• **dataSize** is the number of bytes of inline uniform block data pointed to by **pData**.

• **pData** is a pointer to **dataSize** number of bytes of data to write to the inline uniform block.

### Valid Usage

- **VUID-VkWriteDescriptorSetInlineUniformBlockEXT-dataSize-02222**
  
  **dataSize** must be an integer multiple of 4

### Valid Usage (Implicit)

- **VUID-VkWriteDescriptorSetInlineUniformBlockEXT-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_INLINE_UNIFORM_BLOCK_EXT**

- **VUID-VkWriteDescriptorSetInlineUniformBlockEXT-pData-parameter**
  
  **pData** must be a valid pointer to an array of **dataSize** bytes

- **VUID-VkWriteDescriptorSetInlineUniformBlockEXT-dataSize-arraylength**
  
  **dataSize** must be greater than 0

The **VkWriteDescriptorSetAccelerationStructureKHR** structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkWriteDescriptorSetAccelerationStructureKHR {
    VkStructureType                      sType;
    const void*                          pNext;
    uint32_t                             accelerationStructureCount;
    const VkAccelerationStructureKHR*    pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureKHR;
```

• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **accelerationStructureCount** is the number of elements in **pAccelerationStructures**.

• **pAccelerationStructures** is a pointer to an array of **VkAccelerationStructureKHR** structures specifying the acceleration structures to update.
Valid Usage

• VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-02236
  accelerationStructureCount must be equal to descriptorCount in the extended structure

• VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03579
  Each acceleration structure in pAccelerationStructures must have been created with a type of
  VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or
  VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR

• VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03580
  If the nullDescriptor feature is not enabled, each element of pAccelerationStructures must not be VK_NULL_HANDLE

Valid Usage (Implicit)

• VUID-VkWriteDescriptorSetAccelerationStructureKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_KHR

• VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-parameter
  pAccelerationStructures must be a valid pointer to an array of accelerationStructureCount valid or VK_NULL_HANDLE VkAccelerationStructureKHR handles

• VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-arraylength
  accelerationStructureCount must be greater than 0

The VkWriteDescriptorSetAccelerationStructureNV structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkWriteDescriptorSetAccelerationStructureNV {
    VkStructureType                      sType;
    const void*                          pNext;
    uint32_t                              accelerationStructureCount;
    const VkAccelerationStructureNV*     pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureNV;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• accelerationStructureCount is the number of elements in pAccelerationStructures.
• pAccelerationStructures is a pointer to an array of VkAccelerationStructureNV structures specifying the acceleration structures to update.
Valid Usage

- **VUID-VkWriteDescriptorSetAccelerationStructureNV-accelerationStructureCount-03747**
  accelerationStructureCount must be equal to descriptorCount in the extended structure

- **VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-03748**
  Each acceleration structure in pAccelerationStructures must have been created with VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR

- **VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-03749**
  If the nullDescriptor feature is not enabled, each member of pAccelerationStructures must not be VK_NULL_HANDLE

Valid Usage (Implicit)

- **VUID-VkWriteDescriptorSetAccelerationStructureNV-sType-sType**
  sType must be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_NV

- **VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-parameter**
  pAccelerationStructures must be a valid pointer to an array of accelerationStructureCount valid or VK_NULL_HANDLE VkAccelerationStructureNV handles

- **VUID-VkWriteDescriptorSetAccelerationStructureNV-accelerationStructureCount-arraylength**
  accelerationStructureCount must be greater than 0

The VkCopyDescriptorSet structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCopyDescriptorSet {
    VkStructureType     sType;
    const void*        pNext;
    VkDescriptorSet    srcSet;
    uint32_t            srcBinding;
    uint32_t            srcArrayElement;
    VkDescriptorSet    dstSet;
    uint32_t            dstBinding;
    uint32_t            dstArrayElement;
    uint32_t            descriptorCount;
} VkCopyDescriptorSet;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcSet, srcBinding, and srcArrayElement** are the source set, binding, and array element, respectively. If the descriptor binding identified by srcSet and srcBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT then srcArrayElement specifies the starting byte offset within the binding to copy from.
- **dstSet, dstBinding, and dstArrayElement** are the destination set, binding, and array element,
respectively. If the descriptor binding identified by dstSet and dstBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT then dstArrayElement specifies the starting byte offset within the binding to copy to.

- descriptorCount is the number of descriptors to copy from the source to destination. If descriptorCount is greater than the number of remaining array elements in the source or destination binding, those affect consecutive bindings in a manner similar to VkWriteDescriptorSet above. If the descriptor binding identified by srcSet and srcBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT then descriptorCount specifies the number of bytes to copy and the remaining array elements in the source or destination binding refer to the remaining number of bytes in those.

If the VkDescriptorSetLayoutBinding for dstBinding is VK_DESCRIPTOR_TYPE_MUTABLE_VALUE and srcBinding is not VK_DESCRIPTOR_TYPE_MUTABLE_VALUE, the new active descriptor type becomes the descriptor type of srcBinding. If both VkDescriptorSetLayoutBinding for srcBinding and dstBinding are VK_DESCRIPTOR_TYPE_MUTABLE_VALUE, the active descriptor type in each source descriptor is copied into the corresponding destination descriptor. The active descriptor type can be different for each source descriptor.

Note
The intention is that copies to and from mutable descriptors is a simple memcpy. Copies between non-mutable and mutable descriptors are expected to require one memcpy per descriptor to handle the difference in size, but this use case with more than one descriptorCount is considered rare.
Valid Usage

- **VUID-VkCopyDescriptorSet-srcBinding-00345**
  
  `srcBinding must be a valid binding within srcSet`

- **VUID-VkCopyDescriptorSet-srcArrayElement-00346**
  
  The sum of `srcArrayElement` and `descriptorCount must be less than or equal to the number of array elements in the descriptor set binding specified by `srcBinding`, and all applicable consecutive bindings, as described by consecutive binding updates

- **VUID-VkCopyDescriptorSet-dstBinding-00347**
  
  `dstBinding must be a valid binding within dstSet`

- **VUID-VkCopyDescriptorSet-dstArrayElement-00348**
  
  The sum of `dstArrayElement` and `descriptorCount must be less than or equal to the number of array elements in the descriptor set binding specified by `dstBinding`, and all applicable consecutive bindings, as described by consecutive binding updates

- **VUID-VkCopyDescriptorSet-dstBinding-02632**
  
  The type of `dstBinding` within `dstSet must be equal to the type of `srcBinding` within `srcSet`

- **VUID-VkCopyDescriptorSet-srcSet-00349**
  
  If `srcSet` is equal to `dstSet`, then the source and destination ranges of descriptors must not overlap, where the ranges may include array elements from consecutive bindings as described by consecutive binding updates

- **VUID-VkCopyDescriptorSet-srcBinding-02223**
  
  If the descriptor type of the descriptor set binding specified by `srcBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, `srcArrayElement must be an integer multiple of 4`

- **VUID-VkCopyDescriptorSet-dstBinding-02224**
  
  If the descriptor type of the descriptor set binding specified by `dstBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, `dstArrayElement must be an integer multiple of 4`

- **VUID-VkCopyDescriptorSet-srcBinding-02225**
  
  If the descriptor type of the descriptor set binding specified by either `srcBinding` or `dstBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, `descriptorCount must be an integer multiple of 4`

- **VUID-VkCopyDescriptorSet-srcSet-01918**
  
  If `srcSet's layout was created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT flag set, then `dstSet's layout must also have been created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT flag set`

- **VUID-VkCopyDescriptorSet-srcSet-04885**
  
  If `srcSet's layout was created with neither VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT nor VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE flags set, then `dstSet's layout must have been created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT flag set`
If the descriptor pool from which \texttt{srcSet} was allocated was created with the \texttt{VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT} flag set, then the descriptor pool from which \texttt{dstSet} was allocated \textbf{must} also have been created with the \texttt{VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT} flag set.

If the descriptor pool from which \texttt{srcSet} was allocated was created with neither \texttt{VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT} nor \texttt{VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT} flags set, then the descriptor pool from which \texttt{dstSet} was allocated \textbf{must} have been created without the \texttt{VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT} flag set.

If the descriptor type of the descriptor set binding specified by \texttt{dstBinding} is \texttt{VK_DESCRIPTOR_TYPE_SAMPLER}, then \texttt{dstSet} \textbf{must} not have been allocated with a layout that included immutable samplers for \texttt{dstBinding}.

If \texttt{VkDescriptorSetLayoutBinding} for \texttt{dstSet} at \texttt{dstBinding} is \texttt{VK_DESCRIPTOR_TYPE_MUTABLE_VALUE}, the new active descriptor type \textbf{must} exist in the corresponding \texttt{pMutableDescriptorTypeLists} list for \texttt{dstBinding} if the new active descriptor type is not \texttt{VK_DESCRIPTOR_TYPE_MUTABLE_VALUE}.

If \texttt{VkDescriptorSetLayoutBinding} for \texttt{srcSet} at \texttt{srcBinding} is \texttt{VK_DESCRIPTOR_TYPE_MUTABLE_VALUE} and the \texttt{VkDescriptorSetLayoutBinding} for \texttt{dstSet} at \texttt{dstBinding} is not \texttt{VK_DESCRIPTOR_TYPE_MUTABLE_VALUE}, the active descriptor type for the source descriptor \textbf{must} match the descriptor type of \texttt{dstBinding}.

If \texttt{VkDescriptorSetLayoutBinding} for \texttt{dstSet} at \texttt{dstBinding} is \texttt{VK_DESCRIPTOR_TYPE_MUTABLE_VALUE}, and the new active descriptor type is \texttt{VK_DESCRIPTOR_TYPE_MUTABLE_VALUE}, the \texttt{pMutableDescriptorTypeLists} for \texttt{srcBinding} and \texttt{dstBinding} \textbf{must} match exactly.
14.2.5. Descriptor Update Templates

A descriptor update template specifies a mapping from descriptor update information in host memory to descriptors in a descriptor set. It is designed to avoid passing redundant information to the driver when frequently updating the same set of descriptors in descriptor sets.

Descriptor update template objects are represented by `VkDescriptorUpdateTemplate` handles:

```c
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorUpdateTemplate)
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplate VkDescriptorUpdateTemplateKHR;
```

14.2.6. Descriptor Set Updates with Templates

Updating a large `VkDescriptorSet` array can be an expensive operation since an application must specify one `VkWriteDescriptorSet` structure for each descriptor or descriptor array to update, each of which re-specifies the same state when updating the same descriptor in multiple descriptor sets. For cases when an application wishes to update the same set of descriptors in multiple descriptor sets allocated using the same `VkDescriptorSetLayout`, `vkUpdateDescriptorSetWithTemplate` can be used as a replacement for `vkUpdateDescriptorSets`.

`VkDescriptorUpdateTemplate` allows implementations to convert a set of descriptor update operations on a single descriptor set to an internal format that, in conjunction with `vkUpdateDescriptorSetWithTemplate` or `vkCmdPushDescriptorSetWithTemplateKHR`, can be more efficient compared to calling `vkUpdateDescriptorSets` or `vkCmdPushDescriptorSetKHR`. The descriptors themselves are not specified in the `VkDescriptorUpdateTemplate`, rather, offsets into an application provided pointer to host memory are specified, which are combined with a pointer
passed to `vkUpdateDescriptorSetWithTemplate` or `vkCmdPushDescriptorSetWithTemplateKHR`. This allows large batches of updates to be executed without having to convert application data structures into a strictly-defined Vulkan data structure.

To create a descriptor update template, call:

```c
// Provided by VK_KHR_descriptor_update_template
VkResult vkCreateDescriptorUpdateTemplateKHR(
    VkDevice                                    device,
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkDescriptorUpdateTemplate*                 pDescriptorUpdateTemplate);
```

- `device` is the logical device that creates the descriptor update template.
- `pCreateInfo` is a pointer to a `VkDescriptorUpdateTemplateCreateInfo` structure specifying the set of descriptors to update with a single call to `vkCmdPushDescriptorSetWithTemplateKHR` or `vkUpdateDescriptorSetWithTemplate`.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pDescriptorUpdateTemplate` is a pointer to a `VkDescriptorUpdateTemplate` handle in which the resulting descriptor update template object is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateDescriptorUpdateTemplate-device-parameter**
  device must be a valid `VkDevice` handle

- **VUID-vkCreateDescriptorUpdateTemplate-pCreateInfo-parameter**
  pCreateInfo must be a valid pointer to a valid `VkDescriptorUpdateTemplateCreateInfo` structure

- **VUID-vkCreateDescriptorUpdateTemplate-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateDescriptorUpdateTemplate-pDescriptorUpdateTemplate-parameter**
  pDescriptorUpdateTemplate must be a valid pointer to a `VkDescriptorUpdateTemplate` handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDescriptorUpdateTemplateCreateInfo structure is defined as:

```c
typedef struct VkDescriptorUpdateTemplateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorUpdateTemplateCreateFlags flags;
    uint32_t descriptorUpdateEntryCount;
    const VkDescriptorUpdateTemplateEntry* pDescriptorUpdateEntries;
    VkDescriptorUpdateTemplateType templateType;
    VkDescriptorSetLayout descriptorSetLayout;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipelineLayout pipelineLayout;
    uint32_t set;
} VkDescriptorUpdateTemplateCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateInfo VkDescriptorUpdateTemplateCreateInfoKHR;
```

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is reserved for future use.
• **descriptorUpdateEntryCount** is the number of elements in the **pDescriptorUpdateEntries** array.
• **pDescriptorUpdateEntries** is a pointer to an array of VkDescriptorUpdateTemplateEntry structures describing the descriptors to be updated by the descriptor update template.
• **templateType** specifies the type of the descriptor update template. If set to VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET it can only be used to update descriptor sets with a fixed descriptorSetLayout. If set to VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR it can only be used to push descriptor sets using the provided pipelineBindPoint, pipelineLayout, and set number.
• **descriptorSetLayout** is the descriptor set layout used to build the descriptor update template. All descriptor sets which are going to be updated through the newly created descriptor update template must be created with a layout that matches (is the same as, or defined identically to)
this layout. This parameter is ignored if `templateType` is not
`VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET`.

- `pipelineBindPoint` is a `VkPipelineBindPoint` indicating the type of the pipeline that will use the
descriptors. This parameter is ignored if `templateType` is not
`VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`.

- `pipelineLayout` is a `VkPipelineLayout` object used to program the bindings. This parameter is
ignored if `templateType` is not `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`.

- `set` is the set number of the descriptor set in the pipeline layout that will be updated. This
parameter is ignored if `templateType` is not `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`.

### Valid Usage

- `VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00350` If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET`, `descriptorSetLayout` must be a valid `VkDescriptorSetLayout` handle.

- `VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00351` If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`, `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value.

- `VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00352` If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`, `pipelineLayout` must be a valid `VkPipelineLayout` handle.

- `VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00353` If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`, `set` must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`.

- `VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-04615` If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET`, `descriptorSetLayout` must not contain a binding with type `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE`.

Chapter 14. Resource Descriptors | 969
Valid Usage (Implicit)

- **VUID-VkDescriptorUpdateTemplateCreateInfo-sType-sType**: The `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO`.
- **VUID-VkDescriptorUpdateTemplateCreateInfo-pNext-pNext**: The `pNext` must be `NULL`.
- **VUID-VkDescriptorUpdateTemplateCreateInfo-flags-zerobitmask**: The `flags` must be `0`.
- **VUID-VkDescriptorUpdateTemplateCreateInfo-pDescriptorUpdateEntries-parameter**: The `pDescriptorUpdateEntries` must be a valid pointer to an array of `descriptorUpdateEntryCount` valid `VkDescriptorUpdateTemplateEntry` structures.
- **VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-parameter**: The `templateType` must be a valid `VkDescriptorUpdateTemplateType` value.
- **VUID-VkDescriptorUpdateTemplateCreateInfo-descriptorUpdateEntryCount-arraylength**: The `descriptorUpdateEntryCount` must be greater than `0`.
- **VUID-VkDescriptorUpdateTemplateCreateInfo-commonparent**: Both of `descriptorSetLayout`, and `pipelineLayout` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

```c
typedef VkFlags VkDescriptorUpdateTemplateCreateFlags;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateFlags
    VkDescriptorUpdateTemplateCreateFlagsKHR;
```

`VkDescriptorUpdateTemplateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The descriptor update template type is determined by the `VkDescriptorUpdateTemplateCreateInfo::templateType` property, which takes the following values:
typedef enum VkDescriptorUpdateTemplateType {
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET = 0,
    // Provided by VK_KHR_push_descriptor with VK_VERSION_1_1, VK_KHR_push_descriptor
    // with VK_KHR_descriptor_update_template, VK_KHR_descriptor_update_template with
    // VK_KHR_push_descriptor
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR = 1,
    // Provided by VK_KHR_descriptor_update_template
} VkDescriptorUpdateTemplateType;

or the equivalent

// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateType VkDescriptorUpdateTemplateTypeKHR;

• VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET specifies that the descriptor update
template will be used for descriptor set updates only.
• VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR specifies that the descriptor update
template will be used for push descriptor updates only.

The VkDescriptorUpdateTemplateEntry structure is defined as:

typedef struct VkDescriptorUpdateTemplateEntry {
    uint32_t dstBinding;
    uint32_t dstArrayElement;
    uint32_t descriptorCount;
    VkDescriptorType descriptorType;
    size_t offset;
    size_t stride;
} VkDescriptorUpdateTemplateEntry;

or the equivalent

// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateEntry VkDescriptorUpdateTemplateEntryKHR;

• dstBinding is the descriptor binding to update when using this descriptor update template.
• dstArrayElement is the starting element in the array belonging to dstBinding. If the descriptor
binding identified by dstBinding has a descriptor type of
VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT then dstArrayElement specifies the starting byte
offset to update.
• descriptorCount is the number of descriptors to update. If descriptorCount is greater than the
number of remaining array elements in the destination binding, those affect consecutive
bindings in a manner similar to \texttt{VkWriteDescriptorSet} above. If the descriptor binding identified by \texttt{dstBinding} has a descriptor type of \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT} then \texttt{descriptorCount} specifies the number of bytes to update and the remaining array elements in the destination binding refer to the remaining number of bytes in it.

- \texttt{descriptorType} is a \texttt{VkDescriptorType} specifying the type of the descriptor.
- \texttt{offset} is the offset in bytes of the first binding in the raw data structure.
- \texttt{stride} is the stride in bytes between two consecutive array elements of the descriptor update informations in the raw data structure. The actual pointer \texttt{ptr} for each array element \texttt{j} of update entry \texttt{i} is computed using the following formula:

\begin{verbatim}
const char *ptr = (const char *)pData + pDescriptorUpdateEntries[i].offset + j * pDescriptorUpdateEntries[i].stride
\end{verbatim}

The stride is useful in case the bindings are stored in structs along with other data. If \texttt{descriptorType} is \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT} then the value of \texttt{stride} is ignored and the stride is assumed to be 1, i.e. the descriptor update information for them is always specified as a contiguous range.

### Valid Usage

- \textbf{VUID-VkDescriptorUpdateTemplateEntry-dstBinding-00354} \texttt{dstBinding} must be a valid binding in the descriptor set layout implicitly specified when using a descriptor update template to update descriptors

- \textbf{VUID-VkDescriptorUpdateTemplateEntry-dstArrayElement-00355} \texttt{dstArrayElement} and \texttt{descriptorCount} must be less than or equal to the number of array elements in the descriptor set binding implicitly specified when using a descriptor update template to update descriptors, and all applicable consecutive bindings, as described by \textbf{consecutive binding updates}

- \textbf{VUID-VkDescriptorUpdateTemplateEntry-descriptor-02226} If \texttt{descriptor} type is \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT}, \texttt{dstArrayElement} must be an integer multiple of 4

- \textbf{VUID-VkDescriptorUpdateTemplateEntry-descriptor-02227} If \texttt{descriptor} type is \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT}, \texttt{descriptorCount} must be an integer multiple of 4

### Valid Usage (Implicit)

- \textbf{VUID-VkDescriptorUpdateTemplateEntry-descriptorType-parameter} \texttt{descriptorType} must be a valid \texttt{VkDescriptorType} value

To destroy a descriptor update template, call:
// Provided by VK_KHR_descriptor_update_template

```c
void vkDestroyDescriptorUpdateTemplateKHR(
    VkDevice                                    device,
    VkDescriptorUpdateTemplate                  descriptorUpdateTemplate,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that has been used to create the descriptor update template
- `descriptorUpdateTemplate` is the descriptor update template to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00356
  If `VkAllocationCallbacks` were provided when `descriptorUpdateTemplate` was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00357
  If no `VkAllocationCallbacks` were provided when `descriptorUpdateTemplate` was created, `pAllocator` must be NULL.

### Valid Usage (Implicit)

- VUID-vkDestroyDescriptorUpdateTemplate-device-parameter
  `device` must be a valid `VkDevice` handle.

- VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parameter
  If `descriptorUpdateTemplate` is not `VK_NULL_HANDLE`, `descriptorUpdateTemplate` must be a valid `VkDescriptorUpdateTemplate` handle.

- VUID-vkDestroyDescriptorUpdateTemplate-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parent
  If `descriptorUpdateTemplate` is a valid handle, it must have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `descriptorUpdateTemplate` must be externally synchronized.

