBlendFactor must not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA.

- **VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-00610**
  If the dual source blending feature is not enabled, srcAlphaBlendFactor must not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA.

- **VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-00611**
  If the dual source blending feature is not enabled, dstAlphaBlendFactor must not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA.

- **VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-01406**
  If either of colorBlendOp or alphaBlendOp is an advanced blend operation, then colorBlendOp must equal alphaBlendOp.

- **VUID-VkPipelineColorBlendAttachmentState-advancedBlendIndependentBlend-01407**
  If VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend is VK_FALSE and colorBlendOp is an advanced blend operation, then colorBlendOp must be the same for all attachments.

- **VUID-VkPipelineColorBlendAttachmentState-advancedBlendIndependentBlend-01408**
  If VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend is VK_FALSE and alphaBlendOp is an advanced blend operation, then alphaBlendOp must be the same for all attachments.

- **VUID-VkPipelineColorBlendAttachmentState-advancedBlendAllOperations-01409**

- **VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-01410**
  If colorBlendOp or alphaBlendOp is an advanced blend operation, then colorAttachmentCount...
of the subpass this pipeline is compiled against must be less than or equal to 
`VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendMaxColorAttachments`

- **VUID-VkPipelineColorBlendAttachmentState-constantAlphaColorBlendFactors-04454**

  If the `VK_KHR_portability_subset` extension is enabled, and 
  `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is 
  `VK_FALSE`, **srcColorBlendFactor** must not be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or 
  `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`

- **VUID-VkPipelineColorBlendAttachmentState-constantAlphaColorBlendFactors-04455**

  If the `VK_KHR_portability_subset` extension is enabled, and 
  `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is 
  `VK_FALSE`, **dstColorBlendFactor** must not be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or 
  `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`

### Valid Usage (Implicit)

- **VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-parameter**
  
  **srcColorBlendFactor** must be a valid `VkBlendFactor` value

- **VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-parameter**
  
  **dstColorBlendFactor** must be a valid `VkBlendFactor` value

- **VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-parameter**
  
  **colorBlendOp** must be a valid `VkBlendOp` value

- **VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-parameter**
  
  **srcAlphaBlendFactor** must be a valid `VkBlendFactor` value

- **VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-parameter**
  
  **dstAlphaBlendFactor** must be a valid `VkBlendFactor` value

- **VUID-VkPipelineColorBlendAttachmentState-alphaBlendOp-parameter**
  
  **alphaBlendOp** must be a valid `VkBlendOp` value

- **VUID-VkPipelineColorBlendAttachmentState-colorWriteMask-parameter**
  
  **colorWriteMask** must be a valid combination of `VkColorComponentFlagBits` values

## 29.1.1. Blend Factors

The source and destination color and alpha blending factors are selected from the enum:
The semantics of the enum values are described in the table below:

Table 37. Blend Factors

<table>
<thead>
<tr>
<th>VkBlendFactor</th>
<th>RGB Blend Factors ((S_r, S_g, S_b)) or ((D_r, D_g, D_b))</th>
<th>Alpha Blend Factor ((S_a) or (D_a))</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BLEND_FACTOR_ZERO</td>
<td>((0,0,0))</td>
<td>0</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE</td>
<td>((1,1,1))</td>
<td>1</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC_COLOR</td>
<td>((R_{s0},G_{s0},B_{s0}))</td>
<td>(A_{s0})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR</td>
<td>((1-R_{s0},1-G_{s0},1-B_{s0}))</td>
<td>(1-A_{s0})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_DST_COLOR</td>
<td>((R_{d0},G_{d0},B_{d0}))</td>
<td>(A_{d0})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR</td>
<td>((1-R_{d0},1-G_{d0},1-B_{d0}))</td>
<td>(1-A_{d0})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC_ALPHA</td>
<td>((A_{s0},A_{s0},A_{s0}))</td>
<td>(A_{s0})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA</td>
<td>((1-A_{s0},1-A_{s0},1-A_{s0}))</td>
<td>(1-A_{s0})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_DST_ALPHA</td>
<td>((A_{d0},A_{d0},A_{d0}))</td>
<td>(A_{d0})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA</td>
<td>((1-A_{d0},1-A_{d0},1-A_{d0}))</td>
<td>(1-A_{d0})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_CONSTANT_COLOR</td>
<td>((R_{c0},G_{c0},B_{c0}))</td>
<td>(A_c)</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR</td>
<td>((1-R_{c0},1-G_{c0},1-B_{c0}))</td>
<td>(1-A_c)</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_CONSTANT_ALPHA</td>
<td>((A_{c0},A_{c0},A_{c0}))</td>
<td>(A_{c0})</td>
</tr>
</tbody>
</table>
### RGB Blend Factors

<table>
<thead>
<tr>
<th>VkBlendFactor</th>
<th>RGB Blend Factors ((S_r, S_g, S_b)) or ((D_r, D_g, D_b))</th>
<th>Alpha Blend Factor ((S_a) or (D_a))</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA</td>
<td>((1-A_c, 1-A_c, 1-A_c))</td>
<td>(1-A_c)</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC_ALPHA_SATURATE</td>
<td>((f, f, f)); (f = \min(A_{s0}, 1-A_d))</td>
<td>(1)</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC1_COLOR</td>
<td>((R_{s1}, G_{s1}, B_{s1}))</td>
<td>(A_{s1})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR</td>
<td>((1-R_{s1}, 1-G_{s1}, 1-B_{s1}))</td>
<td>(1-A_{s1})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC1_ALPHA</td>
<td>((A_{s1}, A_{s1}, A_{s1}))</td>
<td>(A_{s1})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA</td>
<td>((1-A_{s1}, 1-A_{s1}, 1-A_{s1}))</td>
<td>(1-A_{s1})</td>
</tr>
</tbody>
</table>

In this table, the following conventions are used:

- \(R_{s0}, G_{s0}, B_{s0}\) and \(A_{s0}\) represent the first source color R, G, B, and A components, respectively, for the fragment output location corresponding to the color attachment being blended.
- \(R_{s1}, G_{s1}, B_{s1}\) and \(A_{s1}\) represent the second source color R, G, B, and A components, respectively, used in dual source blending modes, for the fragment output location corresponding to the color attachment being blended.
- \(R_d, G_d, B_d\) and \(A_d\) represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- \(R_c, G_c, B_c\) and \(A_c\) represent the blend constant R, G, B, and A components, respectively.

If the pipeline state object is created without the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled then the blend constant \((R_c, G_c, B_c, A_c)\) is specified via the `blendConstants` member of the `VkPipelineColorBlendStateCreateInfo`. Otherwise, to dynamically set and change the blend constant, call:

```c
void vkCmdSetBlendConstants(  
    VkCommandBuffer commandBuffer,  
    const float blendConstants[4]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `blendConstants` is a pointer to an array of four values specifying the R, G, B, and A components of the blend constant color used in blending, depending on the blend factor.
Valid Usage (Implicit)

- VUID-vkCmdSetBlendConstants-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetBlendConstants-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetBlendConstants-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

29.1.2. Dual-Source Blending

Blend factors that use the secondary color input \((R_{s1},G_{s1},B_{s1},A_{s1})\) \((\text{VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, and VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA})\) may consume implementation resources that could otherwise be used for rendering to multiple color attachments. Therefore, the number of color attachments that can be used in a framebuffer may be lower when using dual-source blending.

Dual-source blending is only supported if the dualSrcBlend feature is enabled.

The maximum number of color attachments that can be used in a subpass when using dual-source blending functions is implementation-dependent and is reported as the maxFragmentDualSrcAttachments member of VkPhysicalDeviceLimits.

When using a fragment shader with dual-source blending functions, the color outputs are bound to the first and second inputs of the blender using the Index decoration, as described in Fragment Output Interface. If the second color input to the blender is not written in the shader, or if no output is bound to the second input of a blender, the result of the blending operation is not defined.
Once the source and destination blend factors have been selected, they along with the source and destination components are passed to the blending operations. RGB and alpha components can use different operations. Possible values of `VkBlendOp`, specifying the operations, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBlendOp {
    VK_BLEND_OP_ADD = 0,
    VK_BLEND_OP_SUBTRACT = 1,
    VK_BLEND_OP_REVERSE_SUBTRACT = 2,
    VK_BLEND_OP_MIN = 3,
    VK_BLEND_OP_MAX = 4,
    // Provided by VK_EXT_blend_operation_advanced

<td></td>
</tr>
<tr>
<td></td>
<td>( B = \max(B_{s0}, B_{d}) )</td>
<td></td>
</tr>
</tbody>
</table>

In this table, the following conventions are used:

- \( R_{s0}, G_{s0}, B_{s0} \) and \( A_{s0} \) represent the first source color \( R, G, B, \) and \( A \) components, respectively.
- \( R_{d}, G_{d}, B_{d} \) and \( A_{d} \) represent the \( R, G, B, \) and \( A \) components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- \( S_r, S_g, S_b \) and \( S_a \) represent the source blend factor \( R, G, B, \) and \( A \) components, respectively.
- \( D_r, D_g, D_b \) and \( D_a \) represent the destination blend factor \( R, G, B, \) and \( A \) components, respectively.

The blending operation produces a new set of values \( R, G, B \) and \( A \), which are written to the framebuffer attachment. If blending is not enabled for this attachment, then \( R, G, B \) and \( A \) are assigned \( R_{s0}, G_{s0}, B_{s0} \) and \( A_{s0} \), respectively.

If the color attachment is fixed-point, the components of the source and destination values and blend factors are each clamped to \([0,1]\) or \([-1,1]\) respectively for an unsigned normalized or signed normalized color attachment prior to evaluating the blend operations. If the color attachment is floating-point, no clamping occurs.

If the numeric format of a framebuffer attachment uses sRGB encoding, the \( R, G, \) and \( B \) destination color values (after conversion from fixed-point to floating-point) are considered to be encoded for the sRGB color space and hence are linearized prior to their use in blending. Each \( R, G, \) and \( B \) component is converted from nonlinear to linear as described in the “sRGB EOTF” section of the *Khronos Data Format Specification*. If the format is not sRGB, no linearization is performed.

If the numeric format of a framebuffer attachment uses sRGB encoding, then the final \( R, G \) and \( B \) values are converted into the nonlinear sRGB representation before being written to the framebuffer attachment as described in the “sRGB EOTF\(^{-1}\)” section of the Khronos Data Format.
Specification.

If the numeric format of a framebuffer color attachment is not sRGB encoded then the resulting c,
values for R, G and B are unmodified. The value of A is never sRGB encoded. That is, the alpha
component is always stored in memory as linear.

If the framebuffer color attachment is \texttt{VK_ATTACHMENT_UNUSED}, no writes are performed through that
attachment. Writes are not performed to framebuffer color attachments greater than or equal to
the \texttt{VkSubpassDescription::colorAttachmentCount} or \texttt{VkSubpassDescription2::colorAttachmentCount}
value.

29.1.4. Advanced Blend Operations

The \textit{advanced blend operations} are those listed in tables \texttt{f/X/Y/Z Advanced Blend Operations}, \texttt{Hue-}
Saturation-Luminosity Advanced Blend Operations, and \texttt{Additional RGB Blend Operations}.

If the \texttt{pNext} chain of \texttt{VkPipelineColorBlendStateCreateInfo} includes a
\texttt{VkPipelineColorBlendAdvancedStateCreateInfoEXT} structure, then that structure includes parameters
that affect advanced blend operations.

The \texttt{VkPipelineColorBlendAdvancedStateCreateInfoEXT} structure is defined as:

```
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPipelineColorBlendAdvancedStateCreateInfoEXT {
    VkStructureType       sType;
    const void*            pNext;
    VkBool32               srcPremultiplied;
    VkBool32               dstPremultiplied;
    VkBlendOverlapEXT      blendOverlap;
} VkPipelineColorBlendAdvancedStateCreateInfoEXT;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{srcPremultiplied} specifies whether the source color of the blend operation is treated as
  premultiplied.
- \texttt{dstPremultiplied} specifies whether the destination color of the blend operation is treated as
  premultiplied.
- \texttt{blendOverlap} is a \texttt{VkBlendOverlapEXT} value specifying how the source and destination sample’s
  coverage is correlated.

If this structure is not present, \texttt{srcPremultiplied} and \texttt{dstPremultiplied} are both considered to be
\texttt{VK_TRUE}, and \texttt{blendOverlap} is considered to be \texttt{VK_BLEND_OVERLAP_UNCORRELATED_EXT}.
Valid Usage

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-srcPremultiplied-01424
  If the non-premultiplied source color property is not supported, srcPremultiplied must be VK_TRUE

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-dstPremultiplied-01425
  If the non-premultiplied destination color property is not supported, dstPremultiplied must be VK_TRUE

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-blendOverlap-01426
  If the correlated overlap property is not supported, blendOverlap must be VK_BLEND_OVERLAP_UNCORRELATED_EXT

Valid Usage (Implicit)

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_ADVANCED_STATE_CREATE_INFO_EXT

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-blendOverlap-parameter
  blendOverlap must be a valid VkBlendOverlapEXT value

When using one of the operations in table f/X/Y/Z Advanced Blend Operations or Hue-Saturation-Luminosity Advanced Blend Operations, blending is performed according to the following equations:

\[
\begin{align*}
R &= f(R_s', R_d') * p_0(A_s, A_d) + Y * R_s' * p_1(A_s, A_d) + Z * R_d' * p_2(A_s, A_d) \\
G &= f(G_s', G_d') * p_0(A_s, A_d) + Y * G_s' * p_1(A_s, A_d) + Z * G_d' * p_2(A_s, A_d) \\
B &= f(B_s', B_d') * p_0(A_s, A_d) + Y * B_s' * p_1(A_s, A_d) + Z * B_d' * p_2(A_s, A_d) \\
A &= X * p_0(A_s, A_d) + Y * p_1(A_s, A_d) + Z * p_2(A_s, A_d)
\end{align*}
\]

where the function f and terms X, Y, and Z are specified in the table. The R, G, and B components of the source color used for blending are derived according to srcPremultiplied. If srcPremultiplied is set to VK_TRUE, the fragment color components are considered to have been premultiplied by the A component prior to blending. The base source color \((R_s', G_s', B_s')\) is obtained by dividing through by the A component:

\[
(R_s', G_s', B_s', A_s) = \begin{cases} 
(0, 0, 0) & A_s = 0 \\
\left(\frac{R_s}{A_s'}, \frac{G_s}{A_s'}, \frac{B_s}{A_s}\right) & \text{otherwise}
\end{cases}
\]

If srcPremultiplied is VK_FALSE, the fragment color components are used as the base color:

\[
(R_s', G_s', B_s', A_s) = (R_s, G_s, B_s)
\]

The R, G, and B components of the destination color used for blending are derived according to dstPremultiplied. If dstPremultiplied is set to VK_TRUE, the destination components are considered to have been premultiplied by the A component prior to blending. The base destination color \((R_d', G_d', B_d')\) is obtained by dividing through by the A component:
If `dstPremultiplied` is `VK_FALSE`, the destination color components are used as the base color:

\[
(R_g', G_g', B_g') = \begin{cases} 
(0, 0, 0) & A_d = 0 \\
\left( \frac{R_d}{A_d}, \frac{G_d}{A_d}, \frac{B_d}{A_d} \right) & \text{otherwise}
\end{cases}
\]

When blending using advanced blend operations, we expect that the R, G, and B components of premultiplied source and destination color inputs be stored as the product of non-premultiplied R, G, and B component values and the A component of the color. If any R, G, or B component of a premultiplied input color is non-zero and the A component is zero, the color is considered ill-formed, and the corresponding component of the blend result is undefined.

All of the advanced blend operation formulas in this chapter compute the result as a premultiplied color. If `dstPremultiplied` is `VK_FALSE`, that result color’s R, G, and B components are divided by the A component before being written to the framebuffer. If any R, G, or B component of the color is non-zero and the A component is zero, the result is considered ill-formed, and the corresponding component of the blend result is undefined. If all components are zero, that value is unchanged.

If the A component of any input or result color is less than zero, the color is considered ill-formed, and all components of the blend result are undefined.

The weighting functions \( p_0 \), \( p_1 \), and \( p_2 \) are defined in table `Advanced Blend Overlap Modes`. In these functions, the A components of the source and destination colors are taken to indicate the portion of the pixel covered by the fragment (source) and the fragments previously accumulated in the pixel (destination). The functions \( p_0 \), \( p_1 \), and \( p_2 \) approximate the relative portion of the pixel covered by the intersection of the source and destination, covered only by the source, and covered only by the destination, respectively.

Possible values of `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap`, specifying the blend overlap functions, are:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef enum VkBlendOverlapEXT {
    VK_BLEND_OVERLAP_UNCORRELATED_EXT = 0,
    VK_BLEND_OVERLAP_DISJOINT_EXT = 1,
    VK_BLEND_OVERLAP_CONJOINT_EXT = 2,
} VkBlendOverlapEXT;
```

- `VK_BLEND_OVERLAP_UNCORRELATED_EXT` specifies that there is no correlation between the source and destination coverage.
- `VK_BLEND_OVERLAP_CONJOINT_EXT` specifies that the source and destination coverage are considered to have maximal overlap.
- `VK_BLEND_OVERLAP_DISJOINT_EXT` specifies that the source and destination coverage are considered to have minimal overlap.

There is no table included here.

</tbody>
</table>
When using one of the HSL blend operations in table Hue-Saturation-Luminosity Advanced Blend Operations as the blend operation, the RGB color components produced by the function \( f \) are effectively obtained by converting both the non-premultiplied source and destination colors to the HSL (hue, saturation, luminosity) color space, generating a new HSL color by selecting H, S, and L components from the source or destination according to the blend operation, and then converting the result back to RGB. In the equations below, a blended RGB color is produced according to the following pseudocode:

```c
float minv3(vec3 c) {
    return min(min(c.r, c.g), c.b);
}
float maxv3(vec3 c) {
    return max(max(c.r, c.g), c.b);
}
float lumv3(vec3 c) {
    return c.a * c.a;
}
```
return dot(c, vec3(0.30, 0.59, 0.11));
}
float satv3(vec3 c) {
    return maxv3(c) - minv3(c);
}

// If any color components are outside [0,1], adjust the color to
// get the components in range.
vec3 ClipColor(vec3 color) {
    float lum = lumv3(color);
    float mincol = minv3(color);
    float maxcol = maxv3(color);
    if (mincol < 0.0) {
        color = lum + ((color-lum)*lum) / (lum-mincol);
    }
    if (maxcol > 1.0) {
        color = lum + ((color-lum)*(1-lum)) / (maxcol-lum);
    }
    return color;
}

// Take the base RGB color <cbase> and override its luminosity
// with that of the RGB color <clum>.
vec3 SetLum(vec3 cbase, vec3 clum) {

When using one of the operations in table Additional RGB Blend Operations as the blend operation, the source and destination colors used by these blending operations are interpreted according to `srcPremultiplied` and `dstPremultiplied`. The blending operations below are evaluated where the RGB source and destination color components are both considered to have been premultiplied by the corresponding A component.

\[
(R_s', G_s', B_s') = \begin{cases} 
(R_s, G_s, B_s) & \text{if srcPremultiplied is VK_TRUE} \\
(R_sA_s, G_sA_s, B_sA_s) & \text{if srcPremultiplied is VK_FALSE}
\end{cases}
\]

\[
(R_d', G_d', B_d') = \begin{cases} 
(R_d, G_d, B_d) & \text{if dstPremultiplied is VK_TRUE} \\
(R_dA_d, G_dA_d, B_dA_d) & \text{if dstPremultiplied is VK_FALSE}
\end{cases}
\]

</tbody>
</table>
29.2. Logical Operations

The application can enable a logical operation between the fragment’s color values and the existing value in the framebuffer attachment. This logical operation is applied prior to updating the framebuffer attachment. Logical operations are applied only for signed and unsigned integer and normalized integer framebuffers. Logical operations are not applied to floating-point or sRGB format color attachments.

Logical operations are controlled by the `logicOpEnable` and `logicOp` members of `VkPipelineColorBlendStateCreateInfo`. It can also be controlled by `vkCmdSetLogicOpEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo` ::pDynamicStates. If `logicOpEnable` is `VK_TRUE`, then a logical operation selected by `logicOp` is applied between each color attachment and the fragment’s corresponding output value, and blending of all attachments is treated as if it were disabled. Any attachments using color formats for which logical operations are not supported simply pass through the color values unmodified. The logical operation is applied independently for each of the red, green, blue, and alpha components. The `logicOp` is selected from the following operations:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BLEND_OP_MINUS_EXT</td>
<td>((R, G, B, A) = (R_d’, \frac{R_d ’ - R_s ’}{A_d}, G_d’, \frac{G_d ’ - G_s ’}{A_d}, B_d’, \frac{B_d ’ - B_s ’}{A_d}, A_d - A_s))</td>
</tr>
<tr>
<td>VK_BLEND_OP_MINUS_CLAMPED_EXT</td>
<td>((R, G, B, A) = (\max(0, R_d’ - R_s’), \max(0, G_d’ - G_s’), \max(0, B_d’ - B_s’), \max(0, A_d - A_s)))</td>
</tr>
<tr>
<td>VK_BLEND_OP_CONTRAST_EXT</td>
<td>((R, G, B, A) = (\frac{A_d}{2} + 2(R_d’ - \frac{A_d}{2})(R_s’ - \frac{A_s}{2}), \frac{A_d}{2} + 2(G_d’ - \frac{A_d}{2})(G_s’ - \frac{A_s}{2}), \frac{A_d}{2} + 2(B_d’ - \frac{A_d}{2})(B_s’ - \frac{A_s}{2}), \frac{A_d}{2}))</td>
</tr>
<tr>

<td>((R, G, B, A) = (R_d’, G_s’, B_d’, A_d))</td>
</tr>
</tbody>
</table>
/** Provided by VK_VERSION_1.0 **/ typedef enum VkLogicOp {   VK_LOGIC_OP_CLEAR = 0,   VK_LOGIC_OP_AND = 1,   VK_LOGIC_OP_AND_REVERSE = 2,   VK_LOGIC_OP_COPY = 3,   VK_LOGIC_OP_AND_INVERTED = 4,   VK_LOGIC_OP_NO_OP = 5,   VK_LOGIC_OP_XOR = 6,   VK_LOGIC_OP_OR = 7,   VK_LOGIC_OP_NOR = 8,   VK_LOGIC_OP_EQUIVALENT = 9,   VK_LOGIC_OP_INVERT = 10,   VK_LOGIC_OP_OR_REVERSE = 11,   VK_LOGIC_OP_COPY_INVERTED = 12,   VK_LOGIC_OP_OR_INVERTED = 13,   VK_LOGIC_OP_NAND = 14,   VK_LOGIC_OP_SET = 15, } VkLogicOp;
The logical operations supported by Vulkan are summarized in the following table in which

- \( \neg \) is bitwise invert,
- \( \land \) is bitwise and,
- \( \lor \) is bitwise or,
- \( \oplus \) is bitwise exclusive or,
- \( s \) is the fragment's \( R_{o0}, G_{o0}, B_{o0} \) or \( A_{o0} \) component value for the fragment output corresponding to the color attachment being updated, and
- \( d \) is the color attachment's \( R, G, B \) or \( A \) component value:

<table>

<td>VK_LOGIC_OP_SET</td>
<td>all 1s</td>
</tr>
</tbody>
</table>

The result of the logical operation is then written to the color attachment as controlled by the component write mask, described in Blend Operations.

To dynamically set the logical operation to apply for blend state:

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetLogicOpEXT(
    VkCommandBuffer commandBuffer,
    VkLogicOp logicOp);
```
• **commandBuffer** is the command buffer into which the command will be recorded.
• **logicOp** specifies the logical operation to apply for blend state.

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

### Valid Usage

- VUID-vkCmdSetLogicOpEXT-None-04867
  The `extendedDynamicState2LogicOp` feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetLogicOpEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLogicOpEXT-logicOp-parameter
  `logicOp` must be a valid `VkLogicOp` value
- VUID-vkCmdSetLogicOpEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetLogicOpEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tr>
</tbody>
</table>

### 29.3. Color Write Mask

Bits which can be set in `VkPipelineColorBlendAttachmentState::colorWriteMask` to determine whether the final color values R, G, B and A are written to the framebuffer attachment are:
// Provided by VK_VERSION_1_0
typedef enum VkColorComponentFlagBits {
    VK_COLOR_COMPONENT_R_BIT = 0x00000001,
    VK_COLOR_COMPONENT_G_BIT = 0x00000002,
    VK_COLOR_COMPONENT_B_BIT = 0x00000004,
    VK_COLOR_COMPONENT_A_BIT = 0x00000008,
} VkColorComponentFlagBits;

• **VK_COLOR_COMPONENT_R_BIT** specifies that the R value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
• **VK_COLOR_COMPONENT_G_BIT** specifies that the G value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
• **VK_COLOR_COMPONENT_B_BIT** specifies that the B value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
• **VK_COLOR_COMPONENT_A_BIT** specifies that the A value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.

The color write mask operation is applied regardless of whether blending is enabled.

The color write mask operation is applied only if **Color Write Enable** is enabled for the respective attachment. Otherwise the color write mask is ignored and writes to all components of the attachment are disabled.

// Provided by VK_VERSION_1_0
typedef VkFlags VkColorComponentFlags;

VkColorComponentFlags is a bitmask type for setting a mask of zero or more VkColorComponentFlagBits.

### 29.4. Color Write Enable

The **VkPipelineColorWriteCreateInfoEXT** structure is defined as:

// Provided by VK_EXT_color_write_enable
typedef struct VkPipelineColorWriteCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentCount;
    const VkBool32* pColorWriteEnables;
} VkPipelineColorWriteCreateInfoEXT;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **attachmentCount** is the number of VkBool32 elements in **pColorWriteEnables**.
• **pColorWriteEnables** is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

When this structure is included in the **pNext** chain of **VkPipelineColorBlendStateCreateInfo**, it defines per-attachment color write state. If this structure is not included in the **pNext** chain, it is equivalent to specifying this structure with **attachmentCount** equal to the **attachmentCount** member of **VkPipelineColorBlendStateCreateInfo**, and **pColorWriteEnables** pointing to an array of as many **VK_TRUE** values.

If the **colorWriteEnable** feature is not enabled on the device, all **VkBool32** elements in the **pColorWriteEnables** array must be **VK_TRUE**.

Color Write Enable interacts with the **Color Write Mask** as follows:

• If **colorWriteEnable** is **VK_TRUE**, writes to the attachment are determined by the **colorWriteMask**.

• If **colorWriteEnable** is **VK_FALSE**, the **colorWriteMask** is ignored and writes to all components of the attachment are disabled. This is equivalent to specifying a **colorWriteMask** of 0.

---

### Valid Usage

- VUID-VkPipelineColorWriteCreateInfoEXT-pAttachments-04801
  
  If the **colorWriteEnable** feature is not enabled, all elements of **pColorWriteEnables** must be **VK_TRUE**

- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-04802
  
  **attachmentCount** must be equal to the **attachmentCount** member of the **VkPipelineColorBlendStateCreateInfo** structure specified during pipeline creation

---

### Valid Usage (Implicit)

- VUID-VkPipelineColorWriteCreateInfoEXT-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_COLOR_WRITE_CREATE_INFO_EXT**

- VUID-VkPipelineColorWriteCreateInfoEXT-pColorWriteEnables-parameter
  
  If **attachmentCount** is not 0, **pColorWriteEnables** must be a valid pointer to an array of **attachmentCount** **VkBool32** values

To dynamically enable or disable color writes, call:

```c
// Provided by VK_EXT_color_write_enable

void vkCmdSetColorWriteEnableEXT(
    VkCommandBuffer commandBuffer,
    uint32_t attachmentCount,
    const VkBool32* pColorWriteEnables);
```

• **commandBuffer** is the command buffer into which the command will be recorded.
• attachmentCount is the number of VkBool32 elements in pColorWriteEnables.

• pColorWriteEnables is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

This command sets the state for a given draw when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates.

Valid Usage

• VUID-vkCmdSetColorWriteEnableEXT-None-04803
  The colorWriteEnable feature must be enabled

• VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-04804
  attachmentCount must be equal to the attachmentCount member of the VkPipelineColorBlendStateCreateInfo structure specified during pipeline creation

Valid Usage (Implicit)

• VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetColorWriteEnableEXT-pColorWriteEnables-parameter
  pColorWriteEnables must be a valid pointer to an array of attachmentCount VkBool32 values

• VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-arraylength
  attachmentCount must be greater than 0

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Chapter 30. Dispatching Commands

Dispatching commands (commands with Dispatch in the name) provoke work in a compute pipeline. Dispatching commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound compute pipeline. A compute pipeline must be bound to a command buffer before any dispatching commands are recorded in that command buffer.

To record a dispatch, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatch(
    VkCommandBuffer commandBuffer,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

- commandBuffer is the command buffer into which the command will be recorded.
- groupCountX is the number of local workgroups to dispatch in the X dimension.
- groupCountY is the number of local workgroups to dispatch in the Y dimension.
- groupCountZ is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of groupCountX \times groupCountY \times groupCountZ local workgroups is assembled.
Valid Usage

- **VUID-vkCmdDispatch-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDispatch-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDispatch-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDispatch-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdDispatch-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDispatch-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDispatch-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdDispatch-None-02697**
  For each set \( n \) that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to \( n \) at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set \( n \), with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDispatch-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.
Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

A valid pipeline **must** be bound to the pipeline bind point used by this command.

If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

- VUID-vkCmdDispatch-OpImageWrite-04469

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

- VUID-vkCmdDispatch-SampledType-04470

If a `VkImageView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDispatch-SampledType-04471

If a `VkImageView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDispatch-SampledType-04472

If a `VkBufferView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDispatch-SampledType-04473

If a `VkBufferView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDispatch-sparseImageInt64Atomics-04474

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDispatch-sparseImageInt64Atomics-04475

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDispatch-groupCountX-00386
  groupCountX must be less than or equal to `VkPhysicalDeviceLimits`::maxComputeWorkGroupCount[0]

- VUID-vkCmdDispatch-groupCountY-00387
  groupCountY must be less than or equal to `VkPhysicalDeviceLimits`::maxComputeWorkGroupCount[1]

- VUID-vkCmdDispatch-groupCountZ-00388
  groupCountZ must be less than or equal to `VkPhysicalDeviceLimits`::maxComputeWorkGroupCount[2]
Valid Usage (Implicit)

- VUID-vkCmdDispatch-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDispatch-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDispatch-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdDispatch-renderpass
  This command must only be called outside of a render pass instance

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>

To record an indirect dispatching command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatchIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset);
```

- commandBuffer is the command buffer into which the command will be recorded.
- buffer is the buffer containing dispatch parameters.
- offset is the byte offset into buffer where parameters begin.

vkCmdDispatchIndirect behaves similarly to vkCmdDispatch except that the parameters are read by the device from a buffer during execution. The parameters of the dispatch are encoded in a VkDispatchIndirectCommand structure taken from buffer starting at offset.
Valid Usage

- **VUID-vkCmdDispatchIndirect-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDispatchIndirect-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDispatchIndirect-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDispatchIndirect-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdDispatchIndirect-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDispatchIndirect-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDispatchIndirect-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdDispatchIndirect-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDispatchIndirect-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.
Compatibility

- **VUID-vkCmdDispatchIndirect-None-02699**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- **VUID-vkCmdDispatchIndirect-None-02700**
  A valid pipeline must be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDispatchIndirect-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- **VUID-vkCmdDispatchIndirect-None-02859**
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDispatchIndirect-None-02702**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDispatchIndirect-None-02703**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDispatchIndirect-None-02704**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDispatchIndirect-None-02705**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchIndirect-None-02706**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchIndirect-None-04115**
If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view’s format

- VUID-vkCmdDispatchIndirect-OpImageWrite-04469
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view’s format

- VUID-vkCmdDispatchIndirect-SampledType-04470
  If a `VkImageView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64

- VUID-vkCmdDispatchIndirect-SampledType-04471
  If a `VkImageView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32

- VUID-vkCmdDispatchIndirect-SampledType-04472
  If a `VkBufferView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64

- VUID-vkCmdDispatchIndirect-SampledType-04473
  If a `VkBufferView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32

- VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04474
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04475
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDispatchIndirect-buffer-02708
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdDispatchIndirect-buffer-02709
  `buffer` must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- VUID-vkCmdDispatchIndirect-offset-02710
  `offset` must be a multiple of 4

- VUID-vkCmdDispatchIndirect-offset-00407
  The sum of `offset` and the size of `VkDispatchIndirectCommand` must be less than or equal to the size of `buffer`
Valid Usage (Implicit)

- VUID-vkCmdDispatchIndirect-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDispatchIndirect-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-vkCmdDispatchIndirect-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDispatchIndirect-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdDispatchIndirect-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdDispatchIndirect-commonparent
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Compute</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkDispatchIndirectCommand structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDispatchIndirectCommand {
  uint32_t x;
  uint32_t y;
  uint32_t z;
} VkDispatchIndirectCommand;
```

- x is the number of local workgroups to dispatch in the X dimension.
- y is the number of local workgroups to dispatch in the Y dimension.
• \( z \) is the number of local workgroups to dispatch in the Z dimension.

The members of \( \text{VkDispatchIndirectCommand} \) have the same meaning as the corresponding parameters of \( \text{vkCmdDispatch} \).

### Valid Usage

- VUID-VkDispatchIndirectCommand-x-00417  
  \( x \) must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxComputeWorkGroupCount}[0] \)

- VUID-VkDispatchIndirectCommand-y-00418  
  \( y \) must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxComputeWorkGroupCount}[1] \)

- VUID-VkDispatchIndirectCommand-z-00419  
  \( z \) must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxComputeWorkGroupCount}[2] \)

To record a dispatch using non-zero base values for the components of WorkgroupId, call:

```c
// Provided by VK_KHR_device_group
void vkCmdDispatchBaseKHR(  
    VkCommandBuffer commandBuffer,  
    uint32_t baseGroupX,  
    uint32_t baseGroupY,  
    uint32_t baseGroupZ,  
    uint32_t groupCountX,  
    uint32_t groupCountY,  
    uint32_t groupCountZ);
```

- \( \text{commandBuffer} \) is the command buffer into which the command will be recorded.
- \( \text{baseGroupX} \) is the start value for the X component of WorkgroupId.
- \( \text{baseGroupY} \) is the start value for the Y component of WorkgroupId.
- \( \text{baseGroupZ} \) is the start value for the Z component of WorkgroupId.
- \( \text{groupCountX} \) is the number of local workgroups to dispatch in the X dimension.
- \( \text{groupCountY} \) is the number of local workgroups to dispatch in the Y dimension.
- \( \text{groupCountZ} \) is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of \( \text{groupCountX} \times \text{groupCountY} \times \text{groupCountZ} \) local workgroups is assembled, with WorkgroupId values ranging from \( \left[ \text{baseGroup}^{*}, \text{baseGroup}^{*} + \text{groupCount}^{*} \right) \) in each component. \( \text{vkCmdDispatch} \) is equivalent to \( \text{vkCmdDispatchBase}(0,0,0,\text{groupCountX}, \text{groupCountY}, \text{groupCountZ}) \).
Valid Usage

- **VUID-vkCmdDispatchBase-magFilter-04553**

  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatchBase-mipmapMode-04770**

  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatchBase-None-02691**

  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDispatchBase-None-02692**

  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdDispatchBase-filterCubic-02694**

  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDispatchBase-filterCubicMinmax-02695**

  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDispatchBase-flags-02696**

  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdDispatchBase-None-02697**

  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchBase-None-02698**

  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility
Compatibility

• VUID-vkCmdDispatchBase-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be
  valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by
  this command.

• VUID-vkCmdDispatchBase-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command.

• VUID-vkCmdDispatchBase-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires
  any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor`
  extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the
  corresponding state not specified as dynamic.

• VUID-vkCmdDispatchBase-None-02859
  There must not have been any calls to dynamic state setting commands for any state not
  specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this
  command, since that pipeline was bound.

• VUID-vkCmdDispatchBase-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a
  `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to
  sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`,
  `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or
  `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

• VUID-vkCmdDispatchBase-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a
  `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with
  any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`,
  `Dref` or `Proj` in their name, in any shader stage.

• VUID-vkCmdDispatchBase-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a
  `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with
  any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD
  bias or any offset values, in any shader stage.

• VUID-vkCmdDispatchBase-None-02705
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the
  pipeline bind point used by this command accesses a uniform buffer, it must not access
  values outside of the range of the buffer as specified in the descriptor set bound to the
  same pipeline bind point.

• VUID-vkCmdDispatchBase-None-02706
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the
  pipeline bind point used by this command accesses a storage buffer, it must not access
  values outside of the range of the buffer as specified in the descriptor set bound to the
  same pipeline bind point.

• VUID-vkCmdDispatchBase-None-04115
If a *VkImageView* is accessed using *OpImageWrite* as a result of this command, then the *Type* of the *Texel* operand of that instruction **must** have at least as many components as the image view’s format

- VUID-vkCmdDispatchBase-OpImageWrite-04469
  If a *VkBufferView* is accessed using *OpImageWrite* as a result of this command, then the *Type* of the *Texel* operand of that instruction **must** have at least as many components as the buffer view’s format

- VUID-vkCmdDispatchBase-SampledType-04470
  If a *VkImageView* with a *VkFormat* that has a 64-bit channel width is accessed as a result of this command, the *SampledType* of the *OpTypeImage* operand of that instruction **must** have a *Width* of 64

- VUID-vkCmdDispatchBase-SampledType-04471
  If a *VkImageView* with a *VkFormat* that has a channel width less than 64-bit is accessed as a result of this command, the *SampledType* of the *OpTypeImage* operand of that instruction **must** have a *Width* of 32

- VUID-vkCmdDispatchBase-SampledType-04472
  If a *VkBufferView* with a *VkFormat* that has a 64-bit channel width is accessed as a result of this command, the *SampledType* of the *OpTypeImage* operand of that instruction **must** have a *Width* of 64

- VUID-vkCmdDispatchBase-SampledType-04473
  If a *VkBufferView* with a *VkFormat* that has a channel width less than 64-bit is accessed as a result of this command, the *SampledType* of the *OpTypeImage* operand of that instruction **must** have a *Width* of 32

- VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04474
  If the *sparseImageInt64Atomics* feature is not enabled, *VkImage* objects created with the *VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT* flag **must** not be accessed by atomic instructions through an *OpTypeImage* with a *SampledType* with a *Width* of 64 by this command

- VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04475
  If the *sparseImageInt64Atomics* feature is not enabled, *VkBuffer* objects created with the *VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT* flag **must** not be accessed by atomic instructions through an *OpTypeImage* with a *SampledType* with a *Width* of 64 by this command

- VUID-vkCmdDispatchBase-baseGroupX-00421
  *baseGroupX** must be less than *VkPhysicalDeviceLimits::*maxComputeWorkGroupCount[0]*

- VUID-vkCmdDispatchBase-baseGroupX-00422
  *baseGroupY** must be less than *VkPhysicalDeviceLimits::*maxComputeWorkGroupCount[1]*

- VUID-vkCmdDispatchBase-baseGroupZ-00423
  *baseGroupZ** must be less than *VkPhysicalDeviceLimits::*maxComputeWorkGroupCount[2]*

- VUID-vkCmdDispatchBase-groupCountX-00424
  *groupCountX** must be less than or equal to *VkPhysicalDeviceLimits::*maxComputeWorkGroupCount[0] minus *baseGroupX*

- VUID-vkCmdDispatchBase-groupCountY-00425
  *groupCountY** must be less than or equal to *VkPhysicalDeviceLimits::*maxComputeWorkGroupCount[1] minus *baseGroupY*
**VUID-vkCmdDispatchBase-groupCountZ-00426**

`groupCountZ` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] minus baseGroupZ`

**VUID-vkCmdDispatchBase-baseGroupX-00427**

If any of `baseGroupX`, `baseGroupY`, or `baseGroupZ` are not zero, then the bound compute pipeline must have been created with the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag

---

**Valid Usage (Implicit)**

**VUID-vkCmdDispatchBase-commandBuffer-parameter**

`commandBuffer` must be a valid `VkCommandBuffer` handle

**VUID-vkCmdDispatchBase-commandBuffer-recording**

`commandBuffer` must be in the recording state

**VUID-vkCmdDispatchBase-commandBuffer-cmdpool**

The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

**VUID-vkCmdDispatchBase-renderpass**

This command must only be called outside of a render pass instance

---

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

---

**Command Properties**

<table>

A subpass shading dispatches a compute pipeline work with the work dimension of render area of the calling subpass and work groups are partitioned by specified work group size. Subpass operations like subpassLoad and subpassLoadMS are allowed to be used.

To record a subpass shading, call:

```cpp
// Provided by VK_HUAWEI_subpass_shading
void vkCmdSubpassShadingHUAWEI(
    VkCommandBuffer commandBuffer);
```
• `commandBuffer` is the command buffer into which the command will be recorded.

When the command is executed, a global workgroup consisting of \( \text{ceil} \left( \frac{\text{render area size}}{\text{local workgroup size}} \right) \) local workgroups is assembled.
Valid Usage

- **VUID-vkCmdSubpassShadingHUAWEI-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdSubpassShadingHUAWEI-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdSubpassShadingHUAWEI-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdSubpassShadingHUAWEI-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdSubpassShadingHUAWEI-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdSubpassShadingHUAWEI-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdSubpassShadingHUAWEI-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE.CornerSampled_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdSubpassShadingHUAWEI-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in `Pipeline Layout Compatibility`

- **VUID-vkCmdSubpassShadingHUAWEI-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in `Pipeline Layout`
Compatibility

- VUID-vkCmdSubpassShadingHUAWEI-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- VUID-vkCmdSubpassShadingHUAWEI-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdSubpassShadingHUAWEI-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdSubpassShadingHUAWEI-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- VUID-vkCmdSubpassShadingHUAWEI-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- VUID-vkCmdSubpassShadingHUAWEI-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdSubpassShadingHUAWEI-None-02705
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdSubpassShadingHUAWEI-None-02706
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view’s format

- VUID-vkCmdSubpassShadingHUAWEI-OpImageWrite-04469

  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view’s format

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04470

  If a `VkImageView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04471

  If a `VkBufferView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04472

  If a `VkImageView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04473

  If a `VkBufferView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdSubpassShadingHUAWEI-sparseImageInt64Atomics-04474

  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdSubpassShadingHUAWEI-sparseImageInt64Atomics-04475

  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdSubpassShadingHUAWEI-None-04931

  This command must be called in a subpass with bind point `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI`. No draw commands can be called in the same subpass. Only one `vkCmdSubpassShadingHUAWEI` command can be called in a subpass.
Valid Usage (Implicit)

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSubpassShadingHUAWEI-renderpass
  
  This command must only be called inside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Chapter 31. Device-Generated Commands

This chapter discusses the generation of command buffer content on the device, for which these principle steps are to be taken:

- Define via `VkIndirectCommandsLayoutNV` the sequence of commands which should be generated.
- Optionally make use of device-bindable Shader Groups.
- Retrieve device addresses by `vkGetBufferDeviceAddressEXT` for setting buffers on the device.
- Fill one or more `VkBuffer` with the appropriate content that gets interpreted by `VkIndirectCommandsLayoutNV`.
- Create a preprocess `VkBuffer` using the allocation information from `vkGetGeneratedCommandsMemoryRequirementsNV`.
- Optionally preprocess the input data using `vkCmdPreprocessGeneratedCommandsNV` in a separate action.
- Generate and execute the actual commands via `vkCmdExecuteGeneratedCommandsNV` passing all required data.

`vkCmdPreprocessGeneratedCommandsNV` executes in a separate logical pipeline from either graphics or compute. When preprocessing commands in a separate step they must be explicitly synchronized against the command execution. When not preprocessing, the preprocessing is automatically synchronized against the command execution.

31.1. Indirect Commands Layout

The device-side command generation happens through an iterative processing of an atomic sequence comprised of command tokens, which are represented by:

```c
// Provided by VK_NV_device_generated_commands
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkIndirectCommandsLayoutNV)
```

31.1.1. Creation and Deletion

Indirect command layouts are created by:

```c
// Provided by VK_NV_device_generated_commands
VkResult vkCreateIndirectCommandsLayoutNV(  
    VkDevice device,  
    const VkIndirectCommandsLayoutCreateInfoNV* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkIndirectCommandsLayoutNV* pIndirectCommandsLayout)
```

- `device` is the logical device that creates the indirect command layout.
- `pCreateInfo` is a pointer to an instance of the `VkIndirectCommandsLayoutCreateInfoNV` structure.
containing parameters affecting creation of the indirect command layout.

- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pIndirectCommandsLayout** is a pointer to a `VkIndirectCommandsLayoutNV` handle in which the resulting indirect command layout is returned.

### Valid Usage

- `VUID-vkCreateIndirectCommandsLayoutNV-deviceGeneratedCommands-02929` The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled

### Valid Usage (Implicit)

- `VUID-vkCreateIndirectCommandsLayoutNV-device-parameter` 
  **device** must be a valid `VkDevice` handle

- `VUID-vkCreateIndirectCommandsLayoutNV-pCreateInfo-parameter` 
  **pCreateInfo** must be a valid pointer to a valid `VkIndirectCommandsLayoutCreateInfoNV` structure

- `VUID-vkCreateIndirectCommandsLayoutNV-pAllocator-parameter` 
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure

- `VUID-vkCreateIndirectCommandsLayoutNV-pIndirectCommandsLayout-parameter` 
  **pIndirectCommandsLayout** must be a valid pointer to a `VkIndirectCommandsLayoutNV` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkIndirectCommandsLayoutCreateInfoNV` structure is defined as:
typedef struct VkIndirectCommandsLayoutCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkIndirectCommandsLayoutUsageFlagsNV flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t tokenCount;
    const VkIndirectCommandsLayoutTokenNV* pTokens;
    uint32_t streamCount;
    const uint32_t* pStreamStrides;
} VkIndirectCommandsLayoutCreateInfoNV;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pipelineBindPoint** is the VkPipelineBindPoint that this layout targets.
- **flags** is a bitmask of VkIndirectCommandsLayoutUsageFlagBitsNV specifying usage hints of this layout.
- **tokenCount** is the length of the individual command sequence.
- **pTokens** is an array describing each command token in detail. See VkIndirectCommandsTokenTypeNV and VkIndirectCommandsLayoutTokenNV below for details.
- **streamCount** is the number of streams used to provide the token inputs.
- **pStreamStrides** is an array defining the byte stride for each input stream.

The following code illustrates some of the flags:
void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsTokens, sequencesCount, indexbuffer, indexbufferOffset)
{
    for (s = 0; s < sequencesCount; s++)
    {
        sUsed = s;

        if (indirectCommandsLayout.flags & VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV) {
            sUsed = indexbuffer.load_uint32( sUsed * sizeof(uint32_t) + indexbufferOffset);  
        }

        if (indirectCommandsLayout.flags & VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV) {
            sUsed = incoherent_implementation_dependent_permutation[ sUsed ];
        }

        cmdProcessSequence( cmd, pipeline, indirectCommandsLayout, pIndirectCommandsTokens, sUsed );
    }
}
Valid Usage

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-02930**
  The `pipelineBindPoint` must be `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-tokenCount-02931**
  `tokenCount` must be greater than 0 and less than or equal to
  `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenCount`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02932**
  If `pTokens` contains an entry of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV` it must
  be the first element of the array and there must be only a single element of such token type.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02933**
  If `pTokens` contains an entry of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV` there
  must be only a single element of such token type.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02934**
  All state tokens in `pTokens` must occur prior work provoking tokens
  (`VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV`,
  `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV`,
  `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV`).

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02935**
  The content of `pTokens` must include one single work provoking token that is compatible
  with the `pipelineBindPoint`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-streamCount-02936**
  `streamCount` must be greater than 0 and less or equal to
  `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStreamCount`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pStreamStrides-02937**
  Each element of `pStreamStrides` must be greater than 0 and less than or equal to
  `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStreamStride`.
  Furthermore the alignment of each token input must be ensured.
Valid Usage (Implicit)

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_CREATE_INFO_NV`

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pNext-pNext**
  
  *pNext* must be `NULL`

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-flags-parameter**
  
  *flags* must be a valid combination of `VkIndirectCommandsLayoutUsageFlagBitsNV` values

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-parameter**
  
  *pipelineBindPoint* must be a valid `VkPipelineBindPoint` value

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-parameter**
  
  *pTokens* must be a valid pointer to an array of `tokenCount` valid `VkIndirectCommandsLayoutTokenNV` structures

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pStreamStrides-parameter**
  
  *pStreamStrides* must be a valid pointer to an array of `streamCount` `uint32_t` values

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-tokenCount-arraylength**
  
  *tokenCount* must be greater than 0

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-streamCount-arraylength**
  
  *streamCount* must be greater than 0

Bits which can be set in `VkIndirectCommandsLayoutCreateInfoNV::flags`, specifying usage hints of an indirect command layout, are:

```cpp
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectCommandsLayoutUsageFlagBitsNV {
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV = 0x00000001,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV = 0x00000002,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV = 0x00000004,
} VkIndirectCommandsLayoutUsageFlagBitsNV;
```

- **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV** specifies that the layout is always used with the manual preprocessing step through calling `vkCmdPreprocessGeneratedCommandsNV` and executed by `vkCmdExecuteGeneratedCommandsNV` with `isPreprocessed` set to `VK_TRUE`.

- **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV** specifies that the input data for the sequences is not implicitly indexed from 0..sequencesUsed but a user provided `VkBuffer` encoding the index is provided.

- **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV** specifies that the processing of sequences can happen at an implementation-dependent order, which is not: guaranteed to be coherent using the same input data.
VkIndirectCommandsLayoutUsageFlagsNV is a bitmask type for setting a mask of zero or more VkIndirectCommandsLayoutUsageFlagBitsNV.

Indirect command layouts are destroyed by:

```c
void vkDestroyIndirectCommandsLayoutNV(
    VkDevice device,
    VkIndirectCommandsLayoutNV indirectCommandsLayout,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the layout.
- `indirectCommandsLayout` is the layout to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02938
  All submitted commands that refer to `indirectCommandsLayout` must have completed execution

- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02939
  If `VkAllocationCallbacks` were provided when `indirectCommandsLayout` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02940
  If no `VkAllocationCallbacks` were provided when `indirectCommandsLayout` was created, `pAllocator` must be `NULL`

- VUID-vkDestroyIndirectCommandsLayoutNV-deviceGeneratedCommands-02941
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled
Valid Usage (Implicit)

- **VUID-vkDestroyIndirectCommandsLayoutNV-device-parameter**
  
  *device* must be a valid *VkDevice* handle

- **VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-parameter**
  
  If *indirectCommandsLayout* is not *VK_NULL_HANDLE*, *indirectCommandsLayout* must be a valid *VkIndirectCommandsLayoutNV* handle

- **VUID-vkDestroyIndirectCommandsLayoutNV-pAllocator-parameter**
  
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure

- **VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-parent**
  
  If *indirectCommandsLayout* is a valid handle, it must have been created, allocated, or retrieved from *device*

Host Synchronization

- Host access to *indirectCommandsLayout* must be externally synchronized

31.1.2. Token Input Streams

The *VkIndirectCommandsStreamNV* structure specifies the input data for one or more tokens at processing time.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsStreamNV {
    VkBuffer buffer;
    VkDeviceSize offset;
} VkIndirectCommandsStreamNV;
```

- *buffer* specifies the *VkBuffer* storing the functional arguments for each sequence. These arguments can be written by the device.
- *offset* specified an offset into *buffer* where the arguments start.
Valid Usage

• VUID-VkIndirectCommandsStreamNV-buffer-02942
  The buffer’s usage flag must have the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-VkIndirectCommandsStreamNV-offset-02943
  The offset must be aligned to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment

• VUID-VkIndirectCommandsStreamNV-buffer-02975
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

Valid Usage (Implicit)

• VUID-VkIndirectCommandsStreamNV-buffer-parameter
  buffer must be a valid VkBuffer handle

The input streams can contain raw uint32_t values, existing indirect commands such as:

• VkDrawIndirectCommand
• VkDrawIndexedIndirectCommand
• VkDrawMeshTasksIndirectCommandNV

or additional commands as listed below. How the data is used is described in the next section.

The VkBindShaderGroupIndirectCommandNV structure specifies the input data for the VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindShaderGroupIndirectCommandNV {
    uint32_t groupIndex;
} VkBindShaderGroupIndirectCommandNV;
```

• index specifies which shader group of the current bound graphics pipeline is used.

Valid Usage

• VUID-VkBindShaderGroupIndirectCommandNV-None-02944
  The current bound graphics pipeline, as well as the pipelines it may reference, must have been created with VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV

• VUID-VkBindShaderGroupIndirectCommandNV-index-02945
  The index must be within range of the accessible shader groups of the current bound graphics pipeline. See vkCmdBindPipelineShaderGroupNV for further details
The `VkBindIndexBufferIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV` token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindIndexBufferIndirectCommandNV {
    VkDeviceAddress bufferAddress;
    uint32_t size;
    VkIndexType indexType;
} VkBindIndexBufferIndirectCommandNV;
```

- `bufferAddress` specifies a physical address of the `VkBuffer` used as index buffer.
- `size` is the byte size range which is available for this operation from the provided address.
- `indexType` is a `VkIndexType` value specifying how indices are treated. Instead of the Vulkan enum values, a custom `uint32_t` value can be mapped to an `VkIndexType` by specifying the `VkIndirectCommandsLayoutTokenNV::pIndexTypes` and `VkIndirectCommandsLayoutTokenNV::pIndexTypeValues` arrays.

**Valid Usage**

- VUID-VkBindIndexBufferIndirectCommandNV-None-02946
  The buffer’s usage flag from which the address was acquired must have the `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` bit set
- VUID-VkBindIndexBufferIndirectCommandNV-bufferAddress-02947
  The `bufferAddress` must be aligned to the `indexType` used
- VUID-VkBindIndexBufferIndirectCommandNV-None-02948
  Each element of the buffer from which the address was acquired and that is non-sparse must be bound completely and contiguously to a single `VkDeviceMemory` object

**Valid Usage (Implicit)**

- VUID-VkBindIndexBufferIndirectCommandNV-indexType-parameter
  `indexType` must be a valid `VkIndexType` value

The `VkBindVertexBufferIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV` token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindVertexBufferIndirectCommandNV {
    VkDeviceAddress bufferAddress;
    uint32_t size;
    uint32_t stride;
} VkBindVertexBufferIndirectCommandNV;
```
• `bufferAddress` specifies a physical address of the `VkBuffer` used as vertex input binding.
• `size` is the byte size range which is available for this operation from the provided address.
• `stride` is the byte size stride for this vertex input binding as in `VkVertexInputBindingDescription::stride`. It is only used if `VkIndirectCommandsLayoutTokenNV::vertexDynamicStride` was set, otherwise the stride is inherited from the current bound graphics pipeline.

Valid Usage

- VUID-VkBindVertexBufferIndirectCommandNV-None-02949
  The buffer’s usage flag from which the address was acquired must have the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` bit set
- VUID-VkBindVertexBufferIndirectCommandNV-None-02950
  Each element of the buffer from which the address was acquired and that is non-sparse must be bound completely and contiguously to a single `VkDeviceMemory` object

The `VkSetStateFlagsIndirectCommandNV` structure specifies the input data for the `VK间接命令令牌类型状态标志NV` token. Which state is changed depends on the `VkIndirectStateFlagBitsNV` specified at `VkIndirectCommandsLayoutNV` creation time.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkSetStateFlagsIndirectCommandNV {
    uint32_t  data;
} VkSetStateFlagsIndirectCommandNV;
```

• `data` encodes packed state that this command alters.
  ◦ Bit 0: If set represents `VK_FRONT_FACE_CLOCKWISE`, otherwise `VK_FRONT_FACE_COUNTER_CLOCKWISE`

A subset of the graphics pipeline state can be altered using indirect state flags:

```c
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectStateFlagBitsNV {
    VK间接命令令牌类型状态标志NV = 0x00000001,
} VkIndirectStateFlagBitsNV;
```

• `VK间接命令令牌类型状态标志NV` allows to toggle the `VkFrontFace` rasterization state for subsequent draw operations.

```c
// Provided by VK_NV_device_generated_commands
typedef VkFlags VkIndirectStateFlagsNV;
```

`VkIndirectStateFlagsNV` is a bitmask type for setting a mask of zero or more `VkIndirectStateFlagBitsNV`.  