Once a `VkDescriptorUpdateTemplate` has been created, descriptor sets can be updated by calling:
// Provided by VK_KHR_descriptor_update_template
void vkUpdateDescriptorSetWithTemplateKHR(
    VkDevice device,
    VkDescriptorSet descriptorSet,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    const void* pData);

• **device** is the logical device that updates the descriptor set.
• **descriptorSet** is the descriptor set to update.
• **descriptorUpdateTemplate** is a VkDescriptorUpdateTemplate object specifying the update mapping between pData and the descriptor set to update.
• **pData** is a pointer to memory containing one or more VkDescriptorImageInfo, VkDescriptorBufferInfo, or VkBufferView structures or VkAccelerationStructureKHR or VkAccelerationStructureNV handles used to write the descriptors.

### Valid Usage

- VUID-vkUpdateDescriptorSetWithTemplate-pData-01685
  **pData** must be a valid pointer to a memory containing one or more valid instances of VkDescriptorImageInfo, VkDescriptorBufferInfo, or VkBufferView in a layout defined by descriptorUpdateTemplate when it was created with vkCreateDescriptorUpdateTemplate

### Valid Usage (Implicit)

- VUID-vkUpdateDescriptorSetWithTemplate-device-parameter
  **device** must be a valid VkDevice handle
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-parameter
  **descriptorSet** must be a valid VkDescriptorSet handle
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parameter
  **descriptorUpdateTemplate** must be a valid VkDescriptorUpdateTemplate handle
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parent
  **descriptorUpdateTemplate** must have been created, allocated, or retrieved from **device**

### Host Synchronization

- Host access to **descriptorSet** must be externally synchronized

### API example

```c
struct AppBufferView {
    VkBufferView bufferView;
    uint32_t     applicationRelatedInformation;
};
```
struct AppDataStructure
{
    VkDescriptorImageInfo imageInfo;  // a single image info
    VkDescriptorBufferInfo bufferInfoArray[3];  // 3 buffer infos in an array
    AppBufferView bufferView[2];  // An application defined structure containing a bufferView
    // ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] =
{
    // binding to a single image descriptor
    {0, 0, 1, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, offsetof(AppDataStructure, imageInfo), 0, },  // binding

    // binding to an array of buffer descriptors
    {1, 0, 3, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, offsetof(AppDataStructure, bufferInfoArray), sizeof(VkDescriptorBufferInfo), },  // binding

    // binding to an array of buffer views
    {2, 0, 2, VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, offsetof(AppDataStructure, bufferView) + offsetof(AppBufferView, bufferView), sizeof(AppBufferView), },  // binding

    // create a descriptor update template for descriptor set updates
    const VkDescriptorUpdateTemplateCreateInfo createInfo =
    {
    };
};
```c
VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO, // sType
NULL, // pNext
0, // flags
descriptorUpdateEntryCount
descriptorUpdateTemplateEntries, // pDescriptorUpdateEntries
VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET, // templateType
myLayout, // descriptorSetLayout
0, // pipelineBindPoint,
0, // pipelineLayout,
0, // set,
given templateType

VkDescriptorUpdateTemplate myDescriptorUpdateTemplate;
myResult = vkCreateDescriptorUpdateTemplate(
    myDevice, &createInfo, NULL, &myDescriptorUpdateTemplate);

AppDataStructure appData;

// fill appData here or cache it in your engine
vkUpdateDescriptorSetWithTemplate(myDevice, myDescriptorSet, myDescriptorUpdateTemplate, &appData);
```

### 14.2.7. Descriptor Set Binding

To bind one or more descriptor sets to a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindDescriptorSets(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipelineLayout layout,
    uint32_t firstSet,
    uint32_t descriptorSetCount,
    const VkDescriptorSet* pDescriptorSets,
    uint32_t dynamicOffsetCount,
    const uint32_t* pDynamicOffsets);
```

- `commandBuffer` is the command buffer that the descriptor sets will be bound to.
- `pipelineBindPoint` is a `VkPipelineBindPoint` indicating the type of the pipeline that will use the descriptors. There is a separate set of bind points for each pipeline type, so binding one does not
disturb the others.

- **layout** is a `VkPipelineLayout` object used to program the bindings.
- **firstSet** is the set number of the first descriptor set to be bound.
- **descriptorSetCount** is the number of elements in the `pDescriptorSets` array.
- **pDescriptorSets** is a pointer to an array of handles to `VkDescriptorSet` objects describing the descriptor sets to bind to.
- **dynamicOffsetCount** is the number of dynamic offsets in the `pDynamicOffsets` array.
- **pDynamicOffsets** is a pointer to an array of `uint32_t` values specifying dynamic offsets.

`vkCmdBindDescriptorSets` causes the sets numbered `[firstSet..firstSet+descriptorSetCount-1]` to use the bindings stored in `pDescriptorSets[0..descriptorSetCount-1]` for subsequent bound pipeline commands set by `pipelineBindPoint`. Any bindings that were previously applied via these sets are no longer valid.

Once bound, a descriptor set affects rendering of subsequent commands that interact with the given pipeline type in the command buffer until either a different set is bound to the same set number, or the set is disturbed as described in **Pipeline Layout Compatibility**.

A compatible descriptor set **must** be bound for all set numbers that any shaders in a pipeline access, at the time that a draw or dispatch command is recorded to execute using that pipeline. However, if none of the shaders in a pipeline statically use any bindings with a particular set number, then no descriptor set need be bound for that set number, even if the pipeline layout includes a non-trivial descriptor set layout for that set number.

If any of the sets being bound include dynamic uniform or storage buffers, then `pDynamicOffsets` includes one element for each array element in each dynamic descriptor type binding in each set. Values are taken from `pDynamicOffsets` in an order such that all entries for set N come before set N+1; within a set, entries are ordered by the binding numbers in the descriptor set layouts; and within a binding array, elements are in order. **dynamicOffsetCount** must equal the total number of dynamic descriptors in the sets being bound.

The effective offset used for dynamic uniform and storage buffer bindings is the sum of the relative offset taken from `pDynamicOffsets`, and the base address of the buffer plus base offset in the descriptor set. The range of the dynamic uniform and storage buffer bindings is the buffer range as specified in the descriptor set.

Each of the `pDescriptorSets` **must** be compatible with the pipeline layout specified by `layout`. The layout used to program the bindings **must** also be compatible with the pipeline used in subsequent bound pipeline commands with that pipeline type, as defined in the **Pipeline Layout Compatibility** section.

The descriptor set contents bound by a call to `vkCmdBindDescriptorSets` **may** be consumed at the following times:

- For descriptor bindings created with the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit set, the contents **may** be consumed when the command buffer is submitted to a queue, or during shader execution of the resulting draws and dispatches, or any time in between. Otherwise,
• during host execution of the command, or during shader execution of the resulting draws and dispatches, or any time in between.

Thus, the contents of a descriptor set binding **must** not be altered (overwritten by an update command, or freed) between the first point in time that it **may** be consumed, and when the command completes executing on the queue.

The contents of `pDynamicOffsets` are consumed immediately during execution of `vkCmdBindDescriptorSets`. Once all pending uses have completed, it is legal to update and reuse a descriptor set.

### Valid Usage

- **VUID-vkCmdBindDescriptorSets-pDescriptorSets-00358**
  
  Each element of `pDescriptorSets` **must** have been allocated with a `VkDescriptorSetLayout` that matches (is the same as, or identically defined as) the `VkDescriptorSetLayout` at set `n` in `layout`, where `n` is the sum of `firstSet` and the index into `pDescriptorSets`.

- **VUID-vkCmdBindDescriptorSets-dynamicOffsetCount-00359**
  
  `dynamicOffsetCount` **must** be equal to the total number of dynamic descriptors in `pDescriptorSets`.

- **VUID-vkCmdBindDescriptorSets-firstSet-00360**
  
  The sum of `firstSet` and `descriptorSetCount` **must** be less than or equal to `VkPipelineLayoutCreateInfo::setLayoutCount` provided when `layout` was created.

- **VUID-vkCmdBindDescriptorSets-pipelineBindPoint-00361**
  
  `pipelineBindPoint` **must** be supported by the `commandBuffer`'s parent `VkCommandPool`'s queue family.

- **VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01971**
  
  Each element of `pDynamicOffsets` which corresponds to a descriptor binding with type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` **must** be a multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`.

- **VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01972**
  
  Each element of `pDynamicOffsets` which corresponds to a descriptor binding with type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` **must** be a multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`.

- **VUID-vkCmdBindDescriptorSets-pDescriptorSets-01979**
  
  For each dynamic uniform or storage buffer binding in `pDescriptorSets`, the sum of the effective offset, as defined above, and the range of the binding **must** be less than or equal to the size of the buffer.

- **VUID-vkCmdBindDescriptorSets-pDescriptorSets-04616**
  
  Each element of `pDescriptorSets` **must** not have been allocated from a `VkDescriptorPool` with the `VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT` flag set.
Valid Usage (Implicit)

- **VUID-vkCmdBindDescriptorSets-commandBuffer-parameter**
  *commandBuffer must* be a valid **VkCommandBuffer** handle

- **VUID-vkCmdBindDescriptorSets-pipelineBindPoint-parameter**
  *pipelineBindPoint must* be a valid **VkPipelineBindPoint** value

- **VUID-vkCmdBindDescriptorSets-layout-parameter**
  *layout must* be a valid **VkPipelineLayout** handle

- **VUID-vkCmdBindDescriptorSets-pDescriptorSets-parameter**
  *pDescriptorSets must* be a valid pointer to an array of *descriptorSetCount* valid **VkDescriptorSet** handles

- **VUID-vkCmdBindDescriptorSets-pDynamicOffsets-parameter**
  *If dynamicOffsetCount is not 0, pDynamicOffsets must* be a valid pointer to an array of *dynamicOffsetCount* uint32_t values

- **VUID-vkCmdBindDescriptorSets-commandBuffer-recording**
  *commandBuffer must* be in the **recording** state

- **VUID-vkCmdBindDescriptorSets-commandBuffer-cmdpool**
  The **VkCommandPool** that *commandBuffer was allocated from must* support graphics, or compute operations

- **VUID-vkCmdBindDescriptorSets-descriptorSetCount-arraylength**
  *descriptorSetCount must* be greater than 0

- **VUID-vkCmdBindDescriptorSets-commonparent**
  Each of *commandBuffer, layout, and the elements of pDescriptorSets must* have been created, allocated, or retrieved from the same **VkDevice**

Host Synchronization

- Host access to *commandBuffer must* be externally synchronized

- Host access to the **VkCommandPool** that *commandBuffer was allocated from must* be externally synchronized

Command Properties

<table>

</tr>
</tbody>
</table>
14.2.8. Push Descriptor Updates

In addition to allocating descriptor sets and binding them to a command buffer, an application can record descriptor updates into the command buffer.

To push descriptor updates into a command buffer, call:

```c
void vkCmdPushDescriptorSetKHR(  
    VkCommandBuffer commandBuffer,  
    VkPipelineBindPoint pipelineBindPoint,  
    VkPipelineLayout layout,  
    uint32_t set,  
    uint32_t descriptorWriteCount,  
    const VkWriteDescriptorSet* pDescriptorWrites);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.
- `pipelineBindPoint` is a `VkPipelineBindPoint` indicating the type of the pipeline that will use the descriptors. There is a separate set of push descriptor bindings for each pipeline type, so binding one does not disturb the others.
- `layout` is a `VkPipelineLayout` object used to program the bindings.
- `set` is the set number of the descriptor set in the pipeline layout that will be updated.
- `descriptorWriteCount` is the number of elements in the `pDescriptorWrites` array.
- `pDescriptorWrites` is a pointer to an array of `VkWriteDescriptorSet` structures describing the descriptors to be updated.

Push descriptors are a small bank of descriptors whose storage is internally managed by the command buffer rather than being written into a descriptor set and later bound to a command buffer. Push descriptors allow for incremental updates of descriptors without managing the lifetime of descriptor sets.

When a command buffer begins recording, all push descriptors are undefined. Push descriptors can be updated incrementally and cause shaders to use the updated descriptors for subsequent bound pipeline commands with the pipeline type set by `pipelineBindPoint` until the descriptor is overwritten, or else until the set is disturbed as described in Pipeline Layout Compatibility. When the set is disturbed or push descriptors with a different descriptor set layout are set, all push descriptors are undefined.

Push descriptors that are statically used by a pipeline must not be undefined at the time that a draw or dispatch command is recorded to execute using that pipeline. This includes immutable sampler descriptors, which must be pushed before they are accessed by a pipeline (the immutable samplers are pushed, rather than the samplers in `pDescriptorWrites`). Push descriptors that are not statically used can remain undefined.

Push descriptors do not use dynamic offsets. Instead, the corresponding non-dynamic descriptor types can be used and the offset member of `VkDescriptorBufferInfo` can be changed each time the descriptor is written.
Each element of `pDescriptorWrites` is interpreted as in `VkWriteDescriptorSet`, except the `dstSet` member is ignored.

To push an immutable sampler, use a `VkWriteDescriptorSet` with `dstBinding` and `dstArrayElement` selecting the immutable sampler's binding. If the descriptor type is `VK_DESCRIPTOR_TYPE_SAMPLER`, the `pImageInfo` parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout. If the descriptor type is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, the `sampler` member of the `pImageInfo` parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout.

---

**Valid Usage**

- VUID-vkCmdPushDescriptorSetKHR-pipelineBindPoint-00363
  
  `pipelineBindPoint` must be supported by the commandBuffer's parent `VkCommandPool`'s queue family

- VUID-vkCmdPushDescriptorSetKHR-set-00364
  
  `set` must be less than `VkPipelineLayoutCreateInfo::setLayoutCount` provided when `layout` was created

- VUID-vkCmdPushDescriptorSetKHR-set-00365
  
  `set` must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`
Valid Usage (Implicit)

- **VUID-vkCmdPushDescriptorSetKHR-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdPushDescriptorSetKHR-pipelineBindPoint-parameter**
  - `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value

- **VUID-vkCmdPushDescriptorSetKHR-layout-parameter**
  - `layout` must be a valid `VkPipelineLayout` handle

- **VUID-vkCmdPushDescriptorSetKHR-pDescriptorWrites-parameter**
  - `pDescriptorWrites` must be a valid pointer to an array of `descriptorWriteCount` valid `VkWriteDescriptorSet` structures

- **VUID-vkCmdPushDescriptorSetKHR-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdPushDescriptorSetKHR-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- **VUID-vkCmdPushDescriptorSetKHR-descriptorWriteCount-arraylength**
  - `descriptorWriteCount` must be greater than 0

- **VUID-vkCmdPushDescriptorSetKHR-commonparent**
  - Both of `commandBuffer`, and `layout` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

14.2.9. Push Descriptor Updates with Descriptor Update Templates

It is also possible to use a descriptor update template to specify the push descriptors to update. To do so, call:
// Provided by VK_KHR_push_descriptor with VK_VERSION_1_1, VK_KHR_push_descriptor with VK_KHR_descriptor_update_template, VK_KHR_descriptor_update_template with VK_KHR_push_descriptor

```c
void vkCmdPushDescriptorSetWithTemplateKHR(
    VkCommandBuffer                             commandBuffer, 
    VkDescriptorUpdateTemplate                  descriptorUpdateTemplate, 
    VkPipelineLayout                            layout, 
    uint32_t                                    set, 
    const void*                                 pData);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.
- `descriptorUpdateTemplate` is a descriptor update template defining how to interpret the descriptor information in `pData`.
- `layout` is a `VkPipelineLayout` object used to program the bindings. It must be compatible with the layout used to create the `descriptorUpdateTemplate` handle.
- `set` is the set number of the descriptor set in the pipeline layout that will be updated. This must be the same number used to create the `descriptorUpdateTemplate` handle.
- `pData` is a pointer to memory containing descriptors for the templated update.

### Valid Usage

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-00366**
  
  The `pipelineBindPoint` specified during the creation of the descriptor update template must be supported by the `commandBuffer`'s parent `VkCommandPool`'s queue family

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-pData-01686**

  `pData` must be a valid pointer to a memory containing one or more valid instances of `VkDescriptorImageInfo`, `VkDescriptorBufferInfo`, or `VkBufferView` in a layout defined by `descriptorUpdateTemplate` when it was created with `vkCreateDescriptorUpdateTemplate`
Valid Usage (Implicit)

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-descriptorUpdateTemplate-parameter
  
  `descriptorUpdateTemplate` must be a valid `VkDescriptorUpdateTemplate` handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-layout-parameter
  
  `layout` must be a valid `VkPipelineLayout` handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commonparent
  
  Each of `commandBuffer`, `descriptorUpdateTemplate`, and `layout` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>
struct AppDataStructure
{
    VkDescriptorImageInfo imageInfo;    // a single image info
    // ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] =
{
    // binding to a single image descriptor
    { 0, // binding
       0, // dstArrayElement
       1, // descriptorCount
       VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, // descriptorType
       offsetof(AppDataStructure, imageInfo),    // offset
       0   // stride is not required if descriptorCount is 1
    }
};

// create a descriptor update template for push descriptor set updates
const VkDescriptorUpdateTemplateCreateInfo createInfo =
{
    VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO, // sType
    NULL, // pNext
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, // templateType
    myPipelineLayout, // descriptorSetLayout,
    VK_PIPELINE_BIND_POINT_GRAPHICS, // pipelineBindPoint
    0, // pipelineLayout
    0, // set

    descriptorUpdateEntryCount
    descriptorUpdateTemplateEntries,

    pDescriptorUpdateEntries
};

VkDescriptorUpdateTemplate myDescriptorUpdateTemplate;
myResult = vkCreateDescriptorUpdateTemplate(
    myDevice,
    &createInfo,
    NULL,
    &myDescriptorUpdateTemplate);

AppDataStructure appData;
// fill appData here or cache it in your engine
vkCmdPushDescriptorSetWithTemplateKHR(myCmdBuffer, myDescriptorUpdateTemplate,
    myPipelineLayout, 0, &appData);
As described above in section Pipeline Layouts, the pipeline layout defines shader push constants which are updated via Vulkan commands rather than via writes to memory or copy commands.

Note
Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

To update push constants, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdPushConstants(
    VkCommandBuffer                             commandBuffer,
    VkPipelineLayout                            layout,
    VkShaderStageFlags                          stageFlags,
    uint32_t                                    offset,
    uint32_t                                    size,
    const void*                                 pValues);
```

- `commandBuffer` is the command buffer in which the push constant update will be recorded.
- `layout` is the pipeline layout used to program the push constant updates.
- `stageFlags` is a bitmask of `VkShaderStageFlagBits` specifying the shader stages that will use the push constants in the updated range.
- `offset` is the start offset of the push constant range to update, in units of bytes.
- `size` is the size of the push constant range to update, in units of bytes.
- `pValues` is a pointer to an array of `size` bytes containing the new push constant values.

When a command buffer begins recording, all push constant values are undefined.

Push constant values can be updated incrementally, causing shader stages in `stageFlags` to read the new data from `pValues` for push constants modified by this command, while still reading the previous data for push constants not modified by this command. When a bound pipeline command is issued, the bound pipeline's layout must be compatible with the layouts used to set the values of all push constants in the pipeline layout's push constant ranges, as described in Pipeline Layout Compatibility. Binding a pipeline with a layout that is not compatible with the push constant layout does not disturb the push constant values.

Note
As `stageFlags` needs to include all flags the relevant push constant ranges were created with, any flags that are not supported by the queue family that the `VkCommandPool` used to allocate `commandBuffer` was created on are ignored.
Valid Usage

- VUID-vkCmdPushConstants-offset-01795
  For each byte in the range specified by `offset` and `size` and for each shader stage in `stageFlags`, there must be a push constant range in `layout` that includes that byte and that stage.

- VUID-vkCmdPushConstants-offset-01796
  For each byte in the range specified by `offset` and `size` and for each push constant range that overlaps that byte, `stageFlags` must include all stages in that push constant range's `VkPushConstantRange::stageFlags`.

- VUID-vkCmdPushConstants-offset-00368
  `offset` must be a multiple of 4.

- VUID-vkCmdPushConstants-size-00369
  `size` must be a multiple of 4.

- VUID-vkCmdPushConstants-offset-00370
  `offset` must be less than `VkPhysicalDeviceLimits::maxPushConstantsSize`.

- VUID-vkCmdPushConstants-size-00371
  `size` must be less than or equal to `VkPhysicalDeviceLimits::maxPushConstantsSize` minus `offset`.
Valid Usage (Implicit)

- VUID-vkCmdPushConstants-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdPushConstants-layout-parameter
  layout must be a valid VkPipelineLayout handle

- VUID-vkCmdPushConstants-stageFlags-parameter
  stageFlags must be a valid combination of VkShaderStageFlagBits values

- VUID-vkCmdPushConstants-stageFlags-requiredbitmask
  stageFlags must not be 0

- VUID-vkCmdPushConstants-pValues-parameter
  pValues must be a valid pointer to an array of size bytes

- VUID-vkCmdPushConstants-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdPushConstants-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdPushConstants-size-arraylength
  size must be greater than 0

- VUID-vkCmdPushConstants-commonparent
  Both of commandBuffer, and layout must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

14.3. Physical Storage Buffer Access

To query a 64-bit buffer device address value through which buffer memory can be accessed in a shader, call:
Provided by VK_KHR_buffer_device_address

```c
VkDeviceAddress vkGetBufferDeviceAddressKHR(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

or the equivalent command

Provided by VK_EXT_buffer_device_address

```c
VkDeviceAddress vkGetBufferDeviceAddressEXT(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

- `device` is the logical device that the buffer was created on.
- `pInfo` is a pointer to a `VkBufferDeviceAddressInfo` structure specifying the buffer to retrieve an address for.

The 64-bit return value is an address of the start of `pInfo->buffer`. The address range starting at this value and whose size is the size of the buffer can be used in a shader to access the memory bound to that buffer, using the `SPV_KHR_physical_storage_buffer` extension or the equivalent `SPV_EXT_physical_storage_buffer` extension and the `PhysicalStorageBuffer` storage class. For example, this value can be stored in a uniform buffer, and the shader can read the value from the uniform buffer and use it to do a dependent read/write to this buffer. A value of zero is reserved as a “null” pointer and must not be returned as a valid buffer device address. All loads, stores, and atomics in a shader through `PhysicalStorageBuffer` pointers must access addresses in the address range of some buffer.

If the buffer was created with a non-zero value of `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress` or `VkBufferDeviceAddressCreateInfoEXT::deviceAddress` the return value will be the same address that was returned at capture time.

### Valid Usage

- **VUID-vkGetBufferDeviceAddress-bufferDeviceAddress-03324**
  The `bufferDeviceAddress` or `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::bufferDeviceAddress` feature must be enabled

- **VUID-vkGetBufferDeviceAddress-device-03325**
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` or `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::bufferDeviceAddressMultiDevice` feature must be enabled
Valid Usage (Implicit)

- VUID-vkGetBufferDeviceAddress-device-parameter
  
  **device** must be a valid **VkDevice** handle

- VUID-vkGetBufferDeviceAddress-pInfo-parameter
  
  **pInfo** must be a valid pointer to a valid **VkBufferDeviceAddressInfo** structure

The **VkBufferDeviceAddressInfo** structure is defined as:

```c
typedef struct VkBufferDeviceAddressInfo {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
} VkBufferDeviceAddressInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkBufferDeviceAddressInfo VkBufferDeviceAddressInfoKHR;
```

or the equivalent

```c
// Provided by VK_EXT_buffer_device_address
typedef VkBufferDeviceAddressInfo VkBufferDeviceAddressInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **buffer** specifies the buffer whose address is being queried.

Valid Usage

- **VUID-VkBufferDeviceAddressInfo-buffer-02600**

  If **buffer** is non-sparse and was not created with the **VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT** flag, then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-VkBufferDeviceAddressInfo-buffer-02601**

  **buffer** must have been created with **VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT**
Valid Usage (Implicit)

- VUID-VkBufferDeviceAddressInfo-sType-sType
  *sType must be VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_INFO*

- VUID-VkBufferDeviceAddressInfo-pNext-pNext
  *pNext must be NULL*

- VUID-VkBufferDeviceAddressInfo-buffer-parameter
  *buffer must be a valid VkBuffer handle*

To query a 64-bit buffer opaque capture address, call:

```c
// Provided by VK_KHR_buffer_device_address
uint64_t vkGetBufferOpaqueCaptureAddressKHR(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

- *device* is the logical device that the buffer was created on.
- *pInfo* is a pointer to a VkBufferDeviceAddressInfo structure specifying the buffer to retrieve an address for.

The 64-bit return value is an opaque capture address of the start of *pInfo->buffer*.

If the buffer was created with a non-zero value of VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress the return value must be the same address.

Valid Usage

- VUID-vkGetBufferOpaqueCaptureAddress-None-03326
  *The bufferDeviceAddress feature must be enabled*

- VUID-vkGetBufferOpaqueCaptureAddress-device-03327
  *If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled*
Chapter 15. Shader Interfaces

When a pipeline is created, the set of shaders specified in the corresponding `Vk*PipelineCreateInfo` structure are implicitly linked at a number of different interfaces.

- Shader Input and Output Interface
- Vertex Input Interface
- Fragment Output Interface
- Fragment Input Attachment Interface
- Ray Tracing Pipeline Interface
- Shader Resource Interface

Interface definitions make use of the following SPIR-V decorations:

- DescriptorSet and Binding
- Location, Component, and Index
- Flat, NoPerspective, Centroid, and Sample
- Block and BufferBlock
- InputAttachmentIndex
- Offset, ArrayStride, and MatrixStride
- BuiltIn
- PassthroughNV

This specification describes valid uses for Vulkan of these decorations. Any other use of one of these decorations is invalid, with the exception that, when using SPIR-V versions 1.4 and earlier: Block, BufferBlock, Offset, ArrayStride, and MatrixStride can also decorate types and type members used by variables in the Private and Function storage classes.

15.1. Shader Input and Output Interfaces

When multiple stages are present in a pipeline, the outputs of one stage form an interface with the inputs of the next stage. When such an interface involves a shader, shader outputs are matched against the inputs of the next stage, and shader inputs are matched against the outputs of the previous stage.

All the variables forming the shader input and output interfaces are listed as operands to the `OpEntryPoint` instruction and are declared with the `Input` or `Output` storage classes, respectively, in the SPIR-V module. These generally form the interfaces between consecutive shader stages, regardless of any non-shader stages between the consecutive shader stages.

There are two classes of variables that can be matched between shader stages, built-in variables and user-defined variables. Each class has a different set of matching criteria.

Output variables of a shader stage have undefined values until the shader writes to them or uses the
Initializer operand when declaring the variable.

15.1.1. Built-in Interface Block

Shader built-in variables meeting the following requirements define the built-in interface block. They must

- be explicitly declared (there are no implicit built-ins),
- be identified with a BuiltIn decoration,
- form object types as described in the Built-in Variables section, and
- be declared in a block whose top-level members are the built-ins.

There must be no more than one built-in interface block per shader per interface.

Built-ins must not have any Location or Component decorations.

15.1.2. User-defined Variable Interface

The non-built-in variables listed by OpEntryPoint with the Input or Output storage class form the user-defined variable interface. These must have SPIR-V numerical types or, recursively, composite types of such types. By default, the components of such types have a width of 32 or 64 bits. If an implementation supports storageInputOutput16, components can also have a width of 16 bits. These variables must be identified with a Location decoration and can also be identified with a Component decoration.

15.1.3. Interface Matching

Interface matching rules only apply to built-ins when they are declared as members of the built-in interface block.

Tessellation control and mesh shader per-vertex output variables and blocks, and tessellation control, tessellation evaluation, and geometry shader per-vertex input variables and blocks are required to be declared as arrays, with each element representing input or output values for a single vertex of a multi-vertex primitive. For the purposes of interface matching, the outermost array dimension of such variables and blocks is ignored.

A user-defined output variable is considered to match an input variable in the subsequent stage if the two variables are declared with the same Location and Component decoration and match in type and decoration, except that interpolation decorations are not required to match. XfbBuffer, XfbStride, Offset, and Stream are also not required to match for the purposes of interface matching. For the purposes of interface matching, variables declared without a Component decoration are considered to have a Component decoration of zero.

Note

Matching rules for passthrough geometry shaders are slightly different and are described in the Passthrough Interface Matching section.

Variables or block members declared as structures are considered to match in type if and only if
the structure members match in type, decoration, number, and declaration order. Variables or block members declared as arrays are considered to match in type only if both declarations specify the same element type and size.

At an interface between two non-fragment shader stages, the built-in interface block must match exactly, as described above, except for per-view outputs as described in Mesh Shader Per-View Outputs. At an interface involving the fragment shader inputs, the presence or absence of any built-in output does not affect the interface matching.

At an interface between two shader stages, the user-defined variable interface must match exactly, as described above.

Any input value to a shader stage is well-defined as long as the preceding stage writes to a matching output, as described above.

Additionally, scalar and vector inputs are well-defined if there is a corresponding output satisfying all of the following conditions:

- the input and output match exactly in decoration,
- the output is a vector with the same basic type and has at least as many components as the input, and
- the common component type of the input and output is 16-bit integer or floating-point, or 32-bit integer or floating-point (64-bit component types are excluded).

In this case, the components of the input will be taken from the first components of the output, and any extra components of the output will be ignored.

15.1.4. Location Assignment

This section describes location assignments for user-defined variables and how many locations are consumed by a given user-variable type. As mentioned above, some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This outer array level is removed from the type before considering how many locations the type consumes.

The Location value specifies an interface slot comprised of a 32-bit four-component vector conveyed between stages. The Component specifies components within these vector locations. Only types with widths of 16, 32 or 64 are supported in shader interfaces.

Inputs and outputs of the following types consume a single interface location:

- 16-bit scalar and vector types, and
- 32-bit scalar and vector types, and
- 64-bit scalar and 2-component vector types.

64-bit three- and four-component vectors consume two consecutive locations.

If a declared input or output is an array of size \( n \) and each element takes \( m \) locations, it will be assigned \( m \times n \) consecutive locations starting with the location specified.
If the declared input or output is an \( n \times m \) 16-, 32- or 64-bit matrix, it will be assigned multiple locations starting with the location specified. The number of locations assigned for each matrix will be the same as for an \( n \)-element array of \( m \)-component vectors.

An \texttt{OpVariable} with a structure type that is not a block must be decorated with a \texttt{Location}.

When an \texttt{OpVariable} with a structure type (either block or non-block) is decorated with a \texttt{Location}, the members in the structure type \textbf{must} not be decorated with a \texttt{Location}. The \texttt{OpVariable}'s members are assigned consecutive locations in declaration order, starting from the first member, which is assigned the location decoration from the \texttt{OpVariable}.

When a block-type \texttt{OpVariable} is declared without a \texttt{Location} decoration, each member in its structure type \textbf{must} be decorated with a \texttt{Location}. Types nested deeper than the top-level members \textbf{must} not have \texttt{Location} decorations.

The locations consumed by block and structure members are determined by applying the rules above in a depth-first traversal of the instantiated members as though the structure or block member were declared as an input or output variable of the same type.

Any two inputs listed as operands on the same \texttt{OpEntryPoint} \textbf{must} not be assigned the same location, either explicitly or implicitly. Any two outputs listed as operands on the same \texttt{OpEntryPoint} \textbf{must} not be assigned the same location, either explicitly or implicitly.

The number of input and output locations available for a shader input or output interface are limited, and dependent on the shader stage as described in \textit{Shader Input and Output Locations}. All variables in both the \texttt{built-in interface block} and the \texttt{user-defined variable interface} count against these limits. Each effective \texttt{Location} \textbf{must} have a value less than the number of locations available for the given interface, as specified in the "Locations Available" column in \textit{Shader Input and Output Locations}.

\begin{table}[!h]
\centering
\caption{Shader Input and Output Locations}
\begin{tabular}{|l|l|}
\hline
\textbf{Shader Interface} & \textbf{Locations Available} \\
\hline
vertex input & \texttt{maxVertexInputAttributes} \\
vertex output & \texttt{maxVertexOutputComponents} / \texttt{4} \\
tessellation control input & \texttt{maxTessellationControlPerVertexInputComponents} / \texttt{4} \\
tessellation control output & \texttt{maxTessellationControlPerVertexOutputComponents} / \texttt{4} \\
tessellation evaluation input & \texttt{maxTessellationEvaluationInputComponents} / \texttt{4} \\
tessellation evaluation output & \texttt{maxTessellationEvaluationOutputComponents} / \texttt{4} \\
geometry input & \texttt{maxGeometryInputComponents} / \texttt{4} \\
geometry output & \texttt{maxGeometryOutputComponents} / \texttt{4} \\
fragment input & \texttt{maxFragmentInputComponents} / \texttt{4} \\
fragment output & \texttt{maxFragmentOutputAttachments} \\
\hline
\end{tabular}
\end{table}
### 15.1.5. Component Assignment

The Component decoration allows the Location to be more finely specified for scalars and vectors, down to the individual components within a location that are consumed. The components within a location are 0, 1, 2, and 3. A variable or block member starting at component N will consume components N, N+1, N+2, ... up through its size. For 16-, and 32-bit types, it is invalid if this sequence of components gets larger than 3. A scalar 64-bit type will consume two of these components in sequence, and a two-component 64-bit vector type will consume all four components available within a location. A three- or four-component 64-bit vector type must not specify a Component decoration. A three-component 64-bit vector type will consume all four components of the first location and components 0 and 1 of the second location. This leaves components 2 and 3 available for other component-qualified declarations.

A scalar or two-component 64-bit data type must not specify a Component decoration of 1 or 3. A Component decoration must not be specified for any type that is not a scalar or vector.

### 15.2. Vertex Input Interface

When the vertex stage is present in a pipeline, the vertex shader input variables form an interface with the vertex input attributes. The vertex shader input variables are matched by the Location and Component decorations to the vertex input attributes specified in the pVertexInputState member of the VkGraphicsPipelineCreateInfo structure.

The vertex shader input variables listed by OpEntryPoint with the Input storage class form the vertex input interface. These variables must be identified with a Location decoration and can also be identified with a Component decoration.

For the purposes of interface matching: variables declared without a Component decoration are considered to have a Component decoration of zero. The number of available vertex input locations is given by the maxVertexInputAttributes member of the VkPhysicalDeviceLimits structure.

See Attribute Location and Component Assignment for details.

All vertex shader inputs declared as above must have a corresponding attribute and binding in the pipeline.

### 15.3. Fragment Output Interface

When the fragment stage is present in a pipeline, the fragment shader outputs form an interface with the output attachments of the current subpass. The fragment shader output variables are matched by the Location and Component decorations to the color attachments specified in the pColorAttachments array of the VkSubpassDescription structure describing the subpass that the fragment shader is executed in.

The fragment shader output variables listed by OpEntryPoint with the Output storage class form the...
fragment output interface. These variables must be identified with a Location decoration. They can also be identified with a Component decoration and/or an Index decoration. For the purposes of interface matching: variables declared without a Component decoration are considered to have a Component decoration of zero, and variables declared without an Index decoration are considered to have an Index decoration of zero.

A fragment shader output variable identified with a Location decoration of \( i \) is directed to the color attachment indicated by \( \text{pColorAttachments}[i] \), after passing through the blending unit as described in Blending, if enabled. Locations are consumed as described in Location Assignment. The number of available fragment output locations is given by the \( \text{maxFragmentOutputAttachments} \) member of the \( \text{VkPhysicalDeviceLimits} \) structure.

Components of the output variables are assigned as described in Component Assignment. Output components identified as 0, 1, 2, and 3 will be directed to the R, G, B, and A inputs to the blending unit, respectively, or to the output attachment if blending is disabled. If two variables are placed within the same location, they must have the same underlying type (floating-point or integer). The input values to blending or color attachment writes are undefined for components which do not correspond to a fragment shader output.

Fragment outputs identified with an Index of zero are directed to the first input of the blending unit associated with the corresponding Location. Outputs identified with an Index of one are directed to the second input of the corresponding blending unit.

No component aliasing of output variables is allowed, that is there must not be two output variables which have the same location, component, and index, either explicitly declared or implied.

Output values written by a fragment shader must be declared with either OpTypeFloat or OpTypeInt, and a Width of 32. If storageInputOutput16 is supported, output values written by a fragment shader can be also declared with either OpTypeFloat or OpTypeInt and a Width of 16. Composites of these types are also permitted. If the color attachment has a signed or unsigned normalized fixed-point format, color values are assumed to be floating-point and are converted to fixed-point as described in Conversion from Floating-Point to Normalized Fixed-Point; If the color attachment has an integer format, color values are assumed to be integers and converted to the bit-depth of the target. Any value that cannot be represented in the attachment’s format is undefined. For any other attachment format no conversion is performed. If the type of the values written by the fragment shader do not match the format of the corresponding color attachment, the resulting values are undefined for those components.

15.4. Fragment Input Attachment Interface

When a fragment stage is present in a pipeline, the fragment shader subpass inputs form an interface with the input attachments of the current subpass. The fragment shader subpass input variables are matched by InputAttachmentIndex decorations to the input attachments specified in the pInputAttachments array of the VkSubpassDescription structure describing the subpass that the fragment shader is executed in.

The fragment shader subpass input variables with the UniformConstant storage class and a decoration of InputAttachmentIndex that are statically used by OpEntryPoint form the fragment input attachment interface. These variables must be declared with a type of OpTypeImage, a Dim operand of
SubpassData, and a **Sampled** operand of 2.

A subpass input variable identified with an **InputAttachmentIndex** decoration of \( i \) reads from the input attachment indicated by \( p\text{InputAttachments}[i] \) member of \( \text{VkSubpassDescription} \). If the subpass input variable is declared as an array of size \( N \), it consumes \( N \) consecutive input attachments, starting with the index specified. There **must** not be more than one input variable with the same **InputAttachmentIndex** whether explicitly declared or implied by an array declaration. The number of available input attachment indices is given by the \( \text{maxPerStageDescriptorInputAttachments} \) member of the \( \text{VkPhysicalDeviceLimits} \) structure.

Variables identified with the **InputAttachmentIndex** **must** only be used by a fragment stage. The basic data type (floating-point, integer, unsigned integer) of the subpass input **must** match the basic format of the corresponding input attachment, or the values of subpass loads from these variables are undefined.

See [Input Attachment](#) for more details.

### 15.5. Ray Tracing Pipeline Interface

Ray tracing pipelines **may** have more stages than other pipelines with multiple instances of each stage and more dynamic interactions between the stages, but still have interface structures that obey the same general rules as interfaces between shader stages in other pipelines. The three types of inter-stage interface variables for ray tracing pipelines are:

- Ray payloads which contain data tracked for the entire lifetime of the ray.
- Hit attributes which contain data about a specific hit for the duration of its processing.
- Callable data for passing data into and out of a callable shader.

Ray payloads and callable data are used in explicit shader call instructions, so they have an incoming variant to distinguish the parameter passed to the invocation from any other payloads or data being used by subsequent shader call instructions.

An interface structure used between stages **must** match between the stages using it. Specifically:

- The hit attribute structure read in an any-hit or closest hit shader **must** be the same structure as the hit attribute structure written in the corresponding intersection shader in the same hit group.
- The incoming callable data for a callable shader **must** be the same structure as the callable data referenced by the execute callable instruction in the calling shader.
- The ray payload for a shader invoked by a trace ray command **must** be the same structure for all shader stages using the payload for that ray.

Any shader with an incoming ray payload, incoming callable data, or hit attribute **must** only declare one variable of that type.

### 15.6. Shader Resource Interface

When a shader stage accesses buffer or image resources, as described in the Resource Descriptors section, the shader resource variables must be matched with the pipeline layout that is provided at pipeline creation time.

The set of shader variables that form the shader resource interface for a stage are the variables statically used by that stage's `OpEntryPoint` with a storage class of `Uniform`, `UniformConstant`, `StorageBuffer`, or `PushConstant`. For the fragment shader, this includes the fragment input attachment interface.

The shader resource interface consists of two sub-interfaces: the push constant interface and the descriptor set interface.

#### 15.6.1. Push Constant Interface

The shader variables defined with a storage class of `PushConstant` that are statically used by the shader entry points for the pipeline define the push constant interface. They must be:

- typed as `OpTypeStruct`,
- identified with a `Block` decoration, and
- laid out explicitly using the `Offset`, `ArrayStride`, and `MatrixStride` decorations as specified in Offset and Stride Assignment.

There must be no more than one push constant block statically used per shader entry point.

Each statically used member of a push constant block must be placed at an `Offset` such that the entire member is entirely contained within the `VkPushConstantRange` for each `OpEntryPoint` that uses it, and the `stageFlags` for that range must specify the appropriate `VkShaderStageFlagBits` for that stage. The `Offset` decoration for any member of a push constant block must not cause the space required for that member to extend outside the range \([0, \text{maxPushConstantsSize}]\).

Any member of a push constant block that is declared as an array must only be accessed with dynamically uniform indices.
15.6.2. Descriptor Set Interface

The descriptor set interface is comprised of the shader variables with the storage class of StorageBuffer, Uniform or UniformConstant (including the variables in the fragment input attachment interface) that are statically used by the shader entry points for the pipeline.

These variables must have DescriptorSet and Binding decorations specified, which are assigned and matched with the VkDescriptorSetLayout objects in the pipeline layout as described in DescriptorSet and Binding Assignment.

The Image Format of an OpTypeImage declaration must not be Unknown, for variables which are used for OpImageRead, OpImageSparseRead, or OpImageWrite operations, except under the following conditions:

- For OpImageWrite, if the shaderStorageImageWriteWithoutFormat feature is enabled and the shader module declares the StorageImageWriteWithoutFormat capability.
- For OpImageRead or OpImageSparseRead, if the shaderStorageImageReadWithoutFormat feature is enabled and the shader module declares the StorageImageReadWithoutFormat capability.
- For OpImageRead, if Dim is SubpassData (indicating a read from an input attachment).

The Image Format of an OpTypeImage declaration must not be Unknown, for variables which are used for OpAtomic* operations.