---

1662 | Chapter 31. Device-Generated Commands
31.1.3. Tokenized Command Processing

The processing is in principle illustrated below:

```c
void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s)
{
    for (t = 0; t < indirectCommandsLayout.tokenCount; t++)
    {
        uint32_t stream = indirectCommandsLayout.pTokens[t].stream;
        uint32_t offset = indirectCommandsLayout.pTokens[t].offset;
        uint32_t stride = indirectCommandsLayout.pStreamStrides[stream];
        stream = pIndirectCommandsStreams[stream];
        const void* input = stream.buffer.pointer( stream.offset + stride * s + offset );

        // further details later
        indirectCommandsLayout.pTokens[t].command(cmd, pipeline, input, s);
    }
}

void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, sequencesCount)
{
    for (s = 0; s < sequencesCount; s++)
    {
        cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s);
    }
}
```

The processing of each sequence is considered stateless, therefore all state changes must occur prior work provoking commands within the sequence. A single sequence is strictly targeting the VkPipelineBindPoint it was created with.

The primary input data for each token is provided through VkBuffer content at preprocessing using vkCmdPreprocessGeneratedCommandsNV or execution time using vkCmdExecuteGeneratedCommandsNV, however some functional arguments, for example binding sets, are specified at layout creation time. The input size is different for each token.

Possible values of those elements of the VkIndirectCommandsLayoutCreateInfoNV::pTokens array which specify command tokens (other elements of the array specify command parameters) are:
```c
// Provided by VK_NV_device_generated_commands

typedef enum VkIndirectCommandsTokenTypeNV {
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV = 0,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV = 1,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV = 2,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV = 3,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV = 4,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV = 5,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV = 6,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV = 7,
} VkIndirectCommandsTokenTypeNV;
```

**Table 44. Supported indirect command tokens**

The `VkIndirectCommandsLayoutTokenNV` structure specifies details to the function arguments that need to be known at layout creation time:
typedef struct VkIndirectCommandsLayoutTokenNV {
    VkStructureType sType;
    const void* pNext;
    VkIndirectCommandsTokenTypeNV tokenType;
    uint32_t stream;
    uint32_t offset;
    uint32_t vertexBindingUnit;
    VkBool32 vertexDynamicStride;
    VkPipelineLayout pushconstantPipelineLayout;
    VkShaderStageFlags pushconstantShaderStageFlags;
    uint32_t pushconstantOffset;
    uint32_t pushconstantSize;
    VkIndirectStateFlagsNV indirectStateFlags;
    uint32_t indexTypeCount;
    const VkIndexType* pIndexTypes;
    const uint32_t* pIndexTypeValues;
} VkIndirectCommandsLayoutTokenNV;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **tokenType** specifies the token command type.
- **stream** is the index of the input stream that contains the token argument data.
- **offset** is a relative starting offset within the input stream memory for the token argument data.
- **vertexBindingUnit** is used for the vertex buffer binding command.
- **vertexDynamicStride** sets if the vertex buffer stride is provided by the binding command rather than the current bound graphics pipeline state.
- **pushconstantPipelineLayout** is the VkPipelineLayout used for the push constant command.
- **pushconstantShaderStageFlags** are the shader stage flags used for the push constant command.
- **pushconstantOffset** is the offset used for the push constant command.
- **pushconstantSize** is the size used for the push constant command.
- **indirectStateFlags** are the active states for the state flag command.
- **indexTypeCount** is the optional size of the pIndexTypes and pIndexTypeValues array pairings. If not zero, it allows to register a custom uint32_t value to be treated as specific VkIndexType.
- **pIndexTypes** is the used VkIndexType for the corresponding uint32_t value entry in pIndexTypeValues.
Valid Usage

- **VUID-VkIndirectCommandsLayoutTokenNV-stream-02951**
  
  *stream must be smaller than* `VkIndirectCommandsLayoutCreateInfoNV::streamCount`

- **VUID-VkIndirectCommandsLayoutTokenNV-offset-02952**
  
  *offset must be less than or equal to* `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenOffset`

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02976**
  
  If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV`, `vertexBindingUnit` must stay within device supported limits for the appropriate commands

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02977**
  
  If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, `pushconstantPipelineLayout` must be valid

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02978**
  
  If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, `pushconstantOffset` must be a multiple of 4

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02979**
  
  If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, `pushconstantSize` must be a multiple of 4

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02980**
  
  If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, `pushconstantOffset` must be less than `VkPhysicalDeviceLimits::maxPushConstantsSize`

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02981**
  
  If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, `pushconstantSize` must be less than or equal to `VkPhysicalDeviceLimits::maxPushConstantsSize` minus `pushconstantOffset`

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02982**
  
  If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, for each byte in the range specified by `pushconstantOffset` and `pushconstantSize` and for each shader stage in `pushconstantShaderStageFlags`, there must be a push constant range in `pushconstantPipelineLayout` that includes that byte and that stage

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02983**
  
  If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, for each byte in the range specified by `pushconstantOffset` and `pushconstantSize` and for each push constant range that overlaps that byte, `pushconstantShaderStageFlags` must include all stages in that push constant range's `VkPushConstantRange::stageFlags`

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02984**
  
  If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV`, `indirectStateFlags` must not be 0
Valid Usage (Implicit)

- VUID-VkIndirectCommandsLayoutTokenNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_TOKEN_NV

- VUID-VkIndirectCommandsLayoutTokenNV-pNext-pNext
  pNext must be NULL

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-parameter
  tokenType must be a valid VkIndirectCommandsTokenTypeNV value

- VUID-VkIndirectCommandsLayoutTokenNV-pushconstantPipelineLayout-parameter
  If pushconstantPipelineLayout is not VK_NULL_HANDLE, pushconstantPipelineLayout must be a valid VkPipelineLayout handle

- VUID-VkIndirectCommandsLayoutTokenNV-pushconstantShaderStageFlags-parameter
  pushconstantShaderStageFlags must be a valid combination of VkShaderStageFlagBits values

- VUID-VkIndirectCommandsLayoutTokenNV-indirectStateFlags-parameter
  indirectStateFlags must be a valid combination of VkIndirectStateFlagBitsNV values

- VUID-VkIndirectCommandsLayoutTokenNV-pIndexTypes-parameter
  If indexTypeCount is not 0, pIndexTypes must be a valid pointer to an array of VkIndexType values

- VUID-VkIndirectCommandsLayoutTokenNV-pIndexTypeValues-parameter
  If indexTypeCount is not 0, pIndexTypeValues must be a valid pointer to an array of uint32_t values

The following code provides detailed information on how an individual sequence is processed. For valid usage, all restrictions from the regular commands apply.

```c
void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s)
{
    for (uint32_t t = 0; t < indirectCommandsLayout.tokenCount; t++){
        token = indirectCommandsLayout.pTokens[t];

        uint32_t stride = indirectCommandsLayout.pStreamStrides[token.stream];
        stream = pIndirectCommandsStreams[token.stream];
        uint32_t offset = stream.offset + stride * s + token.offset;
        const void* input = stream.buffer.pointer(offset);

        switch(input.type)
        {
            case VK INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV:
                VkBindShaderGroupIndirectCommandNV* bind = input;

                vkCmdBindPipelineShaderGroupNV(cmd, indirectCommandsLayout.pipelineBindPoint, pipeline, bind->groupIndex);
                break;
```
VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV:

VkSetStateFlagsIndirectCommandNV* state = input;

if (token.indirectStateFlags & VK_INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV){
    if (state.data & (1 << 0)){
        set VK_FRONT_FACE_CLOCKWISE;
    } else {
        set VK_FRONT_FACE_COUNTER_CLOCKWISE;
    }
}
break;

VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV:

uint32_t* data = input;

vkCmdPushConstants(cmd,
    token.pushconstantPipelineLayout
    token.pushconstantStageFlags,
    token.pushconstantOffset,
    token.pushconstantSize, data);
break;

VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV:

VkBindIndexBufferIndirectCommandNV* data = input;

// the indexType may optionally be remapped
// from a custom uint32_t value, via
// VkIndirectCommandsLayoutTokenNV::pIndexTypeValues

vkCmdBindIndexBuffer(cmd,
    deriveBuffer(data->bufferAddress),
    deriveOffset(data->bufferAddress),
    data->indexType);
break;

VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV:

VkBindVertexBufferIndirectCommandNV* data = input;

// if token.vertexDynamicStride is VK_TRUE
// then the stride for this binding is set
// using data->stride as well

vkCmdBindVertexBuffers(cmd,
    token.vertexBindingUnit, 1,
    &deriveBuffer(data->bufferAddress),
    &deriveOffset(data->bufferAddress));
break;

VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV:

vkCmdDrawIndexedIndirect(cmd,
    stream.buffer, offset, 1, 0);
31.2. Indirect Commands Generation And Execution

The generation of commands on the device requires a preprocess buffer. To retrieve the memory size and alignment requirements of a particular execution state call:

```c
// Provided by VK_NV_device_generated_commands
void vkGetGeneratedCommandsMemoryRequirementsNV(
    VkDevice device,
    const VkGeneratedCommandsMemoryRequirementsInfoNV* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `pInfo` is a pointer to an instance of the `VkGeneratedCommandsMemoryRequirementsInfoNV` structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

**Valid Usage**

- `VUID-vkGetGeneratedCommandsMemoryRequirementsNV-deviceGeneratedCommands-02906`

The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled.
Valid Usage (Implicit)

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-device-parameter
device **must** be a valid VkDevice handle

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pInfo-parameter
pInfo **must** be a valid pointer to a valid VkGeneratedCommandsMemoryRequirementsInfoNV structure

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pMemoryRequirements-parameter
pMemoryRequirements **must** be a valid pointer to a VkMemoryRequirements2 structure

// Provided by VK_NV_device_generated_commands
typedef struct VkGeneratedCommandsMemoryRequirementsInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipeline pipeline;
    VkIndirectCommandsLayoutNV indirectCommandsLayout;
    uint32_t maxSequencesCount;
} VkGeneratedCommandsMemoryRequirementsInfoNV;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pipelineBindPoint** is the VkPipelineBindPoint of the pipeline that this buffer memory is intended to be used with during the execution.
- **pipeline** is the VkPipeline that this buffer memory is intended to be used with during the execution.
- **indirectCommandsLayout** is the VkIndirectCommandsLayoutNV that this buffer memory is intended to be used with.
- **maxSequencesCount** is the maximum number of sequences that this buffer memory in combination with the other state provided **can** be used with.

Valid Usage

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-maxSequencesCount-02907
maxSequencesCount **must** be less or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount
Valid Usage (Implicit)

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_GENERATED_COMMANDS_MEMORY_REQUIREMENTS_INFO_NV`

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pNext-pNext**
  - `pNext` must be `NULL`

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-parameter**
  - `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipeline-parameter**
  - `pipeline` must be a valid `VkPipeline` handle

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-indirectCommandsLayout-parameter**
  - `indirectCommandsLayout` must be a valid `VkIndirectCommandsLayoutNV` handle

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-commonparent**
  - Both of `indirectCommandsLayout`, and `pipeline` must have been created, allocated, or retrieved from the same `VkDevice`

The actual generation of commands as well as their execution on the device is handled as single action with:

```c
// Provided by VK_NV_device_generated_commands
void vkCmdExecuteGeneratedCommandsNV(
    VkCommandBuffer commandBuffer,         // [in] commandBuffer
    VkBool32 isPreprocessed,               // [in] isPreprocessed
    const VkGeneratedCommandsInfoNV* pGeneratedCommandsInfo);  // [in] pGeneratedCommandsInfo
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `isPreprocessed` represents whether the input data has already been preprocessed on the device. If it is `VK_FALSE` this command will implicitly trigger the preprocessing step, otherwise not.
- `pGeneratedCommandsInfo` is a pointer to an instance of the `VkGeneratedCommandsInfoNV` structure containing parameters affecting the generation of commands.
Valid Usage

- **VUID-vkCmdExecuteGeneratedCommandsNV-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdExecuteGeneratedCommandsNV-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdExecuteGeneratedCommandsNV-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02697**
  For each set $n$ that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to $n$ at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set $n$, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility
Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

A valid pipeline must be bound to the pipeline bind point used by this command.

If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view’s format.

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWrite-04469**

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view’s format.

- **VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04470**

If a `VkImageView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64.

- **VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04471**

If a `VkImageView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32.

- **VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04472**

If a `VkBufferView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64.

- **VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04473**

If a `VkBufferView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04474**

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04475**

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-renderPass-02684**

The current render pass **must** be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-subpass-02685**

The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02686**

Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04584**

Image subresources used as attachments in the current render pass **must** not be accessed.
in any way other than as an attachment by this command, except for cases involving read-only access to depth/stencil attachments as described in the Render Pass chapter

- **VUID-vkCmdExecuteGeneratedCommandsNV-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` dynamic state enabled, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- **VUID-vkCmdExecuteGeneratedCommandsNV-scissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, then `vkCmdSetScissorWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-03419**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic states enabled then both `vkCmdSetViewportWithCountEXT` and `vkCmdSetScissorWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must match the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04137**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04138**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic states enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`
If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT} dynamic state enabled, but not the \texttt{VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV} dynamic state enabled, then the bound graphics pipeline must have been created with \texttt{VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCountEXT}

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT} and \texttt{VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV} dynamic states enabled then the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportShadingRatePaletteNV} must be greater than or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCountEXT}

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT} dynamic state enabled and an instance of \texttt{VkPipelineViewportSwizzleStateCreateInfoNV} chained from \texttt{VkPipelineViewportCreateInfo}, then the bound graphics pipeline must have been created with \texttt{VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCountEXT}

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT} dynamic state enabled and an instance of \texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV} chained from \texttt{VkPipelineViewportCreateInfo}, then the bound graphics pipeline must have been created with \texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCountEXT}

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT} dynamic state enabled then \texttt{vkCmdSetPatchControlPointsEXT} must have been called in the current command buffer prior to this drawing command, and the \texttt{primitiveTopology} parameter of \texttt{vkCmdSetPatchControlPointsEXT} must be of the same topology class as the pipeline \texttt{VkPipelineInputAssemblyStateCreateInfo::topology} state

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT} dynamic state enabled then \texttt{vkCmdSetPatchControlPointsEXT} must have been called in the current command buffer prior to this drawing command
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled then `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1.

- **VUID-vkCmdExecuteGeneratedCommandsNV-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-04740**
  If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the...
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be `VK_NULL_HANDLE`.

For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

If `isPreprocessed` is `VK_TRUE` then `vkCmdPreprocessGeneratedCommandsNV` must have already been executed on the device, using the same `pGeneratedCommandsInfo` content as well as the content of the input buffers it references (all except `VkGeneratedCommandsInfoNV::preprocessBuffer`). Furthermore `pGeneratedCommandsInfo`'s `indirectCommandsLayout` must have been created with the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV` bit set.

`VkGeneratedCommandsInfoNV::pipeline` must match the current bound pipeline at `VkGeneratedCommandsInfoNV::pipelineBindPoint`.

Transform feedback must not be active.

The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled.
Valid Usage (Implicit)

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-parameter
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdExecuteGeneratedCommandsNV-pGeneratedCommandsInfo-parameter
  \texttt{pGeneratedCommandsInfo} must be a valid pointer to a valid \texttt{VkGeneratedCommandsInfoNV} structure

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-recording
  \texttt{commandBuffer} must be in the \texttt{recording state}

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics, or compute operations

- VUID-vkCmdExecuteGeneratedCommandsNV-renderpass
  This command must only be called inside of a render pass instance

Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized

Command Properties

typedef struct VkGeneratedCommandsInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipeline pipeline;
    VkIndirectCommandsLayoutNV indirectCommandsLayout;
    uint32_t streamCount;
    const VkIndirectCommandsStreamNV* pStreams;
    uint32_t sequencesCount;
    VkBuffer preprocessBuffer;
    VkDeviceSize preprocessOffset;
    VkDeviceSize preprocessSize;
    VkBuffer sequencesCountBuffer;
    VkDeviceSize sequencesCountOffset;
    VkBuffer sequencesIndexBuffer;
    VkDeviceSize sequencesIndexOffset;
} VkGeneratedCommandsInfoNV;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **pipelineBindPoint** is the **VkPipelineBindPoint** used for the **pipeline**.
- **pipeline** is the **VkPipeline** used in the generation and execution process.
- **indirectCommandsLayout** is the **VkIndirectCommandsLayoutNV** that provides the command sequence to generate.
- **streamCount** defines the number of input streams.
- **pStreams** is a pointer to an array of **streamCount** **VkIndirectCommandsStreamNV** structures providing the input data for the tokens used in **indirectCommandsLayout**.
- **sequencesCount** is the maximum number of sequences to reserve. If **sequencesCountBuffer** is **VK_NULL_HANDLE**, this is also the actual number of sequences generated.
- **preprocessBuffer** is the **VkBuffer** that is used for preprocessing the input data for execution. If this structure is used with **vkCmdExecuteGeneratedCommandsNV** with its **isPreprocessed** set to **VK_TRUE**, then the preprocessing step is skipped and data is only read from this buffer.
- **preprocessOffset** is the byte offset into **preprocessBuffer** where the preprocessed data is stored.
- **preprocessSize** is the maximum byte size within the **preprocessBuffer** after the **preprocessOffset** that is available for preprocessing.
- **sequencesCountBuffer** is a **VkBuffer** in which the actual number of sequences is provided as single **uint32_t** value.
- **sequencesCountOffset** is the byte offset into **sequencesCountBuffer** where the count value is stored.
- **sequencesIndexBuffer** is a **VkBuffer** that encodes the used sequence indices as **uint32_t** array.
- **sequencesIndexOffset** is the byte offset into **sequencesIndexBuffer** where the index values start.
Valid Usage

- **VUID-VkGeneratedCommandsInfoNV-pipeline-02912**
  The provided pipeline must match the pipeline bound at execution time.

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02913**
  If the indirectCommandsLayout uses a token of `VK_INDIRECT_COMMANDS_TOKENTYPE_SHADERGROUP_NV`, then the pipeline must have been created with multiple shader groups.

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02914**
  If the indirectCommandsLayout uses a token of `VK_INDIRECT_COMMANDS_TOKENTYPE_SHADERGROUP_NV`, then the pipeline must have been created with `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV` set in `VkGraphicsPipelineCreateInfo::flags`.

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02915**
  If the indirectCommandsLayout uses a token of `VK_INDIRECT_COMMANDS_TOKENTYPE_PUSHCONSTANT_NV`, then the pipeline's `VkPipelineLayout` must match the `VkIndirectCommandsLayoutTokenNV::pushconstantPipelineLayout`.

- **VUID-VkGeneratedCommandsInfoNV-streamCount-02916**
  `streamCount` must match the indirectCommandsLayout's `streamCount`.

- **VUID-VkGeneratedCommandsInfoNV-sequencesCount-02917**
  `sequencesCount` must be less or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount` and `VkGeneratedCommandsMemoryRequirementsInfoNV::maxSequencesCount` that was used to determine the `preprocessSize`.

- **VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-02918**
  `preprocessBuffer` must have the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set in its usage flag.

- **VUID-VkGeneratedCommandsInfoNV-preprocessOffset-02919**
  `preprocessOffset` must be aligned to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment`.

- **VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-02917**
  If `preprocessBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkGeneratedCommandsInfoNV-preprocessSize-02920**
  `preprocessSize` must be at least equal to the memory requirement's size returned by `vkGetGeneratedCommandsMemoryRequirementsNV` using the matching inputs (indirectCommandsLayout, ...) as within this structure.

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02921**
  `sequencesCountBuffer` can be set if the actual used count of sequences is sourced from the provided buffer. In that case the `sequencesCount` serves as upper bound.

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02922**
  If `sequencesCountBuffer` is not `VK_NULL_HANDLE`, its usage flag must have the
VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02923
  If sequencesCountBuffer is not VK_NULL_HANDLE, sequencesCountOffset must be aligned to
  VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minSequencesCountBufferOffsetAlignment

- VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02972
  If sequencesCountBuffer is not VK_NULL_HANDLE and is non-sparse then it must be bound
  completely and contiguously to a single VkDeviceMemory object

- VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02924
  If indirectCommandsLayout’s VK INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV
  is set, sequencesIndexBuffer must be set otherwise it must be VK_NULL_HANDLE

- VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02925
  If sequencesIndexBuffer is not VK_NULL_HANDLE, its usage flag must have the
  VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02926
  If sequencesIndexBuffer is not VK_NULL_HANDLE, sequencesIndexOffset must be aligned
  to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minSequencesIndexBufferOffsetAlignment

- VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02973
  If sequencesIndexBuffer is not VK_NULL_HANDLE and is non-sparse then it must be bound
  completely and contiguously to a single VkDeviceMemory object
Valid Usage (Implicit)

- **VUID-VkGeneratedCommandsInfoNV-sType-sType**
  *sType* must be `VK_STRUCTURE_TYPE_GENERATED_COMMANDS_INFO_NV`

- **VUID-VkGeneratedCommandsInfoNV-pNext-pNext**
  *pNext* must be `NULL`

- **VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-parameter**
  *pipelineBindPoint* must be a valid `VkPipelineBindPoint` value

- **VUID-VkGeneratedCommandsInfoNV-pipeline-parameter**
  *pipeline* must be a valid `VkPipeline` handle

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-parameter**
  *indirectCommandsLayout* must be a valid `VkIndirectCommandsLayoutNV` handle

- **VUID-VkGeneratedCommandsInfoNV-pStreams-parameter**
  *pStreams* must be a valid pointer to an array of `streamCount` valid `VkIndirectCommandsStreamNV` structures

- **VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-parameter**
  *preprocessBuffer* must be a valid `VkBuffer` handle

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-parameter**
  If *sequencesCountBuffer* is not `VK_NULL_HANDLE`, *sequencesCountBuffer* must be a valid `VkBuffer` handle

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-parameter**
  If *sequencesIndexBuffer* is not `VK_NULL_HANDLE`, *sequencesIndexBuffer* must be a valid `VkBuffer` handle

- **VUID-VkGeneratedCommandsInfoNV-streamCount-arraylength**
  *streamCount* must be greater than 0

- **VUID-VkGeneratedCommandsInfoNV-commonparent**
  Each of *indirectCommandsLayout*, *pipeline*, *preprocessBuffer*, *sequencesCountBuffer*, and *sequencesIndexBuffer* that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

Referencing the functions defined in *Indirect Commands Layout*, `vkCmdExecuteGeneratedCommandsNV` behaves as:
uint32_t sequencesCount = sequencesCountBuffer ?
    min(maxSequencesCount, sequencesCountBuffer.load_uint32(sequencesCountOffset)) : maxSequencesCount;

cmdProcessAllSequences(commandBuffer, pipeline,
    indirectCommandsLayout, pIndirectCommandsStreams,
    sequencesCount,
    sequencesIndexBuffer, sequencesIndexOffset);

// The stateful commands within indirectCommandsLayout will not
// affect the state of subsequent commands in the target
// command buffer (cmd)

Note
It is important to note that the values of all state related to the pipelineBindPoint
used are undefined after this command.

Commands can be preprocessed prior execution using the following command:

// Provided by VK_NV_device_generated_commands
void vkCmdPreprocessGeneratedCommandsNV(
    VkCommandBuffer commandBuffer,
    const VkGeneratedCommandsInfoNV* pGeneratedCommandsInfo);

• commandBuffer is the command buffer which does the preprocessing.
• pGeneratedCommandsInfo is a pointer to an instance of the VkGeneratedCommandsInfoNV
  structure containing parameters affecting the preprocessing step.

Valid Usage

• VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-02927
  pGeneratedCommandsInfo's indirectCommandsLayout must have been created with the
  VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV bit set

• VUID-vkCmdPreprocessGeneratedCommandsNV-deviceGeneratedCommands-02928
  The VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands feature
  must be enabled
Valid Usage (Implicit)

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-parameter
  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-parameter
  \texttt{pGeneratedCommandsInfo} \textbf{must} be a valid pointer to a valid \texttt{VkGeneratedCommandsInfoNV} structure

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-recording
  \texttt{commandBuffer} \textbf{must} be in the \textit{recording state}

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support graphics, or compute operations

- VUID-vkCmdPreprocessGeneratedCommandsNV-renderpass
  This command \textbf{must} only be called outside of a render pass instance

Host Synchronization

- Host access to \texttt{commandBuffer} \textbf{must} be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} be externally synchronized

Chapter 32. Sparse Resources

As documented in Resource Memory Association, VkBuffer and VkImage resources in Vulkan must be bound completely and contiguously to a single VkDeviceMemory object. This binding must be done before the resource is used, and the binding is immutable for the lifetime of the resource.

Sparse resources relax these restrictions and provide these additional features:

- Sparse resources can be bound non-contiguously to one or more VkDeviceMemory allocations.
- Sparse resources can be re-bound to different memory allocations over the lifetime of the resource.
- Sparse resources can have descriptors generated and used orthogonally with memory binding commands.

32.1. Sparse Resource Features

Sparse resources have several features that must be enabled explicitly at resource creation time. The features are enabled by including bits in the flags parameter of VkImageCreateInfo or VkBufferCreateInfo. Each feature also has one or more corresponding feature enables specified in VkPhysicalDeviceFeatures.

- **Sparse binding** is the base feature, and provides the following capabilities:
  - Resources can be bound at some defined (sparse block) granularity.
  - The entire resource must be bound to memory before use regardless of regions actually accessed.
  - No specific mapping of image region to memory offset is defined, i.e. the location that each texel corresponds to in memory is implementation-dependent.
  - Sparse buffers have a well-defined mapping of buffer range to memory range, where an offset into a range of the buffer that is bound to a single contiguous range of memory corresponds to an identical offset within that range of memory.
  - Requested via the VK_IMAGE_CREATE_SPARSE_BINDING_BIT and VK_BUFFER_CREATE_SPARSE_BINDING_BIT bits.
  - A sparse image created using VK_IMAGE_CREATE_SPARSE_BINDING_BIT (but not VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT) supports all formats that non-sparse usage supports, and supports both VK_IMAGE_TILING_OPTIMAL and VK_IMAGE_TILING_LINEAR tiling.

- **Sparse Residency** builds on (and requires) the sparseBinding feature. It includes the following capabilities:
  - Resources do not have to be completely bound to memory before use on the device.
  - Images have a prescribed sparse image block layout, allowing specific rectangular regions of the image to be bound to specific offsets in memory allocations.
  - Consistency of access to unbound regions of the resource is defined by the absence or presence of VkPhysicalDeviceSparseProperties::residencyNonResidentStrict. If this property is present, accesses to unbound regions of the resource are well defined and behave as if the
data bound is populated with all zeros; writes are discarded. When this property is absent, accesses are considered safe, but reads will return undefined values.

- Requested via the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` and `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bits.

- Sparse residency support is advertised on a finer grain via the following features:

  - `sparseResidencyBuffer`: Support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`.
  - `sparseResidencyImage2D`: Support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - `sparseResidencyImage3D`: Support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - `sparseResidency2Samples`: Support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - `sparseResidency4Samples`: Support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - `sparseResidency8Samples`: Support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - `sparseResidency16Samples`: Support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

Implementations supporting `sparseResidencyImage2D` are only required to support sparse 2D, single-sampled images. Support for sparse 3D and MSAA images is optional and can be enabled via `sparseResidencyImage3D`, `sparseResidency2Samples`, `sparseResidency4Samples`, `sparseResidency8Samples`, and `sparseResidency16Samples`.

- A sparse image created using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` supports all non-compressed color formats with power-of-two element size that non-sparse usage supports. Additional formats may also be supported and can be queried via `vkGetPhysicalDeviceSparseImageFormatProperties`. `VK_IMAGE_TILING_LINEAR` tiling is not supported.

- **Sparse aliasing** provides the following capability that can be enabled per resource:

  Allows physical memory ranges to be shared between multiple locations in the same sparse resource or between multiple sparse resources, with each binding of a memory location observing a consistent interpretation of the memory contents.

  See **Sparse Memory Aliasing** for more information.

### 32.2. Sparse Buffers and Fully-Resident Images

Both `VkBuffer` and `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` or `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bits can be thought of as a linear region of address space. In the `VkImage` case if `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` is not used, this linear region is entirely opaque, meaning that there is no application-visible mapping between texel location and memory...
offset.

Unless `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` or `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` are also used, the entire resource must be bound to one or more `VkDeviceMemory` objects before use.

### 32.2.1. Sparse Buffer and Fully-Resident Image Block Size

The sparse block size in bytes for sparse buffers and fully-resident images is reported as `VkMemoryRequirements::alignment`. `alignment` represents both the memory alignment requirement and the binding granularity (in bytes) for sparse resources.

### 32.3. Sparse Partially-Resident Buffers

`VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bit allow the buffer to be made only partially resident. Partially resident `VkBuffer` objects are allocated and bound identically to `VkBuffer` objects using only the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` feature. The only difference is the ability for some regions of the buffer to be unbound during device use.

### 32.4. Sparse Partially-Resident Images

`VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` bit allow specific rectangular regions of the image called sparse image blocks to be bound to specific ranges of memory. This allows the application to manage residency at either image subresource or sparse image block granularity. Each image subresource (outside of the mip tail) starts on a sparse block boundary and has dimensions that are integer multiples of the corresponding dimensions of the sparse image block.

**Note**

Applications can use these types of images to control LOD based on total memory consumption. If memory pressure becomes an issue the application can unbind and disable specific mipmap levels of images without having to recreate resources or modify texel data of unaffected levels.

The application can also use this functionality to access subregions of the image in a “megatexture” fashion. The application can create a large image and only populate the region of the image that is currently being used in the scene.

### 32.4.1. Accessing Unbound Regions

The following member of `VkPhysicalDeviceSparseProperties` affects how data in unbound regions of sparse resources are handled by the implementation:

- `residencyNonResidentStrict`

If this property is not present, reads of unbound regions of the image will return undefined values. Both reads and writes are still considered safe and will not affect other resources or populated regions of the image.
If this property is present, all reads of unbound regions of the image will behave as if the region was bound to memory populated with all zeros; writes will be discarded.

Formatted accesses to unbound memory may still alter some component values in the natural way for those accesses, e.g. substituting a value of one for alpha in formats that do not have an alpha component.

Example: Reading the alpha component of an unbacked VK_FORMAT_R8_UNORM image will return a value of 1.0f.

See Physical Device Enumeration for instructions for retrieving physical device properties.

Implementor’s Note

For implementations that cannot natively handle access to unbound regions of a resource, the implementation may allocate and bind memory to the unbound regions. Reads and writes to unbound regions will access the implementation-managed memory instead.

Given that the values resulting from reads of unbound regions are undefined in this scenario, implementations may use the same physical memory for all unbound regions of multiple resources within the same process.

32.4.2. Mip Tail Regions

Sparse images created using VK_IMAGE_CREATE_SPARSE_BINDING_BIT (without also using VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT) have no specific mapping of image region or image subresource to memory offset defined, so the entire image can be thought of as a linear opaque address region. However, images created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT do have a prescribed sparse image block layout, and hence each image subresource must start on a sparse block boundary. Within each array layer, the set of mip levels that have a smaller size than the sparse block size in bytes are grouped together into a mip tail region.

If the VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT flag is present in the flags member of VkSparseImageFormatProperties, for the image's format, then any mip level which has dimensions that are not integer multiples of the corresponding dimensions of the sparse image block, and all subsequent mip levels, are also included in the mip tail region.

The following member of VkPhysicalDeviceSparseProperties may affect how the implementation places mip levels in the mip tail region:

• residencyAlignedMipSize

Each mip tail region is bound to memory as an opaque region (i.e. must be bound using a VkSparseImageOpaqueMemoryBindInfo structure) and may be of a size greater than or equal to the sparse block size in bytes. This size is guaranteed to be an integer multiple of the sparse block size in bytes.
An implementation may choose to allow each array-layer’s mip tail region to be bound to memory independently or require that all array-layer’s mip tail regions be treated as one. This is dictated by `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` in `VkSparseImageMemoryRequirements::flags`.

The following diagrams depict how `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` alter memory usage and requirements.

![Diagram of sparse image memory usage](image)

**Figure 19. Sparse Image**

In the absence of `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, each array layer contains a mip tail region containing texel data for all mip levels smaller than the sparse image block in any dimension.

Mip levels that are as large or larger than a sparse image block in all dimensions can be bound individually. Right-edges and bottom-edges of each level are allowed to have partially used sparse blocks. Any bound partially-used-sparse-blocks must still have their full sparse block size in bytes allocated in memory.
When `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` is present all array layers will share a single mip tail region.

**Note**

The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.
When `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` is present the first mip level that would contain partially used sparse blocks begins the mip tail region. This level and all subsequent levels are placed in the mip tail. Only the first \(N\) mip levels whose dimensions are an exact multiple of the sparse image block dimensions can be bound and unbound on a sparse block basis.

![Sparse Image with Aligned Mip Size and Single Mip Tail](image)

**Figure 22. Sparse Image with Aligned Mip Size and Single Mip Tail**

**Note**

The mip tail region is presented here in a 2D array simply for figure size reasons. It is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When both `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` are present the constraints from each of these flags are in effect.

### 32.4.3. Standard Sparse Image Block Shapes

Standard sparse image block shapes define a standard set of dimensions for sparse image blocks that depend on the format of the image. Layout of texels or compressed texel blocks within a sparse image block is implementation-dependent. All currently defined standard sparse image block shapes are 64 KB in size.

For block-compressed formats (e.g. `VK_FORMAT_BC5_UNORM_BLOCK`), the texel size is the size of the compressed texel block (e.g. 128-bit for BC5) thus the dimensions of the standard sparse image block shapes apply in terms of compressed texel blocks.
For block-compressed formats, the dimensions of a sparse image block in terms of texels can be calculated by multiplying the sparse image block dimensions by the compressed texel block dimensions.

</tr>
</tbody>
</table>

Implementations that support the standard sparse image block shape for all formats listed in the Standard Sparse Image Block Shapes (Single Sample) and Standard Sparse Image Block Shapes (MSAA) tables may advertise the following VkPhysicalDeviceSparseProperties:

- residencyStandard2DBlockShape
- residencyStandard2DMultisampleBlockShape
- residencyStandard3DBlockShape

Reporting each of these features does not imply that all possible image types are supported as sparse. Instead, this indicates that no supported sparse image of the corresponding type will use custom sparse image block dimensions for any formats that have a corresponding standard sparse image block shape.

32.4.4. Custom Sparse Image Block Shapes

An implementation that does not support a standard image block shape for a particular sparse partially-resident image may choose to support a custom sparse image block shape for it instead. The dimensions of such a custom sparse image block shape are reported in VkSparseImageFormatProperties::imageGranularity. As with standard sparse image block shapes, the size in bytes of the custom sparse image block shape will be reported in VkMemoryRequirements::alignment.

Custom sparse image block dimensions are reported through vkGetPhysicalDeviceSparseImageFormatProperties and vkGetImageSparseMemoryRequirements.

An implementation must not support both the standard sparse image block shape and a custom...
sparse image block shape for the same image. The standard sparse image block shape must be used if it is supported.

### 32.4.5. Multiple Aspects

Partially resident images are allowed to report separate sparse properties for different aspects of the image. One example is for depth/stencil images where the implementation separates the depth and stencil data into separate planes. Another reason for multiple aspects is to allow the application to manage memory allocation for implementation-private metadata associated with the image. See the figure below:

![Multiple Aspect Sparse Image](image.png)

*Figure 23. Multiple Aspect Sparse Image*

**Note**

The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

In the figure above the depth, stencil, and metadata aspects all have unique sparse properties. The per-texel stencil data is \( \frac{1}{4} \) the size of the depth data, hence the stencil sparse blocks include \( 4 \times \) the number of texels. The sparse block size in bytes for all of the aspects is identical and defined by `VkMemoryRequirements::alignment`.

**Metadata**

The metadata aspect of an image has the following constraints:
• All metadata is reported in the mip tail region of the metadata aspect.
• All metadata must be bound prior to device use of the sparse image.

## 32.5. Sparse Memory Aliasing

By default sparse resources have the same aliasing rules as non-sparse resources. See [Memory Aliasing](#) for more information.

`VkDevice` objects that have the `sparseResidencyAliased` feature enabled are able to use the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flags for resource creation. These flags allow resources to access physical memory bound into multiple locations within one or more sparse resources in a *data consistent* fashion. This means that reading physical memory from multiple aliased locations will return the same value.

Care must be taken when performing a write operation to aliased physical memory. Memory dependencies must be used to separate writes to one alias from reads or writes to another alias. Writes to aliased memory that are not properly guarded against accesses to different aliases will have undefined results for all accesses to the aliased memory.

Applications that wish to make use of data consistent sparse memory aliasing must abide by the following guidelines:

- All sparse resources that are bound to aliased physical memory must be created with the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` / `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flag.
- All resources that access aliased physical memory must interpret the memory in the same way. This implies the following:
  - Buffers and images cannot alias the same physical memory in a data consistent fashion. The physical memory ranges must be used exclusively by buffers or used exclusively by images for data consistency to be guaranteed.
  - Memory in sparse image mip tail regions cannot access aliased memory in a data consistent fashion.
  - Sparse images that alias the same physical memory must have compatible formats and be using the same sparse image block shape in order to access aliased memory in a data consistent fashion.

Failure to follow any of the above guidelines will require the application to abide by the normal, non-sparse resource aliasing rules. In this case memory cannot be accessed in a data consistent fashion.

**Note**

Enabling sparse resource memory aliasing can be a way to lower physical memory use, but it may reduce performance on some implementations. An application developer can test on their target HW and balance the memory / performance trade-offs measured.
32.6. Sparse Resource Implementation Guidelines (Informative)
This section is Informative. It is included to aid in implementors’ understanding of sparse resources.

Device Virtual Address

The basic `sparseBinding` feature allows the resource to reserve its own device virtual address range at resource creation time rather than relying on a bind operation to set this. Without any other creation flags, no other constraints are relaxed compared to normal resources. All pages **must** be bound to physical memory before the device accesses the resource.

The `sparse residency` features allow sparse resources to be used even when not all pages are bound to memory. Implementations that support access to unbound pages without causing a fault **may** support `residencyNonResidentStrict`.

Not faulting on access to unbound pages is not enough to support `residencyNonResidentStrict`. An implementation **must** also guarantee that reads after writes to unbound regions of the resource always return data for the read as if the memory contains zeros. Depending on any caching hierarchy of the implementation this **may** not always be possible.

Any implementation that does not fault, but does not guarantee correct read values **must** not support `residencyNonResidentStrict`.

Any implementation that **cannot** access unbound pages without causing a fault will require the implementation to bind the entire device virtual address range to physical memory. Any pages that the application does not bind to memory **may** be bound to one (or more) "`placeholder" physical page(s) allocated by the implementation. Given the following properties:

- A process **must** not access memory from another process
- Reads return undefined values

It is sufficient for each host process to allocate these placeholder pages and use them for all resources in that process. Implementations **may** allocate more often (per instance, per device, or per resource).

Binding Memory

The byte size reported in `VkMemoryRequirements::size` **must** be greater than or equal to the amount of physical memory **required** to fully populate the resource. Some implementations require “holes” in the device virtual address range that are never accessed. These holes **may** be included in the `size` reported for the resource.

Including or not including the device virtual address holes in the resource size will alter how the implementation provides support for `VkSparseImageOpaqueMemoryBindInfo`. This operation **must** be supported for all sparse images, even ones created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- If the holes are included in the size, this bind function becomes very easy. In most cases the `resourceOffset` is simply a device virtual address offset and the implementation can easily determine what device virtual address to bind. The cost is that the application **may**
allocate more physical memory for the resource than it needs.

- If the holes are not included in the size, the application can allocate less physical memory than otherwise for the resource. However, in this case the implementation must account for the holes when mapping resourceOffset to the actual device virtual address intended to be mapped.

Note

If the application always uses VkSparseImageMemoryBindInfo to bind memory for the non-tail mip levels, any holes that are present in the resource size may never be bound.

Since VkSparseImageMemoryBindInfo uses texel locations to determine which device virtual addresses to bind, it is impossible to bind device virtual address holes with this operation.

Binding Metadata Memory

All metadata for sparse images have their own sparse properties and are embedded in the mip tail region for said properties. See the Multiaspect section for details.

Given that metadata is in a mip tail region, and the mip tail region must be reported as contiguous (either globally or per-array-layer), some implementations will have to resort to complicated offset → device virtual address mapping for handling VkSparseImageOpaqueMemoryBindInfo.

To make this easier on the implementation, the VK_SPARSE_MEMORY_BIND_METADATA_BIT explicitly specifies when metadata is bound with VkSparseImageOpaqueMemoryBindInfo. When this flag is not present, the resourceOffset may be treated as a strict device virtual address offset.

When VK_SPARSE_MEMORY_BIND_METADATA_BIT is present, the resourceOffset must have been derived explicitly from the imageMipTailOffset in the sparse resource properties returned for the metadata aspect. By manipulating the value returned for imageMipTailOffset, the resourceOffset does not have to correlate directly to a device virtual address offset, and may instead be whatever value makes it easiest for the implementation to derive the correct device virtual address.

32.7. Sparse Resource API

The APIs related to sparse resources are grouped into the following categories:

- Physical Device Features
- Physical Device Sparse Properties
- Sparse Image Format Properties
- Sparse Resource Creation
- Sparse Resource Memory Requirements
- Binding Resource Memory
32.7.1. Physical Device Features

Some sparse-resource related features are reported and enabled in VkPhysicalDeviceFeatures. These features must be supported and enabled on the VkDevice object before applications can use them. See Physical Device Features for information on how to get and set enabled device features, and for more detailed explanations of these features.

Sparse Physical Device Features

- **sparseBinding**: Support for creating VkBuffer and VkImage objects with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT and VK_IMAGE_CREATE_SPARSE_BINDING_BIT flags, respectively.
- **sparseResidencyBuffer**: Support for creating VkBuffer objects with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag.
- **sparseResidencyImage2D**: Support for creating 2D single-sampled VkImage objects with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidencyImage3D**: Support for creating 3D VkImage objects with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency2Samples**: Support for creating 2D VkImage objects with 2 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency4Samples**: Support for creating 2D VkImage objects with 4 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency8Samples**: Support for creating 2D VkImage objects with 8 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency16Samples**: Support for creating 2D VkImage objects with 16 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidencyAliased**: Support for creating VkBuffer and VkImage objects with the VK_BUFFER_CREATE_SPARSE_ALIASED_BIT and VK_IMAGE_CREATE_SPARSE_ALIASED_BIT flags, respectively.

32.7.2. Physical Device Sparse Properties

Some features of the implementation are not possible to disable, and are reported to allow applications to alter their sparse resource usage accordingly. These read-only capabilities are reported in the VkPhysicalDeviceProperties::sparseProperties member, which is a VkPhysicalDeviceSparseProperties structure.

The VkPhysicalDeviceSparseProperties structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceSparseProperties {
    VkBool32 residencyStandard2DBlockShape;
    VkBool32 residencyStandard2DMultisampleBlockShape;
    VkBool32 residencyStandard3DBlockShape;
    VkBool32 residencyAlignedMipSize;
    VkBool32 residencyNonResidentStrict;
} VkPhysicalDeviceSparseProperties;
```
• residencyStandard2DBlockShape is VK_TRUE if the physical device will access all single-sample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported, the value returned in the imageGranularity member of the VkSparseImageFormatProperties structure for single-sample 2D images is not required to match the standard sparse image block dimensions listed in the table.

• residencyStandard2DMultisampleBlockShape is VK_TRUE if the physical device will access all multisample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (MSAA) table. If this property is not supported, the value returned in the imageGranularity member of the VkSparseImageFormatProperties structure for multisample 2D images is not required to match the standard sparse image block dimensions listed in the table.

• residencyStandard3DBlockShape is VK_TRUE if the physical device will access all 3D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported, the value returned in the imageGranularity member of the VkSparseImageFormatProperties structure for 3D images is not required to match the standard sparse image block dimensions listed in the table.

• residencyAlignedMipSize is VK_TRUE if images with mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block may be placed in the mip tail. If this property is not reported, only mip levels with dimensions smaller than the imageGranularity member of the VkSparseImageFormatProperties structure will be placed in the mip tail. If this property is reported the implementation is allowed to return VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT in the flags member of VkSparseImageFormatProperties, indicating that mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block will be placed in the mip tail.

• residencyNonResidentStrict specifies whether the physical device can consistently access non-resident regions of a resource. If this property is VK_TRUE, access to non-resident regions of resources will be guaranteed to return values as if the resource was populated with 0; writes to non-resident regions will be discarded.

32.7.3. Sparse Image Format Properties

Given that certain aspects of sparse image support, including the sparse image block dimensions, may be implementation-dependent, vkGetPhysicalDeviceSparseImageFormatProperties can be used to query for sparse image format properties prior to resource creation. This command is used to check whether a given set of sparse image parameters is supported and what the sparse image block shape will be.

**Sparse Image Format Properties API**

The VkSparseImageFormatProperties structure is defined as:
typedef struct VkSparseImageFormatProperties {
    VkImageAspectFlags aspectMask;
    VkExtent3D imageGranularity;
    VkSparseImageFormatFlags flags;
} VkSparseImageFormatProperties;

- **aspectMask** is a bitmask `VkImageAspectFlagBits` specifying which aspects of the image the properties apply to.
- **imageGranularity** is the width, height, and depth of the sparse image block in texels or compressed texel blocks.
- **flags** is a bitmask of `VkSparseImageFormatFlagBits` specifying additional information about the sparse resource.

Bits which **may** be set in `VkSparseImageFormatProperties::flags`, specifying additional information about the sparse resource, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSparseImageFormatFlagBits {
    VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT = 0x00000001,
    VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT = 0x00000002,
    VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT = 0x00000004,
} VkSparseImageFormatFlagBits;
```

- **VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT** specifies that the image uses a single mip tail region for all array layers.
- **VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT** specifies that the first mip level whose dimensions are not integer multiples of the corresponding dimensions of the sparse image block begins the mip tail region.
- **VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT** specifies that the image uses non-standard sparse image block dimensions, and the imageGranularity values do not match the standard sparse image block dimensions for the given format.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkSparseImageFormatFlags;
```

- **VkSparseImageFormatFlags** is a bitmask type for setting a mask of zero or more `VkSparseImageFormatFlagBits`.

`vkGetPhysicalDeviceSparseImageFormatProperties` returns an array of `VkSparseImageFormatProperties`. Each element will describe properties for one set of image aspects that are bound simultaneously in the image. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.
```c
void vkGetPhysicalDeviceSparseImageFormatProperties(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkImageType type,
    VkSampleCountFlagBits samples,
    VkImageUsageFlags usage,
    VkImageTiling tiling,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties* pProperties);
```

- **physicalDevice** is the physical device from which to query the sparse image format properties.
- **format** is the image format.
- **type** is the dimensionality of image.
- **samples** is a `VkSampleCountFlagBits` value specifying the number of samples per texel.
- **usage** is a bitmask describing the intended usage of the image.
- **tiling** is the tiling arrangement of the texel blocks in memory.
- **pPropertyCount** is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- **pProperties** is either `NULL` or a pointer to an array of `VkSparseImageFormatProperties` structures.

If `pProperties` is `NULL`, then the number of sparse format properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of sparse format properties available, at most `pPropertyCount` structures will be written.

If `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` is not supported for the given arguments, `pPropertyCount` will be set to zero upon return, and no data will be written to `pProperties`.

Multiple aspects are returned for depth/stencil images that are implemented as separate planes by the implementation. The depth and stencil data planes each have unique `VkSparseImageFormatProperties` data.

Depth/stencil images with depth and stencil data interleaved into a single plane will return a single `VkSparseImageFormatProperties` structure with the `aspectMask` set to `VK_IMAGE_ASPECT_DEPTH_BIT | VK_IMAGE_ASPECT_STENCIL_BIT`. 
Valid Usage

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-01094**
  
  *samples* must be a bit value that is set in `VkImageFormatProperties::sampleCounts` returned by `vkGetPhysicalDeviceImageFormatProperties` with *format*, *type*, *tiling*, and *usage* equal to those in this command and *flags* equal to the value that is set in `VkImageCreateInfo::flags` when the image is created.

Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-physicalDevice-parameter**
  
  *physicalDevice* must be a valid `VkPhysicalDevice` handle.

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-format-parameter**
  
  *format* must be a valid `VkFormat` value.

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-type-parameter**
  
  *type* must be a valid `VkImageType` value.

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-parameter**
  
  *samples* must be a valid `VkSampleCountFlagBits` value.

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-parameter**
  
  *usage* must be a valid combination of `VkImageUsageFlagBits` values.

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-requiredbitmask**
  
  *usage* must not be 0.

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-tiling-parameter**
  
  *tiling* must be a valid `VkImageTiling` value.

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pPropertyCount-parameter**
  
  *pPropertyCount* must be a valid pointer to a `uint32_t` value.

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pProperties-parameter**
  
  If the value referenced by *pPropertyCount* is not 0, and *pProperties* is not NULL, *pProperties* must be a valid pointer to an array of `VkSparseImageFormatProperties2` structures.

`vkGetPhysicalDeviceSparseImageFormatProperties2` returns an array of `VkSparseImageFormatProperties2`. Each element will describe properties for one set of image aspects that are bound simultaneously in the image. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.
// Provided by VK_KHR_get_physical_device_properties2

```c
void vkGetPhysicalDeviceSparseImageFormatProperties2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties2* pProperties);
```

- **physicalDevice** is the physical device from which to query the sparse image format properties.
- **pFormatInfo** is a pointer to a `VkPhysicalDeviceSparseImageFormatInfo2` structure containing input parameters to the command.
- **pPropertyCount** is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- **pProperties** is either NULL or a pointer to an array of `VkSparseImageFormatProperties2` structures.

`vkGetPhysicalDeviceSparseImageFormatProperties2KHR` behaves identically to `vkGetPhysicalDeviceSparseImageFormatProperties`, with the ability to return extended information by adding extending structures to the `pNext` chain of its `pProperties` parameter.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pFormatInfo-parameter**
  - `pFormatInfo` must be a valid pointer to a valid `VkPhysicalDeviceSparseImageFormatInfo2` structure
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pPropertyCount-parameter**
  - `pPropertyCount` must be a valid pointer to a `uint32_t` value
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pProperties-parameter**
  - If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkSparseImageFormatProperties2` structures

The `VkPhysicalDeviceSparseImageFormatInfo2` structure is defined as:
typedef struct VkPhysicalDeviceSparseImageFormatInfo2 {
    VkStructureType     sType;
    const void*         pNext;
    VkFormat             format;
    VkImageType          type;
    VkSampleCountFlagBits samples;
    VkImageUsageFlags    usage;
    VkImageTiling        tiling;
} VkPhysicalDeviceSparseImageFormatInfo2;

or the equivalent

// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceSparseImageFormatInfo2 VkPhysicalDeviceSparseImageFormatInfo2KHR;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• format is the image format.
• type is the dimensionality of image.
• samples is a VkSampleCountFlagBits value specifying the number of samples per texel.
• usage is a bitmask describing the intended usage of the image.
• tiling is the tiling arrangement of the texel blocks in memory.

Valid Usage

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-01095
  samples must be a bit value that is set in VkImageFormatProperties::sampleCounts returned
  by vkGetPhysicalDeviceImageFormatProperties with format, type, tiling, and usage equal to
  those in this command and flags equal to the value that is set in VkImageCreateInfo
  ::flags when the image is created
Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SPARSE_IMAGE_FORMAT_INFO_2`
- **pNext** must be `NULL`
- **format** must be a valid `VkFormat` value
- **type** must be a valid `VkImageType` value
- **samples** must be a valid `VkSampleCountFlagBits` value
- **usage** must be a valid combination of `VkImageUsageFlagBits` values
- **usage** must not be `0`
- **tiling** must be a valid `VkImageTiling` value

The `VkSparseImageFormatProperties2` structure is defined as:

```c
typedef struct VkSparseImageFormatProperties2 {
    VkStructureType sType;
    void* pNext;
    VkSparseImageFormatProperties properties;
} VkSparseImageFormatProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkSparseImageFormatProperties2 VkSparseImageFormatProperties2KHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **properties** is a `VkSparseImageFormatProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceSparseImageFormatProperties`. 
32.7.4. Sparse Resource Creation

Sparse resources require that one or more sparse feature flags be specified (as part of the 
VkPhysicalDeviceFeatures structure described previously in the Physical Device Features section) 
when calling vkCreateDevice. When the appropriate device features are enabled, the 
VK_BUFFER_CREATE_SPARSE_* and VK_IMAGE_CREATE_SPARSE_* flags can be used. See vkCreateBuffer and 
vkCreateImage for details of the resource creation APIs.

\[\text{Valid Usage (Implicit)}\]

- VUID-VkSparseImageFormatProperties2-sType-sType
  \text{sType must be VK_STRUCTURE_TYPE_SPARSE_IMAGE_FORMAT_PROPERTIES_2}

- VUID-VkSparseImageFormatProperties2-pNext-pNext
  \text{pNext must be NULL}

32.7.5. Sparse Resource Memory Requirements

Sparse resources have specific memory requirements related to binding sparse memory. These 
memory requirements are reported differently for VkBuffer objects and VkImage objects.

**Buffer and Fully-Resident Images**

Buffers (both fully and partially resident) and fully-resident images can be bound to memory using 
only the data from VkMemoryRequirements. For all sparse resources the VkMemoryRequirements 
::alignment member specifies both the bindable sparse block size in bytes and required alignment 
of VkDeviceMemory.

**Partially Resident Images**

Partially resident images have a different method for binding memory. As with buffers and fully resident images, the VkMemoryRequirements::alignment field specifies the bindable sparse block size in bytes for the image.