Variables identified with the Uniform storage class are used to access transparent buffer backed resources. Such variables must be:

- typed as OpTypeStruct, or an array of this type,
- identified with a Block or BufferBlock decoration, and
- laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

Variables identified with the StorageBuffer storage class are used to access transparent buffer backed resources. Such variables must be:

- typed as OpTypeStruct, or an array of this type,
- identified with a Block decoration, and
- laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

The Offset decoration for any member of a Block-decorated variable in the Uniform storage class must not cause the space required for that variable to extend outside the range [0, maxUniformBufferRange). The Offset decoration for any member of a Block-decorated variable in the StorageBuffer storage class must not cause the space required for that variable to extend outside the range [0, maxStorageBufferRange).

Variables identified with the Uniform storage class can also be used to access transparent descriptor set backed resources when the variable is assigned to a descriptor set layout binding with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT. In this case the variable must be
typed as `OpTypeStruct` and **cannot** be aggregated into arrays of that type. Further, the `Offset` decoration for any member of such a variable **must** not cause the space required for that variable to extend outside the range \([0, \text{maxInlineUniformBlockSize}]\).

Variables identified with a storage class of `UniformConstant` and a decoration of `InputAttachmentIndex` **must** be declared as described in *Fragment Input Attachment Interface*.

SPIR-V variables decorated with a descriptor set and binding that identify a combined image sampler descriptor **can** have a type of `OpTypeImage`, `OpTypeSampler (Sampled=1)`, or `OpTypeSampledImage`. Arrays of any of these types **can** be indexed with *constant integral expressions*. The following features **must** be enabled and capabilities **must** be declared in order to index such arrays with dynamically uniform or non-uniform indices:

- **Storage images (except storage texel buffers and input attachments):**
  - Dynamically uniform: `shaderStorageImageArrayDynamicIndexing` and `StorageImageArrayDynamicIndexing`
  - Non-uniform: `shaderStorageImageArrayNonUniformIndexing` and `StorageImageArrayNonUniformIndexing`

- **Storage texel buffers:**
  - Dynamically uniform: `shaderStorageTexelBufferArrayDynamicIndexing` and `StorageTexelBufferArrayDynamicIndexing`
  - Non-uniform: `shaderStorageTexelBufferArrayNonUniformIndexing` and `StorageTexelBufferArrayNonUniformIndexing`

- **Input attachments:**
  - Dynamically uniform: `shaderInputAttachmentArrayDynamicIndexing` and `InputAttachmentArrayDynamicIndexing`
  - Non-uniform: `shaderInputAttachmentArrayNonUniformIndexing` and `InputAttachmentArrayNonUniformIndexing`

- **Sampled images (except uniform texel buffers), samplers and combined image samplers:**
  - Dynamically uniform: `shaderSampledImageArrayDynamicIndexing` and `SampledImageArrayDynamicIndexing`
  - Non-uniform: `shaderSampledImageArrayNonUniformIndexing` and `SampledImageArrayNonUniformIndexing`

- **Uniform texel buffers:**
  - Dynamically uniform: `shaderUniformTexelBufferArrayDynamicIndexing` and `UniformTexelBufferArrayDynamicIndexing`
  - Non-uniform: `shaderUniformTexelBufferArrayNonUniformIndexing` and `UniformTexelBufferArrayNonUniformIndexing`

- **Uniform buffers:**
  - Dynamically uniform: `shaderUniformBufferArrayDynamicIndexing` and `UniformBufferArrayDynamicIndexing`
  - Non-uniform: `shaderUniformBufferArrayNonUniformIndexing` and `UniformBufferArrayNonUniformIndexing`

- **Storage buffers:**
- Dynamically uniform: \texttt{shaderStorageBufferArrayDynamicIndexing} and \texttt{StorageBufferArrayDynamicIndexing}
- Non-uniform: \texttt{shaderStorageBufferArrayNonUniformIndexing} and \texttt{StorageBufferArrayNonUniformIndexing}

- Acceleration structures:
  - Dynamically uniform: Always supported.
  - Non-uniform: Always supported.

If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is not dynamically uniform, then the corresponding non-uniform indexing feature \textbf{must} be enabled and the capability \textbf{must} be declared. If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is loaded from an array element with a non-constant index, then the corresponding dynamic or non-uniform indexing feature \textbf{must} be enabled and the capability \textbf{must} be declared.

If the combined image sampler enables sampler Y'\textsubscript{C}b\textsubscript{C}r conversion or samples a \textit{subsampled image}, it \textbf{must} be indexed only by constant integral expressions when aggregated into arrays in shader code, irrespective of the \texttt{shaderSampledImageArrayDynamicIndexing} feature.

1002 | Chapter 15. Shader Interfaces
### 15.6.3. DescriptorSet and Binding Assignment

A variable decorated with a `DescriptorSet` decoration of `s` and a `Binding` decoration of `b` indicates that this variable is associated with the `VkDescriptorSetLayoutBinding` that has a `binding` equal to `b` in `pSetLayouts[s]` that was specified in `VkPipelineLayoutCreateInfo`.

`DescriptorSet` decoration values **must** be between zero and `maxBoundDescriptorSets` minus one, inclusive. `Binding` decoration values **can** be any 32-bit unsigned integer value, as described in `Descriptor Set Layout`. Each descriptor set has its own binding name space.

If the `Binding` decoration is used with an array, the entire array is assigned that binding value. The array **must** be a single-dimensional array and size of the array **must** be no larger than the number of descriptors in the binding. If the array is runtime-sized, then array elements greater than or equal to the size of that binding in the bound descriptor set **must** not be used. If the array is runtime-sized, the `runtimeDescriptorArray` feature **must** be enabled and the `RuntimeDescriptorArray` capability **must** be declared. The index of each element of the array is referred to as the `arrayElement`. For the purposes of interface matching and descriptor set operations, if a resource variable is not an array, it is treated as if it has an `arrayElement` of zero.
There is a limit on the number of resources of each type that can be accessed by a pipeline stage as shown in Shader Resource Limits. The “Resources Per Stage” column gives the limit on the number each type of resource that can be statically used for an entry point in any given stage in a pipeline. The “Resource Types” column lists which resource types are counted against the limit. Some resource types count against multiple limits. The VK_DESCRIPTOR_TYPE_MUTABLEVALVE descriptor type counts as one individual resource and one for every unique resource limit per descriptor set type that is present in the associated binding’s stype:VkMutableDescriptorTypeListVALVE. If multiple descriptor types in stype:VkMutableDescriptorTypeListVALVE map to the same resource limit, only one descriptor is consumed for purposes of computing resource limits.

The pipeline layout may include descriptor sets and bindings which are not referenced by any variables statically used by the entry points for the shader stages in the binding’s stageflags.

However, if a variable assigned to a given DescriptorSet and Binding is statically used by the entry point for a shader stage, the pipeline layout must contain a descriptor set layout binding in that descriptor set layout and for that binding number, and that binding’s stageflags must include the appropriate VkShadingStageFlagBits for that stage. The variable must be of a valid resource type determined by its SPIR-V type and storage class, as defined in Shader Resource and Storage Class Correspondence. The descriptor set layout binding must be of a corresponding descriptor type, as defined in Shader Resource and Descriptor Type Correspondence.

Note
There are no limits on the number of shader variables that can have overlapping set and binding values in a shader; but which resources are statically used has an impact. If any shader variable identifying a resource is statically used in a shader, then the underlying descriptor bound at the declared set and binding must support the declared type in the shader when the shader executes.

If multiple shader variables are declared with the same set and binding values, and with the same underlying descriptor type, they can all be statically used within the same shader. However, accesses are not automatically synchronized, and Aliased decorations should be used to avoid data hazards (see section 2.18.2 Aliasing in the SPIR-V specification).

If multiple shader variables with the same set and binding values are declared in a single shader, but with different declared types, where any of those are not supported by the relevant bound descriptor, that shader can only be executed if the variables with the unsupported type are not statically used.

A noteworthy example of using multiple statically-used shader variables sharing the same descriptor set and binding values is a descriptor of type VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER that has multiple corresponding shader variables in the UniformConstant storage class, where some could be OpTypeImage (Sampled=1), some could be OpTypeSampler, and some could be OpTypeSampledImage.

Table 23. Shader Resource Limits
### Resources per Stage

| maxPerStageDescriptorSamplers or maxPerStageDescriptorUpdateAfterBindSamplers | sampler |
| maxPerStageDescriptorSampledImages or maxPerStageDescriptorUpdateAfterBindSampledImages | combined image sampler |
| maxPerStageDescriptorStorageImages or maxPerStageDescriptorUpdateAfterBindStorageImages | sampled image |
| maxPerStageDescriptorUniformBuffers or maxPerStageDescriptorUpdateAfterBindUniformBuffers | combined image sampler |
| maxPerStageDescriptorStorageBuffers or maxPerStageDescriptorUpdateAfterBindStorageBuffers | uniform texel buffer |
| maxPerStageDescriptorInputAttachments or maxPerStageDescriptorUpdateAfterBindInputAttachments | storage image |
| maxPerStageDescriptorInlineUniformBlocks or maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks | storage texel buffer |
| VkPhysicalDeviceRayTracingPropertiesNV::maxDescriptorSetAccelerationStructures or maxPerStageDescriptorAccelerationStructures or maxPerStageDescriptorUpdateAfterBindAccelerationStructures | uniform buffer |
| VkPhysicalDeviceRayTracingPropertiesNV::maxDescriptorSetAccelerationStructures or maxPerStageDescriptorAccelerationStructures or maxPerStageDescriptorUpdateAfterBindAccelerationStructures | storage buffer dynamic |
| VkPhysicalDeviceRayTracingPropertiesNV::maxDescriptorSetAccelerationStructures or maxPerStageDescriptorAccelerationStructures or maxPerStageDescriptorUpdateAfterBindAccelerationStructures | storage buffer dynamic |
| maxPerStageDescriptorInputAttachments or maxPerStageDescriptorUpdateAfterBindInputAttachments | input attachment¹ |
| maxPerStageDescriptorInlineUniformBlocks or maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks | inline uniform block |

¹ Input attachments can only be used in the fragment shader stage

### 15.6.4. Offset and Stride Assignment

Certain objects must be explicitly laid out using the Offset, ArrayStride, and MatrixStride, as described in SPIR-V explicit layout validation rules. All such layouts also must conform to the following requirements.

#### Note

The numeric order of Offset decorations does not need to follow member declaration order.

### Alignment Requirements

There are different alignment requirements depending on the specific resources and on the features enabled on the device.
The **scalar alignment** of the type of an `OpTypeStruct` member is defined recursively as follows:

- A scalar of size N has a scalar alignment of N.
- A vector or matrix type has a scalar alignment equal to that of its component type.
- An array type has a scalar alignment equal to that of its element type.
- A structure has a scalar alignment equal to the largest scalar alignment of any of its members.

The **base alignment** of the type of an `OpTypeStruct` member is defined recursively as follows:

- A scalar has a base alignment equal to its scalar alignment.
- A two-component vector has a base alignment equal to twice its scalar alignment.
- A three- or four-component vector has a base alignment equal to four times its scalar alignment.
- An array has a base alignment equal to the base alignment of its element type.
- A structure has a base alignment equal to the largest base alignment of any of its members.
- A row-major matrix of C columns has a base alignment equal to the base alignment of a vector of C matrix components.
- A column-major matrix has a base alignment equal to the base alignment of the matrix column type.

The **extended alignment** of the type of an `OpTypeStruct` member is similarly defined as follows:

- A scalar, vector or matrix type has an extended alignment equal to its base alignment.
- An array or structure type has an extended alignment equal to the largest extended alignment of any of its members, rounded up to a multiple of 16.

A member is defined to **improperly straddle** if either of the following are true:

- It is a vector with total size less than or equal to 16 bytes, and has Offset decorations placing its first byte at F and its last byte at L, where floor(F / 16) != floor(L / 16).
- It is a vector with total size greater than 16 bytes and has its Offset decorations placing its first byte at a non-integer multiple of 16.

**Standard Buffer Layout**

Every member of an `OpTypeStruct` that is required to be explicitly laid out must be aligned according to the first matching rule as follows. If the struct is contained in pointer types of multiple storage classes, it must satisfy the requirements for every storage class used to reference it.

1. If the `scalarBlockLayout` feature is enabled on the device and the storage class is Uniform, StorageBuffer, PhysicalStorageBuffer, ShaderRecordBufferKHR, or PushConstant then every member must be aligned according to its scalar alignment.
2. If the `workgroupMemoryExplicitLayoutScalarBlockLayout` feature is enabled on the device and the storage class is Workgroup then every member must be aligned according to its scalar alignment.
3. All vectors must be aligned according to their scalar alignment.
4. If the `uniformBufferStandardLayout` feature is not enabled on the device, then any member of an
OpTypeStruct with a storage class of Uniform and a decoration of Block must be aligned according to its extended alignment.

5. Every other member must be aligned according to its base alignment.

**Note**
Even if scalar alignment is supported, it is generally more performant to use the base alignment.

The memory layout must obey the following rules:

- The Offset decoration of any member must be a multiple of its alignment.
- Any ArrayStride or MatrixStride decoration must be a multiple of the alignment of the array or matrix as defined above.

If one of the conditions below applies

- The storage class is Uniform, StorageBuffer, PhysicalStorageBuffer, ShaderRecordBufferKHR, or PushConstant, and the scalarBlockLayout feature is not enabled on the device.
- The storage class is Workgroup, and either the struct member is not part of a Block or the workgroupMemoryExplicitLayoutScalarBlockLayout feature is not enabled on the device.
- The storage class is any other storage class.

the memory layout must also obey the following rules:

- Vectors must not improperly straddle, as defined above.
- The Offset decoration of a member must not place it between the end of a structure or an array and the next multiple of the alignment of that structure or array.

**Note**
The std430 layout in GLSL satisfies these rules for types using the base alignment. The std140 layout satisfies the rules for types using the extended alignment.

### 15.7. Built-In Variables

Built-in variables are accessed in shaders by declaring a variable decorated with a BuiltIn SPIR-V decoration. The meaning of each BuiltIn decoration is as follows. In the remainder of this section, the name of a built-in is used interchangeably with a term equivalent to a variable decorated with that particular built-in. Built-ins that represent integer values can be declared as either signed or unsigned 32-bit integers.

As mentioned above, some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This level of arrayness is not included in the type descriptions below, but must be included when declaring the built-in.

**BaryCoordNV**

The BaryCoordNV decoration can be used to decorate a fragment shader input variable. This
variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using perspective interpolation.

**Valid Usage**

- **VUID-BaryCoordNV-BaryCoordNV-04154**
  The *BaryCoordNV* decoration must be used only within the Fragment Execution Model

- **VUID-BaryCoordNV-BaryCoordNV-04155**
  The variable decorated with *BaryCoordNV* must be declared using the Input Storage Class

- **VUID-BaryCoordNV-BaryCoordNV-04156**
  The variable decorated with *BaryCoordNV* must be declared as a three-component vector of 32-bit floating-point values

**BaryCoordNoPerspAMD**

The *BaryCoordNoPerspAMD* decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at the fragment’s center. The K coordinate of the barycentric coordinates can be derived given the identity I + J + K = 1.0.

**Valid Usage**

- **VUID-BaryCoordNoPerspAMD-BaryCoordNoPerspAMD-04157**
  The *BaryCoordNoPerspAMD* decoration must be used only within the Fragment Execution Model

- **VUID-BaryCoordNoPerspAMD-BaryCoordNoPerspAMD-04158**
  The variable decorated with *BaryCoordNoPerspAMD* must be declared using the Input Storage Class

- **VUID-BaryCoordNoPerspAMD-BaryCoordNoPerspAMD-04159**
  The variable decorated with *BaryCoordNoPerspAMD* must be declared as a two-component vector of 32-bit floating-point values

**BaryCoordNoPerspNV**

The *BaryCoordNoPerspNV* decoration can be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using linear interpolation.
**Valid Usage**

- VUID-BaryCoordNoPerspNV-BaryCoordNoPerspNV-04160
  The `BaryCoordNoPerspNV` decoration **must** be used only within the Fragment Execution Model

- VUID-BaryCoordNoPerspNV-BaryCoordNoPerspNV-04161
  The variable decorated with `BaryCoordNoPerspNV` **must** be declared using the Input Storage Class

- VUID-BaryCoordNoPerspNV-BaryCoordNoPerspNV-04162
  The variable decorated with `BaryCoordNoPerspNV` **must** be declared as a three-component vector of 32-bit floating-point values

**BaryCoordNoPerspCentroidAMD**

The `BaryCoordNoPerspCentroidAMD` decoration **can** be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at the centroid. The K coordinate of the barycentric coordinates **can** be derived given the identity I + J + K = 1.0.

**Valid Usage**

- VUID-BaryCoordNoPerspCentroidAMD-BaryCoordNoPerspCentroidAMD-04163
  The `BaryCoordNoPerspCentroidAMD` decoration **must** be used only within the Fragment Execution Model

- VUID-BaryCoordNoPerspCentroidAMD-BaryCoordNoPerspCentroidAMD-04164
  The variable decorated with `BaryCoordNoPerspCentroidAMD` **must** be declared using the Input Storage Class

- VUID-BaryCoordNoPerspCentroidAMD-BaryCoordNoPerspCentroidAMD-04165
  The variable decorated with `BaryCoordNoPerspCentroidAMD` **must** be declared as a three-component vector of 32-bit floating-point values

**BaryCoordNoPerspSampleAMD**

The `BaryCoordNoPerspSampleAMD` decoration **can** be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at each covered sample. The K coordinate of the barycentric coordinates **can** be derived given the identity I + J + K = 1.0.
BaryCoordNoPerspSampleAMD

The BaryCoordNoPerspSampleAMD decoration must be used only within the Fragment Execution Model.

The variable decorated with BaryCoordNoPerspSampleAMD must be declared using the Input Storage Class.

The variable decorated with BaryCoordNoPerspSampleAMD must be declared as a two-component vector of 32-bit floating-point values.

BaryCoordPullModelAMD

The BaryCoordPullModelAMD decoration can be used to decorate a fragment shader input variable. This variable will contain \((1/W, 1/I, 1/J)\) evaluated at the fragment center and can be used to calculate gradients and then interpolate I, J, and W at any desired sample location.

Valid Usage

- VUID-BaryCoordPullModelAMD-BaryCoordPullModelAMD-04169
  The BaryCoordPullModelAMD decoration must be used only within the Fragment Execution Model.

- VUID-BaryCoordPullModelAMD-BaryCoordPullModelAMD-04170
  The variable decorated with BaryCoordPullModelAMD must be declared using the Input Storage Class.

- VUID-BaryCoordPullModelAMD-BaryCoordPullModelAMD-04171
  The variable decorated with BaryCoordPullModelAMD must be declared as a three-component vector of 32-bit floating-point values.

BaryCoordSmoothAMD

The BaryCoordSmoothAMD decoration can be used to decorate a fragment shader input variable. This variable will contain the \((I, J)\) pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at the fragment's center. The K coordinate of the barycentric coordinates can be derived given the identity \(I + J + K = 1.0\).
Valid Usage

- VUID-BaryCoordSmoothAMD-BaryCoordSmoothAMD-04172
  The **BaryCoordSmoothAMD** decoration **must** be used only within the *Fragment Execution Model*

- VUID-BaryCoordSmoothAMD-BaryCoordSmoothAMD-04173
  The variable decorated with **BaryCoordSmoothAMD** **must** be declared using the *Input Storage Class*

- VUID-BaryCoordSmoothAMD-BaryCoordSmoothAMD-04174
  The variable decorated with **BaryCoordSmoothAMD** **must** be declared as a two-component vector of 32-bit floating-point values

**BaryCoordSmoothCentroidAMD**

The **BaryCoordSmoothCentroidAMD** decoration **can** be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at the centroid. The K coordinate of the barycentric coordinates **can** be derived given the identity \( I + J + K = 1.0 \).

Valid Usage

- VUID-BaryCoordSmoothCentroidAMD-BaryCoordSmoothCentroidAMD-04175
  The **BaryCoordSmoothCentroidAMD** decoration **must** be used only within the *Fragment Execution Model*

- VUID-BaryCoordSmoothCentroidAMD-BaryCoordSmoothCentroidAMD-04176
  The variable decorated with **BaryCoordSmoothCentroidAMD** **must** be declared using the *Input Storage Class*

- VUID-BaryCoordSmoothCentroidAMD-BaryCoordSmoothCentroidAMD-04177
  The variable decorated with **BaryCoordSmoothCentroidAMD** **must** be declared as a two-component vector of 32-bit floating-point values

**BaryCoordSmoothSampleAMD**

The **BaryCoordSmoothSampleAMD** decoration **can** be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at each covered sample. The K coordinate of the barycentric coordinates **can** be derived given the identity \( I + J + K = 1.0 \).
Valid Usage

- VUID-BaryCoordSmoothSampleAMD-BaryCoordSmoothSampleAMD-04178
  The `BaryCoordSmoothSampleAMD` decoration must be used only within the Fragment Execution Model

- VUID-BaryCoordSmoothSampleAMD-BaryCoordSmoothSampleAMD-04179
  The variable decorated with `BaryCoordSmoothSampleAMD` must be declared using the Input Storage Class

- VUID-BaryCoordSmoothSampleAMD-BaryCoordSmoothSampleAMD-04180
  The variable decorated with `BaryCoordSmoothSampleAMD` must be declared as a two-component vector of 32-bit floating-point values

BaseInstance

Decorating a variable with the `BaseInstance` built-in will make that variable contain the integer value corresponding to the first instance that was passed to the command that invoked the current vertex shader invocation. `BaseInstance` is the `firstInstance` parameter to a direct drawing command or the `firstInstance` member of a structure consumed by an indirect drawing command.