Requesting sparse memory requirements for VkImage objects using 
vkGetImageSparseMemoryRequirements will return an array of one or more 
VkSparseImageMemoryRequirements structures. Each structure describes the sparse memory 
requirements for a group of aspects of the image.

The sparse image must have been created using the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag to
retrieve valid sparse image memory requirements.

Sparse Image Memory Requirements

The `VkSparseImageMemoryRequirements` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryRequirements {
    VkSparseImageFormatProperties formatProperties;
    uint32_t imageMipTailFirstLod;
    VkDeviceSize imageMipTailSize;
    VkDeviceSize imageMipTailOffset;
    VkDeviceSize imageMipTailStride;
} VkSparseImageMemoryRequirements;
```

- `formatProperties` is a `VkSparseImageFormatProperties` structure specifying properties of the image format.
- `imageMipTailFirstLod` is the first mip level at which image subresources are included in the mip tail region.
- `imageMipTailSize` is the memory size (in bytes) of the mip tail region. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, this is the size of the whole mip tail, otherwise this is the size of the mip tail of a single array layer. This value is guaranteed to be a multiple of the sparse block size in bytes.
- `imageMipTailOffset` is the opaque memory offset used with `VkSparseImageOpaqueMemoryBindInfo` to bind the mip tail region(s).
- `imageMipTailStride` is the offset stride between each array-layer’s mip tail, if `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` (otherwise the value is undefined).

To query sparse memory requirements for an image, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageSparseMemoryRequirements(
    VkDevice device, 
    VkImage image,  
    uint32_t* pSparseMemoryRequirementCount, 
    VkSparseImageMemoryRequirements* pSparseMemoryRequirements);
```

- `device` is the logical device that owns the image.
- `image` is the `VkImage` object to get the memory requirements for.
- `pSparseMemoryRequirementCount` is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
- `pSparseMemoryRequirements` is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements` structures.
If `pSparseMemoryRequirements` is `NULL`, then the number of sparse memory requirements available is returned in `pSparseMemoryRequirementCount`. Otherwise, `pSparseMemoryRequirementCount` must point to a variable set by the user to the number of elements in the `pSparseMemoryRequirements` array, and on return the variable is overwritten with the number of structures actually written to `pSparseMemoryRequirements`. If `pSparseMemoryRequirementCount` is less than the number of sparse memory requirements available, at most `pSparseMemoryRequirementCount` structures will be written.

If the image was not created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` then `pSparseMemoryRequirementCount` will be set to zero and `pSparseMemoryRequirements` will not be written to.

```
Note
```

It is legal for an implementation to report a larger value in `VkMemoryRequirements::size` than would be obtained by adding together memory sizes for all `VkSparseImageMemoryRequirements` returned by `vkGetImageSparseMemoryRequirements`. This may occur when the implementation requires unused padding in the address range describing the resource.

Valid Usage (Implicit)

- VUID-vkGetImageSparseMemoryRequirements-device-parameter
device must be a valid `VkDevice` handle

- VUID-vkGetImageSparseMemoryRequirements-image-parameter
image must be a valid `VkImage` handle

- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter
`pSparseMemoryRequirementCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter
If the value referenced by `pSparseMemoryRequirementCount` is not 0, and `pSparseMemoryRequirements` is not `NULL`, `pSparseMemoryRequirements` must be a valid pointer to an array of `pSparseMemoryRequirementCount` `VkSparseImageMemoryRequirements` structures

- VUID-vkGetImageSparseMemoryRequirements-image-parent
image must have been created, allocated, or retrieved from `device`

To query sparse memory requirements for an image, call:

```
// Provided by VK_KHR_get_memory_requirements2
void vkGetImageSparseMemoryRequirements2KHR(
  VkDevice
  device,
  const VkImageSparseMemoryRequirementsInfo2* pInfo,
  uint32_t* pSparseMemoryRequirementCount,
  VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- `device` is the logical device that owns the image.
• pInfo is a pointer to a VkImageSparseMemoryRequirementsInfo2 structure containing parameters required for the memory requirements query.

• pSparseMemoryRequirementCount is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.

• pSparseMemoryRequirements is either NULL or a pointer to an array of VkSparseImageMemoryRequirements2 structures.

Valid Usage (Implicit)

• VUID-vkGetImageSparseMemoryRequirements2-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetImageSparseMemoryRequirements2-pInfo-parameter
pInfo must be a valid pointer to a valid VkImageSparseMemoryRequirementsInfo2 structure

• VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirementCount-parameter
pSparseMemoryRequirementCount must be a valid pointer to a uint32_t value

• VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirements-parameter
If the value referenced by pSparseMemoryRequirementCount is not 0, and pSparseMemoryRequirements is not NULL, pSparseMemoryRequirements must be a valid pointer to an array of pSparseMemoryRequirementCount VkSparseImageMemoryRequirements2 structures

The VkImageSparseMemoryRequirementsInfo2 structure is defined as:

```c
typedef struct VkImageSparseMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageSparseMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageSparseMemoryRequirementsInfo2 VkImageSparseMemoryRequirementsInfo2KHR;
```

• sType is the type of this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• image is the image to query.
Valid Usage (Implicit)

- VUID-VkImageSparseMemoryRequirementsInfo2-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_IMAGE_SPARSE_MEMORY_REQUIREMENTS_INFO_2`

- VUID-VkImageSparseMemoryRequirementsInfo2-pNext-pNext
  
  **pNext** must be **NULL**

- VUID-VkImageSparseMemoryRequirementsInfo2-image-parameter
  
  **image** must be a valid `VkImage` handle

The `VkSparseImageMemoryRequirements2` structure is defined as:

```c
typedef struct VkSparseImageMemoryRequirements2 {
    VkStructureType sType;
    void* pNext;
    VkSparseImageMemoryRequirements memoryRequirements;
} VkSparseImageMemoryRequirements2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkSparseImageMemoryRequirements2 VkSparseImageMemoryRequirements2KHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **memoryRequirements** is a `VkSparseImageMemoryRequirements` structure describing the memory requirements of the sparse image.

Valid Usage (Implicit)

- VUID-VkSparseImageMemoryRequirements2-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_SPARSE_IMAGE_MEMORY_REQUIREMENTS_2`

- VUID-VkSparseImageMemoryRequirements2-pNext-pNext
  
  **pNext** must be **NULL**

32.7.6. Binding Resource Memory

Non-sparse resources are backed by a single physical allocation prior to device use (via `vkBindImageMemory` or `vkBindBufferMemory`), and their backing **must** not be changed. On the other hand, sparse resources **can** be bound to memory non-contiguously and these bindings **can** be altered during the lifetime of the resource.
Note
It is important to note that freeing a `VkDeviceMemory` object with `vkFreeMemory` will not cause resources (or resource regions) bound to the memory object to become unbound. Applications must not access resources bound to memory that has been freed.

Sparse memory bindings execute on a queue that includes the `VK_QUEUE_SPARSE_BINDING_BIT` bit. Applications must use synchronization primitives to guarantee that other queues do not access ranges of memory concurrently with a binding change. Applications can access other ranges of the same resource while a bind operation is executing.

Note
Implementations must provide a guarantee that simultaneously binding sparse blocks while another queue accesses those same sparse blocks via a sparse resource must not access memory owned by another process or otherwise corrupt the system.

While some implementations may include `VK_QUEUE_SPARSE_BINDING_BIT` support in queue families that also include graphics and compute support, other implementations may only expose a `VK_QUEUE_SPARSE_BINDING_BIT`-only queue family. In either case, applications must use synchronization primitives to explicitly request any ordering dependencies between sparse memory binding operations and other graphics/compute/transfer operations, as sparse binding operations are not automatically ordered against command buffer execution, even within a single queue.

When binding memory explicitly for the `VK_IMAGE_ASPECT_METADATA_BIT` the application must use the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` flag in the `VkSparseMemoryBind::flags` field when binding memory. Binding memory for metadata is done the same way as binding memory for the mip tail, with the addition of the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` flag.

Binding the mip tail for any aspect must only be performed using `VkSparseImageOpaqueMemoryBindInfo`. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, then it can be bound with a single `VkSparseMemoryBind` structure, with `resourceOffset = imageMipTailOffset` and `size = imageMipTailSize`.

If `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` then the offset for the mip tail in each array layer is given as:

```
arrayMipTailOffset = imageMipTailOffset + arrayLayer * imageMipTailStride;
```

and the mip tail can be bound with `layerCount` `VkSparseMemoryBind` structures, each using `size = imageMipTailSize` and `resourceOffset = arrayMipTailOffset` as defined above.

Sparse memory binding is handled by the following APIs and related data structures.
Sparse Memory Binding Functions

The `VkSparseMemoryBind` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseMemoryBind {
    VkDeviceSize resourceOffset;
    VkDeviceSize size;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    VkSparseMemoryBindFlags flags;
} VkSparseMemoryBind;
```

- `resourceOffset` is the offset into the resource.
- `size` is the size of the memory region to be bound.
- `memory` is the `VkDeviceMemory` object that the range of the resource is bound to. If `memory` is `VK_NULL_HANDLE`, the range is unbound.
- `memoryOffset` is the offset into the `VkDeviceMemory` object to bind the resource range to. If `memory` is `VK_NULL_HANDLE`, this value is ignored.
- `flags` is a bitmask of `VkSparseMemoryBindFlagBits` specifying usage of the binding operation.

The binding range `[resourceOffset, resourceOffset + size)` has different constraints based on `flags`. If `flags` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range must be within the mip tail region of the metadata aspect. This metadata region is defined by:

```
metadataRegion = [base, base + imageMipTailSize)
```

```
base = imageMipTailOffset + imageMipTailStride × n
```

and `imageMipTailOffset`, `imageMipTailSize`, and `imageMipTailStride` values are from the `VkSparseImageMemoryRequirements` corresponding to the metadata aspect of the image, and n is a valid array layer index for the image,

`imageMipTailStride` is considered to be zero for aspects where `VkSparseImageMemoryRequirements::formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`.

If `flags` does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range must be within the range `[0, VkMemoryRequirements::size)`.
Valid Usage

- VUID-VkSparseMemoryBind-memory-01096
  If `memory` is not `VK_NULL_HANDLE`, `memory` and `memoryOffset` must match the memory requirements of the resource, as described in section Resource Memory Association.

- VUID-VkSparseMemoryBind-memory-01097
  If `memory` is not `VK_NULL_HANDLE`, `memory` must not have been created with a memory type that reports `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set.

- VUID-VkSparseMemoryBind-size-01098
  `size` must be greater than 0.

- VUID-VkSparseMemoryBind-resourceOffset-01099
  `resourceOffset` must be less than the size of the resource.

- VUID-VkSparseMemoryBind-size-01100
  `size` must be less than or equal to the size of the resource minus `resourceOffset`.

- VUID-VkSparseMemoryBind-memoryOffset-01101
  `memoryOffset` must be less than the size of `memory`.

- VUID-VkSparseMemoryBind-size-01102
  `size` must be less than or equal to the size of `memory` minus `memoryOffset`.

- VUID-VkSparseMemoryBind-memory-02730
  If `memory` was created with `VkExportMemoryAllocateInfo::handleTypes` not equal to 0, at least one handle type it contained must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created.

- VUID-VkSparseMemoryBind-memory-02731
  If `memory` was created by a memory import operation, the external handle type of the imported memory must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created.

Valid Usage (Implicit)

- VUID-VkSparseMemoryBind-memory-parameter
  If `memory` is not `VK_NULL_HANDLE`, `memory` must be a valid `VkDeviceMemory` handle.

- VUID-VkSparseMemoryBind-flags-parameter
  `flags` must be a valid combination of `VkSparseMemoryBindFlagBits` values.

Bits which can be set in `VkSparseMemoryBind::flags`, specifying usage of a sparse memory binding operation, are:
typedef enum VkSparseMemoryBindFlagBits {
    VK_SPARSE_MEMORY_BIND_METADATA_BIT = 0x00000001,
} VkSparseMemoryBindFlagBits;

- **VK_SPARSE_MEMORY_BIND_METADATA_BIT** specifies that the memory being bound is only for the metadata aspect.

typedef VkFlags VkSparseMemoryBindFlags;

VkSparseMemoryBindFlags is a bitmask type for setting a mask of zero or more VkSparseMemoryBindFlagBits.

Memory is bound to VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT flag using the following structure:

typedef struct VkSparseBufferMemoryBindInfo {
    VkBuffer buffer;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseBufferMemoryBindInfo;

- **buffer** is the VkBuffer object to be bound.
- **bindCount** is the number of VkSparseMemoryBind structures in the pBinds array.
- **pBinds** is a pointer to an array of VkSparseMemoryBind structures.

Valid Usage (Implicit)

- VUID-VkSparseBufferMemoryBindInfo-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-VkSparseBufferMemoryBindInfo-pBinds-parameter
  pBinds must be a valid pointer to an array of bindCount valid VkSparseMemoryBind structures

- VUID-VkSparseBufferMemoryBindInfo-bindCount-arraylength
  bindCount must be greater than 0

Memory is bound to opaque regions of VkImage objects created with the VK_IMAGE_CREATE_SPARSE_BINDING_BIT flag using the following structure:
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageOpaqueMemoryBindInfo {
    VkImage image;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseImageOpaqueMemoryBindInfo;

- **image** is the VkImage object to be bound.
- **bindCount** is the number of VkSparseMemoryBind structures in the pBinds array.
- **pBinds** is a pointer to an array of VkSparseMemoryBind structures.

### Valid Usage

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-01103
  If the **flags** member of any element of pBinds contains VK_SPARSE_MEMORY_BIND_METADATA_BIT, the binding range defined **must** be within the mip tail region of the metadata aspect of image

### Valid Usage ( Implicit )

- VUID-VkSparseImageOpaqueMemoryBindInfo-image-parameter
  image **must** be a valid VkImage handle

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-parameter
  pBinds **must** be a valid pointer to an array of bindCount valid VkSparseMemoryBind structures

- VUID-VkSparseImageOpaqueMemoryBindInfo-bindCount-arraylength
  bindCount **must** be greater than 0
Note

This operation is normally used to bind memory to fully-resident sparse images or for mip tail regions of partially resident images. However, it can also be used to bind memory for the entire binding range of partially resident images.

In case flags does not contain VK_SPARSE_MEMORY_BIND_METADATA_BIT, the resourceOffset is in the range [0, VkMemoryRequirements::size). This range includes data from all aspects of the image, including metadata. For most implementations this will probably mean that the resourceOffset is a simple device address offset within the resource. It is possible for an application to bind a range of memory that includes both resource data and metadata. However, the application would not know what part of the image the memory is used for, or if any range is being used for metadata.

When flags contains VK_SPARSE_MEMORY_BIND_METADATA_BIT, the binding range specified must be within the mip tail region of the metadata aspect. In this case the resourceOffset is not required to be a simple device address offset within the resource. However, it is defined to be within [imageMipTailOffset, imageMipTailOffset + imageMipTailSize) for the metadata aspect. See VkSparseMemoryBind for the full constraints on binding region with this flag present.

Memory can be bound to sparse image blocks of VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag using the following structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBindInfo {
    VkImage image;
    uint32_t bindCount;
    const VkSparseImageMemoryBind* pBinds;
} VkSparseImageMemoryBindInfo;
```

- **image** is the VkImage object to be bound
- **bindCount** is the number of VkSparseImageMemoryBind structures in pBinds array
- **pBinds** is a pointer to an array of VkSparseImageMemoryBind structures
Valid Usage

- VUID-VkSparseImageMemoryBindInfo-subresource-01722
  The `subresource.mipLevel` member of each element of `pBinds` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

- VUID-VkSparseImageMemoryBindInfo-subresource-01723
  The `subresource.arrayLayer` member of each element of `pBinds` must be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

- VUID-VkSparseImageMemoryBindInfo-image-02901
  `image` must have been created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set.

Valid Usage (Implicit)

- VUID-VkSparseImageMemoryBindInfo-image-parameter
  `image` must be a valid `VkImage` handle.

- VUID-VkSparseImageMemoryBindInfo-pBinds-parameter
  `pBinds` must be a valid pointer to an array of `bindCount` valid `VkSparseImageMemoryBind` structures.

- VUID-VkSparseImageMemoryBindInfo-bindCount-arraylength
  `bindCount` must be greater than 0.

The `VkSparseImageMemoryBind` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBind {
  VkImageSubresource subresource;
  VkOffset3D offset;
  VkExtent3D extent;
  VkDeviceMemory memory;
  VkDeviceSize memoryOffset;
  VkSparseMemoryBindFlags flags;
} VkSparseImageMemoryBind;
```

- `subresource` is the image `aspect` and region of interest in the image.
- `offset` are the coordinates of the first texel within the image subresource to bind.
- `extent` is the size in texels of the region within the image subresource to bind. The extent must be a multiple of the sparse image block dimensions, except when binding sparse image blocks along the edge of an image subresource it can instead be such that any coordinate of `offset + extent` equals the corresponding dimensions of the image subresource.
- `memory` is the `VkDeviceMemory` object that the sparse image blocks of the image are bound to. If `memory` is `VK_NULL_HANDLE`, the sparse image blocks are unbound.
- `memoryOffset` is an offset into `VkDeviceMemory` object. If `memory` is `VK_NULL_HANDLE`, this value
is ignored.

- **flags** are sparse memory binding flags.

## Valid Usage

- **VUID-VkSparseImageMemoryBind-memory-01104**
  If the sparse aliased residency feature is not enabled, and if any other resources are bound to ranges of memory, the range of memory being bound **must** not overlap with those bound ranges.

- **VUID-VkSparseImageMemoryBind-memory-01105**
  memory and memoryOffset **must** match the memory requirements of the calling command’s image, as described in section Resource Memory Association.

- **VUID-VkSparseImageMemoryBind-subresource-01106**
  subresource **must** be a valid image subresource for image (see Image Views).

- **VUID-VkSparseImageMemoryBind-offset-01107**
  offset.x **must** be a multiple of the sparse image block width (VkSparseImageFormatProperties::imageGranularity.width) of the image.

- **VUID-VkSparseImageMemoryBind-extent-01108**
  extent.width **must** either be a multiple of the sparse image block width of the image, or else (extent.width + offset.x) **must** equal the width of the image subresource.

- **VUID-VkSparseImageMemoryBind-offset-01109**
  offset.y **must** be a multiple of the sparse image block height (VkSparseImageFormatProperties::imageGranularity.height) of the image.

- **VUID-VkSparseImageMemoryBind-extent-01110**
  extent.height **must** either be a multiple of the sparse image block height of the image, or else (extent.height + offset.y) **must** equal the height of the image subresource.

- **VUID-VkSparseImageMemoryBind-offset-01111**
  offset.z **must** be a multiple of the sparse image block depth (VkSparseImageFormatProperties::imageGranularity.depth) of the image.

- **VUID-VkSparseImageMemoryBind-extent-01112**
  extent.depth **must** either be a multiple of the sparse image block depth of the image, or else (extent.depth + offset.z) **must** equal the depth of the image subresource.

- **VUID-VkSparseImageMemoryBind-memory-02732**
  If memory was created with VkExportMemoryAllocateInfo::handleTypes not equal to 0, at least one handle type it contained **must** also have been set in VkExternalMemoryImageCreateInfo::handleTypes when the image was created.

- **VUID-VkSparseImageMemoryBind-memory-02733**
  If memory was created by a memory import operation, the external handle type of the imported memory **must** also have been set in VkExternalMemoryImageCreateInfo::handleTypes when image was created.
Valid Usage (Implicit)

- **VUID-VkSparseImageMemoryBind-subresource-parameter**
  
  subresource must be a valid VkImageSubresource structure

- **VUID-VkSparseImageMemoryBind-memory-parameter**
  
  If memory is not VK_NULL_HANDLE, memory must be a valid VkDeviceMemory handle

- **VUID-VkSparseImageMemoryBind-flags-parameter**
  
  flags must be a valid combination of VkSparseMemoryBindFlagBits values

To submit sparse binding operations to a queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueBindSparse(
    VkQueue queue,  
    uint32_t bindInfoCount,  
    const VkBindSparseInfo* pBindInfo,  
    VkFence fence);
```

- `queue` is the queue that the sparse binding operations will be submitted to.
- `bindInfoCount` is the number of elements in the `pBindInfo` array.
- `pBindInfo` is a pointer to an array of VkBindSparseInfo structures, each specifying a sparse binding submission batch.
- `fence` is an **optional** handle to a fence to be signaled. If `fence` is not VK_NULL_HANDLE, it defines a fence signal operation.

`vkQueueBindSparse` is a **queue submission command**, with each batch defined by an element of `pBindInfo` as a VkBindSparseInfo structure. Batches begin execution in the order they appear in `pBindInfo`, but may complete out of order.

Within a batch, a given range of a resource **must** not be bound more than once. Across batches, if a range is to be bound to one allocation and offset and then to another allocation and offset, then the application **must** guarantee (usually using semaphores) that the binding operations are executed in the correct order, as well as to order binding operations against the execution of command buffer submissions.

As no operation to `vkQueueBindSparse` causes any pipeline stage to access memory, synchronization primitives used in this command effectively only define execution dependencies.

Additional information about fence and semaphore operation is described in the synchronization chapter.
Valid Usage

- VUID-vkQueueBindSparse-fence-01113
  If fence is not VK_NULL_HANDLE, fence must be unsignaled

- VUID-vkQueueBindSparse-fence-01114
  If fence is not VK_NULL_HANDLE, fence must not be associated with any other queue command that has not yet completed execution on that queue

- VUID-vkQueueBindSparse-pSignalSemaphores-01115
  Each element of the pSignalSemaphores member of each element of pBindInfo must be unsignaled when the semaphore signal operation it defines is executed on the device

- VUID-vkQueueBindSparse-pWaitSemaphores-01116
  When a semaphore wait operation referring to a binary semaphore defined by any element of the pWaitSemaphores member of any element of pBindInfo executes on queue, there must be no other queues waiting on the same semaphore

- VUID-vkQueueBindSparse-pWaitSemaphores-01117
  All elements of the pWaitSemaphores member of all elements of pBindInfo referring to a binary semaphore must be semaphores that are signaled, or have semaphore signal operations previously submitted for execution

- VUID-vkQueueBindSparse-pWaitSemaphores-03245
  All elements of the pWaitSemaphores member of all elements of pBindInfo created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) must have also been submitted for execution

Valid Usage (Implicit)

- VUID-vkQueueBindSparse-queue-parameter
  queue must be a valid VkQueue handle

- VUID-vkQueueBindSparse-pBindInfo-parameter
  If bindInfoCount is not 0, pBindInfo must be a valid pointer to an array of bindInfoCount valid VkBindSparseInfo structures

- VUID-vkQueueBindSparse-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

- VUID-vkQueueBindSparse-queuetype
  The queue must support sparse binding operations

- VUID-vkQueueBindSparse-commonparent
  Both of fence, and queue that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to queue must be externally synchronized
- Host access to pBindInfo[].pBufferBinds[].buffer must be externally synchronized
- Host access to pBindInfo[].pImageOpaqueBinds[].image must be externally synchronized
- Host access to pBindInfo[].pImageBinds[].image must be externally synchronized
- Host access to fence must be externally synchronized

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The VkBindSparseInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBindSparseInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t bufferBindCount;
    const VkSparseBufferMemoryBindInfo* pBufferBinds;
    uint32_t imageOpaqueBindCount;
    const VkSparseImageOpaqueMemoryBindInfo* pImageOpaqueBinds;
    uint32_t imageBindCount;
    const VkSparseImageMemoryBindInfo* pImageBinds;
    uint32_t signalSemaphoreCount;
    const VkSemaphore* pSignalSemaphores;
} VkBindSparseInfo;
```
• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **waitSemaphoreCount** is the number of semaphores upon which to wait before executing the sparse binding operations for the batch.

• **pWaitSemaphores** is a pointer to an array of semaphores upon which to wait on before the sparse binding operations for this batch begin execution. If semaphores to wait on are provided, they define a **semaphore wait operation**.

• **bufferBindCount** is the number of sparse buffer bindings to perform in the batch.

• **pBufferBinds** is a pointer to an array of **VkSparseBufferMemoryBindInfo** structures.

• **imageOpaqueBindCount** is the number of opaque sparse image bindings to perform.

• **pImageOpaqueBinds** is a pointer to an array of **VkSparseImageOpaqueMemoryBindInfo** structures, indicating opaque sparse image bindings to perform.

• **imageBindCount** is the number of sparse image bindings to perform.

• **pImageBinds** is a pointer to an array of **VkSparseImageMemoryBindInfo** structures, indicating sparse image bindings to perform.

• **signalSemaphoreCount** is the number of semaphores to be signaled once the sparse binding operations specified by the structure have completed execution.

• **pSignalSemaphores** is a pointer to an array of semaphores which will be signaled when the sparse binding operations for this batch have completed execution. If semaphores to be signaled are provided, they define a **semaphore signal operation**.
Valid Usage

- VUID-VkBindSparseInfo-pWaitSemaphores-03246
  If any element of `pWaitSemaphores` or `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then the `pNext` chain must include a `VkTimelineSemaphoreSubmitInfo` structure.

- VUID-VkBindSparseInfo-pNext-03247
  If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pWaitSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `waitSemaphoreValueCount` member must equal `waitSemaphoreCount`.

- VUID-VkBindSparseInfo-pNext-03248
  If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `signalSemaphoreValueCount` member must equal `signalSemaphoreCount`.

- VUID-VkBindSparseInfo-pSignalSemaphores-03249
  For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value greater than the current value of the semaphore when the semaphore signal operation is executed.

- VUID-VkBindSparseInfo-pWaitSemaphores-03250
  For each element of `pWaitSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues` must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.

- VUID-VkBindSparseInfo-pSignalSemaphores-03251
  For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.
Valid Usage (Implicit)

- **VUID-VkBindSparseInfo-sType-sType**
  
  sType must be VK_STRUCTURE_TYPE_BIND_SPARSE_INFO

- **VUID-VkBindSparseInfo-pNext-pNext**
  
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceGroupBindSparseInfo or VkTimelineSemaphoreSubmitInfo

- **VUID-VkBindSparseInfo-sType-unique**
  
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkBindSparseInfo-pWaitSemaphores-parameter**
  
  If waitSemaphoreCount is not 0, pWaitSemaphores must be a valid pointer to an array of waitSemaphoreCount valid VkSemaphore handles

- **VUID-VkBindSparseInfo-pBufferBinds-parameter**
  
  If bufferBindCount is not 0, pBufferBinds must be a valid pointer to an array of bufferBindCount valid VkSparseBufferMemoryBindInfo structures

- **VUID-VkBindSparseInfo-pImageOpaqueBinds-parameter**
  
  If imageOpaqueBindCount is not 0, pImageOpaqueBinds must be a valid pointer to an array of imageOpaqueBindCount valid VkSparseImageOpaqueMemoryBindInfo structures

- **VUID-VkBindSparseInfo-pImageBinds-parameter**
  
  If imageBindCount is not 0, pImageBinds must be a valid pointer to an array of imageBindCount valid VkSparseImageMemoryBindInfo structures

- **VUID-VkBindSparseInfo-pSignalSemaphores-parameter**
  
  If signalSemaphoreCount is not 0, pSignalSemaphores must be a valid pointer to an array of signalSemaphoreCount valid VkSemaphore handles

- **VUID-VkBindSparseInfo-commonparent**
  
  Both of the elements of pSignalSemaphores, and the elements of pWaitSemaphores that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

To specify the values to use when waiting for and signaling semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, add a VkTimelineSemaphoreSubmitInfo structure to the pNext chain of the VkBindSparseInfo structure.

If the pNext chain of VkBindSparseInfo includes a VkDeviceGroupBindSparseInfo structure, then that structure includes device indices specifying which instance of the resources and memory are bound.

The VkDeviceGroupBindSparseInfo structure is defined as:

```c
typedef struct VkDeviceGroupBindSparseInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t resourceDeviceIndex;
    uint32_t memoryDeviceIndex;
} VkDeviceGroupBindSparseInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupBindSparseInfo VkDeviceGroupBindSparseInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `resourceDeviceIndex` is a device index indicating which instance of the resource is bound.
- `memoryDeviceIndex` is a device index indicating which instance of the memory the resource instance is bound to.

These device indices apply to all buffer and image memory binds included in the batch pointing to this structure. The semaphore waits and signals for the batch are executed only by the physical device specified by the `resourceDeviceIndex`.

If this structure is not present, `resourceDeviceIndex` and `memoryDeviceIndex` are assumed to be zero.

**Valid Usage**

- VUID-VkDeviceGroupBindSparseInfo-resourceDeviceIndex-01118
  `resourceDeviceIndex` and `memoryDeviceIndex` must both be valid device indices

- VUID-VkDeviceGroupBindSparseInfo-memoryDeviceIndex-01119
  Each memory allocation bound in this batch must have allocated an instance for `memoryDeviceIndex`

**Valid Usage (Implicit)**

- VUID-VkDeviceGroupBindSparseInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_BIND_SPARSE_INFO`
Chapter 33. Window System Integration (WSI)

This chapter discusses the window system integration (WSI) between the Vulkan API and the various forms of displaying the results of rendering to a user. Since the Vulkan API can be used without displaying results, WSI is provided through the use of optional Vulkan extensions. This chapter provides an overview of WSI. See the appendix for additional details of each WSI extension, including which extensions must be enabled in order to use each of the functions described in this chapter.

33.1. WSI Platform

A platform is an abstraction for a window system, OS, etc. Some examples include MS Windows, Android, and Wayland. The Vulkan API may be integrated in a unique manner for each platform.

The Vulkan API does not define any type of platform object. Platform-specific WSI extensions are defined, each containing platform-specific functions for using WSI. Use of these extensions is guarded by preprocessor symbols as defined in the Window System-Specific Header Control appendix.

In order for an application to be compiled to use WSI with a given platform, it must either:

- #define the appropriate preprocessor symbol prior to including the vulkan.h header file, or
- include vulkan_core.h and any native platform headers, followed by the appropriate platform-specific header.

The preprocessor symbols and platform-specific headers are defined in the Window System Extensions and Headers table.

Each platform-specific extension is an instance extension. The application must enable instance extensions with vkCreateInstance before using them.

33.2. WSI Surface

Native platform surface or window objects are abstracted by surface objects, which are represented by VkSurfaceKHR handles:

```c
// Provided by VK_KHR_surface
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSurfaceKHR)
```

The VK_KHR_surface extension declares the VkSurfaceKHR object, and provides a function for destroying VkSurfaceKHR objects. Separate platform-specific extensions each provide a function for creating a VkSurfaceKHR object for the respective platform. From the application’s perspective this is an opaque handle, just like the handles of other Vulkan objects.
33.2.1. Android Platform

To create a VkSurfaceKHR object for an Android native window, call:

```c
// Provided by VK_KHR_android_surface
VkResult vkCreateAndroidSurfaceKHR(
    VkInstance instance,
    const VkAndroidSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a VkAndroidSurfaceCreateInfoKHR structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

During the lifetime of a surface created using a particular ANativeWindow handle any attempts to create another surface for the same ANativeWindow and any attempts to connect to the same ANativeWindow through other platform mechanisms will fail.

**Note**

In particular, only one VkSurfaceKHR can exist at a time for a given window. Similarly, a native window cannot be used by both a VkSurfaceKHR and EGLSurface simultaneously.

If successful, vkCreateAndroidSurfaceKHR increments the ANativeWindow's reference count, and vkDestroySurfaceKHR will decrement it.

On Android, when a swapchain's imageExtent does not match the surface's currentExtent, the presentable images will be scaled to the surface's dimensions during presentation. minImageExtent is (1,1), and maxImageExtent is the maximum image size supported by the consumer. For the system composer, currentExtent is the window size (i.e. the consumer's preferred size).
Valid Usage (Implicit)

- **VUID-vkCreateAndroidSurfaceKHR-instance-parameter**
  instance must be a valid VkInstance handle

- **VUID-vkCreateAndroidSurfaceKHR-pCreateInfo-parameter**
  pCreateInfo must be a valid pointer to a valid VkAndroidSurfaceCreateInfoKHR structure

- **VUID-vkCreateAndroidSurfaceKHR-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- **VUID-vkCreateAndroidSurfaceKHR-pSurface-parameter**
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The `VkAndroidSurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_android_surface
typedef struct VkAndroidSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAndroidSurfaceCreateFlagsKHR flags;
    struct ANativeWindow* window;
} VkAndroidSurfaceCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **window** is a pointer to the ANativeWindow to associate the surface with.

Valid Usage

- **VUID-VkAndroidSurfaceCreateInfoKHR-window-01248**
  window must point to a valid Android ANativeWindow
Valid Usage (Implicit)

- **VUID-VkAndroidSurfaceCreateInfoKHR-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_ANDROID_SURFACE_CREATE_INFO_KHR`

- **VUID-VkAndroidSurfaceCreateInfoKHR-pNext-pNext**
  - `pNext` **must** be `NULL`

- **VUID-VkAndroidSurfaceCreateInfoKHR-flags-zerobitmask**
  - `flags` **must** be `0`

To remove an unnecessary compile-time dependency, an incomplete type definition of `ANativeWindow` is provided in the Vulkan headers:

```c
// Provided by VK_KHR_android_surface
struct ANativeWindow;
```

The actual `ANativeWindow` type is defined in Android NDK headers.

```c
// Provided by VK_KHR_android_surface
typedef VkFlags VkAndroidSurfaceCreateFlagsKHR;
```

`VkAndroidSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.2. Wayland Platform

To create a `VkSurfaceKHR` object for a Wayland surface, call:

```c
// Provided by VK_KHR_wayland_surface
VkResult vkCreateWaylandSurfaceKHR(
    VkInstance instance,
    const VkWaylandSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkWaylandSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.
**Valid Usage (Implicit)**

- VUID-vkCreateWaylandSurfaceKHR-instance-parameter
  
  **instance** must be a valid **VkInstance** handle

- VUID-vkCreateWaylandSurfaceKHR-pCreateInfo-parameter
  
  **pCreateInfo** must be a valid pointer to a valid **VkWaylandSurfaceCreateInfoKHR** structure

- VUID-vkCreateWaylandSurfaceKHR-pAllocator-parameter
  
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkCreateWaylandSurfaceKHR-pSurface-parameter
  
  **pSurface** must be a valid pointer to a **VkSurfaceKHR** handle

**Return Codes**

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The **VkWaylandSurfaceCreateInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_wayland_surface
typedef struct VkWaylandSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWaylandSurfaceCreateFlagsKHR flags;
    struct wl_display* display;
    struct wl_surface* surface;
} VkWaylandSurfaceCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **display** and **surface** are pointers to the Wayland **wl_display** and **wl_surface** to associate the surface with.
Valid Usage

- VUID-VkWaylandSurfaceCreateInfoKHR-display-01304
  display must point to a valid Wayland wl_display

- VUID-VkWaylandSurfaceCreateInfoKHR-surface-01305
  surface must point to a valid Wayland wl_surface

Valid Usage (Implicit)

- VUID-VkWaylandSurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_WAYLAND_SURFACE_CREATE_INFO_KHR

- VUID-VkWaylandSurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkWaylandSurfaceCreateInfoKHR-flags-zerobitmask
  flags must be 0

On Wayland, currentExtent is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface. Whatever the application sets a swapchain's imageExtent to will be the size of the window, after the first image is presented. minImageExtent is (1,1), and maxImageExtent is the maximum supported surface size. Any calls to vkGetPhysicalDeviceSurfacePresentModesKHR on a surface created with vkCreateWaylandSurfaceKHR are required to return VK_PRESENT_MODE_MAILBOX_KHR as one of the valid present modes.

Some Vulkan functions may send protocol over the specified wl_display connection when using a swapchain or presentable images created from a VkSurfaceKHR referring to a wl_surface. Applications must therefore ensure that both the wl_display and the wl_surface remain valid for the lifetime of any VkSwapchainKHR objects created from a particular wl_display and wl_surface. Also, calling vkQueuePresentKHR will result in Vulkan sending wl_surface.commit requests to the underlying wl_surface of each VkSwapchainKHR objects referenced by pPresentInfo. If the swapchain is created with a present mode of VK_PRESENT_MODE_MAILBOX_KHR or VK_PRESENT_MODE_IMMEDIATE_KHR, then the corresponding wl_surface.attach, wl_surface.damage, and wl_surface.commit request must be issued by the implementation during the call to vkQueuePresentKHR and must not be issued by the implementation outside of vkQueuePresentKHR. This ensures that any Wayland requests sent by the client after the call to vkQueuePresentKHR returns will be received by the compositor after the wl_surface.commit. Regardless of the mode of swapchain creation, a new wl_event_queue must be created for each successful vkCreateWaylandSurfaceKHR call, and every Wayland object created by the implementation must be assigned to this event queue. If the platform provides Wayland 1.11 or greater, this must be implemented by the use of Wayland proxy object wrappers, to avoid race conditions.

If the application wishes to synchronize any window changes with a particular frame, such requests must be sent to the Wayland display server prior to calling vkQueuePresentKHR. For full control over interactions between Vulkan rendering and other Wayland protocol requests and events, a present mode of VK_PRESENT_MODE_MAILBOX_KHR should be used.
typedef VkFlags VkWaylandSurfaceCreateFlagsKHR;

VkWaylandSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.3. Win32 Platform

To create a VkSurfaceKHR object for a Win32 window, call:

```c
// Provided by VK_KHR_win32_surface

VkResult vkCreateWin32SurfaceKHR(
    VkInstance instance,
    const VkWin32SurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a VkWin32SurfaceCreateInfoKHR structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateWin32SurfaceKHR-instance-parameter
  - `instance` must be a valid VkInstance handle
- VUID-vkCreateWin32SurfaceKHR-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid VkWin32SurfaceCreateInfoKHR structure
- VUID-vkCreateWin32SurfaceKHR-pAllocator-parameter
  - If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateWin32SurfaceKHR-pSurface-parameter
  - `pSurface` must be a valid pointer to a VkSurfaceKHR handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkWin32SurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_win32_surface
typedef struct VkWin32SurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWin32SurfaceCreateFlagsKHR flags;
    HINSTANCE hinstance;
    HWND hwnd;
} VkWin32SurfaceCreateInfoKHR;
```

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `hinstance` is the Win32 `HINSTANCE` for the window to associate the surface with.
• `hwnd` is the Win32 `HWND` for the window to associate the surface with.

Valid Usage

• VUID-VkWin32SurfaceCreateInfoKHR-hinstance-01307
  `hinstance` must be a valid Win32 `HINSTANCE`

• VUID-VkWin32SurfaceCreateInfoKHR hwnd-01308
  `hwnd` must be a valid Win32 `HWND`

Valid Usage (Implicit)

• VUID-VkWin32SurfaceCreateInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_WIN32_SURFACE_CREATE_INFO_KHR`

• VUID-VkWin32SurfaceCreateInfoKHR-pNext-pNext
  `pNext` must be `NULL`

• VUID-VkWin32SurfaceCreateInfoKHR-flags-zerobitmask
  `flags` must be `0`
With Win32, \texttt{minImageExtent}, \texttt{maxImageExtent}, and \texttt{currentExtent} must always equal the window size. The \texttt{currentExtent} of a Win32 surface must have both width and height greater than 0, or both of them 0.

\begin{quote}
\textbf{Note}

Due to above restrictions, it is only possible to create a new swapchain on this platform with \texttt{imageExtent} being equal to the current size of the window.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.
\end{quote}

\begin{verbatim}
// Provided by VK_KHR_win32_surface
typedef VkFlags VkWin32SurfaceCreateFlagsKHR;
\end{verbatim}

\texttt{VkWin32SurfaceCreateFlagsKHR} is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.4. XCB Platform

To create a \texttt{VkSurfaceKHR} object for an X11 window, using the XCB client-side library, call:

\begin{verbatim}
// Provided by VK_KHR_xcb_surface
VkResult vkCreateXcbSurfaceKHR(
    VkInstance instance,
    const VkXcbSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
\end{verbatim}

- \texttt{instance} is the instance to associate the surface with.
- \texttt{pCreateInfo} is a pointer to a \texttt{VkXcbSurfaceCreateInfoKHR} structure containing parameters affecting the creation of the surface object.
- \texttt{pAllocator} is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- \texttt{pSurface} is a pointer to a \texttt{VkSurfaceKHR} handle in which the created surface object is returned.
Valid Usage (Implicit)

- **VUID-vkCreateXcbSurfaceKHR-instance-parameter**
  instance must be a valid VkInstance handle

- **VUID-vkCreateXcbSurfaceKHR-pCreateInfo-parameter**
  pCreateInfo must be a valid pointer to a valid VkXcbSurfaceCreateInfoKHR structure

- **VUID-vkCreateXcbSurfaceKHR-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- **VUID-vkCreateXcbSurfaceKHR-pSurface-parameter**
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkXcbSurfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_xcb_surface
typedef struct VkXcbSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkXcbSurfaceCreateFlagsKHR flags;
    xcb_connection_t* connection;
    xcb_window_t window;
} VkXcbSurfaceCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **connection** is a pointer to an xcb_connection_t to the X server.
- **window** is the xcb_window_t for the X11 window to associate the surface with.
Valid Usage

- VUID-VkXcbSurfaceCreateInfoKHR-connection-01310
  connection must point to a valid X11 xcb_connection_t

- VUID-VkXcbSurfaceCreateInfoKHR-window-01311
  window must be a valid X11 xcb_window_t

Valid Usage (Implicit)

- VUID-VkXcbSurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_XCB_SURFACE_CREATE_INFO_KHR

- VUID-VkXcbSurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkXcbSurfaceCreateInfoKHR-flags-zerobitmask
  flags must be 0

With Xcb, minImageExtent, maxImageExtent, and currentExtent must always equal the window size.

The currentExtent of an Xcb surface must have both width and height greater than 0, or both of them 0.

Note
Due to above restrictions, it is only possible to create a new swapchain on this platform with imageExtent being equal to the current size of the window.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.

Some Vulkan functions may send protocol over the specified xcb connection when using a swapchain or presentable images created from a VkSurfaceKHR referring to an xcb window. Applications must therefore ensure the xcb connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with xcb-based swapchains must

- Avoid holding a server grab on an xcb connection while waiting for Vulkan operations to complete using a swapchain derived from a different xcb connection referring to the same X server instance. Failing to do so may result in deadlock.

// Provided by VK_KHR_xcb_surface
typedef VkFlags VkXcbSurfaceCreateFlagsKHR;

VkXcbSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.
33.2.5. Xlib Platform

To create a `VkSurfaceKHR` object for an X11 window, using the Xlib client-side library, call:

```c
// Provided by VK_KHR_xlib_surface
VkResult vkCreateXlibSurfaceKHR(
    VkInstance instance,
    const VkXlibSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a `VkXlibSurfaceCreateInfoKHR` structure containing the parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateXlibSurfaceKHR-instance-parameter
  - `instance` must be a valid `VkInstance` handle
- VUID-vkCreateXlibSurfaceKHR-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkXlibSurfaceCreateInfoKHR` structure
- VUID-vkCreateXlibSurfaceKHR-pAllocator-parameter
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateXlibSurfaceKHR-pSurface-parameter
  - `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkXlibSurfaceCreateInfoKHR` structure is defined as:
typedef struct VkXlibSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkXlibSurfaceCreateFlagsKHR flags;
    Display* dpy;
    Window window;
} VkXlibSurfaceCreateInfoKHR;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `dpy` is a pointer to an Xlib `Display` connection to the X server.
- `window` is an Xlib `Window` to associate the surface with.

**Valid Usage**

- VUID-VkXlibSurfaceCreateInfoKHR-dpy-01313
  `dpy` must point to a valid Xlib `Display`

- VUID-VkXlibSurfaceCreateInfoKHR-window-01314
  `window` must be a valid Xlib `Window`

**Valid Usage (Implicit)**

- VUID-VkXlibSurfaceCreateInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_XLIB_SURFACE_CREATE_INFO_KHR`

- VUID-VkXlibSurfaceCreateInfoKHR-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkXlibSurfaceCreateInfoKHR-flags-zerobitmask
  `flags` must be `0`

With Xlib, `minImageExtent`, `maxImageExtent`, and `currentExtent` must always equal the window size.

The `currentExtent` of an Xlib surface must have both `width` and `height` greater than 0, or both of them 0.

**Note**

Due to above restrictions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window.

The window size may become `(0, 0)` on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.
Some Vulkan functions may send protocol over the specified Xlib Display connection when using a swapchain or presentable images created from a VkSurfaceKHR referring to an Xlib window. Applications must therefore ensure the display connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with Xlib-based swapchains must

- Avoid holding a server grab on a display connection while waiting for Vulkan operations to complete using a swapchain derived from a different display connection referring to the same X server instance. Failing to do so may result in deadlock.

Some implementations may require threads to implement some presentation modes so applications must call XInitThreads() before calling any other Xlib functions.

```c
// Provided by VK_KHR_xlib_surface
typedef VkFlags VKXlibSurfaceCreateFlagsKHR;

VKXlibSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.6. DirectFB Platform

To create a VkSurfaceKHR object for a DirectFB surface, call:

```c
// Provided by VK_EXT_directfb_surface
VkResult vkCreateDirectFBSurfaceEXT(  
    VkInstance instance,  
    const VkDirectFBSurfaceCreateInfoEXT* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a VkDirectFBSurfaceCreateInfoEXT structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.
Valid Usage (Implicit)

- VUID-vkCreateDirectFBSurfaceEXT-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkCreateDirectFBSurfaceEXT-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkDirectFBSurfaceCreateInfoEXT structure

- VUID-vkCreateDirectFBSurfaceEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateDirectFBSurfaceEXT-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDirectFBSurfaceCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_directfb_surface
typedef struct VkDirectFBSurfaceCreateInfoEXT {
  VkStructureType sType;
  const void* pNext;
  VkDirectFBSurfaceCreateFlagsEXT flags;
  IDirectFB* dfb;
  IDirectFBSurface* surface;
} VkDirectFBSurfaceCreateInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- dfb is a pointer to the IDirectFB main interface of DirectFB.
- surface is a pointer to a IDirectFBSurface surface interface.
Valid Usage

- VUID-VkDirectFBSurfaceCreateInfoEXT-dfb-04117
  dfb must point to a valid DirectFB IDirectFB

- VUID-VkDirectFBSurfaceCreateInfoEXT-surface-04118
  surface must point to a valid DirectFB IDirectFBSurface

Valid Usage (Implicit)

- VUID-VkDirectFBSurfaceCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_DIRECTFB_SURFACE_CREATE_INFO_EXT

- VUID-VkDirectFBSurfaceCreateInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkDirectFBSurfaceCreateInfoEXT-flags-zeroBitmask
  flags must be 0

With DirectFB, minImageExtent, maxImageExtent, and currentExtent must always equal the surface size.

```c
// Provided by VK_EXT_directfb_surface
typedef VkFlags VkDirectFBSurfaceCreateFlagsEXT;
```

`VkDirectFBSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.7. Fuchsia Platform

To create a VkSurfaceKHR object for a Fuchsia ImagePipe, call:

```c
// Provided by VK_FUCHSIA_imagepipe_surface
VkResult vkCreateImagePipeSurfaceFUCHSIA(
    VkInstance            instance,
    const VkImagePipeSurfaceCreateInfoFUCHSIA*  pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR*         pSurface);
```

- `instance` is the instance to associate with the surface.
- `pCreateInfo` is a pointer to a `VkImagePipeSurfaceCreateInfoFUCHSIA` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see `Memory Allocation`).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.
Valid Usage (Implicit)

- VUID-vkCreateImagePipeSurfaceFUCHSIA-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkImagePipeSurfaceCreateInfoFUCHSIA structure

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkImagePipeSurfaceCreateInfoFUCHSIA structure is defined as:

```c
// Provided by VK_FUCHSIA_imagepipe_surface
typedef struct VkImagePipeSurfaceCreateInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkImagePipeSurfaceCreateFlagsFUCHSIA flags;
    zx_handle_t imagePipeHandle;
} VkImagePipeSurfaceCreateInfoFUCHSIA;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- imagePipeHandle is a zx_handle_t referring to the ImagePipe to associate with the surface.

Valid Usage

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-imagePipeHandle-04863
  imagePipeHandle must be a valid zx_handle_t
Valid Usage (Implicit)

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-sType-sType
  *sType must be VK_STRUCTURE_TYPE_IMAGEPIPE_SURFACE_CREATE_INFO_FUCHSIA*

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-pNext-pNext
  *pNext must be NULL*

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-flags-zerobitmask
  *flags must be 0*

On Fuchsia, the surface `currentExtent` is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

```c
// Provided by VK_FUCHSIA_imagepipe_surface
typedef VkFlags VkImagePipeSurfaceCreateFlagsFUCHSIA;
```

`VkImagePipeSurfaceCreateFlagsFUCHSIA` is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.8. Google Games Platform

To create a `VkSurfaceKHR` object for a Google Games Platform stream descriptor, call:

```c
// Provided by VK_GGP_stream_descriptor_surface
VkResult vkCreateStreamDescriptorSurfaceGGP(
    VkInstance instance,  // instance to associate with the surface.
    const VkStreamDescriptorSurfaceCreateInfoGGP* pCreateInfo,  // pCreateInfo is a pointer to a VkStreamDescriptorSurfaceCreateInfoGGP structure containing parameters that affect the creation of the surface object.
    const VkAllocationCallbacks* pAllocator,  // pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
    VkSurfaceKHR* pSurface  // pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.
);
```
Valid Usage (Implicit)

- VUID-vkCreateStreamDescriptorSurfaceGGP-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkCreateStreamDescriptorSurfaceGGP-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkStreamDescriptorSurfaceCreateInfoGGP structure

- VUID-vkCreateStreamDescriptorSurfaceGGP-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateStreamDescriptorSurfaceGGP-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkStreamDescriptorSurfaceCreateInfoGGP structure is defined as:

```c
// Provided by VK_GGP_stream_descriptor_surface
typedef struct VkStreamDescriptorSurfaceCreateInfoGGP {
    VkStructureType sType;
    const void* pNext;
    VkStreamDescriptorSurfaceCreateFlagsGGP flags;
    GgpStreamDescriptor streamDescriptor;
} VkStreamDescriptorSurfaceCreateInfoGGP;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- streamDescriptor is a GgpStreamDescriptor referring to the GGP stream descriptor to associate with the surface.
Valid Usage

- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-streamDescriptor-02681
  streamDescriptor must be a valid GgpStreamDescriptor

Valid Usage (Implicit)

- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-sType-sType
  sType must be VK_STRUCTURE_TYPE_STREAM_DESCRIPTOR_SURFACE_CREATE_INFO_GGP
- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-pNext-pNext
  pNext must be NULL
- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-flags-zerobitmask
  flags must be 0

On Google Games Platform, the surface extents are dynamic. The minImageExtent will never be greater than 1080p and the maxImageExtent will never be less than 1080p. The currentExtent will reflect the current optimal resolution.

Applications are expected to choose an appropriate size for the swapchain’s imageExtent, within the bounds of the surface. Using the surface’s currentExtent will offer the best performance and quality. When a swapchain’s imageExtent does not match the surface’s currentExtent, the presentable images are scaled to the surface’s dimensions during presentation if possible and VK_SUBOPTIMAL_KHR is returned, otherwise presentation fails with VK_ERROR_OUT_OF_DATE_KHR.

```c
// Provided by VK_GGP_stream_descriptor_surface
typedef VkFlags VkStreamDescriptorSurfaceCreateFlagsGGP;
```

VkStreamDescriptorSurfaceCreateFlagsGGP is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.9. iOS Platform

To create a VkSurfaceKHR object for an iOS UIView or CAMetalLayer, call:

```c
// Provided by VK_MVK_ios_surface
VkResult vkCreateIOSSurfaceMVK(
    VkInstance instance,
    const VkIOSSurfaceCreateInfoMVK* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```
The `vkCreateIOSSurfaceMVK` function is considered deprecated and has been superseded by `vkCreateMetalSurfaceEXT` from the `VK_EXT_metal_surface` extension.