Valid Usage

- VUID-BaseInstance-BaseInstance-04181
  The `BaseInstance` decoration must be used only within the Vertex Execution Model

- VUID-BaseInstance-BaseInstance-04182
  The variable decorated with `BaseInstance` must be declared using the Input Storage Class

- VUID-BaseInstance-BaseInstance-04183
  The variable decorated with `BaseInstance` must be declared as a scalar 32-bit integer value

BaseVertex

Decorating a variable with the `BaseVertex` built-in will make that variable contain the integer value corresponding to the first vertex or vertex offset that was passed to the command that invoked the current vertex shader invocation. For non-indexed drawing commands, this variable is the `firstVertex` parameter to a direct drawing command or the `firstVertex` member of the structure consumed by an indirect drawing command. For indexed drawing commands, this variable is the `vertexOffset` parameter to a direct drawing command or the `vertexOffset` member of the structure consumed by an indirect drawing command.
Valid Usage

- VUID-BaseVertex-BaseVertex-04184
  The `BaseVertex` decoration must be used only within the Vertex Execution Model

- VUID-BaseVertex-BaseVertex-04185
  The variable decorated with `BaseVertex` must be declared using the Input Storage Class

- VUID-BaseVertex-BaseVertex-04186
  The variable decorated with `BaseVertex` must be declared as a scalar 32-bit integer value

**ClipDistance**

Decorating a variable with the `ClipDistance` built-in decoration will make that variable contain the mechanism for controlling user clipping. `ClipDistance` is an array such that the \(i^{th}\) element of the array specifies the clip distance for plane \(i\). A clip distance of 0 means the vertex is on the plane, a positive distance means the vertex is inside the clip half-space, and a negative distance means the vertex is outside the clip half-space.

**Note**
The array variable decorated with `ClipDistance` is explicitly sized by the shader.

**Note**
In the last vertex processing stage, these values will be linearly interpolated across the primitive and the portion of the primitive with interpolated distances less than 0 will be considered outside the clip volume. If `ClipDistance` is then used by a fragment shader, `ClipDistance` contains these linearly interpolated values.
Valid Usage

- **VUID-ClipDistance-ClipDistance-04187**
  The `ClipDistance` decoration **must** be used only within the `MeshNV`, `Vertex`, `Fragment`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`

- **VUID-ClipDistance-ClipDistance-04188**
  The variable decorated with `ClipDistance` within the `MeshNV` or `Vertex Execution Model` **must** be declared using the `Output Storage Class`

- **VUID-ClipDistance-ClipDistance-04189**
  The variable decorated with `ClipDistance` within the `Fragment Execution Model` **must** be declared using the `Input Storage Class`

- **VUID-ClipDistance-ClipDistance-04190**
  The variable decorated with `ClipDistance` within the `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model` **must** not be declared in a `Storage Class` other than `Input` or `Output`

- **VUID-ClipDistance-ClipDistance-04191**
  The variable decorated with `ClipDistance` **must** be declared as an array of 32-bit floating-point values

**ClipDistancePerViewNV**

Decorating a variable with the `ClipDistancePerViewNV` built-in decoration will make that variable contain the per-view clip distances. The per-view clip distances have the same semantics as `ClipDistance`.

Valid Usage

- **VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04192**
  The `ClipDistancePerViewNV` decoration **must** be used only within the `MeshNV Execution Model`

- **VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04193**
  The variable decorated with `ClipDistancePerViewNV` **must** be declared using the `Output Storage Class`

- **VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04194**
  The variable decorated with `ClipDistancePerViewNV` **must** also be decorated with the `PerViewNV` decoration.

- **VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04195**
  The variable decorated with `ClipDistancePerViewNV` **must** be declared as a two-dimensional array of 32-bit floating-point values

**CullDistance**

Decorating a variable with the `CullDistance` built-in decoration will make that variable contain the mechanism for controlling user culling. If any member of this array is assigned a negative value for all vertices belonging to a primitive, then the primitive is discarded before rasterization.
Note
In fragment shaders, the values of the CullDistance array are linearly interpolated across each primitive.

Note
If CullDistance decorates an input variable, that variable will contain the corresponding value from the CullDistance decorated output variable from the previous shader stage.

Valid Usage

- VUID-CullDistance-CullDistance-04196
  The CullDistance decoration must be used only within the MeshNV, Vertex, Fragment, TessellationControl, TessellationEvaluation, or Geometry Execution Model.

- VUID-CullDistance-CullDistance-04197
  The variable decorated with CullDistance within the MeshNV or Vertex Execution Model must be declared using the Output Storage Class.

- VUID-CullDistance-CullDistance-04198
  The variable decorated with CullDistance within the Fragment Execution Model must be declared using the Input Storage Class.

- VUID-CullDistance-CullDistance-04199
  The variable decorated with CullDistance within the TessellationControl, TessellationEvaluation, or Geometry Execution Model must not be declared using a Storage Class other than Input or Output.

- VUID-CullDistance-CullDistance-04200
  The variable decorated with CullDistance must be declared as an array of 32-bit floating-point values.

CullDistancePerViewNV
Decorating a variable with the CullDistancePerViewNV built-in decoration will make that variable contain the per-view cull distances. The per-view clip distances have the same semantics as CullDistance.
Valid Usage

- VUID-CullDistancePerViewNV-CullDistancePerViewNV-04201
  The `CullDistancePerViewNV` decoration must be used only within the `MeshNV Execution Model`.

- VUID-CullDistancePerViewNV-CullDistancePerViewNV-04202
  The variable decorated with `CullDistancePerViewNV` must be declared using the `Output Storage Class`.

- VUID-CullDistancePerViewNV-CullDistancePerViewNV-04203
  The variable decorated with `CullDistancePerViewNV` must also be decorated with the `PerViewNV` decoration.

- VUID-CullDistancePerViewNV-CullDistancePerViewNV-04204
  The variable decorated with `CullDistancePerViewNV` must be declared as a two-dimensional array of 32-bit floating-point values.

DeviceIndex

The `DeviceIndex` decoration can be applied to a shader input which will be filled with the device index of the physical device that is executing the current shader invocation. This value will be in the range \([0, \max(1, \text{physicalDeviceCount}))\), where `physicalDeviceCount` is the `physicalDeviceCount` member of `VkDeviceGroupDeviceCreateInfo`.

Valid Usage

- VUID-DeviceIndex-DeviceIndex-04205
  The variable decorated with `DeviceIndex` must be declared using the `Input Storage Class`.

- VUID-DeviceIndex-DeviceIndex-04206
  The variable decorated with `DeviceIndex` must be declared as a scalar 32-bit integer value.

DrawIndex

Decorating a variable with the `DrawIndex` built-in will make that variable contain the integer value corresponding to the zero-based index of the drawing command that invoked the current task, mesh, or vertex shader invocation. For indirect drawing commands, `DrawIndex` begins at zero and increments by one for each draw command executed. The number of draw commands is given by the `drawCount` parameter. For direct drawing commands, `DrawIndex` is always zero. `DrawIndex` is dynamically uniform.

When task or mesh shaders are used, only the first active stage will have proper access to the variable. The value read by other stages is undefined.
Valid Usage

- VUID-DrawIndex-DrawIndex-04207
  The DrawIndex decoration must be used only within the Vertex, MeshNV, or TaskNV Execution Model

- VUID-DrawIndex-DrawIndex-04208
  The variable decorated with DrawIndex must be declared using the Input Storage Class

- VUID-DrawIndex-DrawIndex-04209
  The variable decorated with DrawIndex must be declared as a scalar 32-bit integer value

FragCoord

Decorating a variable with the FragCoord built-in decoration will make that variable contain the framebuffer coordinate \((x, y, z, \frac{1}{w})\) of the fragment being processed. The \((x,y)\) coordinate \((0,0)\) is the upper left corner of the upper left pixel in the framebuffer.

When Sample Shading is enabled, the \(x\) and \(y\) components of FragCoord reflect the location of one of the samples corresponding to the shader invocation.

Otherwise, the \(x\) and \(y\) components of FragCoord reflect the location of the center of the fragment.

The \(z\) component of FragCoord is the interpolated depth value of the primitive.

The \(w\) component is the interpolated \(\frac{1}{w}\).

The Centroid interpolation decoration is ignored, but allowed, on FragCoord.

Valid Usage

- VUID-FragCoord-FragCoord-04210
  The FragCoord decoration must be used only within the Fragment Execution Model

- VUID-FragCoord-FragCoord-04211
  The variable decorated with FragCoord must be declared using the Input Storage Class

- VUID-FragCoord-FragCoord-04212
  The variable decorated with FragCoord must be declared as a four-component vector of 32-bit floating-point values

FragDepth

To have a shader supply a fragment-depth value, the shader must declare the DepthReplacing execution mode. Such a shader’s fragment-depth value will come from the variable decorated with the FragDepth built-in decoration.

This value will be used for any subsequent depth testing performed by the implementation or writes to the depth attachment.
Valid Usage

- VUID-FragDepth-FragDepth-04213
  The **FragDepth** decoration must be used only within the **Fragment Execution Model**

- VUID-FragDepth-FragDepth-04214
  The variable decorated with **FragDepth** must be declared using the **Output Storage Class**

- VUID-FragDepth-FragDepth-04215
  The variable decorated with **FragDepth** must be declared as a scalar 32-bit floating-point value

- VUID-FragDepth-FragDepth-04216
  If the shader dynamically writes to the variable decorated with **FragDepth**, the **DepthReplacing Execution Mode** must be declared

**FragInvocationCountEXT**

Decorating a variable with the **FragInvocationCountEXT** built-in decoration will make that variable contain the maximum number of fragment shader invocations for the fragment, as determined by **minSampleShading**.

If **Sample Shading** is not enabled, **FragInvocationCountEXT** will be filled with a value of 1.

Valid Usage

- VUID-FragInvocationCountEXT-FragInvocationCountEXT-04217
  The **FragInvocationCountEXT** decoration must be used only within the **Fragment Execution Model**

- VUID-FragInvocationCountEXT-FragInvocationCountEXT-04218
  The variable decorated with **FragInvocationCountEXT** must be declared using the **Input Storage Class**

- VUID-FragInvocationCountEXT-FragInvocationCountEXT-04219
  The variable decorated with **FragInvocationCountEXT** must be declared as a scalar 32-bit integer value

**FragSizeEXT**

Decorating a variable with the **FragSizeEXT** built-in decoration will make that variable contain the dimensions in pixels of the **area** that the fragment covers for that invocation.

If fragment density map is not enabled, **FragSizeEXT** will be filled with a value of (1,1).
Valid Usage

- VUID-FragSizeEXT-FragSizeEXT-04220
  The **FragSizeEXT** decoration must be used only within the **Fragment Execution Model**

- VUID-FragSizeEXT-FragSizeEXT-04221
  The variable decorated with **FragSizeEXT** must be declared using the **Input Storage Class**

- VUID-FragSizeEXT-FragSizeEXT-04222
  The variable decorated with **FragSizeEXT** must be declared as a two-component vector of 32-bit integer values

**FragStencilRefEXT**

Decorating a variable with the **FragStencilRefEXT** built-in decoration will make that variable contain the new stencil reference value for all samples covered by the fragment. This value will be used as the stencil reference value used in stencil testing.

To write to **FragStencilRefEXT**, a shader must declare the **StencilRefReplacingEXT** execution mode. If a shader declares the **StencilRefReplacingEXT** execution mode and there is an execution path through the shader that does not set **FragStencilRefEXT**, then the fragment’s stencil reference value is undefined for executions of the shader that take that path.

Only the least significant $s$ bits of the integer value of the variable decorated with **FragStencilRefEXT** are considered for stencil testing, where $s$ is the number of bits in the stencil framebuffer attachment, and higher order bits are discarded.

Valid Usage

- VUID-FragStencilRefEXT-FragStencilRefEXT-04223
  The **FragStencilRefEXT** decoration must be used only within the **Fragment Execution Model**

- VUID-FragStencilRefEXT-FragStencilRefEXT-04224
  The variable decorated with **FragStencilRefEXT** must be declared using the **Output Storage Class**

- VUID-FragStencilRefEXT-FragStencilRefEXT-04225
  The variable decorated with **FragStencilRefEXT** must be declared as a scalar integer value

**FragmentSizeNV**

Decorating a variable with the **FragmentSizeNV** built-in decoration will make that variable contain the width and height of the fragment.
Valid Usage

- VUID-FragmentSizeNV-FragmentSizeNV-04226
  The FragmentSizeNV decoration must be used only within the Fragment Execution Model

- VUID-FragmentSizeNV-FragmentSizeNV-04227
  The variable decorated with FragmentSizeNV must be declared using the Input Storage Class

- VUID-FragmentSizeNV-FragmentSizeNV-04228
  The variable decorated with FragmentSizeNV must be declared as a two-component vector of 32-bit integer values

FrontFacing

Decorating a variable with the FrontFacing built-in decoration will make that variable contain whether the fragment is front or back facing. This variable is non-zero if the current fragment is considered to be part of a front-facing polygon primitive or of a non-polygon primitive and is zero if the fragment is considered to be part of a back-facing polygon primitive.

Valid Usage

- VUID-FrontFacing-FrontFacing-04229
  The FrontFacing decoration must be used only within the Fragment Execution Model

- VUID-FrontFacing-FrontFacing-04230
  The variable decorated with FrontFacing must be declared using the Input Storage Class

- VUID-FrontFacing-FrontFacing-04231
  The variable decorated with FrontFacing must be declared as a boolean value

FullyCoveredEXT

Decorating a variable with the FullyCoveredEXT built-in decoration will make that variable indicate whether the fragment area is fully covered by the generating primitive. This variable is non-zero if conservative rasterization is enabled and the current fragment area is fully covered by the generating primitive, and is zero if the fragment is not covered or partially covered, or conservative rasterization is disabled.

If the implementation supports VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativeRasterizationPostDepthCoverage and the PostDepthCoverage execution mode is specified the SampleMask built-in input variable will reflect the coverage after the early per-fragment depth and stencil tests are applied.
Valid Usage

- **VUID-FullyCoveredEXT-FullyCoveredEXT-04232**
  The `FullyCoveredEXT` decoration **must** be used only within the **Fragment Execution Model**

- **VUID-FullyCoveredEXT-FullyCoveredEXT-04233**
  The variable decorated with `FullyCoveredEXT` **must** be declared using the **Input Storage Class**

- **VUID-FullyCoveredEXT-FullyCoveredEXT-04234**
  The variable decorated with `FullyCoveredEXT` **must** be declared as a boolean value

- **VUID-FullyCoveredEXT-conservativeRasterizationPostDepthCoverage-04235**
  If `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativeRasterizationPostDepthCoverage` is not supported the **PostDepthCoverage Execution Mode** must not be declared, when a variable with the `FullyCoveredEXT` decoration is declared

**GlobalInvocationId**

Decorating a variable with the `GlobalInvocationId` built-in decoration will make that variable contain the location of the current invocation within the global workgroup. Each component is equal to the index of the local workgroup multiplied by the size of the local workgroup plus `LocalInvocationId`.

Valid Usage

- **VUID-GlobalInvocationId-GlobalInvocationId-04236**
  The `GlobalInvocationId` decoration **must** be used only within the **GLCompute, MeshNV, or TaskNV Execution Model**

- **VUID-GlobalInvocationId-GlobalInvocationId-04237**
  The variable decorated with `GlobalInvocationId` **must** be declared using the **Input Storage Class**

- **VUID-GlobalInvocationId-GlobalInvocationId-04238**
  The variable decorated with `GlobalInvocationId` **must** be declared as a three-component vector of 32-bit integer values

**HelperInvocation**

Decorating a variable with the `HelperInvocation` built-in decoration will make that variable contain whether the current invocation is a helper invocation. This variable is non-zero if the current fragment being shaded is a helper invocation and zero otherwise. A helper invocation is an invocation of the shader that is produced to satisfy internal requirements such as the generation of derivatives.

*Note*

It is very likely that a helper invocation will have a value of `SampleMask` fragment shader input value that is zero.
Valid Usage

- VUID-HelperInvocation-HelperInvocation-04239
  The HelperInvocation decoration must be used only within the Fragment Execution Model

- VUID-HelperInvocation-HelperInvocation-04240
  The variable decorated with HelperInvocation must be declared using the Input Storage Class

- VUID-HelperInvocation-HelperInvocation-04241
  The variable decorated with HelperInvocation must be declared as a boolean value

**HitKindKHR**

A variable decorated with the HitKindKHR decoration will describe the intersection that triggered the execution of the current shader. The values are determined by the intersection shader. For user-defined intersection shaders this is the value that was passed to the “Hit Kind” operand of OpReportIntersectionKHR. For triangle intersection candidates, this will be one of HitKindFrontFacingTriangleKHR or HitKindBackFacingTriangleKHR.

Valid Usage

- VUID-HitKindKHR-HitKindKHR-04242
  The HitKindKHR decoration must be used only within the AnyHitKHR or ClosestHitKHR Execution Model

- VUID-HitKindKHR-HitKindKHR-04243
  The variable decorated with HitKindKHR must be declared using the Input Storage Class

- VUID-HitKindKHR-HitKindKHR-04244
  The variable decorated with HitKindKHR must be declared as a scalar 32-bit integer value

**HitTNV**

A variable decorated with the HitTNV decoration is equivalent to a variable decorated with the RayTmaxKHR decoration.

Valid Usage

- VUID-HitTNV-HitTNV-04245
  The HitTNV decoration must be used only within the AnyHitNV or ClosestHitNV Execution Model

- VUID-HitTNV-HitTNV-04246
  The variable decorated with HitTNV must be declared using the Input Storage Class

- VUID-HitTNV-HitTNV-04247
  The variable decorated with HitTNV must be declared as a scalar 32-bit floating-point value
IncomingRayFlagsKHR

A variable with the IncomingRayFlagsKHR decoration will contain the ray flags passed in to the trace call that invoked this particular shader. Setting pipeline flags on the raytracing pipeline must not cause any corresponding flags to be set in variables with this decoration.

Valid Usage

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04248
  The IncomingRayFlagsKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04249
  The variable decorated with IncomingRayFlagsKHR must be declared using the Input Storage Class

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04250
  The variable decorated with IncomingRayFlagsKHR must be declared as a scalar 32-bit integer value

InstanceCustomIndexKHR

A variable decorated with the InstanceCustomIndexKHR decoration will contain the application-defined value of the instance that intersects the current ray. This variable contains the value that was specified in VkAccelerationStructureInstanceKHR::instanceCustomIndex for the current acceleration structure instance in the lower 24 bits and the upper 8 bits will be zero.

Valid Usage

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04251
  The InstanceCustomIndexKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04252
  The variable decorated with InstanceCustomIndexKHR must be declared using the Input Storage Class

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04253
  The variable decorated with InstanceCustomIndexKHR must be declared as a scalar 32-bit integer value

InstanceId

Decorating a variable in an intersection, any-hit, or closest hit shader with the InstanceId decoration will make that variable contain the index of the instance that intersects the current ray.
Valid Usage

- **VUID-InstanceId-InstanceId-04254**
  The `InstanceId` decoration **must** be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.

- **VUID-InstanceId-InstanceId-04255**
  The variable decorated with `InstanceId` **must** be declared using the Input Storage Class.

- **VUID-InstanceId-InstanceId-04256**
  The variable decorated with `InstanceId` **must** be declared as a scalar 32-bit integer value.

InvocationId

Decorating a variable with the `InvocationId` built-in decoration will make that variable contain the index of the current shader invocation in a geometry shader, or the index of the output patch vertex in a tessellation control shader.

In a geometry shader, the index of the current shader invocation ranges from zero to the number of `instances` declared in the shader minus one. If the instance count of the geometry shader is one or is not specified, then `InvocationId` will be zero.

Valid Usage

- **VUID-InvocationId-InvocationId-04257**
  The `InvocationId` decoration **must** be used only within the `TessellationControl` or `Geometry` Execution Model.

- **VUID-InvocationId-InvocationId-04258**
  The variable decorated with `InvocationId` **must** be declared using the Input Storage Class.

- **VUID-InvocationId-InvocationId-04259**
  The variable decorated with `InvocationId` **must** be declared as a scalar 32-bit integer value.

InvocationsPerPixelNV

Decorating a variable with the `InvocationsPerPixelNV` built-in decoration will make that variable contain the maximum number of fragment shader invocations per pixel, as derived from the effective shading rate for the fragment. If a primitive does not fully cover a pixel, the number of fragment shader invocations for that pixel **may** be less than the value of `InvocationsPerPixelNV`. If the shading rate indicates a fragment covering multiple pixels, then `InvocationsPerPixelNV` will be one.
Valid Usage

- VUID-InvocationsPerPixelNV-InvocationsPerPixelNV-04260
  The InvocationsPerPixelNV decoration must be used only within the Fragment Execution Model

- VUID-InvocationsPerPixelNV-InvocationsPerPixelNV-04261
  The variable decorated with InvocationsPerPixelNV must be declared using the Input Storage Class

- VUID-InvocationsPerPixelNV-InvocationsPerPixelNV-04262
  The variable decorated with InvocationsPerPixelNV must be declared as a scalar 32-bit integer value

InstanceIndex

Decorating a variable in a vertex shader with the InstanceIndex built-in decoration will make that variable contain the index of the instance that is being processed by the current vertex shader invocation. InstanceIndex begins at the firstInstance parameter to vkCmdDraw or vkCmdDrawIndexed or at the firstInstance member of a structure consumed by vkCmdDrawIndirect or vkCmdDrawIndexedIndirect.

Valid Usage

- VUID-InstanceIndex-InstanceIndex-04263
  The InstanceIndex decoration must be used only within the Vertex Execution Model

- VUID-InstanceIndex-InstanceIndex-04264
  The variable decorated with InstanceIndex must be declared using the Input Storage Class

- VUID-InstanceIndex-InstanceIndex-04265
  The variable decorated with InstanceIndex must be declared as a scalar 32-bit integer value

LaunchIdKHR

A variable decorated with the LaunchIdKHR decoration will specify the index of the work item being processed. One work item is generated for each of the \( \text{width} \times \text{height} \times \text{depth} \) items dispatched by a vkCmdTraceRaysKHR command. All shader invocations inherit the same value for variables decorated with LaunchIdKHR.
Valid Usage

• VUID-LaunchIdKHR-LaunchIdKHR-04266
  The LaunchIdKHR decoration must be used only within the RayGenerationKHR, IntersectionKHR, AnyHitKHR, ClosestHitKHR, MissKHR, or CallableKHR Execution Model

• VUID-LaunchIdKHR-LaunchIdKHR-04267
  The variable decorated with LaunchIdKHR must be declared using the Input Storage Class

• VUID-LaunchIdKHR-LaunchIdKHR-04268
  The variable decorated with LaunchIdKHR must be declared as a three-component vector of 32-bit integer values

LaunchSizeKHR

A variable decorated with the LaunchSizeKHR decoration will contain the width, height, and depth dimensions passed to the vkCmdTraceRaysKHR command that initiated this shader execution. The width is in the first component, the height is in the second component, and the depth is in the third component.

Valid Usage

• VUID-LaunchSizeKHR-LaunchSizeKHR-04269
  The LaunchSizeKHR decoration must be used only within the RayGenerationKHR, IntersectionKHR, AnyHitKHR, ClosestHitKHR, MissKHR, or CallableKHR Execution Model

• VUID-LaunchSizeKHR-LaunchSizeKHR-04270
  The variable decorated with LaunchSizeKHR must be declared using the Input Storage Class

• VUID-LaunchSizeKHR-LaunchSizeKHR-04271
  The variable decorated with LaunchSizeKHR must be declared as a three-component vector of 32-bit integer values

Layer

Decorating a variable with the Layer built-in decoration will make that variable contain the select layer of a multi-layer framebuffer attachment.

In a mesh, vertex, tessellation evaluation, or geometry shader, any variable decorated with Layer can be written with the framebuffer layer index to which the primitive produced by that shader will be directed.

The last active vertex processing stage (in pipeline order) controls the Layer that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the Layer.

If the last active vertex processing stage shader entry point's interface does not include a variable decorated with Layer, then the first layer is used. If a vertex processing stage shader entry point's interface includes a variable decorated with Layer, it must write the same value to Layer for all output vertices of a given primitive. If the Layer value is less than 0 or greater than or equal to the number of layers in the framebuffer, then primitives may still be rasterized,
fragment shaders may be executed, and the framebuffer values for all layers are undefined.

If a variable with the Layer decoration is also decorated with ViewportRelativeNV, then the ViewportIndex is added to the layer that is used for rendering and that is made available in the fragment shader. If the shader writes to a variable decorated ViewportMaskNV, then the layer selected has a different value for each viewport a primitive is rendered to.

In a fragment shader, a variable decorated with Layer contains the layer index of the primitive that the fragment invocation belongs to.

Valid Usage

- VUID-Layer-Layer-04272
  The Layer decoration must be used only within the MeshNV, Vertex, TessellationEvaluation, Geometry, or Fragment Execution Model

- VUID-Layer-Layer-04274
  The variable decorated with Layer within the MeshNV, Vertex, TessellationEvaluation, or Geometry Execution Model must be declared using the Output Storage Class

- VUID-Layer-Layer-04275
  The variable decorated with Layer within the Fragment Execution Model must be declared using the Input Storage Class

- VUID-Layer-Layer-04276
  The variable decorated with Layer must be declared as a scalar 32-bit integer value

LayerPerViewNV

Decorating a variable with the LayerPerViewNV built-in decoration will make that variable contain the per-view layer information. The per-view layer has the same semantics as Layer, for each view.

Valid Usage

- VUID-LayerPerViewNV-LayerPerViewNV-04277
  The LayerPerViewNV decoration must be used only within the MeshNV Execution Model

- VUID-LayerPerViewNV-LayerPerViewNV-04278
  The variable decorated with LayerPerViewNV must be declared using the Output Storage Class

- VUID-LayerPerViewNV-LayerPerViewNV-04279
  The variable decorated with LayerPerViewNV must also be decorated with the PerViewNV decoration.

- VUID-LayerPerViewNV-LayerPerViewNV-04280
  The variable decorated with LayerPerViewNV must be declared as an array of scalar 32-bit integer values
LocalInvocationId

Decorating a variable with the LocalInvocationId built-in decoration will make that variable contain the location of the current task, mesh, or compute shader invocation within the local workgroup. Each component ranges from zero through to the size of the workgroup in that dimension minus one.

**Note**

If the size of the workgroup in a particular dimension is one, then the LocalInvocationId in that dimension will be zero. If the workgroup is effectively two-dimensional, then LocalInvocationId.z will be zero. If the workgroup is effectively one-dimensional, then both LocalInvocationId.y and LocalInvocationId.z will be zero.

Valid Usage

- VUID-LocalInvocationId-LocalInvocationId-04281
  The LocalInvocationId decoration must be used only within the GLCompute, MeshNV, or TaskNV Execution Model

- VUID-LocalInvocationId-LocalInvocationId-04282
  The variable decorated with LocalInvocationId must be declared using the Input Storage Class

- VUID-LocalInvocationId-LocalInvocationId-04283
  The variable decorated with LocalInvocationId must be declared as a three-component vector of 32-bit integer values

LocalInvocationIndex

Decorating a variable with the LocalInvocationIndex built-in decoration will make that variable contain a one-dimensional representation of LocalInvocationId. This is computed as:

```c
LocalInvocationIndex = LocalInvocationId.z * WorkgroupSize.x * WorkgroupSize.y +
                      LocalInvocationId.y * WorkgroupSize.x +
                      LocalInvocationId.x;
```
Valid Usage

- VUID-LocalInvocationIndex-LocalInvocationIndex-04284

  The **LocalInvocationIndex** decoration **must** be used only within the **GLCompute, MeshNV, or TaskNV Execution Model**

- VUID-LocalInvocationIndex-LocalInvocationIndex-04285

  The variable decorated with **LocalInvocationIndex** **must** be declared using the **Input Storage Class**

- VUID-LocalInvocationIndex-LocalInvocationIndex-04286

  The variable decorated with **LocalInvocationIndex** **must** be declared as a scalar 32-bit integer value

**MeshViewCountNV**

Decorating a variable with the **MeshViewCountNV** built-in decoration will make that variable contain the number of views processed by the current mesh or task shader invocations.

Valid Usage

- VUID-MeshViewCountNV-MeshViewCountNV-04287

  The **MeshViewCountNV** decoration **must** be used only within the **MeshNV or TaskNV Execution Model**

- VUID-MeshViewCountNV-MeshViewCountNV-04288

  The variable decorated with **MeshViewCountNV** **must** be declared using the **Input Storage Class**

- VUID-MeshViewCountNV-MeshViewCountNV-04289

  The variable decorated with **MeshViewCountNV** **must** be declared as a scalar 32-bit integer value

**MeshViewIndicesNV**

Decorating a variable with the **MeshViewIndicesNV** built-in decoration will make that variable contain the mesh view indices. The mesh view indices is an array of values where each element holds the view number of one of the views being processed by the current mesh or task shader invocations. The values of array elements with indices greater than or equal to **MeshViewCountNV** are undefined. If the value of **MeshViewIndicesNV[i]** is j, then any outputs decorated with **PerViewNV** will take on the value of array element i when processing primitives for view index j.
Valid Usage

- VUID-MeshViewIndicesNV-MeshViewIndicesNV-04290
  The `MeshViewIndicesNV` decoration must be used only within the `MeshNV` or `TaskNV Execution Model`.
- VUID-MeshViewIndicesNV-MeshViewIndicesNV-04291
  The variable decorated with `MeshViewIndicesNV` must be declared using the `Input Storage Class`.
- VUID-MeshViewIndicesNV-MeshViewIndicesNV-04292
  The variable decorated with `MeshViewIndicesNV` must be declared as an array of scalar 32-bit integer values.

**NumWorkgroups**

Decorating a variable with the `NumWorkgroups` built-in decoration will make that variable contain the number of local workgroups that are part of the dispatch that the invocation belongs to. Each component is equal to the values of the workgroup count parameters passed into the dispatch commands.

Valid Usage

- VUID-NumWorkgroups-NumWorkgroups-04296
  The `NumWorkgroups` decoration must be used only within the `GLCompute Execution Model`.
- VUID-NumWorkgroups-NumWorkgroups-04297
  The variable decorated with `NumWorkgroups` must be declared using the `Input Storage Class`.
- VUID-NumWorkgroups-NumWorkgroups-04298
  The variable decorated with `NumWorkgroups` must be declared as a three-component vector of 32-bit integer values.

**ObjectRayDirectionKHR**

A variable decorated with the `ObjectRayDirectionKHR` decoration will specify the direction of the ray being processed, in object space.
Valid Usage

- VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04299
  The ObjectRayDirectionKHR decoration **must** be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model

- VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04300
  The variable decorated with ObjectRayDirectionKHR **must** be declared using the Input Storage Class

- VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04301
  The variable decorated with ObjectRayDirectionKHR **must** be declared as a three-component vector of 32-bit floating-point values

ObjectRayOriginKHR

A variable decorated with the ObjectRayOriginKHR decoration will specify the origin of the ray being processed, in object space.

Valid Usage

- VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04302
  The ObjectRayOriginKHR decoration **must** be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model

- VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04303
  The variable decorated with ObjectRayOriginKHR **must** be declared using the Input Storage Class

- VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04304
  The variable decorated with ObjectRayOriginKHR **must** be declared as a three-component vector of 32-bit floating-point values

ObjectToWorldKHR

A variable decorated with the ObjectToWorldKHR decoration will contain the current object-to-world transformation matrix, which is determined by the instance of the current intersection.
Valid Usage

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04305
  The ObjectToWorldKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04306
  The variable decorated with ObjectToWorldKHR must be declared using the Input Storage Class

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04307
  The variable decorated with ObjectToWorldKHR must be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values

PatchVertices

Decorating a variable with the PatchVertices built-in decoration will make that variable contain the number of vertices in the input patch being processed by the shader. In a Tessellation Control Shader, this is the same as the name:patchControlPoints member of VkPipelineTessellationStateCreateInfo. In a Tessellation Evaluation Shader, PatchVertices is equal to the tessellation control output patch size. When the same shader is used in different pipelines where the patch sizes are configured differently, the value of the PatchVertices variable will also differ.

Valid Usage

- VUID-PatchVertices-PatchVertices-04308
  The PatchVertices decoration must be used only within the TessellationControl or TessellationEvaluation Execution Model

- VUID-PatchVertices-PatchVertices-04309
  The variable decorated with PatchVertices must be declared using the Input Storage Class

- VUID-PatchVertices-PatchVertices-04310
  The variable decorated with PatchVertices must be declared as a scalar 32-bit integer value

PointCoord

Decorating a variable with the PointCoord built-in decoration will make that variable contain the coordinate of the current fragment within the point being rasterized, normalized to the size of the point with origin in the upper left corner of the point, as described in Basic Point Rasterization. If the primitive the fragment shader invocation belongs to is not a point, then the variable decorated with PointCoord contains an undefined value.

Note

Depending on how the point is rasterized, PointCoord may never reach (0,0) or (1,1).
Valid Usage

• VUID-PointCoord-PointCoord-04311
  The **PointCoord** decoration **must** be used only within the **Fragment Execution Model**

• VUID-PointCoord-PointCoord-04312
  The variable decorated with **PointCoord** **must** be declared using the **Input Storage Class**

• VUID-PointCoord-PointCoord-04313
  The variable decorated with **PointCoord** **must** be declared as a two-component vector of 32-bit floating-point values

**PointSize**

Decorating a variable with the **PointSize** built-in decoration will make that variable contain the size of point primitives. The value written to the variable decorated with **PointSize** by the last vertex processing stage in the pipeline is used as the framebuffer-space size of points produced by rasterization.

*Note*

When **PointSize** decorates a variable in the **Input Storage Class**, it contains the data written to the output variable decorated with **PointSize** from the previous shader stage.

Valid Usage

• VUID-PointSize-PointSize-04314
  The **PointSize** decoration **must** be used only within the **MeshNV**, **Vertex**, **TessellationControl**, **TessellationEvaluation**, or **Geometry Execution Model**

• VUID-PointSize-PointSize-04315
  The variable decorated with **PointSize** within the **MeshNV** or **Vertex Execution Model** **must** be declared using the **Output Storage Class**

• VUID-PointSize-PointSize-04316
  The variable decorated with **PointSize** within the **TessellationControl**, **TessellationEvaluation**, or **Geometry Execution Model** **must** not be declared using a **Storage Class** other than Input or Output

• VUID-PointSize-PointSize-04317
  The variable decorated with **PointSize** **must** be declared as a scalar 32-bit floating-point value

**Position**

Decorating a variable with the **Position** built-in decoration will make that variable contain the position of the current vertex. In the last vertex processing stage, the value of the variable decorated with **Position** is used in subsequent primitive assembly, clipping, and rasterization operations.
Note
When `Position` decorates a variable in the *Input Storage Class*, it contains the data written to the output variable decorated with `Position` from the previous shader stage.

Valid Usage

- **VUID-Position-Position-04318**
  The `Position` decoration **must** be used only within the `MeshNV`, `Vertex`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`.

- **VUID-Position-Position-04319**
  The variable decorated with `Position` within `MeshNV` or `Vertex Execution Model` **must** be declared using the `Output Storage Class`.

- **VUID-Position-Position-04320**
  The variable decorated with `Position` within `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model` **must not** be declared using a `Storage Class` other than `Input` or `Output`.

- **VUID-Position-Position-04321**
  The variable decorated with `Position` **must** be declared as a four-component vector of 32-bit floating-point values.

**PositionPerViewNV**

Decorating a variable with the `PositionPerViewNV` built-in decoration will make that variable contain the position of the current vertex, for each view.

Elements of the array correspond to views in a multiview subpass, and those elements corresponding to views in the view mask of the subpass the shader is compiled against will be used as the position value for those views. For the final vertex processing stage in the pipeline, values written to an output variable decorated with `PositionPerViewNV` are used in subsequent primitive assembly, clipping, and rasterization operations, as with `Position`. `PositionPerViewNV` output in an earlier vertex processing stage is available as an input in the subsequent vertex processing stage.

If a shader is compiled against a subpass that has the `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX` bit set, then the position values for each view **must** not differ in any component other than the X component. If the values do differ, one will be chosen in an implementation-dependent manner.
Valid Usage

- **VUID-PositionPerViewNV-PositionPerViewNV-04322**
  The `PositionPerViewNV` decoration must be used only within the `MeshNV`, `Vertex`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`.

- **VUID-PositionPerViewNV-PositionPerViewNV-04323**
  The variable decorated with `PositionPerViewNV` within the `Vertex`, or `MeshNV Execution Model` must be declared using the `Output Storage Class`.

- **VUID-PositionPerViewNV-PositionPerViewNV-04324**
  The variable decorated with `PositionPerViewNV` within the `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model` must not be declared using a `Storage Class` other than `Input` or `Output`.

- **VUID-PositionPerViewNV-PositionPerViewNV-04325**
  The variable decorated with `PositionPerViewNV` must be declared as an array of four-component vector of 32-bit floating-point values with at least as many elements as the maximum view in the subpass's view mask plus one.

- **VUID-PositionPerViewNV-PositionPerViewNV-04326**
  The array variable decorated with `PositionPerViewNV` must only be indexed by a constant or specialization constant.

**PrimitiveCountNV**

Decorating a variable with the `PrimitiveCountNV` decoration will make that variable contain the primitive count. The primitive count specifies the number of primitives in the output mesh produced by the mesh shader that will be processed by subsequent pipeline stages.

Valid Usage

- **VUID-PrimitiveCountNV-PrimitiveCountNV-04327**
  The `PrimitiveCountNV` decoration must be used only within the `MeshNV Execution Model`.

- **VUID-PrimitiveCountNV-PrimitiveCountNV-04328**
  The variable decorated with `PrimitiveCountNV` must be declared using the `Output Storage Class`.

- **VUID-PrimitiveCountNV-PrimitiveCountNV-04329**
  The variable decorated with `PrimitiveCountNV` must be declared as a scalar 32-bit integer value.

**PrimitiveId**

Decorating a variable with the `PrimitiveId` built-in decoration will make that variable contain the index of the current primitive.

The index of the first primitive generated by a drawing command is zero, and the index is incremented after every individual point, line, or triangle primitive is processed.

For triangles drawn as points or line segments (see Polygon Mode), the primitive index is
incremented only once, even if multiple points or lines are eventually drawn.

Variables decorated with PrimitiveId are reset to zero between each instance drawn.

Restarting a primitive topology using primitive restart has no effect on the value of variables decorated with PrimitiveId.

In tessellation control and tessellation evaluation shaders, it will contain the index of the patch within the current set of rendering primitives that corresponds to the shader invocation.

In a geometry shader, it will contain the number of primitives presented as input to the shader since the current set of rendering primitives was started.

In a fragment shader, it will contain the primitive index written by the geometry shader if a geometry shader is present, or with the value that would have been presented as input to the geometry shader had it been present.

In an intersection, any-hit, or closest hit shader, it will contain the index within the geometry of the triangle or bounding box being processed.

---

**Note**

When the PrimitiveId decoration is applied to an output variable in the mesh shader or geometry shader, the resulting value is seen through the PrimitiveId decorated input variable in the fragment shader.

The fragment shader using PrimitiveId will need to declare either the Geometry or Tessellation capability to satisfy the requirement SPIR-V has to use PrimitiveId.
Valid Usage

• VUID-PrimitiveId-PrimitiveId-04330
  The PrimitiveId decoration must be used only within the MeshNV, IntersectionKHR, AnyHitKHR, ClosestHitKHR, TessellationControl, TessellationEvaluation, Geometry, or Fragment Execution Model

• VUID-PrimitiveId-Fragment-04331
  If pipeline contains both the Fragment and Geometry Execution Model and a variable decorated with PrimitiveId is read from Fragment shader, then the Geometry shader must write to the output variables decorated with PrimitiveId in all execution paths

• VUID-PrimitiveId-Fragment-04332
  If pipeline contains both the Fragment and MeshNV Execution Model and a variable decorated with PrimitiveId is read from Fragment shader, then the MeshNV shader must write to the output variables decorated with PrimitiveId in all execution paths

• VUID-PrimitiveId-Fragment-04333
  If Fragment Execution Model contains a variable decorated with PrimitiveId either the Geometry or Tessellation capability must also be declared

• VUID-PrimitiveId-PrimitiveId-04334
  The variable decorated with PrimitiveId within the TessellationControl, TessellationEvaluation, Fragment, IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model must be declared using the Input Storage Class

• VUID-PrimitiveId-PrimitiveId-04335
  The variable decorated with PrimitiveId within the Geometry Execution Model must be declared using the Input or Output Storage Class

• VUID-PrimitiveId-PrimitiveId-04336
  The variable decorated with PrimitiveId within the MeshNV Execution Model must be declared using the Output Storage Class

• VUID-PrimitiveId-PrimitiveId-04337
  The variable decorated with PrimitiveId must be declared as a scalar 32-bit integer value

PrimitiveIndicesNV
Decorating a variable with the PrimitiveIndicesNV decoration will make that variable contain the output array of vertex index values. Depending on the output primitive type declared using the execution mode, the indices are split into groups of one (OutputPoints), two (OutputLinesNV), or three (OutputTriangles) indices and each group generates a primitive.
Valid Usage

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04338**
  - The `PrimitiveIndicesNV` decoration must be used only within the MeshNV Execution Model.

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04339**
  - The variable decorated with `PrimitiveIndicesNV` must be declared using the Output Storage Class.

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04340**
  - The variable decorated with `PrimitiveIndicesNV` must be declared as an array of scalar 32-bit integer values.

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04341**
  - All index values of the array decorated with `PrimitiveIndicesNV` must be in the range [0, N-1], where N is the value specified by the OutputVertices Execution Mode.