- **instance** is the instance with which to associate the surface.
- **pCreateInfo** is a pointer to a `VkIOSSurfaceCreateInfoMVK` structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateIOSSurfaceMVK-instance-parameter
  - The **instance** must be a valid `VkInstance` handle
- VUID-vkCreateIOSSurfaceMVK-pCreateInfo-parameter
  - The **pCreateInfo** must be a valid pointer to a valid `VkIOSSurfaceCreateInfoMVK` structure
- VUID-vkCreateIOSSurfaceMVK-pAllocator-parameter
  - If **pAllocator** is not **NULL**, the **Allocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateIOSSurfaceMVK-pSurface-parameter
  - The **pSurface** must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR`

The `VkIOSSurfaceCreateInfoMVK` structure is defined as:
```c
// Provided by VK_MVK_ios_surface
typedef struct VkIOSSurfaceCreateInfoMVK {
    VkStructureType sType;
    const void* pNext;
    VkIOSSurfaceCreateFlagsMVK flags;
    const void* pView;
} VkIOSSurfaceCreateInfoMVK;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **pView** is a reference to either a CAMetalLayer object or a UIView object.

### Valid Usage

- **VUID-VkIOSSurfaceCreateInfoMVK-pView-04143**
  If **pView** is a CAMetalLayer object, it must be a valid CAMetalLayer.

- **VUID-VkIOSSurfaceCreateInfoMVK-pView-01316**
  If **pView** is a UIView object, it must be a valid UIView, must be backed by a CALayer object of type CAMetalLayer, and **vkCreateIOSSurfaceMVK** must be called on the main thread.

### Valid Usage (Implicit)

- **VUID-VkIOSSurfaceCreateInfoMVK-sType-sType**
  **sType** must be VK_STRUCTURE_TYPE_IOS_SURFACE_CREATE_INFO_MVK

- **VUID-VkIOSSurfaceCreateInfoMVK-pNext-pNext**
  **pNext** must be NULL

- **VUID-VkIOSSurfaceCreateInfoMVK-flags-zerobitmask**
  **flags** must be 0

```c
// Provided by VK_MVK_ios_surface
typedef VkFlags VkIOSSurfaceCreateFlagsMVK;
```

**VkIOSSurfaceCreateFlagsMVK** is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.10. macOS Platform

To create a **VkSurfaceKHR** object for a macOS NSView or CAMetalLayer, call:

```cpp
// Provided by VK_MVK_ios_surface
```
// Provided by VK_MVK_macos_surface
VkResult vkCreateMacOSSurfaceMVK(
    VkInstance instance,
    const VkMacOSSurfaceCreateInfoMVK* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);

Note
The `vkCreateMacOSSurfaceMVK` function is considered deprecated and has been
superseded by `vkCreateMetalSurfaceEXT` from the `VK_EXT_metal_surface` extension.

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a `VkMacOSSurfaceCreateInfoMVK` structure containing parameters
  affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is
  no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- `VUID-vkCreateMacOSSurfaceMVK-instance-parameter`
  `instance` must be a valid `VkInstance` handle
- `VUID-vkCreateMacOSSurfaceMVK-pCreateInfo-parameter`
  `pCreateInfo` must be a valid pointer to a valid `VkMacOSSurfaceCreateInfoMVK` structure
- `VUID-vkCreateMacOSSurfaceMVK-pAllocator-parameter`
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- `VUID-vkCreateMacOSSurfaceMVK-pSurface-parameter`
  `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success
- `VK_SUCCESS`

Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR`

The `VkMacOSSurfaceCreateInfoMVK` structure is defined as:
typedef struct VkMacOSSurfaceCreateInfoMVK {
    VkStructureType sType;
    const void* pNext;
    VkMacOSSurfaceCreateFlagsMVK flags;
    const void* pView;
} VkMacOSSurfaceCreateInfoMVK;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `pView` is a reference to either a `CAMetalLayer` object or an `NSView` object.

**Valid Usage**

- VUID-VkMacOSSurfaceCreateInfoMVK-pView-04144
  If `pView` is a `CAMetalLayer` object, it must be a valid `CAMetalLayer`

- VUID-VkMacOSSurfaceCreateInfoMVK-pView-01317
  If `pView` is an `NSView` object, it must be a valid `NSView`, must be backed by a `CALayer` object of type `CAMetalLayer`, and `vkCreateMacOSSurfaceMVK` must be called on the main thread

**Valid Usage (Implicit)**

- VUID-VkMacOSSurfaceCreateInfoMVK-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_MACOS_SURFACE_CREATE_INFO_MVK`

- VUID-VkMacOSSurfaceCreateInfoMVK-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkMacOSSurfaceCreateInfoMVK-flags-zerobitmask
  `flags` must be `0`

// Provided by VK_MVK_macos_surface
typedef VkFlags VkMacOSSurfaceCreateFlagsMVK;

`VkMacOSSurfaceCreateFlagsMVK` is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.11. VI Platform

To create a `VkSurfaceKHR` object for an `nn::vi::Layer`, query the layer's native handle using `nn::vi::GetNativeWindow`, and then call:
VkResult vkCreateViSurfaceNN(
    VkInstance instance,
    const VkViSurfaceCreateInfoNN* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a `VkViSurfaceCreateInfoNN` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

During the lifetime of a surface created using a particular `nn::vi::NativeWindowHandle`, applications must not attempt to create another surface for the same `nn::vi::Layer` or attempt to connect to the same `nn::vi::Layer` through other platform mechanisms.

If the native window is created with a specified size, `currentExtent` will reflect that size. In this case, applications should use the same size for the swapchain’s `imageExtent`. Otherwise, the `currentExtent` will have the special value `(0xFFFFFFFF, 0xFFFFFFFF)`, indicating that applications are expected to choose an appropriate size for the swapchain’s `imageExtent` (e.g., by matching the result of a call to `nn::vi::GetDisplayResolution`).

---

**Valid Usage (Implicit)**

- `VUID-vkCreateViSurfaceNN-instance-parameter`
  - `instance` must be a valid `VkInstance` handle
- `VUID-vkCreateViSurfaceNN-pCreateInfo-parameter`
  - `pCreateInfo` must be a valid pointer to a valid `VkViSurfaceCreateInfoNN` structure
- `VUID-vkCreateViSurfaceNN-pAllocator-parameter`
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- `VUID-vkCreateViSurfaceNN-pSurface-parameter`
  - `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle
Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR**

The `VkViSurfaceCreateInfoNN` structure is defined as:

```c
// Provided by VK_NN_vi_surface
typedef struct VkViSurfaceCreateInfoNN {
    VkStructureType sType;
    const void* pNext;
    VkViSurfaceCreateFlagsNN flags;
    void* window;
} VkViSurfaceCreateInfoNN;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **window** is the `nn::vi::NativeWindowHandle` for the `nn::vi::Layer` with which to associate the surface.

**Valid Usage**

- **VUID-VkViSurfaceCreateInfoNN-window-01318**
  `window` **must be** a valid `nn::vi::NativeWindowHandle`

**Valid Usage (Implicit)**

- **VUID-VkViSurfaceCreateInfoNN-sType-sType**
  `sType` **must be** `VK_STRUCTURE_TYPE_VI_SURFACE_CREATE_INFO_NN`

- **VUID-VkViSurfaceCreateInfoNN-pNext-pNext**
  `pNext` **must be** **NULL**

- **VUID-VkViSurfaceCreateInfoNN-flags-zerobitmask**
  `flags` **must be** 0
typedef VkFlags VkViSurfaceCreateFlagsNN;

VkViSurfaceCreateFlagsNN is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.12. Metal Platform

To create a VkSurfaceKHR object for a CAMetalLayer, call:

```c
// Provided by VK_EXT_metal_surface
VkResult vkCreateMetalSurfaceEXT(
    VkInstance instance,
    const VkMetalSurfaceCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a VkMetalSurfaceCreateInfoEXT structure specifying parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

```c
Valid Usage (Implicit)
```

- VUID-vkCreateMetalSurfaceEXT-instance-parameter
  - `instance` must be a valid VkInstance handle
- VUID-vkCreateMetalSurfaceEXT-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid VkMetalSurfaceCreateInfoEXT structure
- VUID-vkCreateMetalSurfaceEXT-pAllocator-parameter
  - If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateMetalSurfaceEXT-pSurface-parameter
  - `pSurface` must be a valid pointer to a VkSurfaceKHR handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkMetalSurfaceCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_metal_surface
typedef struct VkMetalSurfaceCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMetalSurfaceCreateFlagsEXT flags;
    const CAMetalLayer* pLayer;
} VkMetalSurfaceCreateInfoEXT;
```

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `pLayer` is a reference to a `CAMetalLayer` object representing a renderable surface.

Valid Usage (Implicit)

• VUID-VkMetalSurfaceCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_METAL_SURFACE_CREATE_INFO_EXT`
• VUID-VkMetalSurfaceCreateInfoEXT-pNext-pNext
  `pNext` must be `NULL`
• VUID-VkMetalSurfaceCreateInfoEXT-flags-zerobitmask
  `flags` must be `0`

To remove an unnecessary compile-time dependency, an incomplete type definition of `CAMetalLayer` is provided in the Vulkan headers:
The actual `CAMetalLayer` type is defined in the QuartzCore framework.

`VkMetalSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.13. QNX Screen Platform

To create a `VkSurfaceKHR` object for a QNX Screen surface, call:

```c
// Provided by VK_QNX_screen_surface
VkResult vkCreateScreenSurfaceQNX(
    VkInstance instance,
    const VkScreenSurfaceCreateInfoQNX* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkScreenSurfaceCreateInfoQNX` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.
Valid Usage (Implicit)

- VUID-vkCreateScreenSurfaceQNX-instance-parameter
  
  instance must be a valid VkInstance handle

- VUID-vkCreateScreenSurfaceQNX-pCreateInfo-parameter
  
  pCreateInfo must be a valid pointer to a valid VkScreenSurfaceCreateInfoQNX structure

- VUID-vkCreateScreenSurfaceQNX-pAllocator-parameter
  
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateScreenSurfaceQNX-pSurface-parameter
  
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkScreenSurfaceCreateInfoQNX structure is defined as:

```c
// Provided by VK_QNX_screen_surface
typedef struct VkScreenSurfaceCreateInfoQNX {
    VkStructureType sType;
    const void* pNext;
    VkScreenSurfaceCreateFlagsQNX flags;
    struct _screen_context* context;
    struct _screen_window* window;
} VkScreenSurfaceCreateInfoQNX;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- context and window are QNX Screen context and window to associate the surface with.
Valid Usage

- VUID-VkScreenSurfaceCreateInfoQNX-context-04741
  context must point to a valid QNX Screen struct _screen_context

- VUID-VkScreenSurfaceCreateInfoQNX-window-04742
  window must point to a valid QNX Screen struct _screen_window

Valid Usage (Implicit)

- VUID-VkScreenSurfaceCreateInfoQNX-sType-sType
  sType must be VK_STRUCTURE_TYPE_SCREEN_SURFACE_CREATE_INFO_QNX

- VUID-VkScreenSurfaceCreateInfoQNX-pNext-pNext
  pNext must be NULL

- VUID-VkScreenSurfaceCreateInfoQNX-flags-zerobitmask
  flags must be 0

// Provided by VK_QNX_screen_surface
typedef VkFlags VkScreenSurfaceCreateFlagsQNX;

VkScreenSurfaceCreateFlagsQNX is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.14. Platform-Independent Information

Once created, VkSurfaceKHR objects can be used in this and other extensions, in particular the VK_KHR_swapchain extension.

Several WSI functions return VK_ERROR_SURFACE_LOST_KHR if the surface becomes no longer available. After such an error, the surface (and any child swapchain, if one exists) should be destroyed, as there is no way to restore them to a not-lost state. Applications may attempt to create a new VkSurfaceKHR using the same native platform window object, but whether such re-creation will succeed is platform-dependent and may depend on the reason the surface became unavailable. A lost surface does not otherwise cause devices to be lost.

To destroy a VkSurfaceKHR object, call:

// Provided by VK_KHR_surface
void vkDestroySurfaceKHR(
    VkInstance instance,           // Provided by VK_KHR_surface
    VkSurfaceKHR surface,         // Provided by VK_KHR_surface
    const VkAllocationCallbacks* pAllocator);

- instance is the instance used to create the surface.
• **surface** is the surface to destroy.

• **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

Destroying a **VkSurfaceKHR** merely severs the connection between Vulkan and the native surface, and does not imply destroying the native surface, closing a window, or similar behavior.

---

**Valid Usage**

- VUID-vkDestroySurfaceKHR-surface-01266
  All **VkSwapchainKHR** objects created for **surface** must have been destroyed prior to destroying **surface**

- VUID-vkDestroySurfaceKHR-surface-01267
  If **VkAllocationCallbacks** were provided when **surface** was created, a compatible set of callbacks must be provided here

- VUID-vkDestroySurfaceKHR-surface-01268
  If no **VkAllocationCallbacks** were provided when **surface** was created, **pAllocator** must be **NULL**

---

**Valid Usage (Implicit)**

- VUID-vkDestroySurfaceKHR-instance-parameter
  **instance** must be a valid **VkInstance** handle

- VUID-vkDestroySurfaceKHR-surface-parameter
  If **surface** is not **VK_NULL_HANDLE**, **surface** must be a valid **VkSurfaceKHR** handle

- VUID-vkDestroySurfaceKHR-pAllocator-parameter
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkDestroySurfaceKHR-surface-parent
  If **surface** is a valid handle, it must have been created, allocated, or retrieved from **instance**

---

**Host Synchronization**

- Host access to **surface** must be externally synchronized

---

### 33.3. Presenting Directly to Display Devices

In some environments applications can also present Vulkan rendering directly to display devices without using an intermediate windowing system. This can be useful for embedded applications, or implementing the rendering/presentation backend of a windowing system using Vulkan. The **VK_KHR_display** extension provides the functionality necessary to enumerate display devices and create **VkSurfaceKHR** objects that target displays.
### 33.3.1. Display Enumeration

Displays are represented by `VkDisplayKHR` handles:

```c
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayKHR)
```

Various functions are provided for enumerating the available display devices present on a Vulkan physical device. To query information about the available displays, call:

```c
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPropertiesKHR(VkPhysicalDevice physicalDevice,
                                                 uint32_t* pPropertyCount,
                                                 VkDisplayPropertiesKHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display devices available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display devices for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

#### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pPropertyCount-parameter
  `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pProperties-parameter
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPropertiesKHR` structures
Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplayPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPropertiesKHR {
    VkDisplayKHR display;
    const char* displayName;
    VkExtent2D physicalDimensions;
    VkExtent2D physicalResolution;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkBool32 planeReorderPossible;
    VkBool32 persistentContent;
} VkDisplayPropertiesKHR;
```

- `display` is a handle that is used to refer to the display described here. This handle will be valid for the lifetime of the Vulkan instance.

- `displayName` is `NULL` or a pointer to a null-terminated UTF-8 string containing the name of the display. Generally, this will be the name provided by the display's EDID. If `NULL`, no suitable name is available. If not `NULL`, the string pointed to must remain accessible and unmodified as long as `display` is valid.

- `physicalDimensions` describes the physical width and height of the visible portion of the display, in millimeters.

- `physicalResolution` describes the physical, native, or preferred resolution of the display.

  **Note**
  For devices which have no natural value to return here, implementations should return the maximum resolution supported.

- `supportedTransforms` is a bitmask of `VkSurfaceTransformFlagBitsKHR` describing which transforms are supported by this display.

- `planeReorderPossible` tells whether the planes on this display can have their z order changed. If this is `VK_TRUE`, the application can re-arrange the planes on this display in any order relative to each other.

- `persistentContent` tells whether the display supports self-refresh/internal buffering. If this is
true, the application can submit persistent present operations on swapchains created against this display.

**Note**
Persistent presents may have higher latency, and may use less power when the screen content is updated infrequently, or when only a portion of the screen needs to be updated in most frames.

To query information about the available displays, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayProperties2KHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayProperties2KHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either NULL or a pointer to an array of `VkDisplayProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPropertiesKHR`, with the ability to return extended information via chained output structures.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pProperties-parameter If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayProperties2KHR` structures
Return Codes

Success
  • VK_SUCCESS
  • VK_INCOMPLETE

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplayProperties2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPropertiesKHR displayProperties;
} VkDisplayProperties2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayProperties` is a `VkDisplayPropertiesKHR` structure.

Valid Usage (Implicit)

- VUID-VkDisplayProperties2KHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR`
- VUID-VkDisplayProperties2KHR-pNext-pNext
  `pNext` must be `NULL`

Acquiring and Releasing Displays

On some platforms, access to displays is limited to a single process or native driver instance. On such platforms, some or all of the displays may not be available to Vulkan if they are already in use by a native windowing system or other application.

To acquire permission to directly access a display in Vulkan from an X11 server, call:

```c
// Provided by VK_EXT_acquire_xlib_display
VkResult vkAcquireXlibDisplayEXT( VkPhysicalDevice physicalDevice, Display* dpy, VkDisplayKHR display);
```
• **physicalDevice** The physical device the display is on.

• **dpy** A connection to the X11 server that currently owns **display**.

• **display** The display the caller wishes to control in Vulkan.

All permissions necessary to control the display are granted to the Vulkan instance associated with **physicalDevice** until the display is released or the X11 connection specified by **dpy** is terminated. Permission to access the display may be temporarily revoked during periods when the X11 server from which control was acquired itself loses access to **display**. During such periods, operations which require access to the display must fail with an appropriate error code. If the X11 server associated with **dpy** does not own **display**, or if permission to access it has already been acquired by another entity, the call must return the error code **VK_ERROR_INITIALIZATION_FAILED**.

### Note

One example of when an X11 server loses access to a display is when it loses ownership of its virtual terminal.

---

**Valid Usage (Implicit)**

- VUID-vkAcquireXlibDisplayEXT-physicalDevice-parameter
  **physicalDevice** must be a valid **VkPhysicalDevice** handle

- VUID-vkAcquireXlibDisplayEXT-dpy-parameter
  **dpy** must be a valid pointer to a **Display** value

- VUID-vkAcquireXlibDisplayEXT-display-parameter
  **display** must be a valid **VkDisplayKHR** handle

- VUID-vkAcquireXlibDisplayEXT-display-parent
  **display** must have been created, allocated, or retrieved from **physicalDevice**

---

**Return Codes**

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_INITIALIZATION_FAILED**

When acquiring displays from an X11 server, an application may also wish to enumerate and identify them using a native handle rather than a **VkDisplayKHR** handle. To determine the **VkDisplayKHR** handle corresponding to an X11 RandR Output, call:
// Provided by VK_EXT_acquire_xlib_display

VkResult vkGetRandROutputDisplayEXT(
    VkPhysicalDevice physicalDevice, 
    Display* dpy, 
    RROutput rrOutput, 
    VkDisplayKHR* pDisplay);

• physicalDevice The physical device to query the display handle on.
• dpy A connection to the X11 server from which rrOutput was queried.
• rrOutput An X11 RandR output ID.
• pDisplay The corresponding VkDisplayKHR handle will be returned here.

If there is no VkDisplayKHR corresponding to rrOutput on physicalDevice, VK_NULL_HANDLE must be returned in pDisplay.

Valid Usage (Implicit)

• VUID-vkGetRandROutputDisplayEXT-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetRandROutputDisplayEXT-dpy-parameter
  dpy must be a valid pointer to a Display value

• VUID-vkGetRandROutputDisplayEXT-pDisplay-parameter
  pDisplay must be a valid pointer to a VkDisplayKHR handle

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY

To acquire permission to directly access a display in Vulkan on Windows 10, call:

// Provided by VK_NV_acquire_winrt_display

VkResult vkAcquireWinrtDisplayNV(
    VkPhysicalDevice physicalDevice, 
    VkDisplayKHR display);

• physicalDevice The physical device the display is on.
• display The display the caller wishes to control in Vulkan.
All permissions necessary to control the display are granted to the Vulkan instance associated with `physicalDevice` until the display is released or the application is terminated. Permission to access the display may be revoked by events that cause Windows 10 itself to lose access to `display`. If this has happened, operations which require access to the display must fail with an appropriate error code. If permission to access `display` has already been acquired by another entity, the call must return the error code `VK_ERROR_INITIALIZATION_FAILED`.

**Note**
The Vulkan instance acquires control of a “winrt::Windows::Devices::Display::Core::DisplayTarget” by performing an operation equivalent to “winrt::Windows::Devices::Display::Core::DisplayManager.TryAcquireTarget()” on the “DisplayTarget”.

**Note**
One example of when Windows 10 loses access to a display is when the display is hot-unplugged.

**Note**
One example of when a display has already been acquired by another entity is when the Windows desktop compositor (DWM) is in control of the display. Beginning with Windows 10 version 2004 it is possible to cause DWM to release a display by using the “Advanced display settings” sub-page of the “Display settings” control panel. `vkAcquireWinrtDisplayNV` does not itself cause DWM to release a display; this action must be performed outside of Vulkan.

**Valid Usage (Implicit)**

- `VUID-vkAcquireWinrtDisplayNV-physicalDevice-parameter`  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- `VUID-vkAcquireWinrtDisplayNV-display-parameter`  
  `display` must be a valid `VkDisplayKHR` handle

- `VUID-vkAcquireWinrtDisplayNV-display-parent`  
  `display` must have been created, allocated, or retrieved from `physicalDevice`
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_INITIALIZATION_FAILED

When acquiring displays on Windows 10, an application may also wish to enumerate and identify them using a native handle rather than a VkDisplayKHR handle.

To determine the VkDisplayKHR handle corresponding to a “winrt::Windows::Devices::Display::Core::DisplayTarget”, call:

```c
// Provided by VK_NV_acquire_winrt_display
VkResult vkGetWinrtDisplayNV(
    VkPhysicalDevice physicalDevice,
    uint32_t deviceRelativeId,
    VkDisplayKHR* pDisplay);
```

- **physicalDevice** The physical device on which to query the display handle.
- **deviceRelativeId** The value of the “AdapterRelativeId” property of a “DisplayTarget” that is enumerated by a “DisplayAdapter” with an “Id” property matching the deviceLUID property of a VkPhysicalDeviceIDProperties for physicalDevice.
- **pDisplay** The corresponding VkDisplayKHR handle will be returned here.

If there is no VkDisplayKHR corresponding to deviceRelativeId on physicalDevice, VK_NULL_HANDLE must be returned in pDisplay.

Valid Usage (Implicit)

- VUID-vkGetWinrtDisplayNV-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetWinrtDisplayNV-pDisplay-parameter
  pDisplay must be a valid pointer to a VkDisplayKHR handle
### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_INITIALIZATION_FAILED`

To acquire permission to directly a display in Vulkan from the Direct Rendering Manager (DRM) interface, call:

```c
// Provided by VK_EXT_acquire_drm_display
VkResult vkAcquireDrmDisplayEXT(
    VkPhysicalDevice physicalDevice,    // The physical device the display is on.
    int32_t drmFd,                      // DRM primary file descriptor.
    VkDisplayKHR display);             // The display the caller wishes Vulkan to control.
```

- `physicalDevice` The physical device the display is on.
- `drmFd` DRM primary file descriptor.
- `display` The display the caller wishes Vulkan to control.

All permissions necessary to control the display are granted to the Vulkan instance associated with the provided `physicalDevice` until the display is either released or the connector is unplugged. The provided `drmFd` must correspond to the one owned by the `physicalDevice`. If not, the error code `VK_ERROR_UNKNOWN` must be returned. The DRM FD must have DRM master permissions. If any error is encountered during the acquisition of the display, the call must return the error code `VK_ERROR_INITIALIZATION_FAILED`.

The provided DRM fd should not be closed before the display is released, attempting to do it may result in undefined behaviour.

### Valid Usage (Implicit)

- **VUID-vkAcquireDrmDisplayEXT-physicalDevice-parameter**
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkAcquireDrmDisplayEXT-display-parameter**
  `display` must be a valid `VkDisplayKHR` handle

- **VUID-vkAcquireDrmDisplayEXT-display-parent**
  `display` must have been created, allocated, or retrieved from `physicalDevice`
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_INITIALIZATION_FAILED

Before acquiring a display from the DRM interface, the caller may want to select a specific VkDisplayKHR handle by identifying it using a connectorId. To do so, call:

```c
// Provided by VK_EXT_acquire_drm_display
VkResult vkGetDrmDisplayEXT(
    VkPhysicalDevice physicalDevice,
    int32_t drmFd,
    uint32_t connectorId,
    VkDisplayKHR* display);
```

- `physicalDevice` The physical device to query the display from.
- `drmFd` DRM primary file descriptor.
- `connectorId` Identifier of the specified DRM connector.
- `display` The corresponding VkDisplayKHR handle will be returned here.

If there is no VkDisplayKHR corresponding to the connectorId on the physicalDevice, the returning display must be set to VK_NULL_HANDLE. The provided drmFd must correspond to the one owned by the physicalDevice. If not, the error code VK_ERROR_UNKNOWN must be returned. Master permissions are not required, because the file descriptor is just used for information gathering purposes. The given connectorId must be a resource owned by the provided drmFd. If not, the error code VK_ERROR_UNKNOWN must be returned. If any error is encountered during the identification of the display, the call must return the error code VK_ERROR_INITIALIZATION_FAILED.

Valid Usage (Implicit)

- VUID-vkGetDrmDisplayEXT-physicalDevice-parameter
  `physicalDevice` must be a valid VkPhysicalDevice handle

- VUID-vkGetDrmDisplayEXT-display-parameter
  `display` must be a valid pointer to a VkDisplayKHR handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_INITIALIZATION_FAILED
• VK_ERROR_OUT_OF_HOST_MEMORY

To release a previously acquired display, call:

```c
// Provided by VK_EXT_direct_mode_display
VkResult vkReleaseDisplayEXT(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display);
```

• `physicalDevice` The physical device the display is on.
• `display` The display to release control of.

Valid Usage (Implicit)

• VUID-vkReleaseDisplayEXT-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
• VUID-vkReleaseDisplayEXT-display-parameter `display` must be a valid `VkDisplayKHR` handle
• VUID-vkReleaseDisplayEXT-display-parent `display` must have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success
• VK_SUCCESS

Display Planes

Images are presented to individual planes on a display. Devices **must** support at least one plane on each display. Planes **can** be stacked and blended to composite multiple images on one display. Devices **may** support only a fixed stacking order and fixed mapping between planes and displays, or they **may** allow arbitrary application specified stacking orders and mappings between planes and displays. To query the properties of device display planes, call:
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPlanePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPlanePropertiesKHR* pProperties);

• physicalDevice is a physical device.
• pPropertyCount is a pointer to an integer related to the number of display planes available or queried, as described below.
• pProperties is either NULL or a pointer to an array of VkDisplayPlanePropertiesKHR structures.

If pProperties is NULL, then the number of display planes available for physicalDevice is returned in pPropertyCount. Otherwise, pPropertyCount must point to a variable set by the user to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If the value of pPropertyCount is less than the number of display planes for physicalDevice, at most pPropertyCount structures will be written.

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
• VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value
• VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pProperties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayPlanePropertiesKHR structures

Return Codes

Success
  • VK_SUCCESS
  • VK_INCOMPLETE

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayPlanePropertiesKHR structure is defined as:
typedef struct VkDisplayPlanePropertiesKHR {
    VkDisplayKHR currentDisplay;
    uint32_t currentStackIndex;
} VkDisplayPlanePropertiesKHR;

- `currentDisplay` is the handle of the display the plane is currently associated with. If the plane is not currently attached to any displays, this will be `VK_NULL_HANDLE`.
- `currentStackIndex` is the current z-order of the plane. This will be between 0 and the value returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` in `pPropertyCount`.

To query the properties of a device’s display planes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayPlaneProperties2KHR(
    VkPhysicalDevice physicalDevice, 
    uint32_t* pPropertyCount, 
    VkDisplayPlaneProperties2KHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlaneProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayPlaneProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`, with the ability to return extended information via chained output structures.

**Valid Usage (Implicit)**

- `VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-physicalDevice-parameter` physicalDevice must be a valid `VkPhysicalDevice` handle
- `VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pPropertyCount-parameter` `pPropertyCount` must be a valid pointer to a `uint32_t` value
- `VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pProperties-parameter` If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPlaneProperties2KHR` structures
Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplayPlaneProperties2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlanePropertiesKHR displayPlaneProperties;
} VkDisplayPlaneProperties2KHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **displayPlaneProperties** is a `VkDisplayPlanePropertiesKHR` structure.

**Valid Usage (Implicit)**

- `VUID-VkDisplayPlaneProperties2KHR-sType-sType`  
  sType must be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR`
- `VUID-VkDisplayPlaneProperties2KHR-pNext-pNext`  
  pNext must be NULL

To determine which displays a plane is usable with, call

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneSupportedDisplaysKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t planeIndex,
    uint32_t* pDisplayCount,
    VkDisplayKHR* pDisplays);
```

- **physicalDevice** is a physical device.
- **planeIndex** is the plane which the application wishes to use, and **must** be in the range [0, physical device plane count - 1].
• **pDisplayCount** is a pointer to an integer related to the number of displays available or queried, as described below.

• **pDisplays** is either **NULL** or a pointer to an array of **VkDisplayKHR** handles.

If **pDisplays** is **NULL**, then the number of displays usable with the specified **planeIndex** for **physicalDevice** is returned in **pDisplayCount**. Otherwise, **pDisplayCount** must point to a variable set by the user to the number of elements in the **pDisplays** array, and on return the variable is overwritten with the number of handles actually written to **pDisplays**. If the value of **pDisplayCount** is less than the number of usable display-plane pairs for **physicalDevice**, at most **pDisplayCount** handles will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available pairs were returned.

**Valid Usage**

- **VUID-vkGetDisplayPlaneSupportedDisplaysKHR-planeIndex-01249**
  
  **planeIndex** must be less than the number of display planes supported by the device as determined by calling **vkGetPhysicalDeviceDisplayPlanePropertiesKHR**

**Valid Usage (Implicit)**

- **VUID-vkGetDisplayPlaneSupportedDisplaysKHR-physicalDevice-parameter**
  
  **physicalDevice** must be a valid **VkPhysicalDevice** handle

- **VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplayCount-parameter**
  
  **pDisplayCount** must be a valid pointer to a **uint32_t** value

- **VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplays-parameter**
  
  If the value referenced by **pDisplayCount** is not 0, and **pDisplays** is not **NULL**, **pDisplays** must be a valid pointer to an array of **pDisplayCount** **VkDisplayKHR** handles

**Return Codes**

**Success**

- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

Additional properties of displays are queried using specialized query functions.

**Display Modes**

Display modes are represented by **VkDisplayModeKHR** handles:
Each display has one or more supported modes associated with it by default. These built-in modes are queried by calling:

```c
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayModeKHR)

VkResult vkGetDisplayModePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    uint32_t* pPropertyCount,
    VkDisplayModePropertiesKHR* pProperties);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display modes available on the specified `display` for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display modes for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available display modes were returned.

**Valid Usage (Implicit)**

- **VUID-vkGetDisplayModePropertiesKHR-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- **VUID-vkGetDisplayModePropertiesKHR-display-parameter**
  - `display` must be a valid `VkDisplayKHR` handle
- **VUID-vkGetDisplayModePropertiesKHR-pPropertyCount-parameter**
  - `pPropertyCount` must be a valid pointer to a `uint32_t` value
- **VUID-vkGetDisplayModePropertiesKHR-pProperties-parameter**
  - If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayModePropertiesKHR` structures
- **VUID-vkGetDisplayModePropertiesKHR-display-parent**
  - `display` must have been created, allocated, or retrieved from `physicalDevice`
Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OFDEVICE_MEMORY

The `VkDisplayModePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModePropertiesKHR {
    VkDisplayModeKHR displayMode;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModePropertiesKHR;
```

- `displayMode` is a handle to the display mode described in this structure. This handle will be valid for the lifetime of the Vulkan instance.
- `parameters` is a `VkDisplayModeParametersKHR` structure describing the display parameters associated with `displayMode`.

```c
// Provided by VK_KHR_display
typedef VkFlags VkDisplayModeCreateFlagsKHR;
```

`VkDisplayModeCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To query the properties of a device’s built-in display modes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayModeProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    uint32_t* pPropertyCount,
    VkDisplayModeProperties2KHR* pProperties);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModeProperties2KHR` structures.

`vkGetDisplayModeProperties2KHR` behaves similarly to `vkGetDisplayModePropertiesKHR`, with the ability to return extended information via chained output structures.

### Valid Usage (Implicit)

- **VUID-vkGetDisplayModeProperties2KHR-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- **VUID-vkGetDisplayModeProperties2KHR-display-parameter**
  - `display` must be a valid `VkDisplayKHR` handle
- **VUID-vkGetDisplayModeProperties2KHR-pPropertyCount-parameter**
  - `pPropertyCount` must be a valid pointer to a `uint32_t` value
- **VUID-vkGetDisplayModeProperties2KHR-pProperties-parameter**
  - If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayModeProperties2KHR` structures
- **VUID-vkGetDisplayModeProperties2KHR-display-parent**
  - `display` must have been created, allocated, or retrieved from `physicalDevice`

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayModeProperties2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayModeProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayModePropertiesKHR displayModeProperties;
} VkDisplayModeProperties2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayModeProperties` is a `VkDisplayModePropertiesKHR` structure.
Valid Usage (Implicit)

- VUID-VkDisplayModeProperties2KHR-sType-sType
  *sType must be VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR*

- VUID-VkDisplayModeProperties2KHR-pNext-pNext
  *pNext must be NULL*

The `VkDisplayModeParametersKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModeParametersKHR {
  VkExtent2D visibleRegion;
  uint32_t refreshRate;
} VkDisplayModeParametersKHR;
```

- `visibleRegion` is the 2D extents of the visible region.
- `refreshRate` is a `uint32_t` that is the number of times the display is refreshed each second multiplied by 1000.

**Note**
For example, a 60Hz display mode would report a `refreshRate` of 60,000.

Valid Usage

- VUID-VkDisplayModeParametersKHR-width-01990
  *The `width` member of `visibleRegion` must be greater than 0*

- VUID-VkDisplayModeParametersKHR-height-01991
  *The `height` member of `visibleRegion` must be greater than 0*

- VUID-VkDisplayModeParametersKHR-refreshRate-01992
  *`refreshRate` must be greater than 0*

Additional modes may also be created by calling:

```c
// Provided by VK_KHR_display
VkResult vkCreateDisplayModeKHR(
  VkPhysicalDevice physicalDevice,           physicalDevice,
  VkDisplayKHR display,                       display,
  const VkDisplayModeCreateInfoKHR* pCreateInfo,  pCreateInfo,
  const VkAllocationCallbacks* pAllocator,    pAllocator,
  VkDisplayModeKHR* pMode);                   pMode);
```

- `physicalDevice` is the physical device associated with `display`.

1778 | Chapter 33. Window System Integration (WSI)
• `display` is the display to create an additional mode for.
• `pCreateInfo` is a pointer to a `VkDisplayModeCreateInfoKHR` structure describing the new mode to create.
• `pAllocator` is the allocator used for host memory allocated for the display mode object when there is no more specific allocator available (see Memory Allocation).
• `pMode` is a pointer to a `VkDisplayModeKHR` handle in which the mode created is returned.

### Valid Usage (Implicit)

- `VUID-vkCreateDisplayModeKHR-physicalDevice-parameter`  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- `VUID-vkCreateDisplayModeKHR-display-parameter`  
  `display` must be a valid `VkDisplayKHR` handle
- `VUID-vkCreateDisplayModeKHR-pCreateInfo-parameter`  
  `pCreateInfo` must be a valid pointer to a valid `VkDisplayModeCreateInfoKHR` structure
- `VUID-vkCreateDisplayModeKHR-pAllocator-parameter`  
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- `VUID-vkCreateDisplayModeKHR-pMode-parameter`  
  `pMode` must be a valid pointer to a `VkDisplayModeKHR` handle
- `VUID-vkCreateDisplayModeKHR-display-parent`  
  `display` must have been created, allocated, or retrieved from `physicalDevice`

### Host Synchronization

- Host access to `display` must be externally synchronized

### Return Codes

#### Success

- `VK_SUCCESS`

#### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkDisplayModeCreateInfoKHR` structure is defined as:
typedef struct VkDisplayModeCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplayModeCreateFlagsKHR flags;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModeCreateInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use, and must be zero.
- **parameters** is a VkDisplayModeParametersKHR structure describing the display parameters to use in creating the new mode. If the parameters are not compatible with the specified display, the implementation must return VK_ERROR_INITIALIZATION_FAILED.

**Valid Usage (Implicit)**

- VUID-VkDisplayModeCreateInfoKHR-sType-sType
  - sType must be VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR
- VUID-VkDisplayModeCreateInfoKHR-pNext-pNext
  - pNext must be NULL
- VUID-VkDisplayModeCreateInfoKHR-flags-zerobitmask
  - flags must be 0
- VUID-VkDisplayModeCreateInfoKHR-parameters-parameter
  - parameters must be a valid VkDisplayModeParametersKHR structure

Applications that wish to present directly to a display must select which layer, or “plane” of the display they wish to target, and a mode to use with the display. Each display supports at least one plane. The capabilities of a given mode and plane combination are determined by calling:

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayModeKHR mode,
    uint32_t planeIndex,
    VkDisplayPlaneCapabilitiesKHR* pCapabilities);
```

- **physicalDevice** is the physical device associated with the display specified by **mode**
- **mode** is the display mode the application intends to program when using the specified plane. Note this parameter also implicitly specifies a display.
- **planeIndex** is the plane which the application intends to use with the display, and is less than the number of display planes supported by the device.
• **pCapabilities** is a pointer to a `VkDisplayPlaneCapabilitiesKHR` structure in which the capabilities are returned.

### Valid Usage (Implicit)

- **VUID-vkGetDisplayPlaneCapabilitiesKHR-physicalDevice-parameter**
  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parameter**
  
  `mode` must be a valid `VkDisplayModeKHR` handle

- **VUID-vkGetDisplayPlaneCapabilitiesKHR-pCapabilities-parameter**
  
  `pCapabilities` must be a valid pointer to a `VkDisplayPlaneCapabilitiesKHR` structure

### Host Synchronization

- Host access to `mode` must be externally synchronized

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkDisplayPlaneCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlaneCapabilitiesKHR {
    VkDisplayPlaneAlphaFlagsKHR supportedAlpha;
    VkOffset2D minSrcPosition;
    VkOffset2D maxSrcPosition;
    VkExtent2D minSrcExtent;
    VkExtent2D maxSrcExtent;
    VkOffset2D minDstPosition;
    VkOffset2D maxDstPosition;
    VkExtent2D minDstExtent;
    VkExtent2D maxDstExtent;
} VkDisplayPlaneCapabilitiesKHR;
```

• **supportedAlpha** is a bitmask of `VkDisplayPlaneAlphaFlagBitsKHR` describing the supported alpha blending modes.

• **minSrcPosition** is the minimum source rectangle offset supported by this plane using the
maxSrcPosition is the maximum source rectangle offset supported by this plane using the specified mode. The \( x \) and \( y \) components of \( \text{maxSrcPosition} \) must each be greater than or equal to the \( x \) and \( y \) components of \( \text{minSrcPosition} \), respectively.

- \( \text{minSrcExtent} \) is the minimum source rectangle size supported by this plane using the specified mode.
- \( \text{maxSrcExtent} \) is the maximum source rectangle size supported by this plane using the specified mode.
- \( \text{minDstPosition}, \text{maxDstPosition}, \text{minDstExtent}, \text{maxDstExtent} \) all have similar semantics to their corresponding \( \text{*Src*} \) equivalents, but apply to the output region within the mode rather than the input region within the source image. Unlike the \( \text{*Src*} \) offsets, \( \text{minDstPosition} \) and \( \text{maxDstPosition} \) may contain negative values.

The minimum and maximum position and extent fields describe the implementation limits, if any, as they apply to the specified display mode and plane. Vendors may support displaying a subset of a swapchain's presentable images on the specified display plane. This is expressed by returning \( \text{minSrcPosition}, \text{maxSrcPosition}, \text{minSrcExtent}, \text{and maxSrcExtent} \) values that indicate a range of possible positions and sizes which may be used to specify the region within the presentable images that source pixels will be read from when creating a swapchain on the specified display mode and plane.

Vendors may also support mapping the presentable images' content to a subset or superset of the visible region in the specified display mode. This is expressed by returning \( \text{minDstPosition}, \text{maxDstPosition}, \text{minDstExtent}, \text{and maxDstExtent} \) values that indicate a range of possible positions and sizes which may be used to describe the region within the display mode that the source pixels will be mapped to.

Other vendors may support only a 1-1 mapping between pixels in the presentable images and the display mode. This may be indicated by returning \( (0,0) \) for \( \text{minSrcPosition}, \text{maxSrcPosition}, \text{minDstPosition}, \text{and maxDstPosition} \), and \( \text{(display mode width, display mode height)} \) for \( \text{minSrcExtent, maxSrcExtent, minDstExtent, and maxDstExtent} \).

The value \( \text{supportedAlpha} \) must contain at least one valid \( \text{VkDisplayPlaneAlphaFlagBitsKHR} \) bit.

These values indicate the limits of the implementation's individual fields. Not all combinations of values within the offset and extent ranges returned in \( \text{VkDisplayPlaneCapabilitiesKHR} \) are guaranteed to be supported. Presentation requests specifying unsupported combinations may fail.

To query the capabilities of a given mode and plane combination, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayPlaneCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkDisplayPlaneInfo2KHR* pDisplayPlaneInfo,
    VkDisplayPlaneCapabilities2KHR* pCapabilities);
```

- \( \text{physicalDevice} \) is the physical device associated with \( \text{pDisplayPlaneInfo} \).
• **pDisplayPlaneInfo** is a pointer to a *VkDisplayPlaneInfo2KHR* structure describing the plane and mode.

• **pCapabilities** is a pointer to a *VkDisplayPlaneCapabilities2KHR* structure in which the capabilities are returned.

`vkGetDisplayPlaneCapabilities2KHR` behaves similarly to `vkGetDisplayPlaneCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

### Valid Usage (Implicit)

- **VUID-vkGetDisplayPlaneCapabilities2KHR-physicalDevice-parameter**
  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetDisplayPlaneCapabilities2KHR-pDisplayPlaneInfo-parameter**
  
  `pDisplayPlaneInfo` must be a valid pointer to a valid `VkDisplayPlaneInfo2KHR` structure

- **VUID-vkGetDisplayPlaneCapabilities2KHR-pCapabilities-parameter**
  
  `pCapabilities` must be a valid pointer to a `VkDisplayPlaneCapabilities2KHR` structure

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The *VkDisplayPlaneInfo2KHR* structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplayModeKHR mode;
    uint32_t planeIndex;
} VkDisplayPlaneInfo2KHR;
```

- **sType** is the type of this structure.

- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **mode** is the display mode the application intends to program when using the specified plane.
This parameter also implicitly specifies a display.

- `planeIndex` is the plane which the application intends to use with the display.

The members of `VkDisplayPlaneInfo2KHR` correspond to the arguments to `vkGetDisplayPlaneCapabilitiesKHR`, with `sType` and `pNext` added for extensibility.

### Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR`
- `pNext` must be `NULL`
- `mode` must be a valid `VkDisplayModeKHR` handle

### Host Synchronization

- Host access to `mode` must be externally synchronized

The `VkDisplayPlaneCapabilities2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlaneCapabilitiesKHR capabilities;
} VkDisplayPlaneCapabilities2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `capabilities` is a `VkDisplayPlaneCapabilitiesKHR` structure.

### Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR`
- `pNext` must be `NULL`
33.3.2. Display Control

To set the power state of a display, call:

```c
// Provided by VK_EXT_display_control
VkResult vkDisplayPowerControlEXT(
    VkDevice device,           // Provided by VK_EXT_display_control
    VkDisplayKHR display,      // Provided by VK_EXT_display_control
    const VkDisplayPowerInfoEXT*pDisplayPowerInfo);
```

- `device` is a logical device associated with `display`.
- `display` is the display whose power state is modified.
- `pDisplayPowerInfo` is a pointer to a `VkDisplayPowerInfoEXT` structure specifying the new power state of `display`.

### Valid Usage (Implicit)

- VUID-vkDisplayPowerControlEXT-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkDisplayPowerControlEXT-display-parameter
  - `display` must be a valid `VkDisplayKHR` handle
- VUID-vkDisplayPowerControlEXT-pDisplayPowerInfo-parameter
  - `pDisplayPowerInfo` must be a valid pointer to a valid `VkDisplayPowerInfoEXT` structure
- VUID-vkDisplayPowerControlEXT-commonparent
  - Both of `device`, and `display` must have been created, allocated, or retrieved from the same `VkPhysicalDevice`

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkDisplayPowerInfoEXT` structure is defined as:
// Provided by VK_EXT_display_control
typedef struct VkDisplayPowerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDisplayPowerStateEXT powerState;
} VkDisplayPowerInfoEXT;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **powerState** is a VkDisplayPowerStateEXT value specifying the new power state of the display.

Valid Usage (Implicit)

• VUID-VkDisplayPowerInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT
• VUID-VkDisplayPowerInfoEXT-pNext-pNext
  pNext must be NULL
• VUID-VkDisplayPowerInfoEXT-powerState-parameter
  powerState must be a valid VkDisplayPowerStateEXT value

Possible values of VkDisplayPowerInfoEXT::powerState, specifying the new power state of a display, are:

// Provided by VK_EXT_display_control
typedef enum VkDisplayPowerStateEXT {
    VK_DISPLAY_POWER_STATE_OFF_EXT = 0,
    VK_DISPLAY_POWER_STATE_SUSPEND_EXT = 1,
    VK_DISPLAY_POWER_STATE_ON_EXT = 2,
} VkDisplayPowerStateEXT;

• **VK_DISPLAY_POWER_STATE_OFF_EXT** specifies that the display is powered down.
• **VK_DISPLAY_POWER_STATE_SUSPEND_EXT** specifies that the display is put into a low power mode, from which it may be able to transition back to VK_DISPLAY_POWER_STATE_ON_EXT more quickly than if it were in VK_DISPLAY_POWER_STATE_OFF_EXT. This state may be the same as VK_DISPLAY_POWER_STATE_OFF_EXT.
• **VK_DISPLAY_POWER_STATE_ON_EXT** specifies that the display is powered on.

33.3.3. Display Surfaces

A complete display configuration includes a mode, one or more display planes and any parameters describing their behavior, and parameters describing some aspects of the images associated with those planes. Display surfaces describe the configuration of a single plane within a complete display configuration. To create a VkSurfaceKHR object for a display plane, call:
// Provided by VK_KHR_display

VkResult vkCreateDisplayPlaneSurfaceKHR(
    VkInstance instance, 
    const VkDisplaySurfaceCreateInfoKHR* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkSurfaceKHR* pSurface);

- `instance` is the instance corresponding to the physical device the targeted display is on.
- `pCreateInfo` is a pointer to a `VkDisplaySurfaceCreateInfoKHR` structure specifying which mode, plane, and other parameters to use, as described below.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDisplayPlaneSurfaceKHR-instance-parameter
  - `instance` must be a valid `VkInstance` handle
- VUID-vkCreateDisplayPlaneSurfaceKHR-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkDisplaySurfaceCreateInfoKHR` structure
- VUID-vkCreateDisplayPlaneSurfaceKHR-pAllocator-parameter
  - If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateDisplayPlaneSurfaceKHR-pSurface-parameter
  - `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplaySurfaceCreateInfoKHR` structure is defined as:
// Provided by VK_KHR_display

typedef struct VkDisplaySurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplaySurfaceCreateFlagsKHR flags;
    VkDisplayModeKHR displayMode;
    uint32_t planeIndex;
    uint32_t planeStackIndex;
    VkSurfaceTransformFlagBitsKHR transform;
    float globalAlpha;
    VkDisplayPlaneAlphaFlagBitsKHR alphaMode;
    VkExtent2D imageExtent;
} VkDisplaySurfaceCreateInfoKHR;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use, and **must** be zero.
- **displayMode** is a **VkDisplayModeKHR** handle specifying the mode to use when displaying this surface.
- **planeIndex** is the plane on which this surface appears.
- **planeStackIndex** is the z-order of the plane.
- **transform** is a **VkSurfaceTransformFlagBitsKHR** value specifying the transformation to apply to images as part of the scanout operation.
- **globalAlpha** is the global alpha value. This value is ignored if **alphaMode** is not **VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR**.
- **alphaMode** is a **VkDisplayPlaneAlphaFlagBitsKHR** value specifying the type of alpha blending to use.
- **imageExtent** is the size of the presentable images to use with the surface.

**Note**

Creating a display surface **must** not modify the state of the displays, planes, or other resources it names. For example, it **must** not apply the specified mode to be set on the associated display. Application of display configuration occurs as a side effect of presenting to a display surface.
Valid Usage

- **VUID-VkDisplaySurfaceCreateInfoKHR-planeIndex-01252**
  
  `planeIndex must` be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-planeReorderPossible-01253**
  
  If the `planeReorderPossible` member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display corresponding to `displayMode` is `VK_TRUE` then `planeStackIndex must` be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`; otherwise `planeStackIndex must` equal the `currentStackIndex` member of `VkDisplayPlanePropertiesKHR` returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` for the display plane corresponding to `displayMode`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01254**
  
  If `alphaMode` is `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR` then `globalAlpha must` be between 0 and 1, inclusive.

- **VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01255**
  
  `alphaMode must` be one of the bits present in the `supportedAlpha` member of `VkDisplayPlaneCapabilitiesKHR` for the display plane corresponding to `displayMode`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-width-01256**
  
  The `width` and `height` members of `imageExtent must` be less than or equal to `VkPhysicalDeviceLimits::maxImageDimension2D`.

Valid Usage (Implicit)

- **VUID-VkDisplaySurfaceCreateInfoKHR-sType-sType**
  
  `sType must` be `VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-pNext-pNext**
  
  `pNext must` be `NULL`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-flags-zerobitmask**
  
  `flags must` be 0.

- **VUID-VkDisplaySurfaceCreateInfoKHR-displayMode-parameter**
  
  `displayMode must` be a valid `VkDisplayModeKHR` handle.

- **VUID-VkDisplaySurfaceCreateInfoKHR-transform-parameter**
  
  `transform must` be a valid `VkSurfaceTransformFlagBitsKHR` value.

- **VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-parameter**
  
  `alphaMode must` be a valid `VkDisplayPlaneAlphaFlagBitsKHR` value.

// Provided by VK_KHR_display

typedef VkFlags VkDisplaySurfaceCreateFlagsKHR;
VkDisplaySurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkDisplaySurfaceCreateInfoKHR::alphaMode, specifying the type of alpha blending to use on a display, are:

```c
typedef enum VkDisplayPlaneAlphaFlagBitsKHR {
    VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR = 0x00000002,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR = 0x00000004,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR = 0x00000008,
} VkDisplayPlaneAlphaFlagBitsKHR;
```

- **VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR** specifies that the source image will be treated as opaque.
- **VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR** specifies that a global alpha value must be specified that will be applied to all pixels in the source image.
- **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR** specifies that the alpha value will be determined by the alpha channel of the source image’s pixels. If the source format contains no alpha values, no blending will be applied. The source alpha values are not premultiplied into the source image’s other color channels.
- **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR** is equivalent to **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR**, except the source alpha values are assumed to be premultiplied into the source image’s other color channels.

```c
typedef VkFlags VkDisplayPlaneAlphaFlagsKHR;
```

VkDisplayPlaneAlphaFlagsKHR is a bitmask type for setting a mask of zero or more VkDisplayPlaneAlphaFlagBitsKHR.

### 33.3.4. Presenting to headless surfaces

Vulkan rendering can be presented to a headless surface, where the presentation operation is a no-op producing no externally-visible result.
Note

Because there is no real presentation target, the headless presentation engine may be extended to impose an arbitrary or customisable set of restrictions and features. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

The usual surface query mechanisms must be used to determine the actual restrictions and features of the implementation.

To create a headless VkSurfaceKHR object, call:

```c
// Provided by VK_EXT_headless_surface
VkResult vkCreateHeadlessSurfaceEXT(
    VkInstance instance,  // the instance to associate the surface with.
    const VkHeadlessSurfaceCreateInfoEXT* pCreateInfo,  // a pointer to a VkHeadlessSurfaceCreateInfoEXT structure containing parameters affecting the creation of the surface object.
    const VkAllocationCallbacks* pAllocator,  // the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
    VkSurfaceKHR* pSurface);  // a pointer to a VkSurfaceKHR handle in which the created surface object is returned.
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a VkHeadlessSurfaceCreateInfoEXT structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

**Valid Usage (Implicit)**

- `instance` must be a valid VkInstance handle
- `pCreateInfo` must be a valid pointer to a valid VkHeadlessSurfaceCreateInfoEXT structure
- If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid VkAllocationCallbacks structure
- `pSurface` must be a valid pointer to a VkSurfaceKHR handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkHeadlessSurfaceCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_headless_surface
typedef struct VkHeadlessSurfaceCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkHeadlessSurfaceCreateFlagsEXT flags;
} VkHeadlessSurfaceCreateInfoEXT;
```

• `sType` is the type of this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `flags` is reserved for future use.

Valid Usage (Implicit)

• VUID-VkHeadlessSurfaceCreateInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_HEADLESS_SURFACE_CREATE_INFO_EXT`
• VUID-VkHeadlessSurfaceCreateInfoEXT-pNext-pNext
  `pNext` **must** be NULL
• VUID-VkHeadlessSurfaceCreateInfoEXT-flags-zerobitmask
  `flags` **must** be 0

For headless surfaces, `currentExtent` is the reserved value (0xFFFFFFFF, 0xFFFFFFFF). Whatever the application sets a swapchain’s `imageExtent` to will be the size of the surface, after the first image is presented.

```c
// Provided by VK_EXT_headless_surface
typedef VkFlags VkHeadlessSurfaceCreateFlagsEXT;
```

`VkHeadlessSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.
33.4. Querying for WSI Support

Not all physical devices will include WSI support. Within a physical device, not all queue families will support presentation. WSI support and compatibility can be determined in a platform-neutral manner (which determines support for presentation to a particular surface object) and additionally may be determined in platform-specific manners (which determine support for presentation on the specified physical device but do not guarantee support for presentation to a particular surface object).

To determine whether a queue family of a physical device supports presentation to a given surface, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceSupportKHR(
    VkPhysicalDevice           physicalDevice,
    uint32_t                   queueFamilyIndex,
    VkSurfaceKHR              surface,
    VkBool32*                 pSupported);
```

- **physicalDevice** is the physical device.
- **queueFamilyIndex** is the queue family.
- **surface** is the surface.
- **pSupported** is a pointer to a VkBool32, which is set to VK_TRUE to indicate support, and VK_FALSE otherwise.

### Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-queueFamilyIndex-01269
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-surface-parameter
  surface must be a valid VkSurfaceKHR handle

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-pSupported-parameter
  pSupported must be a valid pointer to a VkBool32 value

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-commonparent
  Both of physicalDevice, and surface must have been created, allocated, or retrieved from the same VkInstance
33.4.1. Android Platform

On Android, all physical devices and queue families must be capable of presentation with any native window. As a result there is no Android-specific query for these capabilities.

33.4.2. Wayland Platform

To determine whether a queue family of a physical device supports presentation to a Wayland compositor, call:

```c
// Provided by VK_KHR_wayland_surface
VkBool32 vkGetPhysicalDeviceWaylandPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    struct wl_display* display);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `display` is a pointer to the `wl_display` associated with a Wayland compositor.

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-queueFamilyIndex-01306

    `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`
33.4.3. Win32 Platform

To determine whether a queue family of a physical device supports presentation to the Microsoft Windows desktop, call:

```c
// Provided by VK_KHR_win32_surface
VkBool32 vkGetPhysicalDeviceWin32PresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.

This platform-specific function can be called prior to creating a surface.

33.4.4. XCB Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the XCB client-side library, call:
VkBool32 vkGetPhysicalDeviceXcbPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    xcb_connection_t* connection,
    xcb_visualid_t visual_id);

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `connection` is a pointer to an `xcb_connection_t` to the X server.
- `visual_id` is an X11 visual (`xcb_visualid_t`).

This platform-specific function can be called prior to creating a surface.

### Valid Usage

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-queueFamilyIndex-01312
  
  *queueFamilyIndex* must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-physicalDevice-parameter
  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-connection-parameter
  
  `connection` must be a valid pointer to an `xcb_connection_t` value

### 33.4.5. Xlib Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the Xlib client-side library, call:

VkBool32 vkGetPhysicalDeviceXlibPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    Display* dpy,
    VisualID visualID);

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `dpy` is a pointer to an Xlib `Display` connection to the server.
• `visualId` is an X11 visual (`VisualID`).

This platform-specific function can be called prior to creating a surface.

### Valid Usage

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-queueFamilyIndex-01315
  queueFamilyIndex must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle.
- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-dpy-parameter
  `dpy` must be a valid pointer to a `Display` value.

### 33.4.6. DirectFB Platform

To determine whether a queue family of a physical device supports presentation with DirectFB library, call:

```c
// Provided by VK_EXT_directfb_surface
VkBool32 vkGetPhysicalDeviceDirectFBPresentationSupportEXT(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    IDirectFB* dfb);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `dfb` is a pointer to the `IDirectFB` main interface of DirectFB.

This platform-specific function can be called prior to creating a surface.

### Valid Usage

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-queueFamilyIndex-04119
  queueFamilyIndex must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-physicalDevice-parameter
  
  *physicalDevice* must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-dfb-parameter
  
  *dfb* must be a valid pointer to an `IDirectFB` value

33.4.7. Fuchsia Platform

On Fuchsia, all physical devices and queue families **must** be capable of presentation with any ImagePipe. As a result there is no Fuchsia-specific query for these capabilities.

33.4.8. Google Games Platform

On Google Games Platform, all physical devices and queue families with the `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT` capabilities **must** be capable of presentation with any Google Games Platform stream descriptor. As a result, there is no query specific to Google Games Platform for these capabilities.

33.4.9. iOS Platform

On iOS, all physical devices and queue families **must** be capable of presentation with any layer. As a result there is no iOS-specific query for these capabilities.

33.4.10. macOS Platform

On macOS, all physical devices and queue families **must** be capable of presentation with any layer. As a result there is no macOS-specific query for these capabilities.