- **VUID-PrimitiveIndicesNV-OutputPoints-04342**
  - If the Execution Mode is OutputPoints, then the array decorated with `PrimitiveIndicesNV` must be the size of the value specified by OutputPrimitivesNV.

- **VUID-PrimitiveIndicesNV-OutputLinesNV-04343**
  - If the Execution Mode is OutputLinesNV, then the array decorated with `PrimitiveIndicesNV` must be the size of two times the value specified by OutputPrimitivesNV.

- **VUID-PrimitiveIndicesNV-OutputTrianglesNV-04344**
  - If the Execution Mode is OutputTrianglesNV, then the array decorated with `PrimitiveIndicesNV` must be the size of three times the value specified by OutputPrimitivesNV.

**PrimitiveShadingRateKHR**

Decorating a variable with the `PrimitiveShadingRateKHR` built-in decoration will make that variable contain the primitive fragment shading rate.

The value written to the variable decorated with `PrimitiveShadingRateKHR` by the last vertex processing stage in the pipeline is used as the primitive fragment shading rate. Outputs in previous shader stages are ignored.

If the last active vertex processing stage shader entry point’s interface does not include a variable decorated with `PrimitiveShadingRateKHR`, then it is as if the shader specified a fragment shading rate value of 0, indicating a horizontal and vertical rate of 1 pixel.

If a shader has `PrimitiveShadingRateKHR` in the output interface and there is an execution path through the shader that does not write to it, its value is undefined for executions of the shader that take that path.
Valid Usage

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04484**
  The `PrimitiveShadingRateKHR` decoration must be used only within the `MeshNV`, `Vertex`, or `Geometry Execution Model`.

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04485**
  The variable decorated with `PrimitiveShadingRateKHR` must be declared using the `Output Storage Class`.

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04486**
  The variable decorated with `PrimitiveShadingRateKHR` must be declared as a scalar 32-bit integer value.

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04487**
  The value written to `PrimitiveShadingRateKHR` must include no more than one of `Vertical2Pixels` and `Vertical4Pixels`.

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04488**
  The value written to `PrimitiveShadingRateKHR` must include no more than one of `Horizontal2Pixels` and `Horizontal4Pixels`.

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04489**
  The value written to `PrimitiveShadingRateKHR` must not have any bits set other than those defined by `Fragment Shading Rate Flags` enumerants in the SPIR-V specification.

**RayGeometryIndexKHR**

A variable decorated with the `RayGeometryIndexKHR` decoration will contain the geometry index for the acceleration structure geometry currently being shaded.

Valid Usage

- **VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04345**
  The `RayGeometryIndexKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.

- **VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04346**
  The variable decorated with `RayGeometryIndexKHR` must be declared using the `Input Storage Class`.

- **VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04347**
  The variable decorated with `RayGeometryIndexKHR` must be declared as a scalar 32-bit integer value.

**RayTmaxKHR**

A variable decorated with the `RayTmaxKHR` decoration will contain the parametric \( t_{\text{max}} \) values of the ray being processed. The values are independent of the space in which the ray origin and direction exist.

The \( t_{\text{max}} \) value changes throughout the lifetime of the ray query that produced the intersection.
In the closest hit shader, the value reflects the closest distance to the intersected primitive. In the any-hit shader, it reflects the distance to the primitive currently being intersected. In the intersection shader, it reflects the distance to the closest primitive intersected so far. The value can change in the intersection shader after calling `OpReportIntersectionKHR` if the corresponding any-hit shader does not ignore the intersection. In a miss shader, the value is identical to the parameter passed into `OpTraceRayKHR`.

### Valid Usage

- **VUID-RayTmaxKHR-RayTmaxKHR-04348**
  The `RayTmaxKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model

- **VUID-RayTmaxKHR-RayTmaxKHR-04349**
  The variable decorated with `RayTmaxKHR` must be declared using the Input Storage Class

- **VUID-RayTmaxKHR-RayTmaxKHR-04350**
  The variable decorated with `RayTmaxKHR` must be declared as a scalar 32-bit floating-point value

### RayTminKHR

A variable decorated with the `RayTminKHR` decoration will contain the parametric $t_{\text{min}}$ values of the ray being processed. The values are independent of the space in which the ray origin and direction exist.

The $t_{\text{min}}$ value remains constant for the duration of the ray query.

### Valid Usage

- **VUID-RayTminKHR-RayTminKHR-04351**
  The `RayTminKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model

- **VUID-RayTminKHR-RayTminKHR-04352**
  The variable decorated with `RayTminKHR` must be declared using the Input Storage Class

- **VUID-RayTminKHR-RayTminKHR-04353**
  The variable decorated with `RayTminKHR` must be declared as a scalar 32-bit floating-point value

### SampleId

Decorating a variable with the `SampleId` built-in decoration will make that variable contain the coverage index for the current fragment shader invocation. `SampleId` ranges from zero to the number of samples in the framebuffer minus one. If a fragment shader entry point's interface includes an input variable decorated with `SampleId`, Sample Shading is considered enabled with a `minSampleShading` value of 1.0.
Valid Usage

- VUID-SampleId-SampleId-04354
  The `SampleId` decoration **must** be used only within the Fragment Execution Model

- VUID-SampleId-SampleId-04355
  The variable decorated with `SampleId` **must** be declared using the Input Storage Class

- VUID-SampleId-SampleId-04356
  The variable decorated with `SampleId` **must** be declared as a scalar 32-bit integer value

**SampleMask**

Decorating a variable with the `SampleMask` built-in decoration will make any variable contain the coverage mask for the current fragment shader invocation.

A variable in the Input storage class decorated with `SampleMask` will contain a bitmask of the set of samples covered by the primitive generating the fragment during rasterization. It has a sample bit set if and only if the sample is considered covered for this fragment shader invocation. `SampleMask[]` is an array of integers. Bits are mapped to samples in a manner where bit B of mask M (`SampleMask[M]`) corresponds to sample $32 \times M + B$.

When state specifies multiple fragment shader invocations for a given fragment, the sample mask for any single fragment shader invocation specifies the subset of the covered samples for the fragment that correspond to the invocation. In this case, the bit corresponding to each covered sample will be set in exactly one fragment shader invocation.

If the PostDepthCoverage execution mode is specified, the sample is considered covered if and only if the sample is covered by the primitive, and the sample is still covered after depth testing. Otherwise the sample is considered covered if the sample is covered by the primitive, regardless of the result of the fragment tests.

A variable in the Output storage class decorated with `SampleMask` is an array of integers forming a bit array in a manner similar to an input variable decorated with `SampleMask`, but where each bit represents coverage as computed by the shader. Modifying the sample mask by writing zero to a bit of `SampleMask` causes the sample to be considered uncovered. If this variable is also decorated with OverrideCoverageNV, the fragment coverage is replaced with the sample mask bits set in the shader otherwise the fragment coverage is ANDed with the bits of the sample mask. If the fragment shader is being evaluated at any frequency other than per-fragment, bits of the sample mask not corresponding to the current fragment shader invocation are ignored. This array **must** be sized in the fragment shader either implicitly or explicitly, to be no larger than the implementation-dependent maximum sample-mask (as an array of 32-bit elements), determined by the maximum number of samples. If a fragment shader entry point's interface includes an output variable decorated with `SampleMask`, the sample mask will be undefined for any array elements of any fragment shader invocations that fail to assign a value. If a fragment shader entry point's interface does not include an output variable decorated with `SampleMask`, the sample mask has no effect on the processing of a fragment.
Valid Usage

- **VUID-SampleMask-SampleMask-04357**
  The *SampleMask* decoration must be used only within the Fragment Execution Model

- **VUID-SampleMask-SampleMask-04358**
  The variable decorated with *SampleMask* must be declared using the Input or Output Storage Class

- **VUID-SampleMask-SampleMask-04359**
  The variable decorated with *SampleMask* must be declared as an array of 32-bit integer values

**SamplePosition**

Decorating a variable with the *SamplePosition* built-in decoration will make that variable contain the sub-pixel position of the sample being shaded. The top left of the pixel is considered to be at coordinate (0,0) and the bottom right of the pixel is considered to be at coordinate (1,1).

If the render pass has a fragment density map attachment, the variable will instead contain the sub-fragment position of the sample being shaded. The top left of the fragment is considered to be at coordinate (0,0) and the bottom right of the fragment is considered to be at coordinate (1,1) for any fragment area.

If a fragment shader entry point's interface includes an input variable decorated with *SamplePosition*, Sample Shading is considered enabled with a *minSampleShading* value of 1.0.

If the current pipeline uses custom sample locations the value of any variable decorated with the *SamplePosition* built-in decoration is undefined.

Valid Usage

- **VUID-SamplePosition-SamplePosition-04360**
  The *SamplePosition* decoration must be used only within the Fragment Execution Model

- **VUID-SamplePosition-SamplePosition-04361**
  The variable decorated with *SamplePosition* must be declared using the Input Storage Class

- **VUID-SamplePosition-SamplePosition-04362**
  The variable decorated with *SamplePosition* must be declared as a two-component vector of 32-bit floating-point values

**ShadingRateKHR**

Decorating a variable with the *ShadingRateKHR* built-in decoration will make that variable contain the fragment shading rate for the current fragment invocation.
Valid Usage

- **VUID-ShadingRateKHR-ShadingRateKHR-04490**
  The *ShadingRateKHR* decoration **must** be used only within the Fragment Execution Model

- **VUID-ShadingRateKHR-ShadingRateKHR-04491**
  The variable decorated with *ShadingRateKHR* **must** be declared using the Input Storage Class

- **VUID-ShadingRateKHR-ShadingRateKHR-04492**
  The variable decorated with *ShadingRateKHR* **must** be declared as a scalar 32-bit integer value

**SMCountNV**

Decorating a variable with the *SMCountNV* built-in decoration will make that variable contain the number of SMs on the device.

Valid Usage

- **VUID-SMCountNV-SMCountNV-04363**
  The variable decorated with *SMCountNV* **must** be declared using the Input Storage Class

- **VUID-SMCountNV-SMCountNV-04364**
  The variable decorated with *SMCountNV* **must** be declared as a scalar 32-bit integer value

**SMIDNV**

Decorating a variable with the *SMIDNV* built-in decoration will make that variable contain the ID of the SM on which the current shader invocation is running. This variable is in the range [0, *SMCountNV*-1].

Valid Usage

- **VUID-SMIDNV-SMIDNV-04365**
  The variable decorated with *SMIDNV* **must** be declared using the Input Storage Class

- **VUID-SMIDNV-SMIDNV-04366**
  The variable decorated with *SMIDNV* **must** be declared as a scalar 32-bit integer value

**SubgroupEqMask**

Decorating a variable with the *SubgroupEqMask* builtin decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bit corresponding to the *SubgroupLocalInvocationId* is set in the variable decorated with *SubgroupEqMask*. All other bits are set to zero.

*SubgroupEqMaskKHR* is an alias of *SubgroupEqMask*. 
Valid Usage

- VUID-SubgroupEqMask-SubgroupEqMask-04370
  The variable decorated with `SubgroupEqMask` must be declared using the `Input Storage Class`

- VUID-SubgroupEqMask-SubgroupEqMask-04371
  The variable decorated with `SubgroupEqMask` must be declared as a four-component vector of 32-bit integer values

**SubgroupGeMask**

Decorating a variable with the `SubgroupGeMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations greater than or equal to `SubgroupLocalInvocationId` through `SubgroupSize`-1 are set in the variable decorated with `SubgroupGeMask`. All other bits are set to zero.

`SubgroupGeMaskKHR` is an alias of `SubgroupGeMask`.

Valid Usage

- VUID-SubgroupGeMask-SubgroupGeMask-04372
  The variable decorated with `SubgroupGeMask` must be declared using the `Input Storage Class`

- VUID-SubgroupGeMask-SubgroupGeMask-04373
  The variable decorated with `SubgroupGeMask` must be declared as a four-component vector of 32-bit integer values

**SubgroupGtMask**

Decorating a variable with the `SubgroupGtMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations greater than `SubgroupLocalInvocationId` through `SubgroupSize`-1 are set in the variable decorated with `SubgroupGtMask`. All other bits are set to zero.

`SubgroupGtMaskKHR` is an alias of `SubgroupGtMask`.

Valid Usage

- VUID-SubgroupGtMask-SubgroupGtMask-04374
  The variable decorated with `SubgroupGtMask` must be declared using the `Input Storage Class`

- VUID-SubgroupGtMask-SubgroupGtMask-04375
  The variable decorated with `SubgroupGtMask` must be declared as a four-component vector of 32-bit integer values
**SubgroupLeMask**

Decorating a variable with the `SubgroupLeMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than or equal to `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLeMask`. All other bits are set to zero.

*SubgroupLeMaskKHR* is an alias of *SubgroupLeMask*.

### Valid Usage

- **VUID-SubgroupLeMask-SubgroupLeMask-04376**
  The variable decorated with `SubgroupLeMask` must be declared using the *Input Storage Class*

- **VUID-SubgroupLeMask-SubgroupLeMask-04377**
  The variable decorated with `SubgroupLeMask` must be declared as a four-component vector of 32-bit integer values

**SubgroupLtMask**

Decorating a variable with the `SubgroupLtMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLtMask`. All other bits are set to zero.

*SubgroupLtMaskKHR* is an alias of *SubgroupLtMask*.

### Valid Usage

- **VUID-SubgroupLtMask-SubgroupLtMask-04378**
  The variable decorated with `SubgroupLtMask` must be declared using the *Input Storage Class*

- **VUID-SubgroupLtMask-SubgroupLtMask-04379**
  The variable decorated with `SubgroupLtMask` must be declared as a four-component vector of 32-bit integer values

**SubgroupLocalInvocationId**

Decorating a variable with the `SubgroupLocalInvocationId` builtin decoration will make that variable contain the index of the invocation within the subgroup. This variable is in range `[0, SubgroupSize-1]`. 
There is no direct relationship between `SubgroupLocalInvocationId` and `LocalInvocationId` or `LocalInvocationIndex`. If the pipeline was created with `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT`, applications can compute their own local invocation index to serve the same purpose:

\[
\text{index} = \text{SubgroupLocalInvocationId} + \text{SubgroupId} \times \text{SubgroupSize}
\]

If full subgroups are not enabled, some subgroups may be dispatched with inactive invocations that do not correspond to a local workgroup invocation, making the value of index unreliable.

### Valid Usage

- **VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04380**
  - The variable decorated with `SubgroupLocalInvocationId` must be declared using the Input Storage Class

- **VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04381**
  - The variable decorated with `SubgroupLocalInvocationId` must be declared as a scalar 32-bit integer value

### SubgroupSize

Decorating a variable with the `SubgroupSize` builtin decoration will make that variable contain the implementation-dependent number of invocations in a subgroup. This value must be a power-of-two integer.

If the pipeline was created with the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flag set, the `SubgroupSize` decorated variable will contain the subgroup size for each subgroup that gets dispatched. This value must be between `minSubgroupSize` and `maxSubgroupSize` and must be uniform with subgroup scope. The value may vary across a single draw or dispatch call, and for fragment shaders may vary across a single primitive.

If the pipeline was created with a chained `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure, the `SubgroupSize` decorated variable will match `requiredSubgroupSize`.

If the pipeline was not created with the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flag set and no `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure was chained, the variable decorated with `SubgroupSize` will match `subgroupSize`.

The maximum number of invocations that an implementation can support per subgroup is 128.
Valid Usage

- **VUID-SubgroupSize-SubgroupSize-04382**
  The variable decorated with `SubgroupSize` must be declared using the **Input Storage Class**

- **VUID-SubgroupSize-SubgroupSize-04383**
  The variable decorated with `SubgroupSize` must be declared as a scalar 32-bit integer value

**TaskCountNV**

Decorating a variable with the `TaskCountNV` decoration will make that variable contain the task count. The task count specifies the number of subsequent mesh shader workgroups that get generated upon completion of the task shader.

Valid Usage

- **VUID-TaskCountNV-TaskCountNV-04384**
  The `TaskCountNV` decoration must be used only within the **TaskNV Execution Model**

- **VUID-TaskCountNV-TaskCountNV-04385**
  The variable decorated with `TaskCountNV` must be declared using the **Output Storage Class**

- **VUID-TaskCountNV-TaskCountNV-04386**
  The variable decorated with `TaskCountNV` must be declared as a scalar 32-bit integer value

**TessCoord**

Decorating a variable with the `TessCoord` built-in decoration will make that variable contain the three-dimensional (u,v,w) barycentric coordinate of the tessellated vertex within the patch. u, v, and w are in the range \([0,1]\) and vary linearly across the primitive being subdivided. For the tessellation modes of **Quads** or **IsoLines**, the third component is always zero.

Valid Usage

- **VUID-TessCoord-TessCoord-04387**
  The `TessCoord` decoration must be used only within the **TessellationEvaluation Execution Model**

- **VUID-TessCoord-TessCoord-04388**
  The variable decorated with `TessCoord` must be declared using the **Input Storage Class**

- **VUID-TessCoord-TessCoord-04389**
  The variable decorated with `TessCoord` must be declared as a three-component vector of 32-bit floating-point values

**TessLevelOuter**

Decorating a variable with the `TessLevelOuter` built-in decoration will make that variable contain the outer tessellation levels for the current patch.
In tessellation control shaders, the variable decorated with `TessLevelOuter` can be written to, which controls the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and can be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with `TessLevelOuter` can read the values written by the tessellation control shader.

**Valid Usage**

- **VUID-TessLevelOuter-TessLevelOuter-04390**
  The `TessLevelOuter` decoration **must** be used only within the `TessellationControl` or `TessellationEvaluation Execution Model`

- **VUID-TessLevelOuter-TessLevelOuter-04391**
  The variable decorated with `TessLevelOuter` within the `TessellationControl Execution Model` **must** be declared using the `Output Storage Class`

- **VUID-TessLevelOuter-TessLevelOuter-04392**
  The variable decorated with `TessLevelOuter` within the `TessellationEvaluation Execution Model` **must** be declared using the `Input Storage Class`

- **VUID-TessLevelOuter-TessLevelOuter-04393**
  The variable decorated with `TessLevelOuter` **must** be declared as an array of size four, containing 32-bit floating-point values

---

**TessLevelInner**

Decorating a variable with the `TessLevelInner` built-in decoration will make that variable contain the inner tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with `TessLevelInner` can be written to, which controls the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and can be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with `TessLevelInner` can read the values written by the tessellation control shader.
Valid Usage

- VUID-TessLevelInner-TessLevelInner-04394
  The TessLevelInner decoration must be used only within the TessellationControl or TessellationEvaluation Execution Model

- VUID-TessLevelInner-TessLevelInner-04395
  The variable decorated with TessLevelInner within the TessellationControl Execution Model must be declared using the Output Storage Class

- VUID-TessLevelInner-TessLevelInner-04396
  The variable decorated with TessLevelInner within the TessellationEvaluation Execution Model must be declared using the Input Storage Class

- VUID-TessLevelInner-TessLevelInner-04397
  The variable decorated with TessLevelInner must be declared as an array of size two, containing 32-bit floating-point values

VertexIndex

Decorating a variable with the VertexIndex built-in decoration will make that variable contain the index of the vertex that is being processed by the current vertex shader invocation. For non-indexed draws, this variable begins at the firstVertex parameter to vkCmdDraw or the firstVertex member of a structure consumed by vkCmdDrawIndirect and increments by one for each vertex in the draw. For indexed draws, its value is the content of the index buffer for the vertex plus the vertexOffset parameter to vkCmdDrawIndexed or the vertexOffset member of the structure consumed by vkCmdDrawIndexedIndirect.

Note

VertexIndex starts at the same starting value for each instance.

Valid Usage

- VUID-VertexIndex-VertexIndex-04398
  The VertexIndex decoration must be used only within the Vertex Execution Model

- VUID-VertexIndex-VertexIndex-04399
  The variable decorated with VertexIndex must be declared using the Input Storage Class

- VUID-VertexIndex-VertexIndex-04400
  The variable decorated with VertexIndex must be declared as a scalar 32-bit integer value

ViewIndex

The ViewIndex decoration can be applied to a shader input which will be filled with the index of the view that is being processed by the current shader invocation.

If multiview is enabled in the render pass, this value will be one of the bits set in the view mask of the subpass the pipeline is compiled against. If multiview is not enabled in the render pass, this value will be zero.
Valid Usage

• VUID-ViewIndex-ViewIndex-04401
  The ViewIndex decoration must not be used within the GLCompute Execution Model

• VUID-ViewIndex-ViewIndex-04402
  The variable decorated with ViewIndex must be declared using the Input Storage Class

• VUID-ViewIndex-ViewIndex-04403
  The variable decorated with ViewIndex must be declared as a scalar 32-bit integer value

ViewportIndex

Decorating a variable with the ViewportIndex built-in decoration will make that variable contain the index of the viewport.

In a mesh, vertex, tessellation evaluation, or geometry shader, the variable decorated with ViewportIndex can be written to with the viewport index to which the primitive produced by that shader will be directed.

The selected viewport index is used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle.

The last active vertex processing stage (in pipeline order) controls the ViewportIndex that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the ViewportIndex.

If the last active vertex processing stage shader entry point's interface does not include a variable decorated with ViewportIndex, then the first viewport is used. If a vertex processing stage shader entry point's interface includes a variable decorated with ViewportIndex, it must write the same value to ViewportIndex for all output vertices of a given primitive.