33.4.11. VI Platform

On VI, all physical devices and queue families **must** be capable of presentation with any layer. As a result there is no VI-specific query for these capabilities.

33.4.12. QNX Screen Platform

To determine whether a queue family of a physical device supports presentation to a QNX Screen compositor, call:

```c
// Provided by VK_QNX_screen_surface
VkBool32 vkGetPhysicalDeviceScreenPresentationSupportQNX(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    struct _screen_window* window);
```

- *physicalDevice* is the physical device.
• `queueFamilyIndex` is the queue family index.

• `window` is the QNX Screen window object.

This platform-specific function can be called prior to creating a surface.

### Valid Usage

- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-queueFamilyIndex-04743
  - `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-physicalDevice-parameter
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-window-parameter
  - `window` must be a valid pointer to a `_screen_window` value

### 33.5. Surface Queries

The capabilities of a swapchain targeting a surface are the intersection of the capabilities of the WSI platform, the native window or display, and the physical device. The resulting capabilities can be obtained with the queries listed below in this section.

#### Note

In addition to the surface capabilities as obtained by surface queries below, swapchain images are also subject to ordinary image creation limits as reported by `vkGetPhysicalDeviceImageFormatProperties`. As an application is instructed by the appropriate Valid Usage sections, both the surface capabilities and the image creation limits have to be satisfied whenever swapchain images are created.

### 33.5.1. Surface Capabilities

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceCapabilitiesKHR(
  VkPhysicalDevice physicalDevice,
  VkSurfaceKHR surface,
  VkSurfaceCapabilitiesKHR* pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
• The `surface` is the surface that will be associated with the swapchain.
• The `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilitiesKHR` structure in which the capabilities are returned.

**Valid Usage**

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06211
  surface must be supported by physicalDevice, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-physicalDevice-parameter
  physicalDevice must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-parameter
  surface must be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-pSurfaceCapabilities-parameter
  pSurfaceCapabilities must be a valid pointer to a `VkSurfaceCapabilitiesKHR` structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-commonparent
  Both of physicalDevice, and surface must have been created, allocated, or retrieved from the same `VkInstance`

**Return Codes**

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The `VkSurfaceCapabilitiesKHR` structure is defined as:
// Provided by VK_KHR_surface

typedef struct VkSurfaceCapabilitiesKHR {
    uint32_t minImageCount;
    uint32_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
} VkSurfaceCapabilitiesKHR;

- **minImageCount** is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.

- **maxImageCount** is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to **minImageCount**. A value of 0 means that there is no limit on the number of images, though there **may** be limits related to the total amount of memory used by presentable images.

- **currentExtent** is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

- **minImageExtent** contains the smallest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be less than or equal to the corresponding width and height of **currentExtent**, unless **currentExtent** has the special value described above.

- **maxImageExtent** contains the largest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be greater than or equal to the corresponding width and height of **minImageExtent**. The width and height of the extent will each be greater than or equal to the corresponding width and height of **currentExtent**, unless **currentExtent** has the special value described above.

- **maxImageArrayLayers** is the maximum number of layers presentable images **can** have for a swapchain created for this device and surface, and will be at least one.

- **supportedTransforms** is a bitmask of VkSurfaceTransformFlagBitsKHR indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.

- **currentTransform** is VkSurfaceTransformFlagBitsKHR value indicating the surface's current transform relative to the presentation engine's natural orientation.

- **supportedCompositeAlpha** is a bitmask of VkCompositeAlphaFlagBitsKHR, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition **can** be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

- **supportedUsageFlags** is a bitmask of VkImageUsageFlagBits representing the ways the
Application can use the presentable images of a swapchain created with VkPresentModeKHR set to VK_PRESENT_MODE_IMMEDIATE_KHR, VK_PRESENT_MODE_MAILBOX_KHR, VK_PRESENT_MODE_FIFO_KHR or VK_PRESENT_MODE_FIFO_RELAXED_KHR for the surface on the specified device. VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT must be included in the set. Implementations may support additional usages.

**Note**

Supported usage flags of a presentable image when using VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR presentation mode are provided by VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags.

**Note**

Formulas such as \( \min(N, \maxImageCount) \) are not correct, since \( \maxImageCount \) may be zero.

To query the basic capabilities of a surface defined by the core or extensions, call:

```c
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkSurfaceCapabilities2KHR* pSurfaceCapabilities);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.
- **pSurfaceInfo** is a pointer to a VkPhysicalDeviceSurfaceInfo2KHR structure describing the surface and other fixed parameters that would be consumed by vkCreateSwapchainKHR.
- **pSurfaceCapabilities** is a pointer to a VkSurfaceCapabilities2KHR structure in which the capabilities are returned.

vkGetPhysicalDeviceSurfaceCapabilities2KHR behaves similarly to vkGetPhysicalDeviceSurfaceCapabilitiesKHR, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

**Valid Usage**

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06210**
  
  \( pSurfaceInfo->surface \) must be supported by **physicalDevice**, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism.

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-02671**

  If a VkSurfaceCapabilitiesFullScreenExclusiveEXT structure is included in the **pNext** chain of **pSurfaceCapabilities**, a VkSurfaceFullScreenExclusiveWin32InfoEXT structure must be included in the **pNext** chain of **pSurfaceInfo**.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-parameter
  pSurfaceInfo must be a valid pointer to a valid VkPhysicalDeviceSurfaceInfo2KHR structure

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceCapabilities-parameter
  pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilities2KHR structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkPhysicalDeviceSurfaceInfo2KHR structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkPhysicalDeviceSurfaceInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceKHR surface;
} VkPhysicalDeviceSurfaceInfo2KHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- surface is the surface that will be associated with the swapchain.

The members of VkPhysicalDeviceSurfaceInfo2KHR correspond to the arguments to vkGetPhysicalDeviceSurfaceCapabilitiesKHR, with sType and pNext added for extensibility.

Additional capabilities of a surface may be available to swapchains created with different full-screen exclusive settings - particularly if exclusive full-screen access is application controlled. These additional capabilities can be queried by adding a VkSurfaceFullScreenExclusiveInfoEXT structure to the pNext chain of this structure when used to query surface properties. Additionally, for Win32 surfaces with application controlled exclusive full-screen access, chaining a VkSurfaceFullScreenExclusiveWin32InfoEXT structure may also report additional surface capabilities. These additional capabilities only apply to swapchains created with the same
parameters included in the `pNext` chain of `VkSwapchainCreateInfoKHR`.

### Valid Usage

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-02672**

  If the `pNext` chain includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure with its `fullScreenExclusive` member set to `VKFULLSCREENEXCLUSIVEAPPLICATIONCONTROLLEDEXT`, and surface was created using `vkCreateWin32SurfaceKHR`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure must be included in the `pNext` chain.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-sType**

  `sType` must be `VKSTRUCTURETYPE_PHYSICALDEVICESURFACEINFO2KHR`.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-pNext**

  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkSurfaceFullScreenExclusiveInfoEXT` or `VkSurfaceFullScreenExclusiveWin32InfoEXT`.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-unique**

  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-parameter**

  `surface` must be a valid `VkSurfaceKHR` handle.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure, then that structure specifies the application’s preferred full-screen transition behavior.

The `VkSurfaceFullScreenExclusiveInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveInfoEXT {
    VkStructureType    sType;
    void*              pNext;
    VkFullScreenExclusiveEXT fullscreenExclusive;
} VkSurfaceFullScreenExclusiveInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fullscreenExclusive` is a `VkFullScreenExclusiveEXT` value specifying the preferred full-screen transition behavior.

If this structure is not present, `fullscreenExclusive` is considered to be `VKFULLSCREENEXCLUSIVE_DEFAULT_EXT`. 
Valid Usage (Implicit)

- VUID-VkSurfaceFullScreenExclusiveInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_INFO_EXT

- VUID-VkSurfaceFullScreenExclusiveInfoEXT-fullScreenExclusive-parameter
  fullscreenExclusive must be a valid VkFullScreenExclusiveEXT value

Possible values of VkSurfaceFullScreenExclusiveInfoEXT::fullscreenExclusive are:

```c
// Provided by VK_EXT_full_screen-exclusive
typedef enum VkFullScreenExclusiveEXT {
    VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT = 0,
    VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT = 1,
    VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT = 2,
    VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT = 3,
} VkFullScreenExclusiveEXT;
```

- **VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT** indicates the implementation should determine the appropriate full-screen method by whatever means it deems appropriate.

- **VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT** indicates the implementation may use full-screen exclusive mechanisms when available. Such mechanisms may result in better performance and/or the availability of different presentation capabilities, but may require a more disruptive transition during swapchain initialization, first presentation and/or destruction.

- **VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT** indicates the implementation should avoid using full-screen mechanisms which rely on disruptive transitions.

- **VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT** indicates the application will manage full-screen exclusive mode by using the vkAcquireFullScreenExclusiveModeEXT and vkReleaseFullScreenExclusiveModeEXT commands.

The VkSurfaceFullScreenExclusiveWin32InfoEXT structure is defined as:

```c
// Provided by VK_EXT_full_screen-exclusive with VK_KHR_win32_surface
typedef struct VkSurfaceFullScreenExclusiveWin32InfoEXT {
    VkStructureType sType;
    const void* pNext;
    HMONITOR hmonitor;
} VkSurfaceFullScreenExclusiveWin32InfoEXT;
```

- **sType** is the type of this structure.

- **pNext** is NULL or a pointer to a structure extending this structure.

- **hmonitor** is the Win32 HMONITOR handle identifying the display to create the surface with.
Note
If `hmonitor` is invalidated (e.g. the monitor is unplugged) during the lifetime of a swapchain created with this structure, operations on that swapchain will return `VK_ERROR_OUT_OF_DATE_KHR`.

Note
It is the responsibility of the application to change the display settings of the targeted Win32 display using the appropriate platform APIs. Such changes may alter the surface capabilities reported for the created surface.

Valid Usage

- VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-hmonitor-02673
  `hmonitor` must be a valid `HMONITOR`

Valid Usage (Implicit)

- VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_WIN32_INFO_EXT`

The `VkSurfaceCapabilities2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkSurfaceCapabilitiesKHR surfaceCapabilities;
} VkSurfaceCapabilities2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceCapabilities` is a `VkSurfaceCapabilitiesKHR` structure describing the capabilities of the specified surface.
Valid Usage (Implicit)

- VUID-VkSurfaceCapabilities2KHR-sType-sType
  The `sType` must be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR`

- VUID-VkSurfaceCapabilities2KHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDisplayNativeHdrSurfaceCapabilitiesAMD`, `VkSharedPresentSurfaceCapabilitiesKHR`, `VkSurfaceCapabilitiesFullScreenExclusiveEXT`, or `VkSurfaceProtectedCapabilitiesKHR`

- VUID-VkSurfaceCapabilities2KHR-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

An application queries if a protected `VkSurfaceKHR` is displayable on a specific windowing system using `VkSurfaceProtectedCapabilitiesKHR`, which can be passed in `pNext` parameter of `VkSurfaceCapabilities2KHR`.

The `VkSurfaceProtectedCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_surface_protected_capabilities
typedef struct VkSurfaceProtectedCapabilitiesKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 supportsProtected;
} VkSurfaceProtectedCapabilitiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supportsProtected` specifies whether a protected swapchain created from `VkPhysicalDeviceSurfaceInfo2KHR::surface` for a particular windowing system can be displayed on screen or not. If `supportsProtected` is `VK_TRUE`, then creation of swapchains with the `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR` flag set must be supported for `surface`.

Valid Usage (Implicit)

- VUID-VkSurfaceProtectedCapabilitiesKHR-sType-sType
  The `sType` must be `VK_STRUCTURE_TYPE_SURFACE_PROTECTED_CAPABILITIES_KHR`

The `VkSharedPresentSurfaceCapabilitiesKHR` structure is defined as:
typedef struct VkSharedPresentSurfaceCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkImageUsageFlags sharedPresentSupportedUsageFlags;
} VkSharedPresentSurfaceCapabilitiesKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **sharedPresentSupportedUsageFlags** is a bitmask of VkImageUsageFlagBits representing the ways the application can use the shared presentable image from a swapchain created with VkPresentModeKHR set to VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR for the surface on the specified device. VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT must be included in the set but implementations may support additional usages.

### Valid Usage (Implicit)

- VUID-VkSharedPresentSurfaceCapabilitiesKHR-sType-sType
  
  **sType** must be VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR

The VkDisplayNativeHdrSurfaceCapabilitiesAMD structure is defined as:

typedef struct VkDisplayNativeHdrSurfaceCapabilitiesAMD {
    VkStructureType sType;
    void* pNext;
    VkBool32 localDimmingSupport;
} VkDisplayNativeHdrSurfaceCapabilitiesAMD;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **localDimmingSupport** specifies whether the surface supports local dimming. If this is VK_TRUE, VkSwapchainDisplayNativeHdrCreateInfoAMD can be used to explicitly enable or disable local dimming for the surface. Local dimming may also be overridden by vkSetLocalDimmingAMD during the lifetime of the swapchain.

### Valid Usage (Implicit)

- VUID-VkDisplayNativeHdrSurfaceCapabilitiesAMD-sType-sType
  
  **sType** must be VK_STRUCTURE_TYPE_DISPLAY_NATIVE_HDR_SURFACE_CAPABILITIES_AMD

The VkSurfaceCapabilitiesFullScreenExclusiveEXT structure is defined as:
typedef struct VkSurfaceCapabilitiesFullScreenExclusiveEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 fullScreenExclusiveSupported;
} VkSurfaceCapabilitiesFullScreenExclusiveEXT;

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `fullscreenExclusiveControlSupported` is a boolean describing whether the surface is able to make use of exclusive full-screen access.

This structure can be included in the `pNext` chain of `VkSurfaceCapabilities2KHR` to determine support for exclusive full-screen access. If `fullscreenExclusiveSupported` is `VK_FALSE`, it indicates that exclusive full-screen access is not obtainable for this surface.

Applications must not attempt to create swapchains with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` set if `fullscreenExclusiveSupported` is `VK_FALSE`.

### Valid Usage (Implicit)

- VUID-VkSurfaceCapabilitiesFullScreenExclusiveEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_FULL_SCREEN_EXCLUSIVE_EXT`.

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_EXT_display_surface_counter
VkResult vkGetPhysicalDeviceSurfaceCapabilities2EXT(
    VkPhysicalDevice physicalDevice,     
    VkSurfaceKHR surface,                
    VkSurfaceCapabilities2EXT* pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilities2EXT` structure in which the capabilities are returned.

`vkGetPhysicalDeviceSurfaceCapabilities2EXT` behaves similarly to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with the ability to return extended information by adding extending structures to the `pNext` chain of its `pSurfaceCapabilities` parameter.
Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-surface-06211
  surface must be supported by physicalDevice, as reported by
  vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-parameter
  surface must be a valid VkSurfaceKHR handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-pSurfaceCapabilities-parameter
  pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilities2EXT structure

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-commonparent
  Both of physicalDevice, and surface must have been created, allocated, or retrieved from
  the same VkInstance

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceCapabilities2EXT structure is defined as:
typedef struct VkSurfaceCapabilities2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t minImageCount;
    uint32_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
    VkSurfaceCounterFlagsEXT supportedSurfaceCounters;
} VkSurfaceCapabilities2EXT;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **minImageCount** is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.
- **maxImageCount** is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to **minImageCount**. A value of 0 means that there is no limit on the number of images, though there may be limits related to the total amount of memory used by presentable images.
- **currentExtent** is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.
- **minImageExtent** contains the smallest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be less than or equal to the corresponding width and height of **currentExtent**, unless **currentExtent** has the special value described above.
- **maxImageExtent** contains the largest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be greater than or equal to the corresponding width and height of **minImageExtent**. The width and height of the extent will each be greater than or equal to the corresponding width and height of **currentExtent**, unless **currentExtent** has the special value described above.
- **maxImageArrayLayers** is the maximum number of layers presentable images can have for a swapchain created for this device and surface, and will be at least one.
- **supportedTransforms** is a bitmask of VkSurfaceTransformFlagBitsKHR indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.
- **currentTransform** is VkSurfaceTransformFlagBitsKHR value indicating the surface’s current transform relative to the presentation engine’s natural orientation.
- **supportedCompositeAlpha** is a bitmask of VkCompositeAlphaFlagBitsKHR, representing the alpha
compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition can be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

- **supportedUsageFlags** is a bitmask of VkImageUsageFlagBits representing the ways the application can use the presentable images of a swapchain created with VkPresentModeKHR set to VK_PRESENT_MODE_IMMEDIATE_KHR, VK_PRESENT_MODE_MAILBOX_KHR, VK_PRESENT_MODE_FIFO_KHR or VK_PRESENT_MODE_FIFO_RELAXED_KHR for the surface on the specified device. VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT must be included in the set. Implementations may support additional usages.

- **supportedSurfaceCounters** is a bitmask of VkSurfaceCounterFlagBitsEXT indicating the supported surface counter types.

**Valid Usage**

- **VUID-VkSurfaceCapabilities2EXT-supportedSurfaceCounters-01246**
  
  supportedSurfaceCounters must not include VK_SURFACE_COUNTER_VBLANK_BIT_EXT unless the surface queried is a display surface

**Valid Usage (Implicit)**

- **VUID-VkSurfaceCapabilities2EXT-sType-sType**
  
  sType must be VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_EXT

- **VUID-VkSurfaceCapabilities2EXT-pNext-pNext**
  
  pNext must be NULL

Bits which can be set in VkSurfaceCapabilities2EXT::supportedSurfaceCounters, indicating supported surface counter types, are:

```c
// Provided by VK_EXT_display_surface_counter
typedef enum VkSurfaceCounterFlagBitsEXT {
    VK_SURFACE_COUNTER_VBLANK_BIT_EXT = 0x00000001,
    VK_SURFACE_COUNTER_VBLANK_EXT = VK_SURFACE_COUNTER_VBLANK_BIT_EXT,
} VkSurfaceCounterFlagBitsEXT;
```

- **VK_SURFACE_COUNTER_VBLANK_BIT_EXT** specifies a counter incrementing once every time a vertical blanking period occurs on the display associated with the surface.

```c
// Provided by VK_EXT_display_surface_counter
typedef VkFlags VkSurfaceCounterFlagsEXT;
```

VkSurfaceCounterFlagsEXT is a bitmask type for setting a mask of zero or more VkSurfaceCounterFlagBitsEXT.
Bits which may be set in `VkSurfaceCapabilitiesKHR::supportedTransforms` indicating the presentation transforms supported for the surface on the specified device, and possible values of `VkSurfaceCapabilitiesKHR::currentTransform` indicating the surface’s current transform relative to the presentation engine’s natural orientation, are:

```c
// Provided by VK_KHR_surface
typedef enum VkSurfaceTransformFlagBitsKHR {
    VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR = 0x00000001,
    VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR = 0x00000002,
    VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR = 0x00000004,
    VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR = 0x00000008,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR = 0x00000010,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR = 0x00000020,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR = 0x00000040,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR = 0x00000080,
    VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR = 0x00000100,
} VkSurfaceTransformFlagBitsKHR;
```

- **VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR** specifies that image content is presented without being transformed.
- **VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR** specifies that image content is rotated 90 degrees clockwise.
- **VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR** specifies that image content is rotated 180 degrees clockwise.
- **VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR** specifies that image content is rotated 270 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR** specifies that image content is mirrored horizontally.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 90 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 180 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 270 degrees clockwise.
- **VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR** specifies that the presentation transform is not specified, and is instead determined by platform-specific considerations and mechanisms outside Vulkan.

```c
// Provided by VK_KHR_display
typedef VkFlags VkSurfaceTransformFlagsKHR;
```

`VkSurfaceTransformFlagsKHR` is a bitmask type for setting a mask of zero or more `VkSurfaceTransformFlagBitsKHR`.

The `supportedCompositeAlpha` member is of type `VkCompositeAlphaFlagBitsKHR`, which contains the
following values:

```c
// Provided by VK_KHR_surface
typedef enum VkCompositeAlphaFlagBitsKHR {
    VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR = 0x00000002,
    VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR = 0x00000004,
    VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR = 0x00000008,
} VkCompositeAlphaFlagBitsKHR;
```

These values are described as follows:

- **VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR**: The alpha channel, if it exists, of the images is ignored in the compositing process. Instead, the image is treated as if it has a constant alpha of 1.0.

- **VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR**: The alpha channel, if it exists, of the images is respected in the compositing process. The non-alpha channels of the image are expected to already be multiplied by the alpha channel by the application.

- **VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR**: The alpha channel, if it exists, of the images is respected in the compositing process. The non-alpha channels of the image are not expected to already be multiplied by the alpha channel by the application; instead, the compositor will multiply the non-alpha channels of the image by the alpha channel during compositing.

- **VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR**: The way in which the presentation engine treats the alpha channel in the images is unknown to the Vulkan API. Instead, the application is responsible for setting the composite alpha blending mode using native window system commands. If the application does not set the blending mode using native window system commands, then a platform-specific default will be used.

```c
// Provided by VK_KHR_surface
typedef VkFlags VkCompositeAlphaFlagsKHR;
```

**VkCompositeAlphaFlagsKHR** is a bitmask type for setting a mask of zero or more **VkCompositeAlphaFlagBitsKHR**.

### 33.5.2. Surface Format Support

To query the supported swapchain format-color space pairs for a surface, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceFormatsKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pSurfaceFormatCount,
    VkSurfaceFormatKHR* pSurfaceFormats);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as
described for \texttt{vkCreateSwapchainKHR}.

- \textit{surface} is the surface that will be associated with the swapchain.
- \texttt{pSurfaceFormatCount} is a pointer to an integer related to the number of format pairs available or queried, as described below.
- \texttt{pSurfaceFormats} is either \texttt{NULL} or a pointer to an array of \texttt{VkSurfaceFormatKHR} structures.

If \texttt{pSurfaceFormats} is \texttt{NULL}, then the number of format pairs supported for the given \textit{surface} is returned in \texttt{pSurfaceFormatCount}. Otherwise, \texttt{pSurfaceFormatCount} \textbf{must} point to a variable set by the user to the number of elements in the \texttt{pSurfaceFormats} array, and on return the variable is overwritten with the number of structures actually written to \texttt{pSurfaceFormats}. If the value of \texttt{pSurfaceFormatCount} is less than the number of format pairs supported, at most \texttt{pSurfaceFormatCount} structures will be written, and \texttt{VK_INCOMPLETE} will be returned instead of \texttt{VK_SUCCESS}, to indicate that not all the available format pairs were returned.

The number of format pairs supported \textbf{must} be greater than or equal to 1. \texttt{pSurfaceFormats} \textbf{must} not contain an entry whose value for \textit{format} is \texttt{VK_FORMAT_UNDEFINED}.

If \texttt{pSurfaceFormats} includes an entry whose value for \textit{colorSpace} is \texttt{VK_COLOR_SPACE_SRGB_NONLINEAR_KHR} and whose value for \textit{format} is a UNORM (or SRGB) format and the corresponding SRGB (or UNORM) format is a color renderable format for \texttt{VK_IMAGE_TILING_OPTIMAL}, then \texttt{pSurfaceFormats} \textbf{must} also contain an entry with the same value for \textit{colorSpace} and \textit{format} equal to the corresponding SRGB (or UNORM) format.

**Valid Usage**

- \textbf{VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06211}: \textit{surface} \textbf{must} be supported by \texttt{physicalDevice}, as reported by \texttt{vkGetPhysicalDeviceSurfaceSupportKHR} or an equivalent platform-specific mechanism.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-parameter
  `surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormatCount-parameter
  `pSurfaceFormatCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormats-parameter
  If the value referenced by `pSurfaceFormatCount` is not 0, and `pSurfaceFormats` is not NULL, `pSurfaceFormats` must be a valid pointer to an array of `pSurfaceFormatCount` `VkSurfaceFormatKHR` structures

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-commonparent
  Both of `physicalDevice`, and `surface` must have been created, allocated, or retrieved from the same `VkInstance`

Return Codes

Success
- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkSurfaceFormatKHR` structure is defined as:

```c
// Provided by VK_KHR_surface
typedef struct VkSurfaceFormatKHR {
  VkFormat format;
  VkColorSpaceKHR colorSpace;
} VkSurfaceFormatKHR;
```

- `format` is a `VkFormat` that is compatible with the specified surface.
- `colorSpace` is a presentation `VkColorSpaceKHR` that is compatible with the surface.

To query the supported swapchain format tuples for a surface, call:
VkResult vkGetPhysicalDeviceSurfaceFormats2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    uint32_t* pSurfaceFormatCount,
    VkSurfaceFormat2KHR* pSurfaceFormats);

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.

- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.

- `pSurfaceFormatCount` is a pointer to an integer related to the number of format tuples available or queried, as described below.

- `pSurfaceFormats` is either `NULL` or a pointer to an array of `VkSurfaceFormat2KHR` structures.

`vkGetPhysicalDeviceSurfaceFormats2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceFormatsKHR`, with the ability to be extended via `pNext` chains.

If `pSurfaceFormats` is `NULL`, then the number of format tuples supported for the given `surface` is returned in `pSurfaceFormatCount`. Otherwise, `pSurfaceFormatCount` must point to a variable set by the user to the number of elements in the `pSurfaceFormats` array, and on return the variable is overwritten with the number of structures actually written to `pSurfaceFormats`. If the value of `pSurfaceFormatCount` is less than the number of format tuples supported, at most `pSurfaceFormatCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available values were returned.

**Valid Usage**

- `VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06210` `pSurfaceInfo->surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism.
Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-physicalDevice-parameter**  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-parameter**  
  `pSurfaceInfo` must be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormatCount-parameter**  
  `pSurfaceFormatCount` must be a valid pointer to a `uint32_t` value

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormats-parameter**  
  If the value referenced by `pSurfaceFormatCount` is not 0, and `pSurfaceFormats` is not NULL, `pSurfaceFormats` must be a valid pointer to an array of `pSurfaceFormatCount` `VkSurfaceFormat2KHR` structures

Return Codes

**Success**

- VK_SUCCESS
- VK_INCOMPLETE

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The `VkSurfaceFormat2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceFormat2KHR {
    VkStructureType sType;
    void* pNext;
    VkSurfaceFormatKHR surfaceFormat;
} VkSurfaceFormat2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceFormat` is a `VkSurfaceFormatKHR` structure describing a format-color space pair that is compatible with the specified surface.
Valid Usage (Implicit)

- VUID-VkSurfaceFormat2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR

- VUID-VkSurfaceFormat2KHR-pNext-pNext
  pNext must be NULL

While the format of a presentable image refers to the encoding of each pixel, the colorSpace determines how the presentation engine interprets the pixel values. A color space in this document refers to a specific color space (defined by the chromaticities of its primaries and a white point in CIE Lab), and a transfer function that is applied before storing or transmitting color data in the given color space.

Possible values of VkSurfaceFormatKHR::colorSpace, specifying supported color spaces of a presentation engine, are:
typedef enum VkColorSpaceKHR {
    VK_COLOR_SPACE_SRGB_NONLINEAR_KHR = 0,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT = 1000104001,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT = 1000104002,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT = 1000104003,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT = 1000104004,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_LINEAR_EXT = 1000104005,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_NONLINEAR_EXT = 1000104006,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT2020_LINEAR_EXT = 1000104007,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_HDR10_ST2084_EXT = 1000104008,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DOLBYVISION_EXT = 1000104009,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_HDR10_HLG_EXT = 1000104010,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT = 1000104011,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT = 1000104012,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_PASS_THROUGH_EXT = 1000104013,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT = 1000104014,
    // Provided by VK_AMD_display_native_hdr
    VK_COLOR_SPACE_DISPLAY_NATIVE_AMD = 1000213000,
    VK_COLORSPACE_SRGB_NONLINEAR_KHR = VK_COLOR_SPACE_SRGB_NONLINEAR_KHR,
    VK_COLOR_SPACE_DCI_P3_LINEAR_EXT = VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT,
} VkColorSpaceKHR;

- **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** specifies support for the sRGB color space.
- **VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT** specifies support for the Display-P3 color space to be displayed using an sRGB-like EOTF (defined below).
- **VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT** specifies support for the extended sRGB color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT** specifies support for the extended sRGB color space to be displayed using an sRGB EOTF.
- **VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT** specifies support for the Display-P3 color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT** specifies support for the DCI-P3 color space to be displayed
using the DCI-P3 EOTF. Note that values in such an image are interpreted as XYZ encoded color data by the presentation engine.

- **VK_COLOR_SPACE_BT709_LINEAR_EXT** specifies support for the BT709 color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_BT709_NONLINEAR_EXT** specifies support for the BT709 color space to be displayed using the SMPTE 170M EOTF.
- **VK_COLOR_SPACE_BT2020_LINEAR_EXT** specifies support for the BT2020 color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_HDR10_ST2084_EXT** specifies support for the HDR10 (BT2020 color) space to be displayed using the SMPTE ST2084 Perceptual Quantizer (PQ) EOTF.
- **VK_COLOR_SPACE_DOLBYVISION_EXT** specifies support for the Dolby Vision (BT2020 color space), proprietary encoding, to be displayed using the SMPTE ST2084 EOTF.
- **VK_COLOR_SPACE_HDR10_HLG_EXT** specifies support for the HDR10 (BT2020 color space) to be displayed using the Hybrid Log Gamma (HLG) EOTF.
- **VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT** specifies support for the AdobeRGB color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT** specifies support for the AdobeRGB color space to be displayed using the Gamma 2.2 EOTF.
- **VK_COLOR_SPACE_PASS_THROUGH_EXT** specifies that color components are used “as is”. This is intended to allow applications to supply data for color spaces not described here.
- **VK_COLOR_SPACE_DISPLAY_NATIVE_AMD** specifies support for the display’s native color space. This matches the color space expectations of AMD’s FreeSync2 standard, for displays supporting it.

**Note**

In the initial release of the **VK_KHR_surface** and **VK_KHR_swapchain** extensions, the token **VK_COLORSPACE_SRGB_NONLINEAR_KHR** was used. Starting in the 2016-05-13 updates to the extension branches, matching release 1.0.13 of the core API specification, **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** is used instead for consistency with Vulkan naming rules. The older enum is still available for backwards compatibility.

**Note**

In older versions of this extension **VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT** was misnamed **VK_COLOR_SPACE_DCI_P3_LINEAR_EXT**. This has been updated to indicate that it uses RGB color encoding, not XYZ. The old name is deprecated but is maintained for backwards compatibility.

The color components of non-linear color space swap chain images must have had the appropriate transfer function applied. The color space selected for the swap chain image will not affect the processing of data written into the image by the implementation. Vulkan requires that all implementations support the sRGB transfer function by use of an SRGB pixel format. Other transfer functions, such as SMPTE 170M or SMPTE2084, can be performed by the application shader. This extension defines enums for **VkColorSpaceKHR** that correspond to the following color spaces:
Table 47. Color Spaces and Attributes

<table>

</tbody>
</table>

The transfer functions are described in the “Transfer Functions” chapter of the [Khronos Data Format Specification](https://www.khronos.org/registry/ Khronos Data Format Specification).

Except Display-P3 OETF, which is:

\[
E = \begin{cases} 
1.055 \times L^{1/3} & \text{for } 0.0030186 \leq L \leq 1 \\
12.92 \times L & \text{for } 0 \leq L < 0.0030186 
\end{cases}
\]

where \( L \) is the linear value of a color channel and \( E \) is the encoded value (as stored in the image in memory).

**Note**

For most uses, the sRGB OETF is equivalent.

### 33.5.3. Surface Presentation Mode Support

To query the supported presentation modes for a surface, call:
// Provided by VK_KHR_surface

VkResult vkGetPhysicalDeviceSurfacePresentModesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pPresentModeCount,
    VkPresentModeKHR* pPresentModes);

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `surface` is the surface that will be associated with the swapchain.
- `pPresentModeCount` is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- `pPresentModes` is either `NULL` or a pointer to an array of `VkPresentModeKHR` values, indicating the supported presentation modes.

If `pPresentModes` is `NULL`, then the number of presentation modes supported for the given `surface` is returned in `pPresentModeCount`. Otherwise, `pPresentModeCount` must point to a variable set by the user to the number of elements in the `pPresentModes` array, and on return the variable is overwritten with the number of values actually written to `pPresentModes`. If the value of `pPresentModeCount` is less than the number of presentation modes supported, at most `pPresentModeCount` values will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available modes were returned.

**Valid Usage**

- `VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06211` 
  `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-physicalDevice-parameter
  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-parameter
  
  `surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModeCount-parameter
  
  `pPresentModeCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModes-parameter
  
  If the value referenced by `pPresentModeCount` is not 0, and `pPresentModes` is not NULL, `pPresentModes` must be a valid pointer to an array of `pPresentModeCount` `VkPresentModeKHR` values

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-commonparent
  
  Both of `physicalDevice`, and `surface` must have been created, allocated, or retrieved from the same `VkInstance`

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

Alternatively, to query the supported presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```c
// Provided by VK_EXT_full_screen_exclusive

VkResult vkGetPhysicalDeviceSurfacePresentModes2EXT(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    uint32_t* pPresentModeCount,
    VkPresentModeKHR* pPresentModes);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.

- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`. 
• `pPresentModeCount` is a pointer to an integer related to the number of presentation modes available or queried, as described below.

• `pPresentModes` is either `NULL` or a pointer to an array of `VkPresentModeKHR` values, indicating the supported presentation modes.

`vkGetPhysicalDeviceSurfacePresentModes2EXT` behaves similarly to `vkGetPhysicalDeviceSurfacePresentModesKHR`, with the ability to specify extended inputs via chained input structures.

### Valid Usage

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06210
  `pSurfaceInfo->surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-parameter
  `pSurfaceInfo` must be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModeCount-parameter
  `pPresentModeCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModes-parameter
  If the value referenced by `pPresentModeCount` is not `0`, and `pPresentModes` is not `NULL`, `pPresentModes` must be a valid pointer to an array of `pPresentModeCount` `VkPresentModeKHR` values

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

Possible values of elements of the `vkGetPhysicalDeviceSurfacePresentModesKHR::pPresentModes` array, indicating the supported presentation modes for a surface, are:
// Provided by VK_KHR_surface
typedef enum VkPresentModeKHR {
    VK_PRESENT_MODE_IMMEDIATE_KHR = 0,
    VK_PRESENT_MODE_MAILBOX_KHR = 1,
    VK_PRESENT_MODE_FIFO_KHR = 2,
    VK_PRESENT_MODE_FIFO_RELAXED_KHR = 3,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR = 1000111000,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR = 1000111001,
} VkPresentModeKHR;

- **VK_PRESENT_MODE_IMMEDIATE_KHR** specifies that the presentation engine does not wait for a vertical blanking period to update the current image, meaning this mode may result in visible tearing. No internal queuing of presentation requests is needed, as the requests are applied immediately.

- **VK_PRESENT_MODE_MAILBOX_KHR** specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing cannot be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for re-use by the application. One request is removed from the queue and processed during each vertical blanking period in which the queue is non-empty.

- **VK_PRESENT_MODE_FIFO_KHR** specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing cannot be observed. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty. This is the only value of presentMode that is required to be supported.

- **VK_PRESENT_MODE_FIFO_RELAXED_KHR** specifies that the presentation engine generally waits for the next vertical blanking period to update the current image. If a vertical blanking period has already passed since the last update of the current image then the presentation engine does not wait for another vertical blanking period for the update, meaning this mode may result in visible tearing in this case. This mode is useful for reducing visual stutter with an application that will mostly present a new image before the next vertical blanking period, but may occasionally be late, and present a new image just after the next vertical blanking period. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during or after each vertical blanking period in which the queue is non-empty.

- **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a shared presentable image. The presentation engine is only required to update the current image after a new presentation request is received. Therefore the application must make a presentation request whenever an update is required. However, the presentation engine may update the current image at any point, meaning this mode may result in visible tearing.
• **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a *shared presentable image*. The presentation engine periodically updates the current image on its regular refresh cycle. The application is only required to make one initial presentation request, after which the presentation engine must update the current image without any need for further presentation requests. The application can indicate the image contents have been updated by making a presentation request, but this does not guarantee the timing of when it will be updated. This mode may result in visible tearing if rendering to the image is not timed correctly.

The supported *VkImageUsageFlagBits* of the presentable images of a swapchain created for a surface may differ depending on the presentation mode, and can be determined as per the table below:

**Table 48. Presentable image usage queries**

<td>VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR</td>
<td>VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags</td>
</tr>
</tbody>
</table>

**Note**

For reference, the mode indicated by **VK_PRESENT_MODE_FIFO_KHR** is equivalent to the behavior of `{wgl|glX|egl}SwapBuffers with a swap interval of 1, while the mode indicated by **VK_PRESENT_MODE_FIFO_RELAXED_KHR** is equivalent to the behavior of `{wgl|glX}SwapBuffers with a swap interval of -1 (from the {WGL|GLX}_EXT_swap_control_tear extensions).

### 33.6. Full Screen Exclusive Control

Swapchains created with `fullscreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` must acquire and release exclusive full-screen access explicitly, using the following commands.

To acquire exclusive full-screen access for a swapchain, call:

```c
// Provided by VK_EXT_full_screen_exclusive
VkResult vkAcquireFullScreenExclusiveModeEXT(
    VkDevice device,
    VkSwapchainKHR swapchain);
```
• `device` is the device associated with `swapchain`.

• `swapchain` is the swapchain to acquire exclusive full-screen access for.

### Valid Usage

- **VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02674**
  `swapchain` must not be in the retired state

- **VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02675**
  `swapchain` must be a swapchain created with a `VkSurfaceFullScreenExclusiveInfoEXT` structure, with `fullScreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`

- **VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02676**
  `swapchain` must not currently have exclusive full-screen access

A return value of `VK_SUCCESS` indicates that the `swapchain` successfully acquired exclusive full-screen access. The swapchain will retain this exclusivity until either the application releases exclusive full-screen access with `vkReleaseFullScreenExclusiveModeEXT`, destroys the swapchain, or if any of the swapchain commands return `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` indicating that the mode was lost because of platform-specific changes.

If the swapchain was unable to acquire exclusive full-screen access to the display then `VK_ERROR_INITIALIZATION_FAILED` is returned. An application can attempt to acquire exclusive full-screen access again for the same swapchain even if this command fails, or if `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` has been returned by a swapchain command.

### Valid Usage (Implicit)

- **VUID-vkAcquireFullScreenExclusiveModeEXT-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parameter**
  `swapchain` must be a valid `VkSwapchainKHR` handle

- **VUID-vkAcquireFullScreenExclusiveModeEXT-commonparent**
  Both of `device`, and `swapchain` must have been created, allocated, or retrieved from the same `VkInstance`
Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_SURFACE_LOST_KHR

To release exclusive full-screen access from a swapchain, call:

```c
// Provided by VK_EXT_full_screen_exclusive
VkResult vkReleaseFullScreenExclusiveModeEXT(
    VkDevice device,
    VkSwapchainKHR swapchain);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to release exclusive full-screen access from.

**Note**
Applications will not be able to present to `swapchain` after this call until exclusive full-screen access is reacquired. This is usually useful to handle when an application is minimised or otherwise intends to stop presenting for a time.

Valid Usage

- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02677
  `swapchain` must not be in the retired state
- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02678
  `swapchain` must be a swapchain created with a `VkSurfaceFullScreenExclusiveInfoEXT` structure, with `fullScreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`

33.7. Device Group Queries

A logical device that represents multiple physical devices may support presenting from images on more than one physical device, or combining images from multiple physical devices.

To query these capabilities, call:
vkGetDeviceGroupPresentCapabilitiesKHR

- `device` is the logical device.
- `pDeviceGroupPresentCapabilities` is a pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure in which the device's capabilities are returned.

Valid Usage (Implicit)

- `device` must be a valid `VkDevice` handle.
- `pDeviceGroupPresentCapabilities` must be a valid pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure.

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDeviceGroupPresentCapabilitiesKHR` structure is defined as:

```c
typedef struct VkDeviceGroupPresentCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t presentMask[VK_MAX_DEVICE_GROUP_SIZE];
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupPresentCapabilitiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentMask` is an array of `VK_MAX_DEVICE_GROUP_SIZE` `uint32_t` masks, where the mask at element `i` is non-zero if physical device `i` has a presentation engine, and where bit `j` is set in element `i` if...
physical device i can present swapchain images from physical device j. If element i is non-zero, then bit i must be set.

- **modes** is a bitmask of `VkDeviceGroupPresentModeFlagBitsKHR` indicating which device group presentation modes are supported.

**modes** always has `VKDEVICEGROUP_PRESENTMODE_LOCAL_BIT_KHR` set.

The present mode flags are also used when presenting an image, in `VkDeviceGroupPresentInfoKHR::mode`.

If a device group only includes a single physical device, then **modes** must equal `VKDEVICEGROUP_PRESENTMODE_LOCAL_BIT_KHR`.

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupPresentCapabilitiesKHR-sType-sType**
  
  - `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR`

- **VUID-VkDeviceGroupPresentCapabilitiesKHR-pNext-pNext**
  
  - `pNext` must be `NULL`

Bits which may be set in `VkDeviceGroupPresentCapabilitiesKHR::modes` to indicate which device group presentation modes are supported are:

```c
// Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with VK_KHR_surface
typedef enum VkDeviceGroupPresentModeFlagBitsKHR {
    VKDEVICEGROUP_PRESENTMODE_LOCAL_BIT_KHR = 0x00000001,
    VKDEVICEGROUP_PRESENTMODE_REMOTE_BIT_KHR = 0x00000002,
    VKDEVICEGROUP_PRESENTMODE_SUM_BIT_KHR = 0x00000004,
    VKDEVICEGROUP_PRESENTMODE_LOCAL_MULTI_DEVICE_BIT_KHR = 0x00000008,
} VkDeviceGroupPresentModeFlagBitsKHR;
```

- **VKDEVICEGROUP_PRESENTMODE_LOCAL_BIT_KHR** specifies that any physical device with a presentation engine can present its own swapchain images.

- **VKDEVICEGROUP_PRESENTMODE_REMOTE_BIT_KHR** specifies that any physical device with a presentation engine can present swapchain images from any physical device in its `presentMask`.

- **VKDEVICEGROUP_PRESENTMODE_SUM_BIT_KHR** specifies that any physical device with a presentation engine can present the sum of swapchain images from any physical devices in its `presentMask`.

- **VKDEVICEGROUP_PRESENTMODE_LOCAL_MULTI_DEVICE_BIT_KHR** specifies that multiple physical devices with a presentation engine can each present their own swapchain images.

```c
// Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with VK_KHR_surface
typedef VkFlags VkDeviceGroupPresentModeFlagsKHR;
```
**VkDeviceGroupPresentModeFlagBitsKHR** is a bitmask type for setting a mask of zero or more **VkDeviceGroupPresentModeFlagBitsKHR**.

Some surfaces **may** not be capable of using all the device group present modes.

To query the supported device group present modes for a particular surface, call:

```
// Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with
// VK_KHR_surface
VkResult vkGetDeviceGroupSurfacePresentModesKHR(
  VkDevice device,
  VkSurfaceKHR surface,
  VkDeviceGroupPresentModeFlagsKHR* pModes);
```

- **device** is the logical device.
- **surface** is the surface.
- **pModes** is a pointer to a **VkDeviceGroupPresentModeFlagsKHR** in which the supported device group present modes for the surface are returned.

The modes returned by this command are not invariant, and **may** change in response to the surface being moved, resized, or occluded. These modes **must** be a subset of the modes returned by **vkGetDeviceGroupPresentCapabilitiesKHR**.

### Valid Usage

- **VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-06212**
  
  **surface** **must** be supported by all physical devices associated with **device**, as reported by **vkGetPhysicalDeviceSurfaceSupportKHR** or an equivalent platform-specific mechanism.

### Valid Usage (Implicit)

- **VUID-vkGetDeviceGroupSurfacePresentModesKHR-device-parameter**
  
  **device** **must** be a valid **VkDevice** handle.

- **VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-parameter**
  
  **surface** **must** be a valid **VkSurfaceKHR** handle.

- **VUID-vkGetDeviceGroupSurfacePresentModesKHR-pModes-parameter**
  
  **pModes** **must** be a valid pointer to a **VkDeviceGroupPresentModeFlagsKHR** value.

- **VUID-vkGetDeviceGroupSurfacePresentModesKHR-commonparent**
  
  Both of **device**, and **surface** **must** have been created, allocated, or retrieved from the same **VkInstance**.
Host Synchronization

• Host access to surface must be externally synchronized

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_SURFACE_LOST_KHR

Alternatively, to query the supported device group presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```c
// Provided by VK_EXT_full_screen_exclusive with VK_KHR_device_group, VK_EXT_full_screen_exclusive with VK_VERSION_1_1
VkResult vkGetDeviceGroupSurfacePresentModes2EXT(
    VkDevice device,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkDeviceGroupPresentModeFlagsKHR* pModes);
```

• `device` is the logical device.
• `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
• `pModes` is a pointer to a `VkDeviceGroupPresentModeFlagsKHR` in which the supported device group present modes for the surface are returned.

`vkGetDeviceGroupSurfacePresentModes2EXT` behaves similarly to `vkGetDeviceGroupSurfacePresentModesKHR`, with the ability to specify extended inputs via chained input structures.

Valid Usage

• `VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-06213`, `pSurfaceInfo->surface` must be supported by all physical devices associated with `device`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism
## Valid Usage (Implicit)

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-device-parameter  
  `device` **must** be a valid `VkDevice` handle

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-parameter  
  `pSurfaceInfo` **must** be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pModes-parameter  
  `pModes` **must** be a valid pointer to a `VkDeviceGroupPresentModeFlagsKHR` value

## Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

When using `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, the application **may** need to know which regions of the surface are used when presenting locally on each physical device. Presentation of swapchain images to this surface need only have valid contents in the regions returned by this command.

To query a set of rectangles used in presentation on the physical device, call:

```c
// Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with VK_KHR_surface
VkResult vkGetPhysicalDevicePresentRectanglesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pRectCount,
    VkRect2D* pRects);
```

- `physicalDevice` is the physical device.
- `surface` is the surface.
- `pRectCount` is a pointer to an integer related to the number of rectangles available or queried, as described below.
- `pRects` is either `NULL` or a pointer to an array of `VkRect2D` structures.

If `pRects` is `NULL`, then the number of rectangles used when presenting the given `surface` is returned in `pRectCount`. Otherwise, `pRectCount` **must** point to a variable set by the user to the number of rectangles used when presenting the given `surface`.
elements in the `pRects` array, and on return the variable is overwritten with the number of structures actually written to `pRects`. If the value of `pRectCount` is less than the number of rectangles, at most `pRectCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available rectangles were returned.

The values returned by this command are not invariant, and may change in response to the surface being moved, resized, or occluded.

The rectangles returned by this command must not overlap.

### Valid Usage

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06211
  - `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-physicalDevice-parameter
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-parameter
  - `surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRectCount-parameter
  - `pRectCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRects-parameter
  - If the value referenced by `pRectCount` is not 0, and `pRects` is not NULL, `pRects` must be a valid pointer to an array of `pRectCount` `VkRect2D` structures

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-commonparent
  - Both of `physicalDevice`, and `surface` must have been created, allocated, or retrieved from the same `VkInstance`

### Host Synchronization

- Host access to `surface` must be externally synchronized
33.8. Display Timing Queries

Traditional game and real-time-animation applications frequently use `VK_PRESENT_MODE_FIFO_KHR` so that presentable images are updated during the vertical blanking period of a given refresh cycle (RC) of the presentation engine’s display. This avoids the visual anomaly known as tearing.

However, synchronizing the presentation of images with the RC does not prevent all forms of visual anomalies. Stuttering occurs when the geometry for each presentable image is not accurately positioned for when that image will be displayed. The geometry may appear to move too little some RCs, and too much for others. Sometimes the animation appears to freeze, when the same image is used for more than one RC.

In order to minimize stuttering, an application needs to correctly position their geometry for when the presentable image will be displayed to the user. To accomplish this, applications need various timing information about the presentation engine’s display. They need to know when presentable images were actually presented, and when they could have been presented. Applications also need to tell the presentation engine to display an image no sooner than a given time. This can allow the application’s animation to look smooth to the user, with no stuttering. The `VK_GOOGLE_display_timing` extension allows an application to satisfy these needs.

The presentation engine’s display typically refreshes the pixels that are displayed to the user on a periodic basis. The period may be fixed or variable. In many cases, the presentation engine is associated with fixed refresh rate (FRR) display technology, with a fixed refresh rate (RR, e.g. 60Hz). In some cases, the presentation engine is associated with variable refresh rate (VRR) display technology, where each refresh cycle (RC) can vary in length. This extension treats VRR displays as if they are FRR.

To query the duration of a refresh cycle (RC) for the presentation engine’s display, call:

```c
// Provided by VK_GOOGLE_display_timing
VkResult vkGetRefreshCycleDurationGOOGLE(
    VkDevice device,
    VkSwapchainKHR swapchain,
    VkRefreshCycleDurationGOOGLE* pDisplayTimingProperties);
```
• **device** is the device associated with **swapchain**.
• **swapchain** is the swapchain to obtain the refresh duration for.
• **pDisplayTimingProperties** is a pointer to a **VkRefreshCycleDurationGOOGLE** structure.

### Valid Usage (Implicit)

- **VUID-vkGetRefreshCycleDurationGOOGLE-device-parameter**  
  * **device** must be a valid **VkDevice** handle*

- **VUID-vkGetRefreshCycleDurationGOOGLE-swapchain-parameter**  
  * **swapchain** must be a valid **VkSwapchainKHR** handle*

- **VUID-vkGetRefreshCycleDurationGOOGLE-pDisplayTimingProperties-parameter**  
  * **pDisplayTimingProperties** must be a valid pointer to a **VkRefreshCycleDurationGOOGLE** structure*

- **VUID-vkGetRefreshCycleDurationGOOGLE-commonparent**  
  * Both of **device**, and **swapchain** must have been created, allocated, or retrieved from the same **VkInstance**

### Host Synchronization

- Host access to **swapchain** must be externally synchronized

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_SURFACE_LOST_KHR

The **VkRefreshCycleDurationGOOGLE** structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing  
typedef struct VkRefreshCycleDurationGOOGLE {
    uint64_t refreshDuration;
} VkRefreshCycleDurationGOOGLE;
```

- **refreshDuration** is the number of nanoseconds from the start of one refresh cycle to the next.
The rate at which an application renders and presents new images is known as the image present rate (IPR, aka frame rate). The inverse of IPR, or the duration between each image present, is the image present duration (IPD). In order to provide a smooth, stutter-free animation, an application will want its IPD to be a multiple of \texttt{refreshDuration}. For example, if a display has a 60Hz refresh rate, \texttt{refreshDuration} will be a value in nanoseconds that is approximately equal to 16.67ms. In such a case, an application will want an IPD of 16.67ms (1X multiplier of \texttt{refreshDuration}), or 33.33ms (2X multiplier of \texttt{refreshDuration}), or 50.0ms (3X multiplier of \texttt{refreshDuration}), etc.

In order to determine a target IPD for a display (i.e. a multiple of \texttt{refreshDuration}), an application needs to determine when its images are actually displayed. Let's say that an application has an initial target IPD of 16.67ms (1X multiplier of \texttt{refreshDuration}). It will therefore position the geometry of a new image 16.67ms later than the previous image. Let's say that this application is running on slower hardware, so that it actually takes 20ms to render each new image. This will create visual anomalies, because the images will not be displayed to the user every 16.67ms, nor every 20ms. In this case, it is better for the application to adjust its target IPD to 33.33ms (i.e. a 2X multiplier of \texttt{refreshDuration}), and tell the presentation engine to not present images any sooner than every 33.33ms. This will allow the geometry to be correctly positioned for each presentable image.

Adjustments to an application's IPD may be needed because different views of an application's geometry can take different amounts of time to render. For example, looking at the sky may take less time to render than looking at multiple, complex items in a room. In general, it is good to not frequently change IPD, as that can cause visual anomalies. Adjustments to a larger IPD because of late images should happen quickly, but adjustments to a smaller IPD should only happen if the \texttt{actualPresentTime} and \texttt{earliestPresentTime} members of the \texttt{VkPastPresentationTimingGOOGLE} structure are consistently different, and if \texttt{presentMargin} is consistently large, over multiple images.

The implementation will maintain a limited amount of history of timing information about previous presents. Because of the asynchronous nature of the presentation engine, the timing information for a given \texttt{vkQueuePresentKHR} command will become available some time later. These time values can be asynchronously queried, and will be returned if available. All time values are in nanoseconds, relative to a monotonically-increasing clock (e.g. \texttt{CLOCK_MONOTONIC} (see \texttt{clock_gettime(2)}) on Android and Linux).

To asynchronously query the presentation engine, for newly-available timing information about one or more previous presents to a given swapchain, call:
// Provided by VK_GOOGLE_display_timing
VkResult vkGetPastPresentationTimingGOOGLE(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint32_t* pPresentationTimingCount,
    VkPastPresentationTimingGOOGLE* pPresentationTimings);

• device is the device associated with swapchain.
• swapchain is the swapchain to obtain presentation timing information duration for.
• pPresentationTimingCount is a pointer to an integer related to the number of VkPastPresentationTimingGOOGLE structures to query, as described below.
• pPresentationTimings is either NULL or a pointer to an array of VkPastPresentationTimingGOOGLE structures.

If pPresentationTimings is NULL, then the number of newly-available timing records for the given swapchain is returned in pPresentationTimingCount. Otherwise, pPresentationTimingCount must point to a variable set by the user to the number of elements in the pPresentationTimings array, and on return the variable is overwritten with the number of structures actually written to pPresentationTimings. If the value of pPresentationTimingCount is less than the number of newly-available timing records, at most pPresentationTimingCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available timing records were returned.

Valid Usage (Implicit)

• VUID-vkGetPastPresentationTimingGOOGLE-device-parameter
  device must be a valid VkDevice handle

• VUID-vkGetPastPresentationTimingGOOGLE-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

• VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimingCount-parameter
  pPresentationTimingCount must be a valid pointer to a uint32_t value

• VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimings-parameter
  If the value referenced by pPresentationTimingCount is not 0, and pPresentationTimings is not NULL, pPresentationTimings must be a valid pointer to an array of pPresentationTimingCount VkPastPresentationTimingGOOGLE structures

• VUID-vkGetPastPresentationTimingGOOGLE-commonparent
  Both of device, and swapchain must have been created, allocated, or retrieved from the same VkInstance

Host Synchronization

• Host access to swapchain must be externally synchronized
Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR

The `VkPastPresentationTimingGOOGLE` structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPastPresentationTimingGOOGLE {
    uint32_t presentID;
    uint64_t desiredPresentTime;
    uint64_t actualPresentTime;
    uint64_t earliestPresentTime;
    uint64_t presentMargin;
} VkPastPresentationTimingGOOGLE;
```

- `presentID` is an application-provided value that was given to a previous `vkQueuePresentKHR` command via `VkPresentTimeGOOGLE::presentID` (see below). It can be used to uniquely identify a previous present with the `vkQueuePresentKHR` command.

- `desiredPresentTime` is an application-provided value that was given to a previous `vkQueuePresentKHR` command via `VkPresentTimeGOOGLE::desiredPresentTime`. If non-zero, it was used by the application to indicate that an image not be presented any sooner than `desiredPresentTime`.

- `actualPresentTime` is the time when the image of the `swapchain` was actually displayed.

- `earliestPresentTime` is the time when the image of the `swapchain` could have been displayed. This may differ from `actualPresentTime` if the application requested that the image be presented no sooner than `VkPresentTimeGOOGLE::desiredPresentTime`.

- `presentMargin` is an indication of how early the `vkQueuePresentKHR` command was processed compared to how soon it needed to be processed, and still be presented at `earliestPresentTime`.

The results for a given `swapchain` and `presentID` are only returned once from `vkGetPastPresentationTimingGOOGLE`.

The application can use the `VkPastPresentationTimingGOOGLE` values to occasionally adjust its timing. For example, if `actualPresentTime` is later than expected (e.g. one `refreshDuration` late), the application may increase its target IPD to a higher multiple of `refreshDuration` (e.g. decrease its
frame rate from 60Hz to 30Hz). If `actualPresentTime` and `earliestPresentTime` are consistently different, and if `presentMargin` is consistently large enough, the application may decrease its target IPD to a smaller multiple of `refreshDuration` (e.g. increase its frame rate from 30Hz to 60Hz). If `actualPresentTime` and `earliestPresentTime` are same, and if `presentMargin` is consistently high, the application may delay the start of its input-render-present loop in order to decrease the latency between user input and the corresponding present (always leaving some margin in case a new image takes longer to render than the previous image). An application that desires its target IPD to always be the same as `refreshDuration`, can also adjust features until `actualPresentTime` is never late and `presentMargin` is satisfactory.

The full `VK_GOOGLE_display_timing` extension semantics are described for swapchains created with `VK_PRESENT_MODE_FIFO_KHR`. For example, non-zero values of `VkPresentTimeGOOGLE::desiredPresentTime` must be honored, and `vkGetPastPresentationTimingGOOGLE` should return a `VkPastPresentationTimingGOOGLE` structure with valid values for all images presented with `vkQueuePresentKHR`. The semantics for other present modes are as follows:

- **VK_PRESENT_MODE_IMMEDIATE_KHR.** The presentation engine may ignore non-zero values of `VkPresentTimeGOOGLE::desiredPresentTime` in favor of presenting immediately. The value of `VkPastPresentationTimingGOOGLE::earliestPresentTime` must be the same as `VkPastPresentationTimingGOOGLE::actualPresentTime`, which should be when the presentation engine displayed the image.

- **VK_PRESENT_MODE_MAILBOX_KHR.** The intention of using this present mode with this extension is to handle cases where an image is presented late, and the next image is presented soon enough to replace it at the next vertical blanking period. For images that are displayed to the user, the value of `VkPastPresentationTimingGOOGLE::actualPresentTime` must be when the image was displayed. For images that are not displayed to the user, `vkGetPastPresentationTimingGOOGLE` may not return a `VkPastPresentationTimingGOOGLE` structure, or it may return a `VkPastPresentationTimingGOOGLE` structure with the value of zero for both `VkPastPresentationTimingGOOGLE::actualPresentTime` and `VkPastPresentationTimingGOOGLE::earliestPresentTime`. It is possible that an application can submit images with `VkPresentTimeGOOGLE::desiredPresentTime` values such that new images may not be displayed. For example, if `VkPresentTimeGOOGLE::desiredPresentTime` is far enough in the future that an image is not presented before `vkQueuePresentKHR` is called to present another image, the first image will not be displayed to the user. If the application continues to do that, the presentation may not display new images.

- **VK_PRESENT_MODE_FIFO_RELAXED_KHR.** For images that are presented in time to be displayed at the next vertical blanking period, the semantics are identical as for `VK_PRESENT_MODE_FIFO_RELAXED_KHR`. For images that are presented late, and are displayed after the start of the vertical blanking period (i.e. with tearing), the values of `VkPastPresentationTimingGOOGLE` may be treated as if the image was displayed at the start of the vertical blanking period, or may be treated the same as for `VK_PRESENT_MODE_IMMEDIATE_KHR`.

### 33.9. Present Wait

Applications wanting to control the pacing of the application by monitoring when presentation processes have completed to limit the number of outstanding images queued for presentation, need to have a method of being signaled during the presentation process.
Using the `VK_GOOGLE_display_timing` extension applications can discover when images were presented, but only asynchronously.

Providing a mechanism which allows applications to block, waiting for a specific step of the presentation process to complete allows them to control the amount of outstanding work (and hence the potential lag in responding to user input or changes in the rendering environment).

The `VK_KHR_present_wait` extension allows applications to tell the presentation engine at the `vkQueuePresentKHR` call that it plans on waiting for presentation by passing a `VkPresentIdKHR` structure. The `presentId` passed in that structure may then be passed to a future `vkWaitForPresentKHR` call to cause the application to block until that presentation is finished.

### 33.10. WSI Swapchain

A swapchain object (a.k.a. swapchain) provides the ability to present rendering results to a surface. Swapchain objects are represented by `VkSwapchainKHR` handles:

```c
// Provided by VK_KHR_swapchain
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSwapchainKHR)
```

A swapchain is an abstraction for an array of presentable images that are associated with a surface. The presentable images are represented by `VkImage` objects created by the platform. One image (which can be an array image for multiview/stereoscopic-3D surfaces) is displayed at a time, but multiple images can be queued for presentation. An application renders to the image, and then queues the image for presentation to the surface.

A native window cannot be associated with more than one non-retired swapchain at a time. Further, swapchains cannot be created for native windows that have a non-Vulkan graphics API surface associated with them.

**Note**

The presentation engine is an abstraction for the platform's compositor or display engine.

The presentation engine may be synchronous or asynchronous with respect to the application and/or logical device.

Some implementations may use the device's graphics queue or dedicated presentation hardware to perform presentation.

The presentable images of a swapchain are owned by the presentation engine. An application can acquire use of a presentable image from the presentation engine. Use of a presentable image must occur only after the image is returned by `vkAcquireNextImageKHR`, and before it is released by `vkQueuePresentKHR`. This includes transitioning the image layout and rendering commands.

An application can acquire use of a presentable image with `vkAcquireNextImageKHR`. After acquiring a presentable image and before modifying it, the application must use a synchronization primitive to ensure that the presentation engine has finished reading from the image. The application can...
then transition the image’s layout, queue rendering commands to it, etc. Finally, the application presents the image with \texttt{vkQueuePresentKHR}, which releases the acquisition of the image.

The presentation engine controls the order in which presentable images are acquired for use by the application.

\begin{quote}
\textit{Note}

This allows the platform to handle situations which require out-of-order return of images after presentation. At the same time, it allows the application to generate command buffers referencing all of the images in the swapchain at initialization time, rather than in its main loop.
\end{quote}

How this all works is described below.

If a swapchain is created with \texttt{presentMode} set to either \texttt{VK_PRESENT_MODE_SHARED_DEMAND-refresh_KHR} or \texttt{VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR}, a single presentable image can be acquired, referred to as a shared presentable image. A shared presentable image may be concurrently accessed by the application and the presentation engine, without transitioning the image’s layout after it is initially presented.

- With \texttt{VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR}, the presentation engine is only required to update to the latest contents of a shared presentable image after a present. The application must call \texttt{vkQueuePresentKHR} to guarantee an update. However, the presentation engine may update from it at any time.

- With \texttt{VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR}, the presentation engine will automatically present the latest contents of a shared presentable image during every refresh cycle. The application is only required to make one initial call to \texttt{vkQueuePresentKHR}, after which the presentation engine will update from it without any need for further present calls. The application can indicate the image contents have been updated by calling \texttt{vkQueuePresentKHR}, but this does not guarantee the timing of when updates will occur.

The presentation engine may access a shared presentable image at any time after it is first presented. To avoid tearing, an application should coordinate access with the presentation engine. This requires presentation engine timing information through platform-specific mechanisms and ensuring that color attachment writes are made available during the portion of the presentation engine’s refresh cycle they are intended for.

\begin{quote}
\textit{Note}

The \texttt{VK_KHR_shared_presentable_image} extension does not provide functionality for determining the timing of the presentation engine’s refresh cycles.
\end{quote}

In order to query a swapchain’s status when rendering to a shared presentable image, call:

\begin{verbatim}
// Provided by VK_KHR_shared_presentable_image
VkResult vkGetSwapchainStatusKHR(VkDevice device, VkSwapchainKHR swapchain);
\end{verbatim}
• **device** is the device associated with **swapchain**.

• **swapchain** is the swapchain to query.

### Valid Usage (Implicit)

- VUID-vkGetSwapchainStatusKHR-device-parameter
  
  **device** must be a valid **VkDevice** handle

- VUID-vkGetSwapchainStatusKHR-swapchain-parameter
  
  **swapchain** must be a valid **VkSwapchainKHR** handle

- VUID-vkGetSwapchainStatusKHR-commonparent
  
  Both of **device**, and **swapchain** must have been created, allocated, or retrieved from the same **VkInstance**

### Host Synchronization

- Host access to **swapchain** must be externally synchronized

### Return Codes

**Success**

- **VK_SUCCESS**
- **VK_SUBOPTIMAL_KHR**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_DEVICE_LOST**
- **VK_ERROR_OUT_OF_DATE_KHR**
- **VK_ERROR_SURFACE_LOST_KHR**
- **VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT**

The possible return values for **vkGetSwapchainStatusKHR** should be interpreted as follows:

• **VK_SUCCESS** specifies the presentation engine is presenting the contents of the shared presentable image, as per the swapchain’s **VkPresentModeKHR**.

• **VK_SUBOPTIMAL_KHR** the swapchain no longer matches the surface properties exactly, but the presentation engine is presenting the contents of the shared presentable image, as per the swapchain’s **VkPresentModeKHR**.

• **VK_ERROR_OUT_OF_DATE_KHR** the surface has changed in such a way that it is no longer compatible with the swapchain.
• **VK_ERROR_SURFACE_LOST_KHR** the surface is no longer available.

**Note**
The swapchain state **may** be cached by implementations, so applications **should** regularly call `vkGetSwapchainStatusKHR` when using a swapchain with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

To create a swapchain, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkCreateSwapchainKHR(
    VkDevice device,
    const VkSwapchainCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSwapchainKHR* pSwapchain);
```

- **device** is the device to create the swapchain for.
- **pCreateInfo** is a pointer to a `VkSwapchainCreateInfoKHR` structure specifying the parameters of the created swapchain.
- **pAllocator** is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).
- **pSwapchain** is a pointer to a `VkSwapchainKHR` handle in which the created swapchain object will be returned.

If the **oldSwapchain** parameter of **pCreateInfo** is a valid swapchain, which has exclusive full-screen access, that access is released from **oldSwapchain**. If the command succeeds in this case, the newly created swapchain will automatically acquire exclusive full-screen access from **oldSwapchain**.

**Note**
This implicit transfer is intended to avoid exiting and entering full-screen exclusive mode, which may otherwise cause unwanted visual updates to the display.

In some cases, swapchain creation **may** fail if exclusive full-screen mode is requested for application control, but for some implementation-specific reason exclusive full-screen access is unavailable for the particular combination of parameters provided. If this occurs, **VK_ERROR_INITIALIZATION_FAILED** will be returned.

**Note**
In particular, it will fail if the **imageExtent** member of **pCreateInfo** does not match the extents of the monitor. Other reasons for failure may include the app not being set as high-dpi aware, or if the physical device and monitor are not compatible in this mode.

When the **VkSurfaceKHR** in `VkSwapchainCreateInfoKHR` is a display surface, then the...
VkDisplayModeKHR in display surface’s VkDisplaySurfaceCreateInfoKHR is associated with a particular VkDisplayKHR. Swapchain creation may fail if that VkDisplayKHR is not acquired by the application. In this scenario VK_ERROR_INITIALIZATION_FAILED is returned.

Valid Usage (Implicit)

- VUID-vkCreateSwapchainKHR-device-parameter
device must be a valid VkDevice handle
- VUID-vkCreateSwapchainKHR-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkSwapchainCreateInfoKHR structure
- VUID-vkCreateSwapchainKHR-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateSwapchainKHR-pSwapchain-parameter
pSwapchain must be a valid pointer to a VkSwapchainKHR handle

Host Synchronization

- Host access to pCreateInfo->surface must be externally synchronized
- Host access to pCreateInfo->oldSwapchain must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR
- VK_ERROR_INITIALIZATION_FAILED

The VkSwapchainCreateInfoKHR structure is defined as:
// Provided by VK_KHR_swapchain

typedef struct VkSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainCreateFlagsKHR flags;
    VkSurfaceKHR surface;
    uint32_t minImageCount;
    VkFormat imageFormat;
    VkColorSpaceKHR imageColorSpace;
    VkExtent2D imageExtent;
    uint32_t imageArrayLayers;
    VkImageUsageFlags imageUsage;
    VkSharingMode imageSharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
    VkSurfaceTransformFlagBitsKHR preTransform;
    VkCompositeAlphaFlagBitsKHR compositeAlpha;
    VkPresentModeKHR presentMode;
    VkBool32 clipped;
    VkSwapchainKHR oldSwapchain;
} VkSwapchainCreateInfoKHR;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is a bitmask of VkSwapchainCreateFlagBitsKHR indicating parameters of the swapchain creation.
• **surface** is the surface onto which the swapchain will present images. If the creation succeeds, the swapchain becomes associated with surface.
• **minImageCount** is the minimum number of presentable images that the application needs. The implementation will either create the swapchain with at least that many images, or it will fail to create the swapchain.
• **imageFormat** is a VkFormat value specifying the format the swapchain image(s) will be created with.
• **imageColorSpace** is a VkColorSpaceKHR value specifying the way the swapchain interprets image data.
• **imageExtent** is the size (in pixels) of the swapchain image(s). The behavior is platform-dependent if the image extent does not match the surface’s *currentExtent* as returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR.

    

    | i | Note |
    |---|------|
    |    | On some platforms, it is normal that maxImageExtent may become (0, 0), for example when the window is minimized. In such a case, it is not possible to create a swapchain due to the Valid Usage requirements. |

• **imageArrayLayers** is the number of views in a multiview/stereo surface. For non-stereoscopic-3D
Applications should set this value to VK_TRUE if they do not expect to read back the content of presentable images before presenting them or after reacquiring them, and if their fragment shaders do not have any side effects that require them to run for all pixels in the presentable image.

- oldSwapchain is VK_NULL_HANDLE, or the existing non-retired swapchain currently associated with surface. Providing a valid oldSwapchain may aid in the resource reuse, and also allows the application to still present any images that are already acquired from it.

Upon calling vkCreateSwapchainKHR with an oldSwapchain that is not VK_NULL_HANDLE, oldSwapchain is retired — even if creation of the new swapchain fails. The new swapchain is created in the non-retired state whether or not oldSwapchain is VK_NULL_HANDLE.

Upon calling vkCreateSwapchainKHR with an oldSwapchain that is not VK_NULL_HANDLE, any images
from `oldSwapchain` that are not acquired by the application may be freed by the implementation, which may occur even if creation of the new swapchain fails. The application can destroy `oldSwapchain` to free all memory associated with `oldSwapchain`.

**Note**

Multiple retired swapchains can be associated with the same `VkSurfaceKHR` through multiple uses of `oldSwapchain` that outnumber calls to `vkDestroySwapchainKHR`.

After `oldSwapchain` is retired, the application can pass to `vkQueuePresentKHR` any images it had already acquired from `oldSwapchain`. E.g., an application may present an image from the old swapchain before an image from the new swapchain is ready to be presented. As usual, `vkQueuePresentKHR` may fail if `oldSwapchain` has entered a state that causes `VK_ERROR_OUT_OF_DATE_KHR` to be returned.

The application can continue to use a shared presentable image obtained from `oldSwapchain` until a presentable image is acquired from the new swapchain, as long as it has not entered a state that causes it to return `VK_ERROR_OUT_OF_DATE_KHR`.
Valid Usage

- **VUID-VkSwapchainCreateInfoKHR-surface-01270**
  - `surface` must be a surface that is supported by the device as determined using `vkGetPhysicalDeviceSurfaceSupportKHR`.

- **VUID-VkSwapchainCreateInfoKHR-minImageCount-01272**
  - `minImageCount` must be less than or equal to the value returned in the `maxImageCount` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface if the returned `maxImageCount` is not zero.

- **VUID-VkSwapchainCreateInfoKHR-presentMode-02839**
  - If `presentMode` is not `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` nor `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, then `minImageCount` must be greater than or equal to the value returned in the `minImageCount` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface.

- **VUID-VkSwapchainCreateInfoKHR-minImageCount-01383**
  - `minImageCount` must be 1 if `presentMode` is either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

- **VUID-VkSwapchainCreateInfoKHR-imageFormat-01273**
  - `imageFormat` and `imageColorSpace` must match the format and `colorSpace` members, respectively, of one of the `VkSurfaceFormatKHR` structures returned by `vkGetPhysicalDeviceSurfaceFormatsKHR` for the surface.

- **VUID-VkSwapchainCreateInfoKHR-imageExtent-01274**
  - `imageExtent` must be between `minImageExtent` and `maxImageExtent`, inclusive, where `minImageExtent` and `maxImageExtent` are members of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface.

- **VUID-VkSwapchainCreateInfoKHR-imageExtent-01689**
  - `imageExtent` members `width` and `height` must both be non-zero.

- **VUID-VkSwapchainCreateInfoKHR-imageArrayLayers-01275**
  - `imageArrayLayers` must be greater than 0 and less than or equal to the `maxImageArrayLayers` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface.

- **VUID-VkSwapchainCreateInfoKHR-presentMode-01427**
  - If `presentMode` is `VK_PRESENT_MODE_IMMEDIATE_KHR`, `VK_PRESENT_MODE_MAILBOX_KHR`, `VK_PRESENT_MODE_FIFO_KHR`, or `VK_PRESENT_MODE_FIFO_RELAXED_KHR`, `imageUsage` must be a subset of the supported usage flags present in the `supportedUsageFlags` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface.

- **VUID-VkSwapchainCreateInfoKHR-imageUsage-01384**
  - If `presentMode` is `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, `imageUsage` must be a subset of the supported usage flags present in the `sharedPresentSupportedUsageFlags` member of the
VkSharedPresentSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilities2KHR for surface

• VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01277
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, pQueueFamilyIndices must be a valid pointer to an array of queueFamilyIndexCount uint32_t values

• VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01278
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, queueFamilyIndexCount must be greater than 1

• VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01428
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, each element of pQueueFamilyIndices must be unique and must be less than queueFamilyPropertyCount returned by either vkGetPhysicalDeviceQueueFamilyProperties or vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to create device

• VUID-VkSwapchainCreateInfoKHR-preTransform-01279
  preTransform must be one of the bits present in the supportedTransforms member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-compositeAlpha-01280
  compositeAlpha must be one of the bits present in the supportedCompositeAlpha member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-presentMode-01281
  presentMode must be one of the VkPresentModeKHR values returned by vkGetPhysicalDeviceSurfacePresentModesKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-physicalDeviceCount-01429
  If the logical device was created with VkDeviceGroupDeviceCreateInfo::physicalDeviceCount equal to 1, flags must not contain VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR

• VUID-VkSwapchainCreateInfoKHR-oldSwapchain-01933
  If oldSwapchain is not VK_NULL_HANDLE, oldSwapchain must be a non-retired swapchain associated with native window referred to by surface

• VUID-VkSwapchainCreateInfoKHR-imageFormat-01778
  The implied image creation parameters of the swapchain must be supported as reported by vkGetPhysicalDeviceImageFormatProperties

• VUID-VkSwapchainCreateInfoKHR-flags-03168
  If flags contains VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR then the pNext chain must include a VkImageFormatListCreateInfo structure with a viewFormatCount greater than zero and pViewFormats must have an element equal to imageFormat

• VUID-VkSwapchainCreateInfoKHR-pNext-04099
  If a VkImageFormatListCreateInfo structure was included in the pNext chain and VkImageFormatListCreateInfo::viewFormatCount is not zero then all of the formats in VkImageFormatListCreateInfo::pViewFormats must be compatible with the format as described in the compatibility table

Chapter 33. Window System Integration (WSI) | 1851
If `flags` does not contain `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` and the `pNext` chain include a `VkImageFormatListCreateInfo` structure then `VkImageFormatListCreateInfo::viewFormatCount` must be 0 or 1

If `flags` contains `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR`, then `VkSurfaceProtectedCapabilitiesKHR::supportsProtected` must be `VK_TRUE` in the `VkSurfaceProtectedCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilities2KHR` for `surface`

If the `pNext` chain includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure with its `fullScreenExclusive` member set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, and `surface` was created using `vkCreateWin32SurfaceKHR`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure must be included in the `pNext` chain
Valid Usage (Implicit)

- **VUID-VkSwapchainCreateInfoKHR-sType-sType**
  
  * **sType** must be `VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR`

- **VUID-VkSwapchainCreateInfoKHR-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDeviceGroupSwapchainCreateInfoKHR`, `VkImageFormatListCreateInfo`, `VkSurfaceFullScreenExclusiveInfoEXT`, `VkSurfaceFullScreenExclusiveWin32InfoEXT`, `VkSwapchainCounterCreateInfoEXT`, or `VkSwapchainDisplayNativeHdrCreateInfoAMD`

- **VUID-VkSwapchainCreateInfoKHR-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkSwapchainCreateInfoKHR-flags-parameter**
  
  * **flags** must be a valid combination of `VkSwapchainCreateFlagBitsKHR` values

- **VUID-VkSwapchainCreateInfoKHR-surface-parameter**
  
  * **surface** must be a valid `VkSurfaceKHR` handle

- **VUID-VkSwapchainCreateInfoKHR-imageFormat-parameter**
  
  * **imageFormat** must be a valid `VkFormat` value

- **VUID-VkSwapchainCreateInfoKHR-imageColorSpace-parameter**
  
  * **imageColorSpace** must be a valid `VkColorSpaceKHR` value

- **VUID-VkSwapchainCreateInfoKHR-imageUsage-parameter**
  
  * **imageUsage** must be a valid combination of `VkImageUsageFlagBits` values

- **VUID-VkSwapchainCreateInfoKHR-imageUsage-requiredbitmask**
  
  * **imageUsage** must not be 0

- **VUID-VkSwapchainCreateInfoKHR-imageSharingMode-parameter**
  
  * **imageSharingMode** must be a valid `VkSharingMode` value

- **VUID-VkSwapchainCreateInfoKHR-preTransform-parameter**
  
  * **preTransform** must be a valid `VkSurfaceTransformFlagBitsKHR` value

- **VUID-VkSwapchainCreateInfoKHR-compositeAlpha-parameter**
  
  * **compositeAlpha** must be a valid `VkCompositeAlphaFlagBitsKHR` value

- **VUID-VkSwapchainCreateInfoKHR-presentMode-parameter**
  
  * **presentMode** must be a valid `VkPresentModeKHR` value

- **VUID-VkSwapchainCreateInfoKHR-oldSwapchain-parameter**
  
  If `oldSwapchain` is not `VK_NULL_HANDLE`, `oldSwapchain` must be a valid `VkSwapchainKHR` handle

- **VUID-VkSwapchainCreateInfoKHR-oldSwapchain-parent**
  
  If `oldSwapchain` is a valid handle, it must have been created, allocated, or retrieved from `surface`

- **VUID-VkSwapchainCreateInfoKHR-commonparent**
  
  Both of `oldSwapchain` and `surface` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkInstance`
Bits which can be set in `VkSwapchainCreateInfoKHR::flags`, specifying parameters of swapchain creation, are:

```c
// Provided by VK_KHR_swapchain
typedef enum VkSwapchainCreateFlagBitsKHR {
    // Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with
    VkKHR_swapchain
    VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = 0x00000001,
    // Provided by VK_KHR_swapchain with VK_VERSION_1_1
    VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR = 0x00000002,
    // Provided by VK_KHR_swapchain_mutable_format
    VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR = 0x00000004,
} VkSwapchainCreateFlagBitsKHR;
```

- `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR` specifies that images created from the swapchain (i.e. with the `swapchain` member of `VkImageSwapchainCreateInfoKHR` set to this swapchain’s handle) must use `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT`.

- `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` specifies that the images of the swapchain can be used to create a `VkImageView` with a different format than what the swapchain was created with. The list of allowed image view formats is specified by adding a `VkImageFormatListCreateInfo` structure to the `pNext` chain of `VkSwapchainCreateInfoKHR`. In addition, this flag also specifies that the swapchain can be created with usage flags that are not supported for the format the swapchain is created with but are supported for at least one of the allowed image view formats.

```c
// Provided by VK_KHR_swapchain
typedef VkFlags VkSwapchainCreateFlagsKHR;
```

`VkSwapchainCreateFlagsKHR` is a bitmask type for setting a mask of zero or more `VkSwapchainCreateFlagBitsKHR`.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkDeviceGroupSwapchainCreateInfoKHR` structure, then that structure includes a set of device group present modes that the swapchain can be used with.

The `VkDeviceGroupSwapchainCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with
VkKHR_swapchain
typedef struct VkDeviceGroupSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupSwapchainCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• `modes` is a bitfield of modes that the swapchain can be used with.

If this structure is not present, `modes` is considered to be `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

### Valid Usage (Implicit)

- VUID-VkDeviceGroupSwapchainCreateInfoKHR-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR`
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-parameter
  - `modes` must be a valid combination of `VkDeviceGroupPresentModeFlagBitsKHR` values
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-requiredbitmask
  - `modes` must not be 0

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSwapchainDisplayNativeHdrCreateInfoAMD` structure, then that structure includes additional swapchain creation parameters specific to display native HDR support.

The `VkSwapchainDisplayNativeHdrCreateInfoAMD` structure is defined as:

```c
// Provided by VK_AMD_display_native_hdr
typedef struct VkSwapchainDisplayNativeHdrCreateInfoAMD {
    VkStructureType sType;
    const void* pNext;
    VkBool32 localDimmingEnable;
} VkSwapchainDisplayNativeHdrCreateInfoAMD;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `localDimmingEnable` specifies whether local dimming is enabled for the swapchain.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` does not include this structure, the default value for `localDimmingEnable` is `VK_TRUE`, meaning local dimming is initially enabled for the swapchain.

### Valid Usage (Implicit)

- VUID-VkSwapchainDisplayNativeHdrCreateInfoAMD-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_SWAPCHAIN_DISPLAY_NATIVE_HDR_CREATE_INFO_AMD`
Valid Usage

- VUID-VkSwapchainDisplayNativeHdrCreateInfoAMD-localDimmingEnable-04449
  It is only valid to set `localDimmingEnable` to `VK_TRUE` if 
  `VkDisplayNativeHdrSurfaceCapabilitiesAMD::localDimmingSupport` is supported

The local dimming HDR setting may also be changed over the life of a swapchain by calling:

```c
// Provided by VK_AMD_display_native_hdr
void vkSetLocalDimmingAMD( 
    VkDevice device, 
    VkSwapchainKHR swapChain, 
    VkBool32 localDimmingEnable);
```

- `device` is the device associated with `swapChain`.
- `swapChain` handle to enable local dimming.
- `localDimmingEnable` specifies whether local dimming is enabled for the swapchain.

Valid Usage (Implicit)

- VUID-vkSetLocalDimmingAMD-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkSetLocalDimmingAMD-swapChain-parameter
  `swapChain` must be a valid `VkSwapchainKHR` handle
- VUID-vkSetLocalDimmingAMD-commonparent
  Both of `device`, and `swapChain` must have been created, allocated, or retrieved from the same `VkInstance`

Valid Usage

- VUID-vkSetLocalDimmingAMD-localDimmingSupport-04618
  `VkDisplayNativeHdrSurfaceCapabilitiesAMD::localDimmingSupport` must be supported

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure, then that structure specifies the application's preferred full-screen presentation behavior. If this structure is not present, `fullScreenExclusive` is considered to be `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT`.

To enable surface counters when creating a swapchain, add a `VkSwapchainCounterCreateInfoEXT` structure to the `pNext` chain of `VkSwapchainCreateInfoKHR`. `VkSwapchainCounterCreateInfoEXT` is defined as:
// Provided by VK_EXT_display_control

typedef struct VkSwapchainCounterCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceCounterFlagsEXT surfaceCounters;
} VkSwapchainCounterCreateInfoEXT;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **surfaceCounters** is a bitmask of VkSurfaceCounterFlagBitsEXT specifying surface counters to enable for the swapchain.

**Valid Usage**

- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-01244
  The bits in surfaceCounters must be supported by VkSwapchainCreateInfoKHR::surface, as reported by vkGetPhysicalDeviceSurfaceCapabilities2EXT

**Valid Usage (Implicit)**

- VUID-VkSwapchainCounterCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT
- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-parameter
  surfaceCounters must be a valid combination of VkSurfaceCounterFlagBitsEXT values

The requested counters become active when the first presentation command for the associated swapchain is processed by the presentation engine. To query the value of an active counter, use:

// Provided by VK_EXT_display_control

VkResult vkGetSwapchainCounterEXT(
    VkDevice device,
    VkSwapchainKHR swapchain,
    VkSurfaceCounterFlagBitsEXT counter,
    uint64_t* pCounterValue);

- **device** is the VkDevice associated with swapchain.
- **swapchain** is the swapchain from which to query the counter value.
- **counter** is a VkSurfaceCounterFlagBitsEXT value specifying the counter to query.
- **pCounterValue** will return the current value of the counter.

If a counter is not available because the swapchain is out of date, the implementation may return VK_ERROR_OUT_OF_DATE_KHR.
Valid Usage

- VUID-vkGetSwapchainCounterEXT-swapchain-01245
  One or more present commands on swapchain must have been processed by the presentation engine

Valid Usage (Implicit)

- VUID-vkGetSwapchainCounterEXT-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetSwapchainCounterEXT-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle
- VUID-vkGetSwapchainCounterEXT-counter-parameter
counter must be a valid VkSurfaceCounterFlagBitsEXT value
- VUID-vkGetSwapchainCounterEXT-pCounterValue-parameter
  pCounterValue must be a valid pointer to a uint64_t value
- VUID-vkGetSwapchainCounterEXT-commonparent
  Both of device, and swapchain must have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR

As mentioned above, if vkCreateSwapchainKHR succeeds, it will return a handle to a swapchain containing an array of at least minImageCount presentable images.

While acquired by the application, presentable images can be used in any way that equivalent non-presentable images can be used. A presentable image is equivalent to a non-presentable image created with the following VkImageCreateInfo parameters:
<table>
<thead>
<tr>
<th>VkImageCreateInfo Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>flags</td>
<td>VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT is set if VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR is set; VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR are both set if VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR is set; all other bits are unset</td>
</tr>
<tr>
<td>imageType</td>

</tbody>
</table>

The **surface** **must** not be destroyed until after the swapchain is destroyed.

If **oldSwapchain** is **VK_NULL_HANDLE**, and the native window referred to by **surface** is already associated with a Vulkan swapchain, **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** must be returned.

If the native window referred to by **surface** is already associated with a non-Vulkan graphics API surface, **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** must be returned.

The native window referred to by **surface** **must** not become associated with a non-Vulkan graphics API surface before all associated Vulkan swapchains have been destroyed.

Like core functions, several WSI functions, including **vkCreateSwapchainKHR** return **VK_ERROR_DEVICE_LOST** if the logical device was lost. See **Lost Device**. As with most core objects, **VkSwapchainKHR** is a child of the device and is affected by the lost state; it **must** be destroyed before destroying the **VkDevice**. However, **VkSurfaceKHR** is not a child of any **VkDevice** and is not otherwise affected by the lost device. After successfully recreating a **VkDevice**, the same **VkSurfaceKHR** **can** be used to create a new **VkSwapchainKHR**, provided the previous one was destroyed.
As mentioned in Lost Device, after a lost device event, the \texttt{VkPhysicalDevice} may also be lost. If other \texttt{VkPhysicalDevice} are available, they can be used together with the same \texttt{VkSurfaceKHR} to create the new \texttt{VkSwapchainKHR}, however the application must query the surface capabilities again, because they may differ on a per-physical device basis.

To destroy a swapchain object call:

```c
// Provided by VK_KHR_swapchain
don_t vkDestroySwapchainKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    const VkAllocationCallbacks* pAllocator);
```

- \texttt{device} is the \texttt{VkDevice} associated with \texttt{swapchain}.
- \texttt{swapchain} is the swapchain to destroy.
- \texttt{pAllocator} is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).

The application must not destroy a swapchain until after completion of all outstanding operations on images that were acquired from the swapchain. \texttt{swapchain} and all associated \texttt{VkImage} handles are destroyed, and must not be acquired or used any more by the application. The memory of each \texttt{VkImage} will only be freed after that image is no longer used by the presentation engine. For example, if one image of the swapchain is being displayed in a window, the memory for that image may not be freed until the window is destroyed, or another swapchain is created for the window. Destroying the swapchain does not invalidate the parent \texttt{VkSurfaceKHR}, and a new swapchain can be created with it.

When a swapchain associated with a display surface is destroyed, if the image most recently presented to the display surface is from the swapchain being destroyed, then any display resources modified by presenting images from any swapchain associated with the display surface must be reverted by the implementation to their state prior to the first present performed on one of these swapchains, or such resources must be left in their current state.

If \texttt{swapchain} has exclusive full-screen access, it is released before the swapchain is destroyed.
**Valid Usage**

- VUID-vkDestroySwapchainKHR-swapchain-01282
  All uses of presentable images acquired from `swapchain` must have completed execution

- VUID-vkDestroySwapchainKHR-swapchain-01283
  If `VkAllocationCallbacks` were provided when `swapchain` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroySwapchainKHR-swapchain-01284
  If no `VkAllocationCallbacks` were provided when `swapchain` was created, `pAllocator` must be `NULL`

**Valid Usage (Implicit)**

- VUID-vkDestroySwapchainKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkDestroySwapchainKHR-swapchain-parameter
  If `swapchain` is not `VK_NULL_HANDLE`, `swapchain` must be a valid `VkSwapchainKHR` handle

- VUID-vkDestroySwapchainKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroySwapchainKHR-commonparent
  Both of `device`, and `swapchain` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkInstance`

**Host Synchronization**

- Host access to `swapchain` must be externally synchronized

When the `VK_KHR_display_swapchain` extension is enabled, multiple swapchains that share presentable images are created by calling:

```c
// Provided by VK_KHR_display_swapchain
VKResult vkCreateSharedSwapchainsKHR(
    VkDevice device,        // device
    uint32_t swapchainCount, // swapchainCount
    const VkSwapchainCreateInfoKHR* pCreateInfos, // pCreateInfos
    const VkAllocationCallbacks* pAllocator,       // pAllocator
    VkSwapchainKHR* pSwapchains);                  // pSwapchains)
```

- `device` is the device to create the swapchains for.
- `swapchainCount` is the number of swapchains to create.
• **pCreateInfos** is a pointer to an array of `VkSwapchainCreateInfoKHR` structures specifying the parameters of the created swapchains.

• **pAllocator** is the allocator used for host memory allocated for the swapchain objects when there is no more specific allocator available (see Memory Allocation).

• **pSwapchains** is a pointer to an array of `VkSwapchainKHR` handles in which the created swapchain objects will be returned.

`vkCreateSharedSwapchainsKHR` is similar to `vkCreateSwapchainKHR`, except that it takes an array of `VkSwapchainCreateInfoKHR` structures, and returns an array of swapchain objects.

The swapchain creation parameters that affect the properties and number of presentable images must match between all the swapchains. If the displays used by any of the swapchains do not use the same presentable image layout or are incompatible in a way that prevents sharing images, swapchain creation will fail with the result code `VK_ERROR_INCOMPATIBLE_DISPLAY_KHR`. If any error occurs, no swapchains will be created. Images presented to multiple swapchains must be re-acquired from all of them before transitioning away from `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`. After destroying one or more of the swapchains, the remaining swapchains and the presentable images can continue to be used.

### Valid Usage (Implicit)

- **VUID-vkCreateSharedSwapchainsKHR-device-parameter**
  
  device must be a valid `VkDevice` handle

- **VUID-vkCreateSharedSwapchainsKHR-pCreateInfos-parameter**
  
  pCreateInfos must be a valid pointer to an array of `swapchainCount` valid `VkSwapchainCreateInfoKHR` structures

- **VUID-vkCreateSharedSwapchainsKHR-pAllocator-parameter**
  
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateSharedSwapchainsKHR-pSwapchains-parameter**
  
  pSwapchains must be a valid pointer to an array of `swapchainCount` `VkSwapchainKHR` handles

- **VUID-vkCreateSharedSwapchainsKHR-swapchainCount-arraylength**
  
  `swapchainCount` must be greater than 0

### Host Synchronization

- Host access to `pCreateInfos[][].surface` must be externally synchronized

- Host access to `pCreateInfos[][].oldSwapchain` must be externally synchronized
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INCOMPATIBLE_DISPLAY_KHR
• VK_ERROR_DEVICE_LOST
• VK_ERROR_SURFACE_LOST_KHR

To obtain the array of presentable images associated with a swapchain, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkGetSwapchainImagesKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint32_t* pSwapchainImageCount,
    VkImage* pSwapchainImages);
```

• `device` is the device associated with `swapchain`.
• `swapchain` is the swapchain to query.
• `pSwapchainImageCount` is a pointer to an integer related to the number of presentable images available or queried, as described below.
• `pSwapchainImages` is either `NULL` or a pointer to an array of `VkImage` handles.

If `pSwapchainImages` is `NULL`, then the number of presentable images for `swapchain` is returned in `pSwapchainImageCount`. Otherwise, `pSwapchainImageCount` must point to a variable set by the user to the number of elements in the `pSwapchainImages` array, and on return the variable is overwritten with the number of structures actually written to `pSwapchainImages`. If the value of `pSwapchainImageCount` is less than the number of presentable images for `swapchain`, at most `pSwapchainImageCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available presentable images were returned.
Valid Usage (Implicit)

- **VUID-vkGetSwapchainImagesKHR-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetSwapchainImagesKHR-swapchain-parameter**
  
  `swapchain` must be a valid `VkSwapchainKHR` handle

- **VUID-vkGetSwapchainImagesKHR-pSwapchainImageCount-parameter**
  
  `pSwapchainImageCount` must be a valid pointer to a `uint32_t` value

- **VUID-vkGetSwapchainImagesKHR-pSwapchainImages-parameter**
  
  If the value referenced by `pSwapchainImageCount` is not 0, and `pSwapchainImages` is not NULL, `pSwapchainImages` must be a valid pointer to an array of `pSwapchainImageCount` `VkImage` handles

- **VUID-vkGetSwapchainImagesKHR-commonparent**
  
  Both of `device`, and `swapchain` must have been created, allocated, or retrieved from the same `VkInstance`

Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Note

By knowing all presentable images used in the swapchain, the application can create command buffers that reference these images prior to entering its main rendering loop.

Images returned by `vkGetSwapchainImagesKHR` are fully backed by memory before they are passed to the application. All presentable images are initially in the `VK_IMAGE_LAYOUT_UNDEFINED` layout, thus before using presentable images, the application must transition them to a valid layout for the intended use.

Further, the lifetime of presentable images is controlled by the implementation, so applications must not destroy a presentable image. See `vkDestroySwapchainKHR` for further details on the lifetime of presentable images.

Images can also be created by using `vkCreateImage` with `VkImageSwapchainCreateInfoKHR` and bound to swapchain memory using `vkBindImageMemory2KHR` with `VkBindImageMemorySwapchainInfoKHR`. These images can be used anywhere swapchain images...
are used, and are useful in logical devices with multiple physical devices to create peer memory bindings of swapchain memory. These images and bindings have no effect on what memory is presented. Unlike images retrieved from `vkGetSwapchainImagesKHR`, these images **must** be destroyed with `vkDestroyImage`.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkAcquireNextImageKHR(
    VkDevice device,                  // device,
    VkSwapchainKHR swapchain,        // swapchain,
    uint64_t timeout,                // timeout,
    VkSemaphore semaphore,           // semaphore,
    VkFence fence,                   // fence,
    uint32_t* pImageIndex            // pImageIndex);
```

- **device** is the device associated with `swapchain`.
- **swapchain** is the non-retired swapchain from which an image is being acquired.
- **timeout** specifies how long the function waits, in nanoseconds, if no image is available.
- **semaphore** is `VK_NULL_HANDLE` or a semaphore to signal.
- **fence** is `VK_NULL_HANDLE` or a fence to signal.
- **pImageIndex** is a pointer to a `uint32_t` in which the index of the next image to use (i.e. an index into the array of images returned by `vkGetSwapchainImagesKHR`) is returned.
Valid Usage

- VUID-vkAcquireNextImageKHR-swapchain-01285
  
  `swapchain` must not be in the retired state

- VUID-vkAcquireNextImageKHR-semaphore-01286
  
  If `semaphore` is not `VK_NULL_HANDLE` it must be unsignaled

- VUID-vkAcquireNextImageKHR-semaphore-01779
  
  If `semaphore` is not `VK_NULL_HANDLE` it must not have any uncompleted signal or wait operations pending

- VUID-vkAcquireNextImageKHR-fence-01287
  
  If `fence` is not `VK_NULL_HANDLE` it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue

- VUID-vkAcquireNextImageKHR-semaphore-01780
  
  `semaphore` and `fence` must not both be equal to `VK_NULL_HANDLE`

- VUID-vkAcquireNextImageKHR-swaponchain-01802
  
  If the number of currently acquired images is greater than the difference between the number of images in `swapchain` and the value of `VkSurfaceCapabilitiesKHR::minImageCount` as returned by a call to `vkGetPhysicalDeviceSurfaceCapabilities2KHR` with the `surface` used to create `swapchain`, `timeout` must not be `UINT64_MAX`

- VUID-vkAcquireNextImageKHR-semaphore-03265
  
  `semaphore` must have a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`
Valid Usage (Implicit)

- VUID-vkAcquireNextImageKHR-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkAcquireNextImageKHR-swapchain-parameter
  
  swapchain must be a valid VkSwapchainKHR handle

- VUID-vkAcquireNextImageKHR-semaphore-parameter
  
  If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle

- VUID-vkAcquireNextImageKHR-fence-parameter
  
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

- VUID-vkAcquireNextImageKHR-pImageIndex-parameter
  
  pImageIndex must be a valid pointer to a uint32_t value

- VUID-vkAcquireNextImageKHR-semaphore-parent
  
  If semaphore is a valid handle, it must have been created, allocated, or retrieved from device

- VUID-vkAcquireNextImageKHR-fence-parent
  
  If fence is a valid handle, it must have been created, allocated, or retrieved from device

- VUID-vkAcquireNextImageKHR-commonparent
  
  Both of device, and swapchain that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkInstance

Host Synchronization

- Host access to swapchain must be externally synchronized
- Host access to semaphore must be externally synchronized
- Host access to fence must be externally synchronized
Return Codes

Success

• VK_SUCCESS
• VK_TIMEOUT
• VK_NOT_READY
• VK_SUBOPTIMAL_KHR

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_DEVICE_LOST
• VK_ERROR_OUT_OF_DATE_KHR
• VK_ERROR_SURFACE_LOST_KHR
• VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

When successful, vkAcquireNextImageKHR acquires a presentable image from swapchain that an application can use, and sets pImageIndex to the index of that image within the swapchain. The presentation engine may not have finished reading from the image at the time it is acquired, so the application must use semaphore and/or fence to ensure that the image layout and contents are not modified until the presentation engine reads have completed. If semaphore is not VK_NULL_HANDLE, the application may assume that, once vkAcquireNextImageKHR returns, the semaphore signal operation referenced by semaphore has been submitted for execution. The order in which images are acquired is implementation-dependent, and may be different than the order the images were presented.

If timeout is zero, then vkAcquireNextImageKHR does not wait, and will either successfully acquire an image, or fail and return VK_NOT_READY if no image is available.

If the specified timeout period expires before an image is acquired, vkAcquireNextImageKHR returns VK_TIMEOUT. If timeout is UINT64_MAX, the timeout period is treated as infinite, and vkAcquireNextImageKHR will block until an image is acquired or an error occurs.

vkAcquireNextImageKHR should not be called if the number of images that the application has currently acquired is greater than the difference between the number of images in swapchain and the value of VkSurfaceCapabilitiesKHR::minImageCount. If vkAcquireNextImageKHR is called when the number of images that the application has currently acquired is less or equal than the difference between the number of images in swapchain and the value of VkSurfaceCapabilitiesKHR::minImageCount, vkAcquireNextImageKHR must return in finite time with an allowed VkResult code.
Returning a result in finite time guarantees that the implementation cannot deadlock an application, or suspend its execution indefinitely with correct API usage. Acquiring too many images at once may block indefinitely, which is covered by valid usage when attempting to use \texttt{UINT64\_MAX}. For example, a scenario here is when a compositor holds on to images which are currently being presented, and there are not any vacant images left to be acquired.

If an image is acquired successfully, \texttt{vkAcquireNextImageKHR} must either return \texttt{VK\_SUCCESS} or \texttt{VK\_SUBOPTIMAL\_KHR}. The implementation may return \texttt{VK\_SUBOPTIMAL\_KHR} if the swapchain no longer matches the surface properties exactly, but can still be used for presentation.

\texttt{VK\_SUBOPTIMAL\_KHR} may happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain in this state, or to re-create the swapchain to better match the platform surface properties.

If the swapchain images no longer match native surface properties, either \texttt{VK\_SUBOPTIMAL\_KHR} or \texttt{VK\_ERROR\_OUT\_OF\_DATE\_KHR} must be returned. If \texttt{VK\_ERROR\_OUT\_OF\_DATE\_KHR} is returned, no image is acquired and attempts to present previously acquired images to the swapchain will also fail with \texttt{VK\_ERROR\_OUT\_OF\_DATE\_KHR}. Applications need to create a new swapchain for the surface to continue presenting if \texttt{VK\_ERROR\_OUT\_OF\_DATE\_KHR} is returned.

If device loss occurs (see \texttt{Lost Device}) before the timeout has expired, \texttt{vkAcquireNextImageKHR} must return in finite time with either one of the allowed success codes, or \texttt{VK\_ERROR\_DEVICE\_LOST}.

If \texttt{semaphore} is not \texttt{VK\_NULL\_HANDLE}, the semaphore must be unsignaled, with no signal or wait operations pending. It will become signaled when the application can use the image.

Use of \texttt{semaphore} allows rendering operations to be recorded and submitted before the presentation engine has completed its use of the image.

If \texttt{fence} is not equal to \texttt{VK\_NULL\_HANDLE}, the fence must be unsignaled, with no signal operations pending. It will become signaled when the application can use the image.

Applications should not rely on \texttt{vkAcquireNextImageKHR} blocking in order to meter their rendering speed. The implementation may return from this function immediately regardless of how many presentation requests are queued, and regardless of when queued presentation requests will complete relative to the call. Instead, applications can use \texttt{fence} to meter their frame generation work to match the presentation rate.

An application must wait until either the \texttt{semaphore} or \texttt{fence} is signaled before accessing the image's
When the presentable image will be accessed by some stage S, the recommended idiom for ensuring correct synchronization is:

- The `VkSubmitInfo` used to submit the image layout transition for execution includes `vkAcquireNextImageKHR::semaphore` in its `pWaitSemaphores` member, with the corresponding element of `pWaitDstStageMask` including S.
- The synchronization command that performs any necessary image layout transition includes S in both the `srcStageMask` and `dstStageMask`.

After a successful return, the image indicated by `pImageIndex` and its data will be unmodified compared to when it was presented.

Exclusive ownership of presentable images corresponding to a swapchain created with `VK_SHARING_MODE_EXCLUSIVE` as defined in Resource Sharing is not altered by a call to `vkAcquireNextImageKHR`. That means upon the first acquisition from such a swapchain presentable images are not owned by any queue family, while at subsequent acquisitions the presentable images remain owned by the queue family the image was previously presented on.

The possible return values for `vkAcquireNextImageKHR` depend on the `timeout` provided:

- `VK_SUCCESS` is returned if an image became available.
- `VK_ERROR_SURFACE_LOST_KHR` is returned if the surface becomes no longer available.
- `VK_NOT_READY` is returned if `timeout` is zero and no image was available.
- `VK_TIMEOUT` is returned if `timeout` is greater than zero and less than `UINT64_MAX`, and no image became available within the time allowed.
- `VK_SUBOPTIMAL_KHR` is returned if an image became available, and the swapchain no longer matches the surface properties exactly, but can still be used to present to the surface successfully.

This may happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain indefinitely or temporarily in this state, or to recreate the swapchain to better match the platform surface properties.

- `VK_ERROR_OUT_OF_DATE_KHR` is returned if the surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications must query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.
If the native surface and presented image sizes no longer match, presentation may fail. If presentation does succeed, the mapping from the presented image to the native surface is implementation-defined. It is the application’s responsibility to detect surface size changes and react appropriately. If presentation fails because of a mismatch in the surface and presented image sizes, a \texttt{VK\_ERROR\_OUT\_OF\_DATE\_KHR} error will be returned.

\textbf{Note}

For example, consider a 4x3 window/surface that gets resized to be 3x4 (taller than wider). On some window systems, the portion of the window/surface that was previously and still is visible (the 3x3 part) will contain the same contents as before, while the remaining parts of the window will have undefined contents. Other window systems may squash/stretch the image to fill the new window size without any undefined contents, or apply some other mapping.

To acquire an available presentable image to use, and retrieve the index of that image, call:

\begin{verbatim}
// Provided by VK_KHR_swapchain with VK\_VERSION\_1\_1, VK\_KHR\_device\_group with
VK\_KHR\_swapchain
VkResult vkAcquireNextImage2KHR(
    VkDevice device,
    const VkAcquireNextImageInfoKHR* pAcquireInfo,
    uint32_t* pImageIndex);
\end{verbatim}

- \texttt{device} is the device associated with \texttt{swapchain}.
- \texttt{pAcquireInfo} is a pointer to a \texttt{VkAcquireNextImageInfoKHR} structure containing parameters of the acquire.
- \texttt{pImageIndex} is a pointer to a \texttt{uint32\_t} that is set to the index of the next image to use.

\textbf{Valid Usage}

- \textbf{VUID-vkAcquireNextImage2KHR-swapchain-01803}
  
  If the number of currently acquired images is greater than the difference between the number of images in the \texttt{swapchain} member of \texttt{pAcquireInfo} and the value of \texttt{VkSurfaceCapabilitiesKHR::minImageCount} as returned by a call to \texttt{vkGetPhysicalDeviceSurfaceCapabilities2KHR} with the \texttt{surface} used to create \texttt{swapchain}, the \texttt{timeout} member of \texttt{pAcquireInfo} must not be \texttt{UINT64\_MAX}
Valid Usage (Implicit)

- VUID-vkAcquireNextImage2KHR-device-parameter
  
  **device must be a valid** `VkDevice` **handle**

- VUID-vkAcquireNextImage2KHR-pAcquireInfo-parameter
  
  **pAcquireInfo must be a valid pointer to a valid** `VkAcquireNextImageInfoKHR` **structure**

- VUID-vkAcquireNextImage2KHR-pImageIndex-parameter
  
  **pImageIndex must be a valid pointer to a** `uint32_t` **value**

Return Codes

**Success**

- `VK_SUCCESS`
- `VK_TIMEOUT`
- `VK_NOT_READY`
- `VK_SUBOPTIMAL_KHR`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`

The `VkAcquireNextImageInfoKHR` structure is defined as:

```c
typedef struct VkAcquireNextImageInfoKHR {
    VkStructureType sType;
    const void*pNext;
    VkSwapchainKHR swapchain;
    uint64_t timeout;
    VkSemaphore semaphore;
    VkFence fence;
    uint32_t deviceMask;
} VkAcquireNextImageInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
• **swapchain** is a non-retired swapchain from which an image is acquired.
• **timeout** specifies how long the function waits, in nanoseconds, if no image is available.
• **semaphore** is **VK_NULL_HANDLE** or a semaphore to signal.
• **fence** is **VK_NULL_HANDLE** or a fence to signal.
• **deviceMask** is a mask of physical devices for which the swapchain image will be ready to use when the semaphore or fence is signaled.

If `vkAcquireNextImageKHR` is used, the device mask is considered to include all physical devices in the logical device.

**Note**

`vkAcquireNextImage2KHR` signals at most one semaphore, even if the application requests waiting for multiple physical devices to be ready via the **deviceMask**. However, only a single physical device **can** wait on that semaphore, since the semaphore becomes unsignaled when the wait succeeds. For other physical devices to wait for the image to be ready, it is necessary for the application to submit semaphore signal operation(s) to that first physical device to signal additional semaphore(s) after the wait succeeds, which the other physical device(s) **can** wait upon.

**Valid Usage**

- VUID-VkAcquireNextImageInfoKHR-swapchain-01675
  
  **swapchain** must not be in the retired state

- VUID-VkAcquireNextImageInfoKHR-semaphore-01288
  
  If **semaphore** is not **VK_NULL_HANDLE** it must be unsignaled

- VUID-VkAcquireNextImageInfoKHR-semaphore-01781
  
  If **semaphore** is not **VK_NULL_HANDLE** it must not have any uncompleted signal or wait operations pending

- VUID-VkAcquireNextImageInfoKHR-fence-01289
  
  If **fence** is not **VK_NULL_HANDLE** it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue

- VUID-VkAcquireNextImageInfoKHR-semaphore-01782
  
  **semaphore** and **fence** must not both be equal to **VK_NULL_HANDLE**

- VUID-VkAcquireNextImageInfoKHR-deviceMask-01290
  
  **deviceMask** must be a valid device mask

- VUID-VkAcquireNextImageInfoKHR-deviceMask-01291
  
  **deviceMask** must not be zero

- VUID-VkAcquireNextImageInfoKHR-semaphore-03266
  
  **semaphore** must have a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_BINARY**
Valid Usage (Implicit)

- VUID-VkAcquireNextImageInfoKHR-sType-sType
  
  \( \text{sType must be } \text{VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR} \)

- VUID-VkAcquireNextImageInfoKHR-pNext-pNext
  
  \( \text{pNext must be NULL} \)

- VUID-VkAcquireNextImageInfoKHR-swapchain-parameter
  
  \( \text{swapchain must be a valid VkSwapchainKHR handle} \)

- VUID-VkAcquireNextImageInfoKHR-semaphore-parameter
  
  \( \text{If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle} \)

- VUID-VkAcquireNextImageInfoKHR-fence-parameter
  
  \( \text{If fence is not VK_NULL_HANDLE, fence must be a validVkFence handle} \)

- VUID-VkAcquireNextImageInfoKHR-commonparent
  
  \( \text{Each of fence, semaphore, and swapchain that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkInstance} \)

Host Synchronization

- Host access to \text{swapchain} must be externally synchronized

- Host access to \text{semaphore} must be externally synchronized

- Host access to \text{fence} must be externally synchronized

After queueing all rendering commands and transitioning the image to the correct layout, to queue an image for presentation, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkQueuePresentKHR(
    VkQueue queue,
    const VkPresentInfoKHR* pPresentInfo);
```

- \text{queue} is a queue that is capable of presentation to the target surface's platform on the same device as the image's swapchain.

- \text{pPresentInfo} is a pointer to a \text{VkPresentInfoKHR} structure specifying parameters of the presentation.

**Note**

There is no requirement for an application to present images in the same order that they were acquired - applications can arbitrarily present any image that is currently acquired.
Valid Usage

• VUID-vkQueuePresentKHR-pSwapchains-01292
  Each element of pSwapchains member of pPresentInfo must be a swapchain that is created
  for a surface for which presentation is supported from queue as determined using a call to
  vkGetPhysicalDeviceSurfaceSupportKHR.

• VUID-vkQueuePresentKHR-pSwapchains-01293
  If more than one member of pSwapchains was created from a display surface, all display
  surfaces referenced that refer to the same display must use the same display mode.

• VUID-vkQueuePresentKHR-pWaitSemaphores-01294
  When a semaphore wait operation referring to a binary semaphore defined by the
  elements of the pWaitSemaphores member of pPresentInfo executes on queue, there must be
  no other queues waiting on the same semaphore.

• VUID-vkQueuePresentKHR-pWaitSemaphores-01295
  All elements of the pWaitSemaphores member of pPresentInfo must be semaphores that are
  signaled, or have semaphore signal operations previously submitted for execution.

• VUID-vkQueuePresentKHR-pWaitSemaphores-03267
  All elements of the pWaitSemaphores member of pPresentInfo must be created with a
  VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY.

• VUID-vkQueuePresentKHR-pWaitSemaphores-03268
  All elements of the pWaitSemaphores member of pPresentInfo must reference a semaphore
  signal operation that has been submitted for execution and any semaphore signal
  operations on which it depends (if any) must have also been submitted for execution.

Any writes to memory backing the images referenced by the pImageIndices and pSwapchains
members of pPresentInfo, that are available before vkQueuePresentKHR is executed, are
automatically made visible to the read access performed by the presentation engine. This automatic
visibility operation for an image happens-after the semaphore signal operation, and happens-
before the presentation engine accesses the image.

Queueing an image for presentation defines a set of queue operations, including waiting on the
semaphores and submitting a presentation request to the presentation engine. However, the scope
of this set of queue operations does not include the actual processing of the image by the
presentation engine.

Note

The origin of the native orientation of the surface coordinate system is not
specified in the Vulkan specification; it depends on the platform. For most
platforms the origin is by default upper-left, meaning the pixel of the presented
VkImage at coordinates (0,0) would appear at the upper left pixel of the platform
surface (assuming VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR, and the display
standing the right way up).

If vkQueuePresentKHR fails to enqueue the corresponding set of queue operations, it may return
VK_ERROR_OUT_OF_HOST_MEMORY or VK_ERROR_OUT_OF_DEVICE_MEMORY. If it does, the implementation must
ensure that the state and contents of any resources or synchronization primitives referenced is unaffected by the call or its failure.

If \texttt{vkQueuePresentKHR} fails in such a way that the implementation is unable to make that guarantee, the implementation \textbf{must} return \texttt{VK_ERROR_DEVICE_LOST}.

However, if the presentation request is rejected by the presentation engine with an error \\
\texttt{VK_ERROR_OUT_OF_DATE_KHR}, \texttt{VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT}, or \\
\texttt{VK_ERROR_SURFACE_LOST_KHR}, the set of queue operations are still considered to be enqueued and thus any semaphore wait operation specified in \texttt{VkPresentInfoKHR} will execute when the corresponding queue operation is complete.

Calls to \texttt{vkQueuePresentKHR} \textbf{may} block, but \textbf{must} return in finite time.

If any swapchain member of \texttt{pPresentInfo} was created with \texttt{VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT}, \texttt{VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT} will be returned if that swapchain does not have exclusive full-screen access, possibly for implementation-specific reasons outside of the application’s control.

### Valid Usage (Implicit)

- VUID-vkQueuePresentKHR-queue-parameter  
  \texttt{queue} \textbf{must} be a valid \texttt{VkQueue} handle

- VUID-vkQueuePresentKHR-pPresentInfo-parameter  
  \texttt{pPresentInfo} \textbf{must} be a valid pointer to a valid \texttt{VkPresentInfoKHR} structure

### Host Synchronization

- Host access to \texttt{queue} \textbf{must} be externally synchronized

- Host access to \texttt{pPresentInfo->pWaitSemaphores[]} \textbf{must} be externally synchronized

- Host access to \texttt{pPresentInfo->pSwapchains[]} \textbf{must} be externally synchronized

1876 | Chapter 33. Window System Integration (WSI)
Return Codes

Success
• VK_SUCCESS
• VK_SUBOPTIMAL_KHR

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_DEVICE_LOST
• VK_ERROR_OUT_OF_DATE_KHR
• VK_ERROR_SURFACE_LOST_KHR
• VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

The VkPresentInfoKHR structure is defined as:

```c
// Provided by VK_KHR_swapchain
typedef struct VkPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t swapchainCount;
    const VkSwapchainKHR* pSwapchains;
    const uint32_t* pImageIndices;
    VkResult* pResults;
} VkPresentInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **waitSemaphoreCount** is the number of semaphores to wait for before issuing the present request. The number may be zero.
- **pWaitSemaphores** is NULL or a pointer to an array of VkSemaphore objects with **waitSemaphoreCount** entries, and specifies the semaphores to wait for before issuing the present request.
- **swapchainCount** is the number of swapchains being presented to by this command.
- **pSwapchains** is a pointer to an array of VkSwapchainKHR objects with **swapchainCount** entries. A given swapchain must not appear in this list more than once.
- **pImageIndices** is a pointer to an array of indices into the array of each swapchain’s presentable images, with **swapchainCount** entries. Each entry in this array identifies the image to present on the corresponding entry in the **pSwapchains** array.
- **pResults** is a pointer to an array of VkResult typed elements with **swapchainCount** entries.
Applications that do not need per-swapchain results can use NULL for pResults. If non-NULL, each entry in pResults will be set to the VkResult for presenting the swapchain corresponding to the same index in pSwapchains.

Before an application can present an image, the image's layout must be transitioned to the VK_IMAGE_LAYOUT_PRESENT_SRC_KHR layout, or for a shared presentable image the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR layout.

Note

When transitioning the image to VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR or VK_IMAGE_LAYOUT_PRESENT_SRC_KHR, there is no need to delay subsequent processing, or perform any visibility operations (as vkQueuePresentKHR performs automatic visibility operations). To achieve this, the dstAccessMask member of the VkImageMemoryBarrier should be set to 0, and the dstStageMask parameter should be set to VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT.

Valid Usage

• VUID-VkPresentInfoKHR-pImageIndices-01430
  Each element of pImageIndices must be the index of a presentable image acquired from the swapchain specified by the corresponding element of the pSwapchains array, and the presented image subresource must be in the VK_IMAGE_LAYOUT_PRESENT_SRC_KHR or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR layout at the time the operation is executed on a VkDevice

• VUID-VkPresentInfoKHR-pNext-06235
  If a VkPresentIdKHR structure is included in the pNext chain, and the presentId feature is not enabled, each presentIds entry in that structure must be NULL.
Valid Usage (Implicit)

- **VUID-VkPresentInfoKHR-sType-sType**
  
  *sType* must be **VK_STRUCTURE_TYPE_PRESENT_INFO_KHR**

- **VUID-VkPresentInfoKHR-pNext-pNext**
  
  Each *pNext* member of any structure (including this one) in the *pNext* chain must be either **NULL** or a pointer to a valid instance of **VkDeviceGroupPresentInfoKHR**, **VkDisplayPresentInfoKHR**, **VkPresentFrameTokenGGP**, **VkPresentIdKHR**, **VkPresentRegionsKHR**, or **VkPresentTimesInfoGOOGLE**

- **VUID-VkPresentInfoKHR-sType-unique**
  
  The *sType* value of each struct in the *pNext* chain must be unique

- **VUID-VkPresentInfoKHR-pWaitSemaphores-parameter**
  
  If *waitSemaphoreCount* is not 0, *pWaitSemaphores* must be a valid pointer to an array of *waitSemaphoreCount* valid **VkSemaphore** handles

- **VUID-VkPresentInfoKHR-pSwapchains-parameter**
  
  *pSwapchains* must be a valid pointer to an array of *swapchainCount* valid **VkSwapchainKHR** handles

- **VUID-VkPresentInfoKHR-pImageIndices-parameter**
  
  *pImageIndices* must be a valid pointer to an array of *swapchainCount* uint32_t values

- **VUID-VkPresentInfoKHR-pResults-parameter**
  
  If *pResults* is not NULL, *pResults* must be a valid pointer to an array of *swapchainCount* **VkResult** values

- **VUID-VkPresentInfoKHR-swapchainCount-arraylength**
  
  *swapchainCount* must be greater than 0

- **VUID-VkPresentInfoKHR-commonparent**
  
  Both of the elements of *pSwapchains*, and the elements of *pWaitSemaphores* that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same **VkInstance**

When the **VK_KHR_incremental_present** extension is enabled, additional fields can be specified that allow an application to specify that only certain rectangular regions of the presentable images of a swapchain are changed. This is an optimization hint that a presentation engine may use to only update the region of a surface that is actually changing. The application still must ensure that all pixels of a presented image contain the desired values, in case the presentation engine ignores this hint. An application can provide this hint by adding a **VkPresentRegionsKHR** structure to the *pNext* chain of the **VkPresentInfoKHR** structure.

The **VkPresentRegionsKHR** structure is defined as:
// Provided by VK_KHR_incremental_present

typedef struct VkPresentRegionsKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentRegionKHR* pRegions;
} VkPresentRegionsKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **swapchainCount** is the number of swapchains being presented to by this command.
- **pRegions** is NULL or a pointer to an array of VkPresentRegionKHR elements with swapchainCount entries. If not NULL, each element of pRegions contains the region that has changed since the last present to the swapchain in the corresponding entry in the VkPresentInfoKHR::pSwapchains array.

### Valid Usage

- VUID-VkPresentRegionsKHR-swapchainCount-01260
  swapchainCount must be the same value as VkPresentInfoKHR::swapchainCount, where VkPresentInfoKHR is included in the pNext chain of this VkPresentRegionsKHR structure

### Valid Usage (Implicit)

- VUID-VkPresentRegionsKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR

- VUID-VkPresentRegionsKHR-pRegions-parameter
  If pRegions is not NULL, pRegions must be a valid pointer to an array of swapchainCount valid VkPresentRegionKHR structures

- VUID-VkPresentRegionsKHR-swapchainCount-arraylength
  swapchainCount must be greater than 0

For a given image and swapchain, the region to present is specified by the VkPresentRegionKHR structure, which is defined as:

// Provided by VK_KHR_incremental_present

typedef struct VkPresentRegionKHR {
    uint32_t rectangleCount;
    const VkRectLayerKHR* pRectangles;
} VkPresentRegionKHR;

- **rectangleCount** is the number of rectangles in pRectangles, or zero if the entire image has changed and should be presented.
• pRectangles is either NULL or a pointer to an array of VkRectLayerKHR structures. The VkRectLayerKHR structure is the framebuffer coordinates, plus layer, of a portion of a presentable image that has changed and must be presented. If non-NULL, each entry in pRectangles is a rectangle of the given image that has changed since the last image was presented to the given swapchain. The rectangles must be specified relative to VkSurfaceCapabilitiesKHR::currentTransform, regardless of the swapchain’s preTransform. The presentation engine will apply the preTransform transformation to the rectangles, along with any further transformation it applies to the image content.

Valid Usage (Implicit)

• VUID-VkPresentRegionKHR-pRectangles-parameter
  If rectangleCount is not 0, and pRectangles is not NULL, pRectangles must be a valid pointer to an array of rectangleCount valid VkRectLayerKHR structures

The VkRectLayerKHR structure is defined as:

```c
// Provided by VK_KHR_incremental_present
typedef struct VkRectLayerKHR {
    VkOffset2D offset;
    VkExtent2D extent;
    uint32_t layer;
} VkRectLayerKHR;
```

• offset is the origin of the rectangle, in pixels.
• extent is the size of the rectangle, in pixels.
• layer is the layer of the image. For images with only one layer, the value of layer must be 0.

Some platforms allow the size of a surface to change, and then scale the pixels of the image to fit the surface. VkRectLayerKHR specifies pixels of the swapchain’s image(s), which will be constant for the life of the swapchain.

Valid Usage

• VUID-VkRectLayerKHR-offset-04864
  The sum of offset and extent, after being transformed according to the preTransform member of the VkSwapchainCreateInfoKHR structure, must be no greater than the imageExtent member of the VkSwapchainCreateInfoKHR structure passed to vkCreateSwapchainKHR

• VUID-VkRectLayerKHR-layer-01262
  layer must be less than the imageArrayLayers member of the VkSwapchainCreateInfoKHR structure passed to vkCreateSwapchainKHR

When the VK_KHR_display_swapchain extension is enabled additional fields can be specified when
presenting an image to a swapchain by setting `VkPresentInfoKHR::pNext` to point to a `VkDisplayPresentInfoKHR` structure.

The `VkDisplayPresentInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_display_swapchain
typedef struct VkDisplayPresentInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkRect2D           srcRect;
    VkRect2D           dstRect;
    VkBool32           persistent;
} VkDisplayPresentInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcRect` is a rectangular region of pixels to present. It **must** be a subset of the image being presented. If `VkDisplayPresentInfoKHR` is not specified, this region will be assumed to be the entire presentable image.
- `dstRect` is a rectangular region within the visible region of the swapchain’s display mode. If `VkDisplayPresentInfoKHR` is not specified, this region will be assumed to be the entire visible region of the swapchain’s mode. If the specified rectangle is a subset of the display mode’s visible region, content from display planes below the swapchain’s plane will be visible outside the rectangle. If there are no planes below the swapchain’s, the area outside the specified rectangle will be black. If portions of the specified rectangle are outside of the display’s visible region, pixels mapping only to those portions of the rectangle will be discarded.
- `persistent`: If this is `VK_TRUE`, the display engine will enable buffered mode on displays that support it. This allows the display engine to stop sending content to the display until a new image is presented. The display will instead maintain a copy of the last presented image. This allows less power to be used, but may increase presentation latency. If `VkDisplayPresentInfoKHR` is not specified, persistent mode will not be used.

If the extent of the `srcRect` and `dstRect` are not equal, the presented pixels will be scaled accordingly.
Valid Usage

- **VUID-VkDisplayPresentInfoKHR-srcRect-01257**
  
  `srcRect` **must** specify a rectangular region that is a subset of the image being presented.

- **VUID-VkDisplayPresentInfoKHR-dstRect-01258**
  
  `dstRect` **must** specify a rectangular region that is a subset of the `visibleRegion` parameter of the display mode the swapchain being presented uses.

- **VUID-VkDisplayPresentInfoKHR-persistentContent-01259**
  
  If the `persistentContent` member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display the present operation targets is `VK_FALSE`, then `persistent` **must** be `VK_FALSE`.

Valid Usage (Implicit)

- **VUID-VkDisplayPresentInfoKHR-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR`.

If the `pNext` chain of `VkPresentInfoKHR` includes a `VkDeviceGroupPresentInfoKHR` structure, then that structure includes an array of device masks and a device group present mode.

The `VkDeviceGroupPresentInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with
Vk_KHR_swapchain
typedef struct VkDeviceGroupPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const uint32_t* pDeviceMasks;
    VkDeviceGroupPresentModeFlagBitsKHR mode;
} VkDeviceGroupPresentInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is zero or the number of elements in `pDeviceMasks`.
- `pDeviceMasks` is a pointer to an array of device masks, one for each element of `VkPresentInfoKHR::pSwapchains`.
- `mode` is a `VkDeviceGroupPresentModeFlagBitsKHR` value specifying the device group present mode that will be used for this present.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`, then each element of `pDeviceMasks` selects which instance of the swapchain image is presented. Each element of `pDeviceMasks` **must** have exactly one bit set, and the corresponding physical device **must** have a presentation engine as
reported by VkDeviceGroupPresentCapabilitiesKHR.

If mode is VKDEVICEGROUPPRESENTMODEREMOTEBITKHR, then each element of pDeviceMasks selects which instance of the swapchain image is presented. Each element of pDeviceMasks must have exactly one bit set, and some physical device in the logical device must include that bit in its VkDeviceGroupPresentCapabilitiesKHR::presentMask.

If mode is VKDEVICEGROUPPRESENTMODESUMBITKHR, then each element of pDeviceMasks selects which instances of the swapchain image are component-wise summed and the sum of those images is presented. If the sum in any component is outside the representable range, the value of that component is undefined. Each element of pDeviceMasks must have a value for which all set bits are set in one of the elements of VkDeviceGroupPresentCapabilitiesKHR::presentMask.

If mode is VKDEVICEGROUPPRESENTMODELOCALMULTIDEVICEBITKHR, then each element of pDeviceMasks selects which instance(s) of the swapchain images are presented. For each bit set in each element of pDeviceMasks, the corresponding physical device must have a presentation engine as reported by VkDeviceGroupPresentCapabilitiesKHR.

If VkDeviceGroupPresentInfoKHR is not provided or swapchainCount is zero then the masks are considered to be 1. If VkDeviceGroupPresentInfoKHR is not provided, mode is considered to be VKDEVICEGROUPPRESENTMODELOCALBITKHR.
Valid Usage

- VUID-VkDeviceGroupPresentInfoKHR-swapchainCount-01297
  swapchainCount must equal 0 or VkPresentInfoKHR::swapchainCount

- VUID-VkDeviceGroupPresentInfoKHR-mode-01298
  If mode is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR, then each element of pDeviceMasks
  must have exactly one bit set, and the corresponding element of
  VkDeviceGroupPresentCapabilitiesKHR::presentMask must be non-zero

- VUID-VkDeviceGroupPresentInfoKHR-mode-01299
  If mode is VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR, then each element of pDeviceMasks
  must have exactly one bit set, and some physical device in the logical device must include
  that bit in its VkDeviceGroupPresentCapabilitiesKHR::presentMask

- VUID-VkDeviceGroupPresentInfoKHR-mode-01300
  If mode is VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR, then each element of pDeviceMasks
  must have a value for which all set bits are set in one of the elements of
  VkDeviceGroupPresentCapabilitiesKHR::presentMask

- VUID-VkDeviceGroupPresentInfoKHR-mode-01301
  If mode is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR, then for each bit set
  in each element of pDeviceMasks, the corresponding element of
  VkDeviceGroupPresentCapabilitiesKHR::presentMask must be non-zero

- VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-01302
  The value of each element of pDeviceMasks must be equal to the device mask passed in
  VkAcquireNextImageInfoKHR::deviceMask when the image index was last acquired

- VUID-VkDeviceGroupPresentInfoKHR-mode-parameter
  mode must have exactly one bit set, and that bit must have been included in
  VkDeviceGroupSwapchainCreateInfoKHR::modes

Valid Usage (Implicit)

- VUID-VkDeviceGroupPresentInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR

- VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-parameter
  If swapchainCount is not 0, pDeviceMasks must be a valid pointer to an array of
  swapchainCount uint32_t values

- VUID-VkDeviceGroupPresentInfoKHR-mode-parameter
  mode must be a valid VkDeviceGroupPresentModeFlagBitsKHR value

When the VK_GOOGLE_display_timing extension is enabled, additional fields can be specified that
allow an application to specify the earliest time that an image should be displayed. This allows an
application to avoid stutter that is caused by an image being displayed earlier than planned. Such
stuttering can occur with both fixed and variable-refresh-rate displays, because stuttering occurs
when the geometry is not correctly positioned for when the image is displayed. An application can
instruct the presentation engine that an image should not be displayed earlier than a specified time by adding a `VkPresentTimesInfoGOOGLE` structure to the `pNext` chain of the `VkPresentInfoKHR` structure.

The `VkPresentTimesInfoGOOGLE` structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPresentTimesInfoGOOGLE {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentTimeGOOGLE* pTimes;
} VkPresentTimesInfoGOOGLE;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pTimes` is `NULL` or a pointer to an array of `VkPresentTimeGOOGLE` elements with `swapchainCount` entries. If not `NULL`, each element of `pTimes` contains the earliest time to present the image corresponding to the entry in the `VkPresentInfoKHR::pImageIndices` array.

### Valid Usage

- VUID-VkPresentTimesInfoGOOGLE-swapchainCount-01247
  swapchainCount must be the same value as `VkPresentInfoKHR::swapchainCount`, where `VkPresentInfoKHR` is included in the `pNext` chain of this `VkPresentTimesInfoGOOGLE` structure

### Valid Usage (Implicit)

- VUID-VkPresentTimesInfoGOOGLE-sType-sType
  sType must be `VK_STRUCTURE_TYPE_PRESENT_TIMES_INFO_GOOGLE`
- VUID-VkPresentTimesInfoGOOGLE-pTimes-parameter
  If `pTimes` is not `NULL`, `pTimes` must be a valid pointer to an array of `VkPresentTimeGOOGLE` structures
- VUID-VkPresentTimesInfoGOOGLE-swapchainCount-arraylength
  swapchainCount must be greater than 0

The `VkPresentTimeGOOGLE` structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPresentTimeGOOGLE {
    uint32_t presentID;
    uint64_t desiredPresentTime;
} VkPresentTimeGOOGLE;
```
presentID is an application-provided identification value, that can be used with the results of vkGetPastPresentationTimingGOOGLE, in order to uniquely identify this present. In order to be useful to the application, it should be unique within some period of time that is meaningful to the application.

desiredPresentTime specifies that the image given should not be displayed to the user any earlier than this time. desiredPresentTime is a time in nanoseconds, relative to a monotonically-increasing clock (e.g. CLOCK_MONOTONIC (see clock_gettime(2)) on Android and Linux). A value of zero specifies that the presentation engine may display the image at any time. This is useful when the application desires to provide presentID, but does not need a specific desiredPresentTime.

The VkPresentIdKHR structure is defined as:

```c
// Provided by VK_KHR_present_id
typedef struct VkPresentIdKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const uint64_t* pPresentIds;
} VkPresentIdKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **swapchainCount** is the number of swapchains being presented to the vkQueuePresentKHR command.
- **pPresentIds** is NULL or a pointer to an array of uint64_t with swapchainCount entries. If not NULL, each non-zero value in pPresentIds specifies the present id to be associated with the presentation of the swapchain with the same index in the vkQueuePresentKHR call.

For applications to be able to reference specific presentation events queued by a call to vkQueuePresentKHR, an identifier needs to be associated with them. When the presentId feature is enabled, applications can include the VkPresentIdKHR structure in the pNext chain of the VkPresentInfoKHR structure to supply identifiers.

Each VkSwapchainKHR has a presentId associated with it. This value is initially set to zero when the VkSwapchainKHR is created.

When a VkPresentIdKHR structure with a non-NULL pPresentIds is included in the pNext chain of a VkPresentInfoKHR structure, each pSwapchains entry has a presentId associated in the pPresentIds array at the same index as the swapchain in the pSwapchains array. If this presentId is non-zero, then the application can later use this value to refer to that image presentation. A value of zero indicates that this presentation has no associated presentId. A non-zero presentId must be greater than any non-zero presentId passed previously by the application for the same swapchain.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the presentId value, but implementations should make this as close as possible to the presentation of the first pixel in the new image to the user.
Valid Usage

- **VUID-VkPresentIdKHR-swapchainCount-04998**
  
  `swapchainCount` must be the same value as `VkPresentInfoKHR::swapchainCount`, where this `VkPresentIdKHR` is in the pNext-chain of the `VkPresentInfoKHR` structure.

- **VUID-VkPresentIdKHR-presentIds-04999**
  
  Each `presentIds` entry must be greater than any previous `presentIds` entry passed for the associated `pSwapchains` entry.

Valid Usage (Implicit)

- **VUID-VkPresentIdKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PRESENT_ID_KHR`.

- **VUID-VkPresentIdKHR-pPresentIds-parameter**
  
  If `pPresentIds` is not `NULL`, `pPresentIds` must be a valid pointer to an array of `swapchainCount` `uint64_t` values.

- **VUID-VkPresentIdKHR-swapchainCount-arraylength**
  
  `swapchainCount` must be greater than 0.

When the `presentWait` feature is enabled, an application can wait for an image to be presented to the user by first specifying a `presentId` for the target presentation by adding a `VkPresentIdKHR` structure to the `pNext` chain of the `VkPresentInfoKHR` structure and then waiting for that presentation to complete by calling:

```c
// Provided by VK_KHR_present_wait
VkResult vkWaitForPresentKHR(
    VkDevice device,                  // device
    VkSwapchainKHR swapchain,         // swapchain
    uint64_t presentId,               // presentId
    uint64_t timeout);                // timeout)
```

- `device` is the device associated with `swapchain`.

- `swapchain` is the non-retired swapchain on which an image was queued for presentation.

- `presentId` is the presentation presentId to wait for.

- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which `may` be substantially longer than one nanosecond, and `may` be longer than the requested period.

`vkWaitForPresentKHR` waits for the presentId associated with `swapchain` to be increased in value so that it is at least equal to `presentId`.

For `VK_PRESENT_MODE_MAILBOX_KHR` (or other present mode where images may be replaced in the presentation queue) any wait of this type associated with such an image must be signaled no later than 1888 | Chapter 33. Window System Integration (WSI)
than a wait associated with the replacing image would be signaled.

When the presentation has completed, the presentId associated with the related pSwapChains entry will be increased in value so that it is at least equal to the value provided in the VkPresentIdKHR structure.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the presentId value, but implementations should make this as close as possible to the presentation of the first pixel in the new image to the user.

The call to vkWaitForPresentKHR will block until either the presentId associated with swapchain is greater than or equal to presentId, or timeout nanoseconds passes. When the swapchain becomes OUT_OF_DATE, the call will either return VK_SUCCESS (if the image was delivered to the presentation engine and may have been presented to the user) or will return early with status VK_ERROR_OUT_OF_DATE_KHR (if the image was not presented to the user).

As an exception to the normal rules for objects which are externally synchronized, the swapchain passed to vkWaitForPresentKHR may be simultaneously used by other threads in calls to functions other than vkDestroySwapchainKHR. Access to the swapchain data associated with this extension must be atomic within the implementation.

---

### Valid Usage

- VUID-vkWaitForPresentKHR-swapchain-04997
  - swapchain must not be in the retired state

- VUID-vkWaitForPresentKHR-presentWait-06234
  - The presentWait feature must be enabled

---

### Valid Usage (Implicit)

- VUID-vkWaitForPresentKHR-device-parameter
  - device must be a valid VkDevice handle

- VUID-vkWaitForPresentKHR-swapchain-parameter
  - swapchain must be a valid VkSwapchainKHR handle

- VUID-vkWaitForPresentKHR-commonparent
  - Both of device, and swapchain must have been created, allocated, or retrieved from the same VkInstance

---

### Host Synchronization

- Host access to swapchain must be externally synchronized
Return Codes

Success
• VK_SUCCESS
• VK_TIMEOUT

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_DEVICE_LOST

When the VK_GGP_frame_token extension is enabled, a Google Games Platform frame token can be specified when presenting an image to a swapchain by adding a VkPresentFrameTokenGGP structure to the pNext chain of the VkPresentInfoKHR structure.

The VkPresentFrameTokenGGP structure is defined as:

```c
// Provided by VK_GGP_frame_token
typedef struct VkPresentFrameTokenGGP {
    VkStructureType sType;
    const void* pNext;
    GgpFrameToken frameToken;
} VkPresentFrameTokenGGP;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• frameToken is the Google Games Platform frame token.

Valid Usage

• VUID-VkPresentFrameTokenGGP-frameToken-02680
  frameToken must be a valid GgpFrameToken

Valid Usage (Implicit)

• VUID-VkPresentFrameTokenGGP-sType-sType
  sType must be VK_STRUCTURE_TYPE_PRESENT_FRAME_TOKEN_GGP

vkQueuePresentKHR, releases the acquisition of the images referenced by imageIndices. The queue family corresponding to the queue vkQueuePresentKHR is executed on must have ownership of the presented images as defined in Resource Sharing. vkQueuePresentKHR does not alter the queue family ownership, but the presented images must not be used again before they have been reacquired.
using `vkAcquireNextImageKHR`.

The processing of the presentation happens in issue order with other queue operations, but semaphores have to be used to ensure that prior rendering and other commands in the specified queue complete before the presentation begins. The presentation command itself does not delay processing of subsequent commands on the queue, however, presentation requests sent to a particular queue are always performed in order. Exact presentation timing is controlled by the semantics of the presentation engine and native platform in use.

If an image is presented to a swapchain created from a display surface, the mode of the associated display will be updated, if necessary, to match the mode specified when creating the display surface. The mode switch and presentation of the specified image will be performed as one atomic operation.

The result codes `VK_ERROR_OUT_OF_DATE_KHR` and `VK_SUBOPTIMAL_KHR` have the same meaning when returned by `vkQueuePresentKHR` as they do when returned by `vkAcquireNextImageKHR`. If multiple swapchains are presented, the result code is determined applying the following rules in order:

- If the device is lost, `VK_ERROR_DEVICE_LOST` is returned.
- If any of the target surfaces are no longer available the error `VK_ERROR_SURFACE_LOST_KHR` is returned.
- If any of the presents would have a result of `VK_ERROR_OUT_OF_DATE_KHR` if issued separately then `VK_ERROR_OUT_OF_DATE_KHR` is returned.
- If any of the presents would have a result of `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` if issued separately then `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` is returned.
- If any of the presents would have a result of `VK_SUBOPTIMAL_KHR` if issued separately then `VK_SUBOPTIMAL_KHR` is returned.
- Otherwise `VK_SUCCESS` is returned.

Presentation is a read-only operation that will not affect the content of the presentable images. Upon reacquiring the image and transitioning it away from the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, the contents will be the same as they were prior to transitioning the image to the present source layout and presenting it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

Note

The application can continue to present any acquired images from a retired swapchain as long as the swapchain has not entered a state that causes `vkQueuePresentKHR` to return `VK_ERROR_OUT_OF_DATE_KHR`.

33.11. Hdr Metadata

To improve color reproduction of content it is useful to have information that can be used to better reproduce the colors as seen on the reference monitor. That information can be provided to an implementation by calling `vkSetHdrMetadataEXT`. The metadata will be applied to the specified
VkSwapchainKHR objects at the next `vkQueuePresentKHR` call using that `VkSwapchainKHR` object. The metadata will persist until a subsequent `vkSetHdrMetadataEXT` changes it. The definitions below are from the associated SMPTE 2086, CTA 861.3 and CIE 15:2004 specifications.

The definition of `vkSetHdrMetadataEXT` is:

```c
// Provided by VK_EXT_hdr_metadata
void vkSetHdrMetadataEXT(
    VkDevice device,  
    uint32_t swapchainCount,  
    const VkSwapchainKHR* pSwapchains,  
    const VkHdrMetadataEXT* pMetadata);
```

- `device` is the logical device where the swapchain(s) were created.
- `swapchainCount` is the number of swapchains included in `pSwapchains`.
- `pSwapchains` is a pointer to an array of `swapchainCount` `VkSwapchainKHR` handles.
- `pMetadata` is a pointer to an array of `swapchainCount` `VkHdrMetadataEXT` structures.

Valid Usage (Implicit)

- VUID-vkSetHdrMetadataEXT-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkSetHdrMetadataEXT-pSwapchains-parameter
  - `pSwapchains` must be a valid pointer to an array of `swapchainCount` valid `VkSwapchainKHR` handles
- VUID-vkSetHdrMetadataEXT-pMetadata-parameter
  - `pMetadata` must be a valid pointer to an array of `swapchainCount` valid `VkHdrMetadataEXT` structures
- VUID-vkSetHdrMetadataEXT-swapchainCount-arraylength
  - `swapchainCount` must be greater than 0
- VUID-vkSetHdrMetadataEXT-commonparent
  - Both of `device`, and the elements of `pSwapchains` must have been created, allocated, or retrieved from the same `VkInstance`

```c
// Provided by VK_EXT_hdr_metadata
typedef struct VkXYColorEXT {
    float x;
    float y;
} VkXYColorEXT;
```

Chromaticity coordinates x and y are as specified in CIE 15:2004 “Calculation of chromaticity coordinates” (Section 7.3) and are limited to between 0 and 1 for real colors for the reference monitor.
typedef struct VkHdrMetadataEXT {
    VkStructureType sType;
    const void* pNext;
    VkXYColorEXT displayPrimaryRed;
    VkXYColorEXT displayPrimaryGreen;
    VkXYColorEXT displayPrimaryBlue;
    VkXYColorEXT whitePoint;
    float maxLuminance;
    float minLuminance;
    float maxContentLightLevel;
    float maxFrameAverageLightLevel;
} VkHdrMetadataEXT;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• displayPrimaryRed is the reference monitor's red primary in chromaticity coordinates.
• displayPrimaryGreen is the reference monitor's green primary in chromaticity coordinates.
• displayPrimaryBlue is the reference monitor's blue primary in chromaticity coordinates.
• whitePoint is the reference monitor's white-point in chromaticity coordinates.
• maxLuminance is the maximum luminance of the reference monitor in nits.
• minLuminance is the minimum luminance of the reference monitor in nits.
• maxContentLightLevel is content's maximum luminance in nits.
• maxFrameAverageLightLevel is the maximum frame average light level in nits.

Valid Usage (Implicit)

• VUID-VkHdrMetadataEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_HDR_METADATA_EXT
• VUID-VkHdrMetadataEXT-pNext-pNext
  pNext must be NULL

Note
The validity and use of this data is outside the scope of Vulkan.
Chapter 34. Deferred Host Operations

Certain Vulkan commands are inherently expensive for the host CPU to execute. It is often desirable to offload such work onto background threads, and to parallelize the work across multiple CPUs. The concept of deferred operations allows applications and drivers to coordinate the execution of expensive host commands using an application-managed thread pool.

The VK_KHR_deferred_host_operations extension defines the infrastructure and usage patterns for deferrable commands, but does not specify any commands as deferrable. This is left to additional dependant extensions. Commands must not be deferred unless the deferral is specifically allowed by another extension which depends on VK_KHR_deferred_host_operations. This specification will refer to such extensions as deferral extensions.

34.1. Requesting Deferral

When an application requests an operation deferral, the implementation may defer the operation. When deferral is requested and the implementation defers any operation, the implementation must return VK_OPERATION_DEFERRED_KHR as the success code if no errors occurred. When deferral is requested, the implementation should defer the operation when the workload is significant, however if the implementation chooses not to defer any of the requested operations and instead executes all of them immediately, the implementation must return VK_OPERATION_NOT_DEFERRED_KHR as the success code if no errors occurred.

A deferred operation is created complete with an initial result value of VK_SUCCESS. The deferred operation becomes pending when an operation has been successfully deferred with that deferred operation object.

A deferred operation is considered pending until the deferred operation completes. A pending deferred operation becomes complete when it has been fully executed by one or more threads. Pending deferred operations will never complete until they are joined by an application thread, using vkDeferredOperationJoinKHR. Applications can join multiple threads to the same deferred operation, enabling concurrent execution of subtasks within that operation.

The application can query the status of a VkDeferredOperationKHR using the vkGetDeferredOperationMaxConcurrencyKHR or vkGetDeferredOperationResultKHR commands.

Parameters to the command requesting a deferred operation may be accessed at any time until the deferred operation enters the pending state. While a deferred operation is pending:

- Externally synchronized parameters must not be accessed.
- Pointer parameters must not be modified (e.g. reallocated/freed).
- The contents of pointer parameters which may be read by the command must not be modified.
- The contents of pointer parameters which may be written by the command must not be read.
- Vulkan object parameters must not be passed as externally synchronized parameters to any other command.

When the deferred operation is complete, the application should call
vkGetDeferredOperationResultKHR to obtain the VkResult indicating success or failure of the operation. The VkResult value returned will be one of the values that the command requesting the deferred operation is able to return. Writes to output parameters of the requesting command will happen-before the deferred operation is complete.

### 34.2. Deferred Host Operations API

The VkDeferredOperationKHR handle is defined as:

```c
// Provided by VK_KHR_deferred_host_operations
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeferredOperationKHR)
```

This handle refers to a tracking structure which manages the execution state for a deferred command.

To construct the tracking object for a deferred command, call:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkCreateDeferredOperationKHR(
    VkDevice           device,           
    const VkAllocationCallbacks* pAllocator, 
    VkDeferredOperationKHR* pDeferredOperation);
```

- **device** is the device which owns operation.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pDeferredOperation** is a pointer to a handle in which the created VkDeferredOperationKHR is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateDeferredOperationKHR-device-parameter**
  device must be a valid VkDevice handle

- **VUID-vkCreateDeferredOperationKHR-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- **VUID-vkCreateDeferredOperationKHR-pDeferredOperation-parameter**
  pDeferredOperation must be a valid pointer to a VkDeferredOperationKHR handle
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY

To assign a thread to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkDeferredOperationJoinKHR(
    VkDevice device,
    VkDeferredOperationKHR operation);
```

- `device` is the device which owns `operation`.
- `operation` is the deferred operation that the calling thread should work on.

The `vkDeferredOperationJoinKHR` command will execute a portion of the deferred operation on the calling thread.

The return value will be one of the following:

- A return value of `VK_SUCCESS` indicates that `operation` is complete. The application **should** use `vkGetDeferredOperationResultKHR` to retrieve the result of `operation`.
- A return value of `VK_THREAD_DONE_KHR` indicates that the deferred operation is not complete, but there is no work remaining to assign to threads. Future calls to `vkDeferredOperationJoinKHR` are not necessary and will simply harm performance. This situation **may** occur when other threads executing `vkDeferredOperationJoinKHR` are about to complete `operation`, and the implementation is unable to partition the workload any further.
- A return value of `VK_THREAD_IDLE_KHR` indicates that the deferred operation is not complete, and there is no work for the thread to do at the time of the call. This situation **may** occur if the operation encounters a temporary reduction in parallelism. By returning `VK_THREAD_IDLE_KHR`, the implementation is signaling that it expects that more opportunities for parallelism will emerge as execution progresses, and that future calls to `vkDeferredOperationJoinKHR` **can** be beneficial. In the meantime, the application **can** perform other work on the calling thread.

Implementations **must** guarantee forward progress by enforcing the following invariants:

1. If only one thread has invoked `vkDeferredOperationJoinKHR` on a given operation, that thread **must** execute the operation to completion and return `VK_SUCCESS`.
2. If multiple threads have concurrently invoked `vkDeferredOperationJoinKHR` on the same operation, then at least one of them **must** complete the operation and return `VK_SUCCESS`.

1896 | Chapter 34. Deferred Host Operations
Valid Usage (Implicit)

- **VUID-vkDeferredOperationJoinKHR-device-parameter**
  
  *device* must be a valid *VkDevice* handle

- **VUID-vkDeferredOperationJoinKHR-operation-parameter**
  
  *operation* must be a valid *VkDeferredOperationKHR* handle

- **VUID-vkDeferredOperationJoinKHR-operation-parent**
  
  *operation* must have been created, allocated, or retrieved from *device*

Return Codes

**Success**

- **VK_SUCCESS**
- **VK_THREAD_DONE_KHR**
- **VK_THREAD_IDLE_KHR**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

When a deferred operation is completed, the application can destroy the tracking object by calling:

```c
// Provided by VK_KHR_deferred_host_operations

void vkDestroyDeferredOperationKHR(  
  VkDevice device,  
  VkDeferredOperationKHR operation,  
  const VkAllocationCallbacks* pAllocator);
```

- *device* is the device which owns *operation*.
- *operation* is the completed operation to be destroyed.
- *pAllocator* controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage

- VUID-vkDestroyDeferredOperationKHR-operation-03434
  If VkAllocationCallbacks were provided when operation was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyDeferredOperationKHR-operation-03435
  If no VkAllocationCallbacks were provided when operation was created, pAllocator must be NULL.

- VUID-vkDestroyDeferredOperationKHR-operation-03436
  operation must be completed.

Valid Usage (Implicit)

- VUID-vkDestroyDeferredOperationKHR-device-parameter
  device must be a valid VkDevice handle.

- VUID-vkDestroyDeferredOperationKHR-operation-parameter
  If operation is not VK_NULL_HANDLE, operation must be a valid VkDeferredOperationKHR handle.

- VUID-vkDestroyDeferredOperationKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure.

- VUID-vkDestroyDeferredOperationKHR-operation-parent
  If operation is a valid handle, it must have been created, allocated, or retrieved from device.

Host Synchronization

- Host access to operation must be externally synchronized.

To query the number of additional threads that can usefully be joined to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
uint32_t vkGetDeferredOperationMaxConcurrencyKHR(
    VkDevice device,
    VkDeferredOperationKHR operation);
```

- device is the device which owns operation.
- operation is the deferred operation to be queried.

The returned value is the maximum number of threads that can usefully execute a deferred operation concurrently, reported for the state of the deferred operation at the point this command is called. This value is intended to be used to better schedule work onto available threads.
Applications can join any number of threads to the deferred operation and expect it to eventually complete, though excessive joins may return VK_THREAD_DONE_KHR immediately, performing no useful work.

If operation is complete, vkGetDeferredOperationMaxConcurrencyKHR returns zero.

If operation is currently joined to any threads, the value returned by this command may immediately be out of date.

If operation is pending, implementations must not return zero unless at least one thread is currently executing vkDeferredOperationJoinKHR on operation. If there are such threads, the implementation should return an estimate of the number of additional threads which it could profitably use.

Implementations may return $2^{32} - 1$ to indicate that the maximum concurrency is unknown and cannot be easily derived. Implementations may return values larger than the maximum concurrency available on the host CPU. In these situations, an application should clamp the return value rather than oversubscribing the machine.

Note
The recommended usage pattern for applications is to query this value once, after deferral, and schedule no more than the specified number of threads to join the operation. Each time a joined thread receives VK_THREAD_IDLE_KHR, the application should schedule an additional join at some point in the future, but is not required to do so.

Valid Usage (Implicit)

- VUID-vkGetDeferredOperationMaxConcurrencyKHR-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parameter
  
  operation must be a valid VkDeferredOperationKHR handle

- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parent
  
  operation must have been created, allocated, or retrieved from device

The vkGetDeferredOperationResultKHR function is defined as:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkGetDeferredOperationResultKHR(
    VkDevice device,           // device is the device which owns operation.
    VkDeferredOperationKHR operation); // operation is the operation whose deferred result is being queried.

If no command has been deferred on operation, vkGetDeferredOperationResultKHR returns
VK_SUCCESS.

If the deferred operation is pending, `vkGetDeferredOperationResultKHR` returns VK_NOT_READY.

If the deferred operation is complete, it returns the appropriate return value from the original command. This value must be one of the `VkResult` values which could have been returned by the original command if the operation had not been deferred.

### Valid Usage (Implicit)

- **VUID-vkGetDeferredOperationResultKHR-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkGetDeferredOperationResultKHR-operation-parameter**
  - `operation` must be a valid `VkDeferredOperationKHR` handle
- **VUID-vkGetDeferredOperationResultKHR-operation-parent**
  - `operation` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- VK_SUCCESS
- VK_NOT_READY

1900 | Chapter 34. Deferred Host Operations
Chapter 35. Private Data

The private data extension provides a way for users to associate arbitrary user defined data with Vulkan objects. This association is accomplished by storing 64-bit unsigned integers of user defined data in private data slots.

An application can reserve private data slots at device creation. To reserve private data slots, insert a `VkDevicePrivateDataCreateInfoEXT` in the `pNext` chain in `VkDeviceCreateInfo` before device creation. Multiple `VkDevicePrivateDataCreateInfoEXT` structures can be chained together, and the sum of the requested slots will be reserved. This is an exception to the specified valid usage for structure pointer chains. Reserving slots in this manner is not strictly necessary but it may improve performance.

Private data slots are represented by `VkPrivateDataSlotEXT` handles:

```cpp
// Provided by VK_EXT_private_data
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPrivateDataSlotEXT)
```

To create a private data slot, call:

```cpp
// Provided by VK_EXT_private_data
VkResult vkCreatePrivateDataSlotEXT(
    VkDevice device,
    const VkPrivateDataSlotCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkPrivateDataSlotEXT* pPrivateDataSlot);
```

- `device` is the logical device associated with the creation of the object(s) holding the private data slot.
- `pCreateInfo` is a pointer to a `VkPrivateDataSlotCreateInfoEXT`
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPrivateDataSlot` is a pointer to a `VkPrivateDataSlotEXT` handle in which the resulting private data slot is returned

**Valid Usage**

- VUID-vkCreatePrivateDataSlotEXT-privateData-04564
  The `privateData` feature must be enabled
Valid Usage (Implicit)

- **VUID-vkCreatePrivateDataSlotEXT-device-parameter**
  - The **device** must be a valid `VkDevice` handle.

- **VUID-vkCreatePrivateDataSlotEXT-pCreateInfo-parameter**
  - The **pCreateInfo** must be a valid pointer to a valid `VkPrivateDataSlotCreateInfoEXT` structure.

- **VUID-vkCreatePrivateDataSlotEXT-pAllocator-parameter**
  - If **pAllocator** is not NULL, **pAllocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkCreatePrivateDataSlotEXT-pPrivateDataSlot-parameter**
  - The **pPrivateDataSlot** must be a valid pointer to a `VkPrivateDataSlotEXT` handle.

Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**

The `VkPrivateDataSlotCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_private_data
typedef struct VkPrivateDataSlotCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPrivateDataSlotCreateFlagsEXT flags;
} VkPrivateDataSlotCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkPrivateDataSlotCreateFlagsEXT` specifying additional parameters of the new private data slot.
Valid Usage (Implicit)

- **VUID-VkPrivateDataSlotCreateInfoEXT-sType-sType**
  
  *sType must be VK_STRUCTURE_TYPE_PRIVATE_DATA_SLOT_CREATE_INFO_EXT*

- **VUID-VkPrivateDataSlotCreateInfoEXT-pNext-pNext**

  *pNext must be NULL*

- **VUID-VkPrivateDataSlotCreateInfoEXT-flags-zerobitmask**

  *flags must be 0*

---

```c
// Provided by VK_EXT_private_data
typedef enum VkPrivateDataSlotCreateFlagBitsEXT {
} VkPrivateDataSlotCreateFlagBitsEXT;
```

---

```c
// Provided by VK_EXT_private_data
typedef VkFlags VkPrivateDataSlotCreateFlagsEXT;
```

**VkPrivateDataSlotCreateFlagsEXT** is a bitmask type for setting a mask of zero or more **VkPrivateDataSlotCreateFlagBitsEXT**.

To destroy a private data slot, call:

```c
// Provided by VK_EXT_private_data
void vkDestroyPrivateDataSlotEXT(
    VkDevice device,
    VkPrivateDataSlotEXT privateDataSlot,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device associated with the creation of the object(s) holding the private data slot.

- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

- **privateDataSlot** is the private data slot to destroy.

---

Valid Usage

- **VUID-vkDestroyPrivateDataSlotEXT-privateDataSlot-04062**

  If **VkAllocationCallbacks** were provided when **privateDataSlot** was created, a compatible set of callbacks **must** be provided here

- **VUID-vkDestroyPrivateDataSlotEXT-privateDataSlot-04063**

  If no **VkAllocationCallbacks** were provided when **privateDataSlot** was created, **pAllocator** **must** be **NULL**
Valid Usage (Implicit)

- VUID-vkDestroyPrivateDataSlotEXT-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkDestroyPrivateDataSlotEXT-privateDataSlot-parameter
  
  If `privateDataSlot` is not `VK_NULL_HANDLE`, `privateDataSlot` must be a valid `VkPrivateDataSlotEXT` handle

- VUID-vkDestroyPrivateDataSlotEXT-pAllocator-parameter
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyPrivateDataSlotEXT-privateDataSlot-parent
  
  If `privateDataSlot` is a valid handle, it must have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `privateDataSlot` must be externally synchronized

To store user defined data in a slot associated with a Vulkan object, call:

```c
// Provided by VK_EXT_private_data
VkResult vkSetPrivateDataEXT(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlotEXT privateDataSlot,
    uint64_t data);
```

- `device` is the device that created the object.
- `objectType` is a `VkObjectType` specifying the type of object to associate data with.
- `objectHandle` is a handle to the object to associate data with.
- `privateDataSlot` is a handle to a `VkPrivateDataSlotEXT` specifying location of private data storage.
- `data` is user defined data to associate the object with. This data will be stored at `privateDataSlot`.

Valid Usage

- VUID-vkSetPrivateDataEXT-objectHandle-04016
  `objectHandle` must be `device` or a child of `device`

- VUID-vkSetPrivateDataEXT-objectHandle-04017
  `objectHandle` must be a valid handle to an object of type `objectType`
Valid Usage (Implicit)

- **VUID-vkSetPrivateDataEXT-device-parameter**
  
  *device* must be a valid *VkDevice* handle

- **VUID-vkSetPrivateDataEXT-objectType-parameter**
  
  *objectType* must be a valid *VkObjectType* value

- **VUID-vkSetPrivateDataEXT-privateDataSlot-parameter**
  
  *privateDataSlot* must be a valid *VkPrivateDataSlotEXT* handle

- **VUID-vkSetPrivateDataEXT-privateDataSlot-parent**
  
  *privateDataSlot* must have been created, allocated, or retrieved from *device*

Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**

To retrieve user defined data from a slot associated with a Vulkan object, call:

```c
// Provided by VK_EXT_private_data
void vkGetPrivateDataEXT(
    VkDevice device,          // device is the device that created the object
    VkObjectType objectType,   // objectType is a VkObjectType specifying the type of object data is associated with.  
    uint64_t objectHandle,    // objectHandle is a handle to the object data is associated with.  
    VkPrivateDataSlotEXT privateDataSlot,  // privateDataSlot is a handle to a VkPrivateDataSlotEXT specifying location of private data pointer storage.  
    uint64_t* pData           // pData is a pointer to specify where user data is returned. 0 will be written in the absence of a previous call to vkSetPrivateDataEXT using the object specified by objectHandle.
);
```

Note

Due to platform details on Android, implementations might not be able to reliably return 0 from calls to `vkGetPrivateDataEXT` for `VkSwapchainKHR` objects on which `vkSetPrivateDataEXT` has not previously been called. This erratum is exclusive to the Android platform and objects of type `VkSwapchainKHR`. 

Chapter 35. Private Data | 1905
Valid Usage

- VUID-vkGetPrivateDataEXT-objectType-04018
  objectType must be VK_OBJECT_TYPE_DEVICE, or an object type whose parent is VkDevice

Valid Usage (Implicit)

- VUID-vkGetPrivateDataEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetPrivateDataEXT-objectType-parameter
  objectType must be a valid VkObjectType value

- VUID-vkGetPrivateDataEXT-privateDataSlot-parameter
  privateDataSlot must be a valid VkPrivateDataSlotEXT handle

- VUID-vkGetPrivateDataEXT-pData-parameter
  pData must be a valid pointer to a uint64_t value

- VUID-vkGetPrivateDataEXT-privateDataSlot-parent
  privateDataSlot must have been created, allocated, or retrieved from device
Chapter 36. Acceleration Structures

36.1. Acceleration Structures

*Acceleration structures* are data structures used by the implementation to efficiently manage scene geometry as it is traversed during a ray tracing query. The application is responsible for managing acceleration structure objects (see *Acceleration Structures*), including allocation, destruction, executing builds or updates, and synchronizing resources used during ray tracing queries.

There are two types of acceleration structures, *top level acceleration structures* and *bottom level acceleration structures*.

An acceleration structure is considered to be constructed if an *acceleration structure build command* or *copy command* has been executed with the given acceleration structure as the destination.

![Diagram showing the relationship between top and bottom level acceleration structures.](image)

*Figure 24. Acceleration Structure*

**Caption**

The diagram shows the relationship between top and bottom level acceleration structures.

36.1.1. Geometry

*Geometries* refer to a triangle or axis-aligned bounding box.

36.1.2. Top Level Acceleration Structures

Opaque acceleration structure for an array of instances. The descriptor or device address referencing this is the starting point for traversal.
The top level acceleration structure takes a reference to any bottom level acceleration structure referenced by its instances. Those bottom level acceleration structure objects must be valid when the top level acceleration structure is accessed.

### 36.1.3. Bottom Level Acceleration Structures

Opaque acceleration structure for an array of geometries.

### 36.1.4. Acceleration Structure Update Rules

The API defines two types of operations to produce acceleration structures from geometry:

- A *build* operation is used to construct an acceleration structure.
- An *update* operation is used to modify an existing acceleration structure.

An update operation imposes certain constraints on the input, in exchange for considerably faster execution. When performing an update, the application is required to provide a full description of the acceleration structure, but is prohibited from changing anything other than instance definitions, transform matrices, and vertex or AABB positions. All other aspects of the description must exactly match the one from the original build.

More precisely, the application must not use an update operation to do any of the following:

- Change primitives or instances from *active* to *inactive* (as defined in Inactive Primitives and Instances).
- Change the index or vertex formats of triangle geometry.
- Change triangle geometry transform pointers from null to non-null or vice versa.
- Change the number of geometries or instances in the structure.
- Change the geometry flags for any geometry in the structure.
- Change the number of vertices or primitives for any geometry in the structure.

### 36.1.5. Inactive Primitives and Instances

Acceleration structures allow the use of particular input values to signal *inactive* primitives or instances.

An *inactive* triangle is one for which the first (X) component of each vertex is NaN. If any other vertex component is NaN, and the first is not, the behavior is undefined. If the vertex format does not have a NaN representation, then all triangles are considered active.

An *inactive* instance is one whose acceleration structure handle is `VK_NULL_HANDLE`.

An *inactive* AABB is one for which the minimum X coordinate is NaN. If any other component is NaN, and the first is not, the behavior is undefined.

In the above definitions, "NaN" refers to any type of NaN. Signaling, non-signaling, quiet, loud, or otherwise.
An inactive object is considered invisible to all rays, and **should** not be represented in the acceleration structure. Implementations **should** ensure that the presence of inactive objects does not seriously degrade traversal performance.

Inactive objects are counted in the auto-generated index sequences which are provided to shaders via `InstanceId` and `PrimitiveId` SPIR-V decorations. This allows objects in the scene to change freely between the active and inactive states, without affecting the layout of any arrays which are being indexed using the ID values.

Any transition between the active and inactive states requires a full acceleration structure rebuild. Applications **must** not perform an acceleration structure update where an object is active in the source acceleration structure but would be inactive in the destination, or vice versa.

### 36.1.6. Building Acceleration Structures

To build an acceleration structure call:

```c
// Provided by VK_NV_ray_tracing
void vkCmdBuildAccelerationStructureNV(
    VkCommandBuffer commandBuffer,
    const VkAccelerationStructureInfoNV* pInfo,
    VkBuffer instanceData,
    VkDeviceSize instanceOffset,
    VkBool32 update,
    VkAccelerationStructureNV dst,
    VkAccelerationStructureNV src,
    VkBuffer scratch,
    VkDeviceSize scratchOffset);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **pInfo** contains the shared information for the acceleration structure's structure.
- **instanceData** is the buffer containing an array of `VkAccelerationStructureInstanceKHR` structures defining acceleration structures. This parameter **must** be **NULL** for bottom level acceleration structures.
- **instanceOffset** is the offset in bytes (relative to the start of `instanceData`) at which the instance data is located.
- **update** specifies whether to update the `dst` acceleration structure with the data in `src`.
- **dst** is a pointer to the target acceleration structure for the build.
- **src** is a pointer to an existing acceleration structure that is to be used to update the `dst` acceleration structure.
- **scratch** is the `VkBuffer` that will be used as scratch memory for the build.
- **scratchOffset** is the offset in bytes relative to the start of `scratch` that will be used as a scratch memory.

Accesses to `dst`, `src`, and `scratch` **must** be **synchronized** with the...
VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR or VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR.
Valid Usage

- **VUID-vkCmdBuildAccelerationStructureNV-geometryCount-02241**
  
  *geometryCount must be less than or equal to** `VkPhysicalDeviceRayTracingPropertiesNV::maxGeometryCount`.

- **VUID-vkCmdBuildAccelerationStructureNV-dst-02488**
  
  *dst must have been created with compatible `VkAccelerationStructureInfoNV` where `VkAccelerationStructureInfoNV::type` and `VkAccelerationStructureInfoNV::flags` are identical, `VkAccelerationStructureInfoNV::instanceCount` and `VkAccelerationStructureInfoNV::geometryCount` for dst are greater than or equal to the build size and each geometry in `VkAccelerationStructureInfoNV::pGeometries` for dst has greater than or equal to the number of vertices, indices, and AABBs.

- **VUID-vkCmdBuildAccelerationStructureNV-update-02489**

  *If update is VK_TRUE, src must not be VK_NULL_HANDLE.*

- **VUID-vkCmdBuildAccelerationStructureNV-update-02490**

  *If update is VK_TRUE, src must have previously been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_NV set in `VkAccelerationStructureInfoNV::flags` in the original build.*

- **VUID-vkCmdBuildAccelerationStructureNV-update-02491**

  *If update is VK_FALSE, the size member of the VkMemoryRequirements structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `VkAccelerationStructureMemoryRequirementsInfoNV::accelerationStructure` set to dst and `VkAccelerationStructureMemoryRequirementsInfoNV::type` set to VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV must be less than or equal to the size of scratch minus scratchOffset.*

- **VUID-vkCmdBuildAccelerationStructureNV-update-02492**

  *If update is VK_TRUE, the size member of the VkMemoryRequirements structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `VkAccelerationStructureMemoryRequirementsInfoNV::accelerationStructure` set to dst and `VkAccelerationStructureMemoryRequirementsInfoNV::type` set to VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV must be less than or equal to the size of scratch minus scratchOffset.*

- **VUID-vkCmdBuildAccelerationStructureNV-scratch-03522**

  *scratch must have been created with VK_BUFFER_USAGE_RAY_TRACING_BIT_NV usage flag.*

- **VUID-vkCmdBuildAccelerationStructureNV-instanceData-03523**

  *If instanceData is not VK_NULL_HANDLE, instanceData must have been created with VK_BUFFER_USAGE_RAY_TRACING_BIT_NV usage flag.*

- **VUID-vkCmdBuildAccelerationStructureNV-accelerationStructureReference-03786**

  *Each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in instanceData must be a valid device address containing a value obtained from `vkGetAccelerationStructureHandleNV`.*

- **VUID-vkCmdBuildAccelerationStructureNV-update-03524**

  *If update is VK_TRUE, then objects that were previously active must not be made inactive as per Inactive Primitives and Instances.*
If \texttt{update} is \texttt{VK_TRUE}, then objects that were previously inactive must not be made active as per Inactive Primitives and Instances.

If \texttt{update} is \texttt{VK_TRUE}, the \texttt{src} and \texttt{dst} objects must either be the same object or not have any memory aliasing.

### Valid Usage (Implicit)

- \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle
- \texttt{pInfo} must be a valid pointer to a valid \texttt{VkAccelerationStructureInfoNV} structure
- \texttt{instanceData} must be a valid \texttt{VkBuffer} handle
- \texttt{dst} must be a valid \texttt{VkAccelerationStructureNV} handle
- \texttt{src} must be a valid \texttt{VkAccelerationStructureNV} handle
- \texttt{scratch} must be a valid \texttt{VkBuffer} handle
- \texttt{commandBuffer} must be in the recording state
- The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support compute operations
- This command must only be called outside of a render pass instance
- Each of \texttt{commandBuffer}, \texttt{dst}, \texttt{instanceData}, \texttt{scratch}, and \texttt{src} that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same \texttt{VkDevice}

### Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized
- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized
To build acceleration structures call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdBuildAccelerationStructuresKHR(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of acceleration structures to build. It specifies the number of the `pInfos` structures and `ppBuildRangeInfos` pointers that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- `ppBuildRangeInfos` is a pointer to an array of `infoCount` pointers to arrays of `VkAccelerationStructureBuildRangeInfoKHR` structures. Each `ppBuildRangeInfos[i]` is a pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i]`.

The `vkCmdBuildAccelerationStructuresKHR` command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

**Note**

This means that an application cannot build a top-level acceleration structure in the same `vkCmdBuildAccelerationStructuresKHR` call as the associated bottom-level or instance acceleration structures are being built. There also cannot be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

Accesses to the acceleration structure scratch buffers as identified by the `VkAccelerationStructureBuildGeometryInfoKHR::scratchData` buffer device addresses must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`. Similarly for accesses to each `VkAccelerationStructureBuildGeometryInfoKHR::srcAccelerationStructure` and `VkAccelerationStructureBuildGeometryInfoKHR::dstAccelerationStructure`. 
Accesses to other input buffers as identified by any used values of

VkAccelerationStructureGeometryMotionTrianglesDataNV::vertexData,
VkAccelerationStructureGeometryTrianglesDataKHR::vertexData,
VkAccelerationStructureGeometryTrianglesDataKHR::indexData,
VkAccelerationStructureGeometryTrianglesDataKHR::transformData,
VkAccelerationStructureGeometryAabbsDataKHR::data, and
VkAccelerationStructureGeometryInstancesDataKHR::data must be synchronized with the
VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of
VK_ACCESS_SHADER_READ_BIT.
Valid Usage

- VUID-vkCmdBuildAccelerationStructuresKHR-mode-04628
  The mode member of each element of pInfos must be a valid VkBuildAccelerationStructureModeKHR value

- VUID-vkCmdBuildAccelerationStructuresKHR-srcAccelerationStructure-04629
  If the srcAccelerationStructure member of any element of pInfos is not VK_NULL_HANDLE, the srcAccelerationStructure member must be a valid VkAccelerationStructureKHR handle

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-04630
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member must not be VK_NULL_HANDLE

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03403
  The srcAccelerationStructure member of any element of pInfos must not be the same acceleration structure as the dstAccelerationStructure member of any other element of pInfos

- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03698
  The dstAccelerationStructure member of any element of pInfos must not be the same acceleration structure as the dstAccelerationStructure member of any other element of pInfos

- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03800
  The dstAccelerationStructure member of any element of pInfos must be a valid VkAccelerationStructureKHR handle

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03699
  For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, its dstAccelerationStructure member must have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03700
  For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR, its dstAccelerationStructure member must have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03663
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, inactive primitives in its srcAccelerationStructure member must not be made active

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03664
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, active primitives in its srcAccelerationStructure member must not be made inactive
The \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} \textbf{must} not be referenced by the \texttt{geometry.instances.data} member of any element of \texttt{pGeometries} or \texttt{ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR} in any other element of \texttt{pInfos}.

The range of memory backing the \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} that is accessed by this command \textbf{must} not overlap the memory backing the \texttt{srcAccelerationStructure} member of any other element of \texttt{pInfos} with a \texttt{mode} equal to \texttt{VK\_BUILD\_ACCELERATION\_STRUCTURE\_MODE\_UPDATE\_KHR}, which is accessed by this command.

The range of memory backing the \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} that is accessed by this command \textbf{must} not overlap the memory backing the \texttt{srcAccelerationStructure} member of any other element of \texttt{pInfos}, which is accessed by this command.

The range of memory backing the \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} that is accessed by this command \textbf{must} not overlap the memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} (including the same element), which is accessed by this command.

The range of memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} that is accessed by this command \textbf{must} not overlap the memory backing the \texttt{scratchData} member of any other element of \texttt{pInfos}, which is accessed by this command.

The range of memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} that is accessed by this command \textbf{must} not overlap the memory backing the \texttt{srcAccelerationStructure} member of any element of \texttt{pInfos} with a \texttt{mode} equal to \texttt{VK\_BUILD\_ACCELERATION\_STRUCTURE\_MODE\_UPDATE\_KHR} (including the same element), which is accessed by this command.

The range of memory backing the \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} that is accessed by this command \textbf{must} not overlap the memory backing any acceleration structure referenced by the \texttt{geometry.instances.data} member of any element of \texttt{pGeometries} or \texttt{ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR} in any other element of \texttt{pInfos}, which is accessed by this command.

For each element of \texttt{pInfos}, if its \texttt{mode} member is \texttt{VK\_BUILD\_ACCELERATION\_STRUCTURE\_MODE\_UPDATE\_KHR}, its \texttt{srcAccelerationStructure} member \textbf{must} have previously been constructed with \texttt{VK\_BUILD\_ACCELERATION\_STRUCTURE\_ALLOW\_UPDATE\_BIT\_KHR} set in \texttt{VkAccelerationStructureBuildGeometryInfoKHR::flags} in the build.

For each element of \texttt{pInfos}, if its \texttt{mode} member is \texttt{VK\_BUILD\_ACCELERATION\_STRUCTURE\_MODE\_UPDATE\_KHR}, its \texttt{srcAccelerationStructure} and \texttt{dstAccelerationStructure} members \textbf{must} either be the same.
**VkAccelerationStructureKHR**, or not have any memory aliasing

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03758**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `geometryCount` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03759**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `flags` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03760**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `type` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03761**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `geometryType` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03762**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `flags` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03763**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.vertexFormat` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03764**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.maxVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03765**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.indexType` member **must** have the same value which was specified
when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03766**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was `NULL` when `srcAccelerationStructure` was last built, then it **must** be `NULL`

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03767**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was not `NULL` when `srcAccelerationStructure` was last built, then it **must not** be `NULL`

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03768**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, then the value of each index referenced **must** be the same as the corresponding index value when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-primitiveCount-03769**
  For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, its `primitiveCount` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-firstVertex-03770**
  For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, if the corresponding geometry uses indices, its `firstVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03801**
  For each element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the corresponding `ppBuildRangeInfos[i][j].primitiveCount` **must be** less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03707**
  For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member **must be** bound to device memory

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03708**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member **must be** bound to device memory

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03709**
For each element of $pInfos$, the buffer used to create each acceleration structure referenced by the $geometry.instances.data$ member of any element of $pGeometries$ or $ppGeometries$ with a $geometryType$ of $VK_GEOMETRY_TYPE_INSTANCES_KHR$ must be bound to device memory

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03671**
  If $pInfos[i].mode$ is $VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR$, all addresses between $pInfos[i].scratchData.deviceAddress$ and $pInfos[i].scratchData.deviceAddress + N - 1$ must be in the buffer device address range of the same buffer, where $N$ is given by the buildScratchSize member of the $VkAccelerationStructureBuildSizesInfoKHR$ structure returned from a call to $vkGetAccelerationStructureBuildSizesKHR$ with an identical $VkAccelerationStructureBuildGeometryInfoKHR$ structure and primitive count

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03672**
  If $pInfos[i].mode$ is $VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR$, all addresses between $pInfos[i].scratchData.deviceAddress$ and $pInfos[i].scratchData.deviceAddress + N - 1$ must be in the buffer device address range of the same buffer, where $N$ is given by the updateScratchSize member of the $VkAccelerationStructureBuildSizesInfoKHR$ structure returned from a call to $vkGetAccelerationStructureBuildSizesKHR$ with an identical $VkAccelerationStructureBuildGeometryInfoKHR$ structure and primitive count

- **VUID-vkCmdBuildAccelerationStructuresKHR-geometry-03673**
  The buffers from which the buffer device addresses for all of the $geometry.triangles.vertexData$, $geometry.triangles.indexData$, $geometry.triangles.transformData$, $geometry.aabbs.data$, and $geometry.instances.data$ members of all $pInfos[i].pGeometries$ and $pInfos[i].ppGeometries$ are queried must have been created with the $VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR$ usage flag

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03674**
  The buffer from which the buffer device address $pInfos[i].scratchData.deviceAddress$ is queried must have been created with $VK_BUFFER_USAGE_STORAGE_BUFFER_BIT$ usage flag

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03802**
  For each element of $pInfos$, its $scratchData.deviceAddress$ member must be a valid device address obtained from $vkGetBufferDeviceAddress$

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03803**
  For each element of $pInfos$, if $scratchData.deviceAddress$ is the address of a non-sparse buffer then it must be bound completely and contiguously to a single $VkDeviceMemory$ object

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03710**
  For each element of $pInfos$, its $scratchData.deviceAddress$ member must be a multiple of $VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment$

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03804**
  For any element of $pInfos[i].pGeometries$ or $pInfos[i].ppGeometries$ with a $geometryType$ of $VK_GEOMETRY_TYPE_TRIANGLES_KHR$, $geometry.triangles.vertexData.deviceAddress$ must be a valid device address obtained from $vkGetBufferDeviceAddress$

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03805**
For any element of \( \text{pInfos}[i].\text{pGeometries} \) or \( \text{pInfos}[i].\text{ppGeometries} \) with a \textit{geometryType} of \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, if \texttt{geometry.triangles.vertexData.deviceAddress} is the address of a non-sparse buffer then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03711}

  For any element of \( \text{pInfos}[i].\text{pGeometries} \) or \( \text{pInfos}[i].\text{ppGeometries} \) with a \textit{geometryType} of \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, \texttt{geometry.triangles.vertexData.deviceAddress} \textbf{must} be aligned to the size in bytes of the smallest component of the format in \textit{vertexFormat}.

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03806}

  For any element of \( \text{pInfos}[i].\text{pGeometries} \) or \( \text{pInfos}[i].\text{ppGeometries} \) with a \textit{geometryType} of \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, if \texttt{geometry.triangles.transformData.deviceAddress} is not \texttt{0}, it \textbf{must} be a valid device address obtained from \texttt{vkGetBufferDeviceAddress}.

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03807}

  For any element of \( \text{pInfos}[i].\text{pGeometries} \) or \( \text{pInfos}[i].\text{ppGeometries} \) with a \textit{geometryType} of \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, and with \texttt{geometry.triangles.transformData.deviceAddress} is not \texttt{0}, it \textbf{must} be aligned to 16 bytes.

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03810}

  For any element of \( \text{pInfos}[i].\text{pGeometries} \) or \( \text{pInfos}[i].\text{ppGeometries} \) with a \textit{geometryType} of \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, \texttt{geometry.aabbs.data.deviceAddress} \textbf{must} be a valid device address obtained from \texttt{vkGetBufferDeviceAddress}.

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03811}

  For any element of \( \text{pInfos}[i].\text{pGeometries} \) or \( \text{pInfos}[i].\text{ppGeometries} \) with a \textit{geometryType} of \texttt{VK_GEOMETRY_TYPE_AABBS_KHR}, \texttt{geometry.aabbs.data.deviceAddress} \textbf{must} be a valid device address obtained from \texttt{vkGetBufferDeviceAddress}.

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03812}

  For any element of \( \text{pInfos}[i].\text{pGeometries} \) or \( \text{pInfos}[i].\text{ppGeometries} \) with a \textit{geometryType} of \texttt{VK_GEOMETRY_TYPE_AABBS_KHR}, if \texttt{geometry.aabbs.data.deviceAddress} is the address of a non-sparse buffer then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03812}

  For any element of \( \text{pInfos}[i].\text{pGeometries} \) or \( \text{pInfos}[i].\text{ppGeometries} \) with a \textit{geometryType} of \texttt{VK_GEOMETRY_TYPE_AABBS_KHR}, if \texttt{geometry.aabbs.data.deviceAddress} is the address of a non-sparse buffer then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.
sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03714**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.deviceAddress` **must** be aligned to 8 bytes

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03715**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_FALSE`, `geometry.instances.data.deviceAddress` **must** be aligned to 16 bytes

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03716**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_TRUE`, each element of `geometry.instances.data.deviceAddress` in device memory **must** be aligned to 16 bytes

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03813**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, `geometry.instances.data.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03814**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.instances.data.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03815**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `geometry.instances.data.deviceAddress` **must** be a valid device address containing a value obtained from `vkGetAccelerationStructureDeviceAddressKHR`

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03675**
  For each `pInfos[i]`, `dstAccelerationStructure` **must** have been created with a value of `VkAccelerationStructureCreateInfoKHR::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetAccelerationStructureBuildSizesKHR` with `pBuildInfo = pInfos[i]` and with each element of the `pMaxPrimitiveCounts` array greater than or equal to the equivalent `ppBuildRangeInfos[i][j].primitiveCount` values for `j` in `[0, pInfos[i].geometryCount]`

- **VUID-vkCmdBuildAccelerationStructuresKHR-ppBuildRangeInfos-03676**
  Each element of `ppBuildRangeInfos[i]` **must** be a valid pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures
Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-parameter
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-parameter
  \texttt{pInfos} must be a valid pointer to an array of \texttt{infoCount} valid \texttt{VkAccelerationStructureBuildGeometryInfoKHR} structures

- VUID-vkCmdBuildAccelerationStructuresKHR-ppBuildRangeInfos-parameter
  \texttt{ppBuildRangeInfos} must be a valid pointer to an array of \texttt{infoCount} \texttt{VkAccelerationStructureBuildRangeInfoKHR} structures

- VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-recording
  \texttt{commandBuffer} must be in the \texttt{recording} state

- VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support compute operations

- VUID-vkCmdBuildAccelerationStructuresKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBuildAccelerationStructuresKHR-infoCount-arraylength
  \texttt{infoCount} must be greater than 0

Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized

Command Properties

<table>
<thead>

To build acceleration structures with some parameters sourced on the device call:
void vkCmdBuildAccelerationStructuresIndirectKHR(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkDeviceAddress* pIndirectDeviceAddresses,
    const uint32_t* pIndirectStrides,
    const uint32_t* const* ppMaxPrimitiveCounts);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of acceleration structures to build.
- `pInfos` is a pointer to an array of `infoCount` `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- `pIndirectDeviceAddresses` is a pointer to an array of `infoCount` buffer device addresses which point to `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i]`.
- `pIndirectStrides` is a pointer to an array of `infoCount` byte strides between elements of `pIndirectDeviceAddresses`.
- `ppMaxPrimitiveCounts` is a pointer to an array of `infoCount` pointers to arrays of `pInfos[i].geometryCount` values indicating the maximum number of primitives that will be built by this command for each geometry.

Accesses to acceleration structures, scratch buffers, vertex buffers, index buffers, and instance buffers must be synchronized as with `vkCmdBuildAccelerationStructuresKHR`.

Accesses to any element of `pIndirectDeviceAddresses` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_INDIRECT_COMMAND_READ_BIT`.

Chapter 36. Acceleration Structures | 1923
Valid Usage

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-mode-04628**
  The `mode` member of each element of `pInfos` must be a valid `VkBuildAccelerationStructureModeKHR` value.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-srcAccelerationStructure-04629**
  If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-04630**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must not be `VK_NULL_HANDLE`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03403**
  The `srcAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03698**
  The `dstAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03800**
  The `dstAccelerationStructure` member of any element of `pInfos` must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03699**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03700**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03663**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, inactive primitives in its `srcAccelerationStructure` member must not be made active.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03664**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, active primitives in its `srcAccelerationStructure` member must not be made inactive.
The `dstAccelerationStructure` member of any element of `pInfos` must not be referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `srcAccelerationStructure` member of any other element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, which is accessed by this command.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`, which is accessed by this command.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must have previously been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` in the build.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` and `dstAccelerationStructure` members must either be the same.
VkAccelerationStructureKHR, or not have any memory aliasing

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03758
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its geometryCount member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03759
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its flags member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03760
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its type member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03761
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its geometryType member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03762
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its flags member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03763
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.vertexFormat member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03764
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.maxVertex member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03765
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.indexType member must have the same value which was specified...
when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03766
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
  VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
  ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its
  geometry.triangles.transformData address was NULL when srcAccelerationStructure was
  last built, then it must be NULL

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03767
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
  VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
  ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its
  geometry.triangles.transformData address was not NULL when srcAccelerationStructure was
  last built, then it must not be NULL

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03768
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
  VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
  ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, and
  geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, then the value of each index
  referenced must be the same as the corresponding index value when
  srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-primitiveCount-03769
  For each VkAccelerationStructureBuildRangeInfoKHR referenced by this command, its
  primitiveCount member must have the same value which was specified when
  srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-firstVertex-03770
  For each VkAccelerationStructureBuildRangeInfoKHR referenced by this command, if the
  corresponding geometry uses indices, its firstVertex member must have the same value
  which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03801
  For each element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of
  VK_GEOMETRY_TYPE_INSTANCES_KHR, the corresponding ppMaxPrimitiveCounts[i][j] must be less
  than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03707
  For each element of pInfos, the buffer used to create its dstAccelerationStructure member
  must be bound to device memory

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03708
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR the buffer used to create its
  srcAccelerationStructure member must be bound to device memory

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03709
  For each element of pInfos, the buffer used to create each acceleration structure
referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` must be bound to device memory.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03671**
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where `N` is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03672**
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-geometry-03673**
  The buffers from which the buffer device addresses for all of the `geometry.triangles.vertexData`, `geometry.triangles.indexData`, `geometry.triangles.transformData`, `geometry.aabbs.data`, and `geometry.instances.data` members of all `pInfos[i].pGeometries` and `pInfos[i].ppGeometries` are queried must have been created with the `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` usage flag.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03674**
  The buffer from which the buffer device address `pInfos[i].scratchData.deviceAddress` is queried must have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03802**
  For each element of `pInfos`, its `scratchData.deviceAddress` member must be a valid device address obtained from `vkGetBufferDeviceAddress`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03803**
  For each element of `pInfos`, if `scratchData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03710**
  For each element of `pInfos`, its `scratchData.deviceAddress` member must be a multiple of `VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03804**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.deviceAddress` must be a valid device address obtained from `vkGetBufferDeviceAddress`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03805**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of
VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.vertexData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03711
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress must be aligned to the size in bytes of the smallest component of the format in vertexFormat

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03806
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03807
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, if geometry.triangles.indexData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03712
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, and with geometry.triangles.indexType not equal to VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress must be aligned to the size in bytes of the type in indexType

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03808
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is not 0, it must be a valid device address obtained from vkGetBufferDeviceAddress

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03809
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03810
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is not 0, it must be aligned to 16 bytes

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03811
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03812
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, if geometry.aabbs.data.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.deviceAddress` must be aligned to 8 bytes.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_FALSE`, `geometry.instances.data.deviceAddress` must be aligned to 16 bytes.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_TRUE`, each element of `geometry.instances.data.deviceAddress` in device memory must be aligned to 16 bytes.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.instances.data.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

For any element of `pIndirectDeviceAddresses`, if the buffer from which it was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

For any element of `pIndirectDeviceAddresses[i]`, all device addresses between `pIndirectDeviceAddresses[i]` and `pIndirectDeviceAddresses[i] + (pInfos[i].geometryCount * pIndirectStrides[i]) - 1` must be in the buffer device address range of the same buffer.

For any element of `pIndirectDeviceAddresses`, the buffer from which it was queried must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.
Each element of \texttt{pIndirectDeviceAddresses} must be a multiple of 4

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-03787
  Each element of \texttt{pIndirectStrides} must be a multiple of 4

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-03649
  \texttt{commandBuffer} must not be a protected command buffer

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-accelerationStructureIndirectBuild-03650
  The \texttt{VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureIndirectBuild} feature must be enabled

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03651
  Each \texttt{VkAccelerationStructureBuildRangeInfoKHR} structure referenced by any element of \texttt{pIndirectDeviceAddresses} must be a valid \texttt{VkAccelerationStructureBuildRangeInfoKHR} structure

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03652
  \texttt{pInfos[i].dstAccelerationStructure} must have been created with a value of \texttt{VkAccelerationStructureCreateInfoKHR::size} greater than or equal to the memory size required by the build operation, as returned by \texttt{vkGetAccelerationStructureBuildSizesKHR} with \texttt{pBuildInfo = pInfos[i]} and \texttt{pMaxPrimitiveCounts = ppMaxPrimitiveCounts[i]}

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-03653
  Each \texttt{ppMaxPrimitiveCounts[i][j]} must be greater than or equal to the the \texttt{primitiveCount} value specified by the \texttt{VkAccelerationStructureBuildRangeInfoKHR} structure located at \texttt{pIndirectDeviceAddresses[i] + (j \times pIndirectStrides[i])}
Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-parameter
  pInfos must be a valid pointer to an array of infoCount valid
  VkAccelerationStructureBuildGeometryInfoKHR structures

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-parameter
  pIndirectDeviceAddresses must be a valid pointer to an array of infoCount VkDeviceAddress values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-parameter
  pIndirectStrides must be a valid pointer to an array of infoCount uint32_t values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-parameter
  ppMaxPrimitiveCounts must be a valid pointer to an array of infoCount uint32_t values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-infoCount-arraylength
  infoCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The VkAccelerationStructureBuildGeometryInfoKHR structure is defined as:
// Provided by VK_KHR_acceleration_structure

typedef struct VkAccelerationStructureBuildGeometryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureTypeKHR type;
    VkBuildAccelerationStructureFlagsKHR flags;
    VkBuildAccelerationStructureModeKHR mode;
    VkAccelerationStructureKHR srcAccelerationStructure;
    VkAccelerationStructureKHR dstAccelerationStructure;
    uint32_t geometryCount;
    const VkAccelerationStructureGeometryKHR* pGeometries;
    const VkAccelerationStructureGeometryKHR* const* ppGeometries;
    VkDeviceOrHostAddressKHR scratchData;
} VkAccelerationStructureBuildGeometryInfoKHR;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **type** is a VkAccelerationStructureTypeKHR value specifying the type of acceleration structure being built.
• **flags** is a bitmask of VkBuildAccelerationStructureFlagBitsKHR specifying additional parameters of the acceleration structure.
• **mode** is a VkBuildAccelerationStructureModeKHR value specifying the type of operation to perform.
• **srcAccelerationStructure** is a pointer to an existing acceleration structure that is to be used to update the dst acceleration structure when **mode** is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR.
• **dstAccelerationStructure** is a pointer to the target acceleration structure for the build.
• **geometryCount** specifies the number of geometries that will be built into dstAccelerationStructure.
• **pGeometries** is a pointer to an array of VkAccelerationStructureGeometryKHR structures.
• **ppGeometries** is a pointer to an array of pointers to VkAccelerationStructureGeometryKHR structures.
• **scratchData** is the device or host address to memory that will be used as scratch memory for the build.

Only one of **pGeometries** or **ppGeometries** can be a valid pointer, the other must be NULL. Each element of the non-NULL array describes the data used to build each acceleration structure geometry.

The index of each element of the **pGeometries** or **ppGeometries** members of VkAccelerationStructureBuildGeometryInfoKHR is used as the geometry index during ray traversal. The geometry index is available in ray shaders via the RayGeometryIndexKHR built-in, and is used to determine hit and intersection shaders executed during traversal. The geometry index is available to ray queries via the OpRayQueryGetIntersectionGeometryIndexKHR instruction.
Setting `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in `flags` indicates that this build is a motion top level acceleration structure. A motion top level uses instances of `VkAccelerationStructureMotionInstanceNV` if `VkAccelerationStructureGeometryInstancesDataKHR::arrayOfPointers` is `VK_FALSE`.

If `VkAccelerationStructureGeometryInstancesDataKHR::arrayOfPointers` is `VK_TRUE`, the pointer for any given element of the array of instance pointers consists of 4 bits of `VkAccelerationStructureMotionInstanceTypeNV` in the low 4 bits of the pointer identifying the type of structure at the pointer. The device address accessed is the value in the array with the low 4 bits set to zero. The structure at the pointer is one of `VkAccelerationStructureInstanceKHR`, `VkAccelerationStructureMatrixMotionInstanceNV` or `VkAccelerationStructureSRTMotionInstanceNV`, depending on the type value encoded in the low 4 bits.

A top level acceleration structure with either motion instances or vertex motion in its instances must set `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in `flags`. 
Valid Usage

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03654
  type must not be VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-03788
  Only one of pGeometries or ppGeometries can be a valid pointer, the other must be NULL

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03789
  If type is VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, the geometryType member of elements of either pGeometries or ppGeometries must be VK_GEOMETRY_TYPE_INSTANCES_KHR

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03790
  If type is VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, geometryCount must be 1

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03791
  If type is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR the geometryType member of elements of either pGeometries or ppGeometries must not be VK_GEOMETRY_TYPE_INSTANCES_KHR

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03792
  If type is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR then the geometryType member of each geometry in either pGeometries or ppGeometries must be the same

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03793
  If type is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR then geometryCount must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxGeometryCount

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03794
  If type is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR and the geometryType member of either pGeometries or ppGeometries is VK_GEOMETRY_TYPE_AABBS_KHR, the total number of AABBs in all geometries must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03795
  If type is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR and the geometryType member of either pGeometries or ppGeometries is VK_GEOMETRY_TYPE_TRIANGLES_KHR, the total number of triangles in all geometries must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-03796
  If flags has the VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR bit set, then it must not have the VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR bit set

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-dstAccelerationStructure-04927
  If dstAccelerationStructure was created with VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV, VkAccelerationStructureCreateInfoKHR::flags, VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV must be set in flags

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-04928
  If VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV is set in flags, dstAccelerationStructure must have been created with VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV set in
**VkAccelerationStructureCreateInfoKHR::flags**

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-04929
  
  If `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` is set in `flags`, `type` must not be `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

**Valid Usage (Implicit)**

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_GEOMETRY_INFO_KHR`.

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-pNext-pNext
  
  `pNext` must be `NULL`.

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-parameter
  
  `type` must be a valid `VkAccelerationStructureTypeKHR` value.

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-parameter
  
  `flags` must be a valid combination of `VkBuildAccelerationStructureFlagBitsKHR` values.

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-parameter
  
  If `geometryCount` is not `0`, and `pGeometries` is not `NULL`, `pGeometries` must be a valid pointer to an array of `geometryCount` valid `VkAccelerationStructureGeometryKHR` structures.

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-ppGeometries-parameter
  
  If `geometryCount` is not `0`, and `ppGeometries` is not `NULL`, `ppGeometries` must be a valid pointer to an array of `geometryCount` valid pointers to valid `VkAccelerationStructureGeometryKHR` structures.

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-commonparent
  
  Both of `dstAccelerationStructure`, and `srcAccelerationStructure` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

The `VkBuildAccelerationStructureModeKHR` enumeration is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureModeKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR = 0,
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR = 1,
} VkBuildAccelerationStructureModeKHR;
```

- `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR` specifies that the destination acceleration structure will be built using the specified geometries.

- `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` specifies that the destination acceleration structure will be built using data in a source acceleration structure, updated by the specified geometries.

The `VkDeviceOrHostAddressKHR` union is defined as:
typedef union VkDeviceOrHostAddressKHR {
    VkDeviceAddress deviceAddress;
    void* hostAddress;
} VkDeviceOrHostAddressKHR;

- **deviceAddress** is a buffer device address as returned by the `vkGetBufferDeviceAddressKHR` command.
- **hostAddress** is a host memory address.

The `VkDeviceOrHostAddressConstKHR` union is defined as:

typedef union VkDeviceOrHostAddressConstKHR {
    VkDeviceAddress deviceAddress;
    const void* hostAddress;
} VkDeviceOrHostAddressConstKHR;

- **deviceAddress** is a buffer device address as returned by the `vkGetBufferDeviceAddressKHR` command.
- **hostAddress** is a const host memory address.

The `VkAccelerationStructureGeometryKHR` structure is defined as:

typedef struct VkAccelerationStructureGeometryKHR {
    VkStructureType sType;
    const void* pNext;
    VkGeometryTypeKHR geometryType;
    VkAccelerationStructureGeometryDataKHR geometry;
    VkGeometryFlagsKHR flags;
} VkAccelerationStructureGeometryKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **geometryType** describes which type of geometry this `VkAccelerationStructureGeometryKHR` refers to.
- **geometry** is a `VkAccelerationStructureGeometryDataKHR` union describing the geometry data for the relevant geometry type.
- **flags** is a bitmask of `VkGeometryFlagBitsKHR` values describing additional properties of how the geometry should be built.
Valid Usage (Implicit)

- **VUID-VkAccelerationStructureGeometryKHR-sType-sType**
  
  *sType* must be **VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_KHR**

- **VUID-VkAccelerationStructureGeometryKHR-pNext-pNext**
  
  *pNext* must be **NULL**

- **VUID-VkAccelerationStructureGeometryKHR-geometryType-parameter**
  
  *geometryType* must be a valid **VkGeometryTypeKHR** value

- **VUID-VkAccelerationStructureGeometryKHR-triangles-parameter**
  
  If *geometryType* is **VK_GEOMETRY_TYPE_TRIANGLES_KHR**, the *triangles* member of *geometry* must be a valid **VkAccelerationStructureGeometryTrianglesDataKHR** structure

- **VUID-VkAccelerationStructureGeometryKHR-aabbs-parameter**
  
  If *geometryType* is **VK_GEOMETRY_TYPE_AABBS_KHR**, the *aabbs* member of *geometry* must be a valid **VkAccelerationStructureGeometryAabbsDataKHR** structure

- **VUID-VkAccelerationStructureGeometryKHR-instances-parameter**
  
  If *geometryType* is **VK_GEOMETRY_TYPE_INSTANCES_KHR**, the *instances* member of *geometry* must be a valid **VkAccelerationStructureGeometryInstancesDataKHR** structure

- **VUID-VkAccelerationStructureGeometryKHR-flags-parameter**
  
  *flags* must be a valid combination of **VkGeometryFlagBitsKHR** values

The **VkAccelerationStructureGeometryDataKHR** union is defined as:

```c
 // Provided by VK_KHR_acceleration_structure
typedef union VkAccelerationStructureGeometryDataKHR {
    VkAccelerationStructureGeometryTrianglesDataKHR triangles;
    VkAccelerationStructureGeometryAabbsDataKHR aabbs;
    VkAccelerationStructureGeometryInstancesDataKHR instances;
} VkAccelerationStructureGeometryDataKHR;
```

- *triangles* is a **VkAccelerationStructureGeometryTrianglesDataKHR** structure.
- *aabbs* is a **VkAccelerationStructureGeometryAabbsDataKHR** structure.
- *instances* is a **VkAccelerationStructureGeometryInstancesDataKHR** structure.

The **VkAccelerationStructureGeometryTrianglesDataKHR** structure is defined as:
// Provided by VK_KHR_acceleration_structure

typedef struct VkAccelerationStructureGeometryTrianglesDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkFormat vertexFormat;
    VkDeviceOrHostAddressConstKHR vertexData;
    VkDeviceSize vertexStride;
    uint32_t maxVertex;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexData;
    VkDeviceOrHostAddressConstKHR transformData;
} VkAccelerationStructureGeometryTrianglesDataKHR;

• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **vertexFormat** is the **VkFormat** of each vertex element.

• **vertexData** is a device or host address to memory containing vertex data for this geometry.

• **maxVertex** is the highest index of a vertex that will be addressed by a build command using this structure.

• **vertexStride** is the stride in bytes between each vertex.

• **indexType** is the **VkIndexType** of each index element.

• **indexData** is a device or host address to memory containing index data for this geometry.

• **transformData** is a device or host address to memory containing an optional reference to a **VkTransformMatrixKHR** structure defining a transformation that should be applied to vertices in this geometry.

---

**Note**

Unlike the stride for vertex buffers in **VkVertexInputBindingDescription** for graphics pipelines which must not exceed **maxVertexInputBindingStride**, **vertexStride** for acceleration structure geometry is instead restricted to being a 32-bit value.
Valid Usage

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03735
  vertexStride must be a multiple of the size in bytes of the smallest component of vertexFormat

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03819
  vertexStride must be less than or equal to $2^{32} - 1$

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-03797
  vertexFormat must support the VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR in VkFormatProperties
  ::bufferFeatures as returned by vkGetPhysicalDeviceFormatProperties2

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-03798
  indexType must be VK_INDEX_TYPE_UINT16, VK_INDEX_TYPE_UINT32, or VK_INDEX_TYPE_NONE_KHR

Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_TRIANGLES_DATA_KHR

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkAccelerationStructureGeometryMotionTrianglesDataNV

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-parameter
  vertexFormat must be a valid VkFormat value

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-parameter
  indexType must be a valid VkIndexType value

The VkAccelerationStructureGeometryMotionTrianglesDataNV structure is defined as:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureGeometryMotionTrianglesDataNV {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR vertexData;
} VkAccelerationStructureGeometryMotionTrianglesDataNV;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- vertexData is a pointer to vertex data for this geometry at time 1.0

If VkAccelerationStructureGeometryMotionTrianglesDataNV is included in the pNext chain of a
The **VkAccelerationStructureGeometryTrianglesDataKHR** structure, the basic vertex positions are used for the position of the triangles in the geometry at time 0.0 and the **vertexData** in **VkAccelerationStructureGeometryMotionTrianglesDataNV** is used for the vertex positions at time 1.0, with positions linearly interpolated at intermediate times.

Indexing for **VkAccelerationStructureGeometryMotionTrianglesDataNV** **vertexData** is equivalent to the basic vertex position data.

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureGeometryMotionTrianglesDataNV-sType-sType**

  ```
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_MOTION_TRIANGLES_DATA_NV
  ```

The **VkTransformMatrixKHR** structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkTransformMatrixKHR {
  float matrix[3][4];
} VkTransformMatrixKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkTransformMatrixKHR VkTransformMatrixNV;
```

- **matrix** is a 3x4 row-major affine transformation matrix.

### Valid Usage

- **VUID-VkTransformMatrixKHR-matrix-03799**

  The first three columns of **matrix** must define an invertible 3x3 matrix.

The **VkAccelerationStructureGeometryAabbsDataKHR** structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryAabbsDataKHR {
  VkStructureType sType;
  const void* pNext;
  VkDeviceOrHostAddressConstKHR data;
  VkDeviceSize stride;
} VkAccelerationStructureGeometryAabbsDataKHR;
```

- **sType** is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `data` is a device or host address to memory containing `VkAabbPositionsKHR` structures containing position data for each axis-aligned bounding box in the geometry.
• `stride` is the stride in bytes between each entry in `data`. The stride must be a multiple of 8.

### Valid Usage

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03545
  
  **`stride` must be a multiple of 8**

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03820
  
  **`stride` must be less than or equal to $2^{32}$-1**

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-sType-sType
  
  **`sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_AABBS_DATA_KHR`**

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-pNext-pNext
  
  **`pNext` must be `NULL`**

The `VkAabbPositionsKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAabbPositionsKHR {
    float minX;
    float minY;
    float minZ;
    float maxX;
    float maxY;
    float maxZ;
} VkAabbPositionsKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkAabbPositionsKHR VkAabbPositionsNV;
```

- `minX` is the x position of one opposing corner of a bounding box.
- `minY` is the y position of one opposing corner of a bounding box.
- `minZ` is the z position of one opposing corner of a bounding box.
- `maxX` is the x position of the other opposing corner of a bounding box.
- `maxY` is the y position of the other opposing corner of a bounding box.
maxZ is the z position of the other opposing corner of a bounding box.

### Valid Usage

- **VUID-VkAabbPositionsKHR-minX-03546**
  
  **minX must be less than or equal to maxX**

- **VUID-VkAabbPositionsKHR-minY-03547**
  
  **minY must be less than or equal to maxY**

- **VUID-VkAabbPositionsKHR-minZ-03548**
  
  **minZ must be less than or equal to maxZ**

The `VkAccelerationStructureGeometryInstancesDataKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryInstancesDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 arrayOfPointers;
    VkDeviceOrHostAddressConstKHR data;
} VkAccelerationStructureGeometryInstancesDataKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **arrayOfPointers** specifies whether **data** is used as an array of addresses or just an array.
- **data** is either the address of an array of device or host addresses referencing individual `VkAccelerationStructureInstanceKHR` structures or packed motion instance information as described in *motion instances* if **arrayOfPointers** is **VK_TRUE**, or the address of an array of `VkAccelerationStructureInstanceKHR` or `VkAccelerationStructureMotionInstanceNV` structures. Addresses and `VkAccelerationStructureInstanceKHR` structures are tightly packed. `VkAccelerationStructureMotionInstanceNV` have a stride of 160 bytes.

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureGeometryInstancesDataKHR-sType-sType**
  
  **sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_INSTANCES_DATA_KHR**

- **VUID-VkAccelerationStructureGeometryInstancesDataKHR-pNext-pNext**
  
  **pNext must be NULL**

**Acceleration structure instances** can be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location. Multiple instances can point to the same bottom level acceleration structure.
An acceleration structure instance is defined by the structure:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureInstanceKHR {
    VkTransformMatrixKHR transform;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureInstanceKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkAccelerationStructureInstanceKHR VkAccelerationStructureInstanceNV;
```

- `transform` is a `VkTransformMatrixKHR` structure describing a transformation to be applied to the acceleration structure.
- `instanceCustomIndex` is a 24-bit user-specified index value accessible to ray shaders in the `InstanceCustomIndexKHR` built-in.
- `mask` is an 8-bit visibility mask for the geometry. The instance may only be hit if `rayMask & instance.mask != 0`
- `instanceShaderBindingTableRecordOffset` is a 24-bit offset used in calculating the hit shader binding table index.
- `flags` is an 8-bit mask of `VkGeometryInstanceFlagBitsKHR` values to apply to this instance.
- `accelerationStructureReference` is either:
  - a device address containing the value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or `vkGetAccelerationStructureHandleNV` (used by device operations which reference acceleration structures) or,
  - a `VkAccelerationStructureKHR` object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- `instanceCustomIndex` and `mask` occupy the same memory as if a single `uint32_t` was specified in their place
  - `instanceCustomIndex` occupies the 24 least significant bits of that memory
  - `mask` occupies the 8 most significant bits of that memory
- `instanceShaderBindingTableRecordOffset` and `flags` occupy the same memory as if a single `uint32_t` was specified in their place
  - `instanceShaderBindingTableRecordOffset` occupies the 24 least significant bits of that memory
flags occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications must employ another method to set values according to the correct bit pattern.

Valid Usage (Implicit)

• VUID-VkAccelerationStructureInstanceKHR-flags-parameter
flags must be a valid combination of VkGeometryInstanceFlagBitsKHR values

Possible values of flags in the instance modifying the behavior of that instance are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryInstanceFlagBitsKHR {
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR = 0x00000002,
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR = 0x00000004,
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR = 0x00000008,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR =
    VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_TRIANGLE_CULL_DISABLE_BIT_NV =
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_NV =
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_NV =
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_NV =
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR,
} VkGeometryInstanceFlagBitsKHR;
```
or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkGeometryInstanceFlagBitsKHR VkGeometryInstanceFlagBitsNV;
```

• VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR disables face culling for this instance.

• VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR indicates that the facing determination for geometry in this instance is inverted. Because the facing is determined in object space, an instance transform does not change the winding, but a geometry transform does.

• VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR causes this instance to act as though VK_GEOMETRY_OPAQUE_BIT_KHR were specified on all geometries referenced by this instance. This
behavior can be overridden by the SPIR-V NoOpaqueKHR ray flag.

- `VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR` causes this instance to act as though `VK_GEOMETRY_OPAQUE_BIT_KHR` were not specified on all geometries referenced by this instance. This behavior can be overridden by the SPIR-V OpaqueKHR ray flag.

`VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR` and `VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR` must not be used in the same flag.

```c
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkGeometryInstanceFlagsKHR;
```
or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkGeometryInstanceFlagsKHR VkGeometryInstanceFlagsNV;
```

`VkGeometryInstanceFlagsKHR` is a bitmask type for setting a mask of zero or more `VkGeometryInstanceFlagBitsKHR`.

**Acceleration structure motion instances** can be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location including a type of motion and parameters to determine the motion of the instance over time.

An acceleration structure motion instance is defined by the structure:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureMotionInstanceNV {
    VkAccelerationStructureMotionInstanceTypeNV type;
    VkAccelerationStructureMotionInstanceFlagsNV flags;
    VkAccelerationStructureMotionInstanceDataNV data;
} VkAccelerationStructureMotionInstanceNV;
```

- `type` is a `VkAccelerationStructureMotionInstanceTypeNV` enumerant identifying which type of motion instance this is and which type of the union is valid.
- `flags` is currently unused, but is required to keep natural alignment of `data`.
- `data` is a `VkAccelerationStructureMotionInstanceDataNV` containing motion instance data for this instance.

**Note**

If writing this other than with a standard C compiler, note that the final structure should be 152 bytes in size.
Valid Usage (Implicit)

- VUID-VkAccelerationStructureMotionInstanceNV-type-parameter
  type must be a valid VkAccelerationStructureMotionInstanceTypeNV value

- VUID-VkAccelerationStructureMotionInstanceNV-flags-zerobitmask
  flags must be 0

- VUID-VkAccelerationStructureMotionInstanceNV-staticInstance-parameter
  If type is VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV, the staticInstance member of data must be a valid VkAccelerationStructureInstanceKHR structure

- VUID-VkAccelerationStructureMotionInstanceNV-matrixMotionInstance-parameter
  If type is VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV, the matrixMotionInstance member of data must be a valid VkAccelerationStructureMatrixMotionInstanceNV structure

- VUID-VkAccelerationStructureMotionInstanceNV-srtMotionInstance-parameter
  If type is VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV, the srtMotionInstance member of data must be a valid VkAccelerationStructureSRTMotionInstanceNV structure

Acceleration structure motion instance is defined by the union:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef union VkAccelerationStructureMotionInstanceDataNV {
    VkAccelerationStructureInstanceKHR staticInstance;
    VkAccelerationStructureMatrixMotionInstanceNV matrixMotionInstance;
    VkAccelerationStructureSRTMotionInstanceNV srtMotionInstance;
} VkAccelerationStructureMotionInstanceDataNV;
```

- staticInstance is a VkAccelerationStructureInstanceKHR structure containing data for a static instance.
- matrixMotionInstance is a VkAccelerationStructureMatrixMotionInstanceNV structure containing data for a matrix motion instance.
- srtMotionInstance is a VkAccelerationStructureSRTMotionInstanceNV structure containing data for an SRT motion instance.

The VkAccelerationStructureMotionInstanceTypeNV enumeration is defined as:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef enum VkAccelerationStructureMotionInstanceTypeNV {
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV = 0,
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV = 1,
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV = 2,
} VkAccelerationStructureMotionInstanceTypeNV;
```
• `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV` specifies that the instance is a static instance with no instance motion.

• `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV` specifies that the instance is a motion instance with motion specified by interpolation between two matrices.

• `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV` specifies that the instance is a motion instance with motion specified by interpolation in the SRT decomposition.

An acceleration structure matrix motion instance is defined by the structure:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureMatrixMotionInstanceNV {
    VkTransformMatrixKHR transformT0;
    VkTransformMatrixKHR transformT1;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureMatrixMotionInstanceNV;
```

• `transformT0` is a `VkTransformMatrixKHR` structure describing a transformation to be applied to the acceleration structure at time 0.

• `transformT1` is a `VkTransformMatrixKHR` structure describing a transformation to be applied to the acceleration structure at time 1.

• `instanceCustomIndex` is a 24-bit user-specified index value accessible to ray shaders in the `InstanceCustomIndexKHR` built-in.

• `mask` is an 8-bit visibility mask for the geometry. The instance may only be hit if `rayMask & instance.mask` != 0.

• `instanceShaderBindingTableRecordOffset` is a 24-bit offset used in calculating the hit shader binding table index.

• `flags` is an 8-bit mask of `VkGeometryInstanceFlagBitsKHR` values to apply to this instance.

• `accelerationStructureReference` is either:
  - a device address containing the value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or `vkGetAccelerationStructureHandleNV` (used by device operations which reference acceleration structures) or,
  - a `VkAccelerationStructureKHR` object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

• `instanceCustomIndex` and `mask` occupy the same memory as if a single `uint32_t` was specified in their place
  - `instanceCustomIndex` occupies the 24 least significant bits of that memory
mask occupies the 8 most significant bits of that memory

- instanceShaderBindingTableRecordOffset and flags occupy the same memory as if a single uint32_t was specified in their place
- instanceShaderBindingTableRecordOffset occupies the 24 least significant bits of that memory
- flags occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications must employ another method to set values according to the correct bit pattern.

The transform for a matrix motion instance at a point in time is derived by component-wise linear interpolation of the two transforms. That is, for a time in [0,1] the resulting transform is

\[ \text{transformT0} \times (1 - \text{time}) + \text{transformT1} \times \text{time} \]

**Valid Usage (Implicit)**

- VUID-VkAccelerationStructureMatrixMotionInstanceNV-flags-parameter
  - flags must be a valid combination of VkGeometryInstanceFlagBitsKHR values

An acceleration structure SRT motion instance is defined by the structure:

```c
typedef struct VkAccelerationStructureSRTMotionInstanceNV {
  VkSRTDataNV transformT0;
  VkSRTDataNV transformT1;
  uint32_t instanceCustomIndex:24;
  uint32_t mask:8;
  uint32_t instanceShaderBindingTableRecordOffset:24;
  VkGeometryInstanceFlagsKHR flags:8;
  uint64_t accelerationStructureReference;
} VkAccelerationStructureSRTMotionInstanceNV;
```

- transformT0 is a VkSRTDataNV structure describing a transformation to be applied to the acceleration structure at time 0.
- transformT1 is a VkSRTDataNV structure describing a transformation to be applied to the acceleration structure at time 1.
- instanceCustomIndex is a 24-bit user-specified index value accessible to ray shaders in the InstanceCustomIndexKHR built-in.
- mask is an 8-bit visibility mask for the geometry. The instance may only be hit if rayMask & instance.mask != 0
- instanceShaderBindingTableRecordOffset is a 24-bit offset used in calculating the hit shader binding table index.
- flags is an 8-bit mask of VkGeometryInstanceFlagBitsKHR values to apply to this instance.
• **accelerationStructureReference** is either:
  ◦ a device address containing the value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or `vkGetAccelerationStructureHandleNV` (used by device operations which reference acceleration structures) or,
  ◦ a `VkAccelerationStructureKHR` object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

• `instanceCustomIndex` and `mask` occupy the same memory as if a single `uint32_t` was specified in their place
  ◦ `instanceCustomIndex` occupies the 24 least significant bits of that memory
  ◦ `mask` occupies the 8 most significant bits of that memory

• `instanceShaderBindingTableRecordOffset` and `flags` occupy the same memory as if a single `uint32_t` was specified in their place
  ◦ `instanceShaderBindingTableRecordOffset` occupies the 24 least significant bits of that memory
  ◦ `flags` occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values according to the correct bit pattern.

The transform for a SRT motion instance at a point in time is derived from component-wise linear interpolation of the two SRT transforms. That is, for a time in [0,1] the resulting transform is

\[
\text{transformT0} \times (1 - \text{time}) + \text{transformT1} \times \text{time}
\]

### Valid Usage (Implicit)

• **VUID-VkAccelerationStructureSRTMotionInstanceNV-flags-parameter**
  
  `flags` **must** be a valid combination of `VkGeometryInstanceFlagBitsKHR` values

An acceleration structure SRT transform is defined by the structure:
typedef struct VkSRTDataNV {
    float sx;
    float a;
    float b;
    float pvx;
    float sy;
    float c;
    float pvy;
    float sz;
    float pvz;
    float qx;
    float qy;
    float qz;
    float qw;
    float tx;
    float ty;
    float tz;
} VkSRTDataNV;

- sx is the x component of the scale of the transform
- a is one component of the shear for the transform
- b is one component of the shear for the transform
- pvx is the x component of the pivot point of the transform
- sy is the y component of the scale of the transform
- c is one component of the shear for the transform
- pvy is the y component of the pivot point of the transform
- sz is the z component of the scale of the transform
- pvz is the z component of the pivot point of the transform
- qx is the x component of the rotation quaternion
- qy is the y component of the rotation quaternion
- qz is the z component of the rotation quaternion
- qw is the w component of the rotation quaternion
- tx is the x component of the post-rotation translation
- ty is the y component of the post-rotation translation
- tz is the z component of the post-rotation translation

This transform decomposition consists of three elements. The first is a matrix S, consisting of a scale, shear, and translation, usually used to define the pivot point of the following rotation. This matrix is constructed from the parameters above by:
The rotation quaternion is defined as:

\[ R = [qx, qy, qz, qw] \]

This is a rotation around a conceptual normalized axis \([ ax, ay, az ]\) of amount \(\theta\) such that:

\[ [qx, qy, qz] = \sin(\theta/2) \times [ax, ay, az] \]

and

\[ qw = \cos(\theta/2) \]

Finally, the transform has a translation \(T\) constructed from the parameters above by:

\[
T = \begin{pmatrix}
1 & 0 & 0 & tx \\
0 & 1 & 0 & ty \\
0 & 0 & 1 & tz \\
\end{pmatrix}
\]

The effective derived transform is then given by

\[ T \times R \times S \]

\(Vk\)AccelerationStructureBuildRangeInfoKHR is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildRangeInfoKHR {
    uint32_t primitiveCount;
    uint32_t primitiveOffset;
    uint32_t firstVertex;
    uint32_t transformOffset;
} VkAccelerationStructureBuildRangeInfoKHR;
```

- \(\text{primitiveCount}\) defines the number of primitives for a corresponding acceleration structure geometry.
- \(\text{primitiveOffset}\) defines an offset in bytes into the memory where primitive data is defined.
- \(\text{firstVertex}\) is the index of the first vertex to build from for triangle geometry.
- \(\text{transformOffset}\) defines an offset in bytes into the memory where a transform matrix is defined.

The primitive count and primitive offset are interpreted differently depending on the \(Vk\)GeometryTypeKHR used:

- For geometries of type \(VK\_GEOMETRY\_TYPE\_TRIANGLES\_KHR\), \(\text{primitiveCount}\) is the number of
triangles to be built, where each triangle is treated as 3 vertices.

- If the geometry uses indices, `primitiveCount × 3` indices are consumed from `VkAccelerationStructureGeometryTrianglesDataKHR::indexData`, starting at an offset of `primitiveOffset`. The value of `firstVertex` is added to the index values before fetching vertices.

- If the geometry does not use indices, `primitiveCount × 3` vertices are consumed from `VkAccelerationStructureGeometryTrianglesDataKHR::vertexData`, starting at an offset of `primitiveOffset + VkAccelerationStructureGeometryTrianglesDataKHR::vertexStride × firstVertex`.

- If `VkAccelerationStructureGeometryTrianglesDataKHR::transformData` is not `NULL`, a single `VkTransformMatrixKHR` structure is consumed from `VkAccelerationStructureGeometryTrianglesDataKHR::transformData`, at an offset of `transformOffset`. This transformation matrix is used by all triangles.