In a fragment shader, the variable decorated with ViewportIndex contains the viewport index of the primitive that the fragment invocation belongs to.
### Valid Usage

- **VUID-ViewportIndex-ViewportIndex-04404**
  
  The `ViewportIndex` decoration **must** be used only within the `MeshNV`, `Vertex`, `TessellationEvaluation`, `Geometry`, or `Fragment Execution Model`.

- **VUID-ViewportIndex-ViewportIndex-04406**
  
  The variable decorated with `ViewportIndex` within the `MeshNV`, `Vertex`, `TessellationEvaluation`, or `Geometry Execution Model` **must** be declared using the `Output Storage Class`.

- **VUID-ViewportIndex-ViewportIndex-04407**
  
  The variable decorated with `ViewportIndex` within the `Fragment Execution Model` **must** be declared using the `Input Storage Class`.

- **VUID-ViewportIndex-ViewportIndex-04408**
  
  The variable decorated with `ViewportIndex` **must** be declared as a scalar 32-bit integer value.

### ViewportMaskNV

Decorating a variable with the `ViewportMaskNV` built-in decoration will make that variable contain the viewport mask.

In a mesh, vertex, tessellation evaluation, or geometry shader, the variable decorated with `ViewportMaskNV` can be written to with the mask of which viewports the primitive produced by that shader will directed.

The `ViewportMaskNV` variable **must** be an array that has `⌈(VkPhysicalDeviceLimits::maxViewports / 32)⌉` elements. When a shader writes to this variable, bit B of element M controls whether a primitive is emitted to viewport `32 × M + B`. The viewports indicated by the mask are used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle that a primitive will be transformed by.

The last active **vertex processing stage** (in pipeline order) controls the `ViewportMaskNV` that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the `ViewportMaskNV`. When `ViewportMaskNV` is written by the final vertex processing stage, any variable decorated with `ViewportIndex` in the fragment shader will have the index of the viewport that was used in generating that fragment.

If a vertex processing stage shader entry point’s interface includes a variable decorated with `ViewportMaskNV`, it **must** write the same value to `ViewportMaskNV` for all output vertices of a given primitive.
Valid Usage

- VUID-ViewportMaskNV-ViewportMaskNV-04409
  The `ViewportMaskNV` decoration **must** be used only within the `Vertex`, `MeshNV`, `TessellationEvaluation`, or `Geometry Execution Model`.

- VUID-ViewportMaskNV-ViewportMaskNV-04410
  The variable decorated with `ViewportMaskNV` **must** be declared using the `Output Storage Class`.

- VUID-ViewportMaskNV-ViewportMaskNV-04411
  The variable decorated with `ViewportMaskNV` **must** be declared as an array of 32-bit integer values.

**ViewportMaskPerViewNV**

Decorating a variable with the `ViewportMaskPerViewNV` built-in decoration will make that variable contain the mask of viewports primitives are broadcast to, for each view.

The value written to an element of `ViewportMaskPerViewNV` in the last vertex processing stage is a bitmask indicating which viewports the primitive will be directed to. The primitive will be broadcast to the viewport corresponding to each non-zero bit of the bitmask, and that viewport index is used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle, for each view. The same values **must** be written to all vertices in a given primitive, or else the set of viewports used for that primitive is undefined.

Elements of the array correspond to views in a multiview subpass, and those elements corresponding to views in the view mask of the subpass the shader is compiled against will be used as the viewport mask value for those views. `ViewportMaskPerViewNV` output in an earlier vertex processing stage is not available as an input in the subsequent vertex processing stage.

Although `ViewportMaskNV` is an array, `ViewportMaskPerViewNV` is not a two-dimensional array. Instead, `ViewportMaskPerViewNV` is limited to 32 viewports.
Valid Usage

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04412**
  The `ViewportMaskPerViewNV` decoration must be used only within the *Vertex, MeshNV, TessellationControl, TessellationEvaluation, or Geometry Execution Model*.

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04413**
  The variable decorated with `ViewportMaskPerViewNV` must be declared using the *Output Storage Class*.

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04414**
  The variable decorated with `ViewportMaskPerViewNV` must be declared as an array of 32-bit integer values.

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04415**
  The array decorated with `ViewportMaskPerViewNV` must be a size less than or equal to 32.

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04416**
  The array decorated with `ViewportMaskPerViewNV` must be a size greater than the maximum view in the subpass’s view mask.

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04417**
  The array variable decorated with `ViewportMaskPerViewNV` must only be indexed by a constant or specialization constant.

**WarpsPerSMNV**

Decorating a variable with the `WarpsPerSMNV` built-in decoration will make that variable contain the maximum number of warps executing on a SM.

Valid Usage

- **VUID-WarpsPerSMNV-WarpsPerSMNV-04418**
  The variable decorated with `WarpsPerSMNV` must be declared using the *Input Storage Class*.

- **VUID-WarpsPerSMNV-WarpsPerSMNV-04419**
  The variable decorated with `WarpsPerSMNV` must be declared as a scalar 32-bit integer value.

**WarpIDNV**

Decorating a variable with the `WarpIDNV` built-in decoration will make that variable contain the ID of the warp on a SM on which the current shader invocation is running. This variable is in the range \([0, \text{WarpsPerSMNV} - 1]\).
Valid Usage

- VUID-WarpIDNV-WarpIDNV-04420
  The variable decorated with **WarpIDNV** must be declared using the **Input Storage Class**

- VUID-WarpIDNV-WarpIDNV-04421
  The variable decorated with **WarpIDNV** must be declared as a scalar 32-bit integer value

**WorkgroupId**

Decorating a variable with the **WorkgroupId** built-in decoration will make that variable contain the global workgroup that the current invocation is a member of. Each component ranges from a base value to a base + count value, based on the parameters passed into the dispatch commands.

Valid Usage

- VUID-WorkgroupId-WorkgroupId-04422
  The **WorkgroupId** decoration must be used only within the **GLCompute, MeshNV, or TaskNV Execution Model**

- VUID-WorkgroupId-WorkgroupId-04423
  The variable decorated with **WorkgroupId** must be declared using the **Input Storage Class**

- VUID-WorkgroupId-WorkgroupId-04424
  The variable decorated with **WorkgroupId** must be declared as a three-component vector of 32-bit integer values

**WorkgroupSize**

Decorating an object with the **WorkgroupSize** built-in decoration will make that object contain the dimensions of a local workgroup. If an object is decorated with the **WorkgroupSize** decoration, this takes precedence over any **LocalSize** execution mode.

Valid Usage

- VUID-WorkgroupSize-WorkgroupSize-04425
  The **WorkgroupSize** decoration must be used only within the **GLCompute, MeshNV, or TaskNV Execution Model**

- VUID-WorkgroupSize-WorkgroupSize-04426
  The variable decorated with **WorkgroupSize** must be a specialization constant or a constant

- VUID-WorkgroupSize-WorkgroupSize-04427
  The variable decorated with **WorkgroupSize** must be declared as a three-component vector of 32-bit integer values

**WorldRayDirectionKHR**

A variable decorated with the **WorldRayDirectionKHR** decoration will specify the direction of the ray being processed, in world space.
Valid Usage

- VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04428
  The `WorldRayDirectionKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR Execution Model`.

- VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04429
  The variable decorated with `WorldRayDirectionKHR` must be declared using the `Input Storage Class`.

- VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04430
  The variable decorated with `WorldRayDirectionKHR` must be declared as a three-component vector of 32-bit floating-point values.

`WorldRayOriginKHR`

A variable decorated with the `WorldRayOriginKHR` decoration will specify the origin of the ray being processed, in world space.

Valid Usage

- VUID-WorldRayOriginKHR-WorldRayOriginKHR-04431
  The `WorldRayOriginKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR Execution Model`.

- VUID-WorldRayOriginKHR-WorldRayOriginKHR-04432
  The variable decorated with `WorldRayOriginKHR` must be declared using the `Input Storage Class`.

- VUID-WorldRayOriginKHR-WorldRayOriginKHR-04433
  The variable decorated with `WorldRayOriginKHR` must be declared as a three-component vector of 32-bit floating-point values.

`WorldToObjectKHR`

A variable decorated with the `WorldToObjectKHR` decoration will contain the current world-to-object transformation matrix, which is determined by the instance of the current intersection.
Valid Usage

- VUID-WorldToObjectKHR-WorldToObjectKHR-04434
  The `WorldToObjectKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model

- VUID-WorldToObjectKHR-WorldToObjectKHR-04435
  The variable decorated with `WorldToObjectKHR` must be declared using the `Input Storage Class`

- VUID-WorldToObjectKHR-WorldToObjectKHR-04436
  The variable decorated with `WorldToObjectKHR` must be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values
Chapter 16. Image Operations

16.1. Image Operations Overview

Vulkan Image Operations are operations performed by those SPIR-V Image Instructions which take an OpTypeImage (representing a VkImageView) or OpTypeSampledImage (representing a (VkImageView, VkSampler) pair). Read, write, and atomic operations also take texel coordinates as operands, and return a value based on a neighborhood of texture elements (texels) within the image. Query operations return properties of the bound image or of the lookup itself. The “Depth” operand of OpTypeImage is ignored.

Note
Texel is a term which is a combination of the words texture and element. Early interactive computer graphics supported texture operations on textures, a small subset of the image operations on images described here. The discrete samples remain essentially equivalent, however, so we retain the historical term texel to refer to them.

Image Operations include the functionality of the following SPIR-V Image Instructions:

- **OpImageSample* and OpImageSparseSample*** read one or more neighboring texels of the image, and filter the texel values based on the state of the sampler.
  - Instructions with ImplicitLod in the name determine the LOD used in the sampling operation based on the coordinates used in neighboring fragments.
  - Instructions with ExplicitLod in the name determine the LOD used in the sampling operation based on additional coordinates.
  - Instructions with Proj in the name apply homogeneous projection to the coordinates.

- **OpImageFetch and OpImageSparseFetch** return a single texel of the image. No sampler is used.

- **OpImage*Gather and OpImageSparse*Gather** read neighboring texels and return a single component of each.

- **OpImageRead (and OpImageSparseRead) and OpImageWrite** read and write, respectively, a texel in the image. No sampler is used.

- **OpImageSampleFootprintNV** identifies and returns information about the set of texels in the image that would be accessed by an equivalent OpImageSample* instruction.

- Instructions with Dref in the name apply depth comparison on the texel values.

- Instructions with Sparse in the name additionally return a sparse residency code.

- **OpImageQuerySize, OpImageQuerySizeLod, OpImageQueryLevels, and OpImageQuerySamples** return properties of the image descriptor that would be accessed. The image itself is not accessed.

- **OpImageQueryLod** returns the lod parameters that would be used in a sample operation. The actual operation is not performed.
16.1.1. Texel Coordinate Systems

Images are addressed by texel coordinates. There are three texel coordinate systems:

- normalized texel coordinates [0.0, 1.0]
- unnormalized texel coordinates [0.0, width/height/depth)
- integer texel coordinates [0, width/height/depth)

SPIR-V `OpImageFetch`, `OpImageSparseFetch`, `OpImageRead`, `OpImageSparseRead`, and `OpImageWrite` instructions use integer texel coordinates. Other image instructions can use either normalized or unnormalized texel coordinates (selected by the `unnormalizedCoordinates` state of the sampler used in the instruction), but there are limitations on what operations, image state, and sampler state is supported. Normalized coordinates are logically converted to unnormalized as part of image operations, and certain steps are only performed on normalized coordinates. The array layer coordinate is always treated as unnormalized even when other coordinates are normalized.

Normalized texel coordinates are referred to as (s,t,r,q,a), with the coordinates having the following meanings:

- s: Coordinate in the first dimension of an image.
- t: Coordinate in the second dimension of an image.
- r: Coordinate in the third dimension of an image.
  - (s,t,r) are interpreted as a direction vector for Cube images.
- q: Fourth coordinate, for homogeneous (projective) coordinates.
- a: Coordinate for array layer.

The coordinates are extracted from the SPIR-V operand based on the dimensionality of the image variable and type of instruction. For Proj instructions, the components are in order (s, [t,] [r,] q), with t and r being conditionally present based on the Dim of the image. For non-Proj instructions, the coordinates are (s [,t] [,r] [,a]), with t and r being conditionally present based on the Dim of the image and a being conditionally present based on the Arrayed property of the image. Projective image instructions are not supported on Arrayed images.

Unnormalized texel coordinates are referred to as (u,v,w,a), with the coordinates having the following meanings:

- u: Coordinate in the first dimension of an image.
- v: Coordinate in the second dimension of an image.
- w: Coordinate in the third dimension of an image.
- a: Coordinate for array layer.

Only the u and v coordinates are directly extracted from the SPIR-V operand, because only 1D and 2D (non-Arrayed) dimensionalities support unnormalized coordinates. The components are in order (u [,v,]), with v being conditionally present when the dimensionality is 2D. When normalized coordinates are converted to unnormalized coordinates, all four coordinates are used.
Integer texel coordinates are referred to as \((i,j,k,l,n)\), with the coordinates having the following meanings:

- \(i\): Coordinate in the first dimension of an image.
- \(j\): Coordinate in the second dimension of an image.
- \(k\): Coordinate in the third dimension of an image.
- \(l\): Coordinate for array layer.
- \(n\): Index of the sample within the texel.

They are extracted from the SPIR-V operand in order \((i[,j][,k][,l][,n])\), with \(j\) and \(k\) conditionally present based on the \texttt{Dim} of the image, and \(l\) conditionally present based on the \texttt{Arrayed} property of the image. \(n\) is conditionally present and is taken from the \texttt{Sample} image operand.

For all coordinate types, unused coordinates are assigned a value of zero.

![Figure 3. Texel Coordinate Systems, Linear Filtering](image)

The Texel Coordinate Systems - For the example shown of an 8×4 texel two dimensional image.

- Normalized texel coordinates:
  - The \(s\) coordinate goes from 0.0 to 1.0.
  - The \(t\) coordinate goes from 0.0 to 1.0.

- Unnormalized texel coordinates:
  - The \(u\) coordinate within the range 0.0 to 8.0 is within the image, otherwise it is outside the image.
  - The \(v\) coordinate within the range 0.0 to 4.0 is within the image, otherwise it is outside the image.

- Integer texel coordinates:
• The i coordinate within the range 0 to 7 addresses texels within the image, otherwise it is outside the image.

• The j coordinate within the range 0 to 3 addresses texels within the image, otherwise it is outside the image.

• Also shown for linear filtering:
  ◦ Given the unnormalized coordinates (u,v), the four texels selected are i_{0|0}, i_{1|0}, i_{0|1}, and i_{1|1}.
  ◦ The fractions α and β.
  ◦ Given the offset Δ_i and Δ_j, the four texels selected by the offset are i_{0'}, i_{1'}, i_{0'}', and i_{1'}'.

---

**Note**

For formats with reduced-resolution channels, Δ_i and Δ_j are relative to the resolution of the highest-resolution channel, and therefore may be divided by two relative to the unnormalized coordinate space of the lower-resolution channels.

---

The Texel Coordinate Systems - For the example shown of an 8×4 texel two dimensional image.

• Texel coordinates as above. Also shown for nearest filtering:
  ◦ Given the unnormalized coordinates (u,v), the texel selected is ij.
  ◦ Given the offset Δ_i and Δ_j, the texel selected by the offset is ij'.

For corner-sampled images, the texel samples are located at the grid intersections instead of the texel centers.
16.2. Conversion Formulas

16.2.1. RGB to Shared Exponent Conversion

An RGB color (red, green, blue) is transformed to a shared exponent color (red\textsubscript{shared}, green\textsubscript{shared}, blue\textsubscript{shared}, exp\textsubscript{shared}) as follows:

First, the components (red, green, blue) are clamped to (red\textsubscript{clamped}, green\textsubscript{clamped}, blue\textsubscript{clamped}) as:

\[
\begin{align*}
\text{red}_{\text{clamped}} &= \max(0, \min(\text{sharedexp}_{\text{max}}, \text{red})) \\
\text{green}_{\text{clamped}} &= \max(0, \min(\text{sharedexp}_{\text{max}}, \text{green})) \\
\text{blue}_{\text{clamped}} &= \max(0, \min(\text{sharedexp}_{\text{max}}, \text{blue}))
\end{align*}
\]

where:

\[
\begin{align*}
N &= 9 & \text{number of mantissa bits per component} \\
B &= 15 & \text{exponent bias} \\
E_{\text{max}} &= 31 & \text{maximum possible biased exponent value} \\
\text{sharedexp}_{\text{max}} &= \frac{(2^N - 1)}{2^N} \times 2^{(E_{\text{max}} - B)}
\end{align*}
\]

\textbf{Note}

NaN, if supported, is handled as in IEEE 754-2008 \texttt{minNum()} and \texttt{maxNum()}. This results in any NaN being mapped to zero.
The largest clamped component, \( \text{max}_{\text{clamped}} \) is determined:

\[
\text{max}_{\text{clamped}} = \max(\text{red}_{\text{clamped}}, \text{green}_{\text{clamped}}, \text{blue}_{\text{clamped}})
\]

A preliminary shared exponent \( \exp' \) is computed:

\[
\exp' = \begin{cases} 
\log_2(\text{max}_{\text{clamped}}) + (B + 1) & \text{for } \text{max}_{\text{clamped}} > 2^{-(B + 1)} \\
0 & \text{for } \text{max}_{\text{clamped}} \leq 2^{-(B + 1)}
\end{cases}
\]

The shared exponent \( \exp_{\text{shared}} \) is computed:

\[
\exp_{\text{shared}} = \begin{cases} 
\exp' & \text{for } 0 \leq \exp_{\text{shared}} < 2^N \\
\exp' + 1 & \text{for } \exp_{\text{shared}} = 2^N
\end{cases}
\]

Finally, three integer values in the range 0 to \( 2^N \) are computed:

\[
\begin{align*}
\text{red}_{\text{shared}} &= \left\lfloor \frac{\text{red}_{\text{clamped}}}{2^{(\exp_{\text{shared}} - B - N)}} + \frac{1}{2} \right\rfloor \\
\text{green}_{\text{shared}} &= \left\lfloor \frac{\text{green}_{\text{clamped}}}{2^{(\exp_{\text{shared}} - B - N)}} + \frac{1}{2} \right\rfloor \\
\text{blue}_{\text{shared}} &= \left\lfloor \frac{\text{blue}_{\text{clamped}}}{2^{(\exp_{\text{shared}} - B - N)}} + \frac{1}{2} \right\rfloor
\end{align*}
\]

### 16.2.2. Shared Exponent to RGB

A shared exponent color (\( \text{red}_{\text{shared}}, \text{green}_{\text{shared}}, \text{blue}_{\text{shared}}, \exp_{\text{shared}} \)) is transformed to an RGB color (red, green, blue) as follows:

\[
\begin{align*}
\text{red} &= \text{red}_{\text{shared}} \times 2^{(\exp_{\text{shared}} - B - N)} \\
\text{green} &= \text{green}_{\text{shared}} \times 2^{(\exp_{\text{shared}} - B - N)} \\
\text{blue} &= \text{blue}_{\text{shared}} \times 2^{(\exp_{\text{shared}} - B - N)}
\end{align*}
\]

where:

\[
N = 9 \text{ (number of mantissa bits per component)}
\]

\[
B = 15 \text{ (exponent bias)}
\]
16.3. Texel Input Operations

*Texel input instructions* are SPIR-V image instructions that read from an image. *Texel input operations* are a set of steps that are performed on state, coordinates, and texel values while processing a texel input instruction, and which are common to some or all texel input instructions. They include the following steps, which are performed in the listed order:

- **Validation operations**
  - Instruction/Sampler/Image validation
  - Coordinate validation
  - Sparse validation
  - Layout validation
- **Format conversion**
- **Texel replacement**
- **Depth comparison**
- **Conversion to RGBA**
- **Component swizzle**
- **Chroma reconstruction**
- **Y′C_bC_r conversion**

For texel input instructions involving multiple texels (for sampling or gathering), these steps are applied for each texel that is used in the instruction. Depending on the type of image instruction, other steps are conditionally performed between these steps or involving multiple coordinate or texel values.

If *Chroma Reconstruction* is implicit, *Texel Filtering* instead takes place during chroma reconstruction, before *sampler Y′C_bC_r conversion* occurs.

16.3.1. Texel Input Validation Operations

*Texel input validation operations* inspect instruction/image/sampler state or coordinates, and in certain circumstances cause the texel value to be replaced or become undefined. There are a series of validations that the texel undergoes.

**Instruction/Sampler/Image View Validation**

There are a number of cases where a SPIR-V instruction *can* mismatch with the sampler, the image view, or both, and a number of further cases where the sampler *can* mismatch with the image view. In such cases the value of the texel returned is undefined.

These cases include:

- The sampler *borderColor* is an integer type and the image view *format* is not one of the *VkFormat* integer types or a stencil component of a depth/stencil format.
• The sampler `borderColor` is a float type and the image view `format` is not one of the `VkFormat` float types or a depth component of a depth/stencil format.

• The sampler `borderColor` is one of the opaque black colors (`VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK` or `VK_BORDER_COLOR_INT_OPAQUE_BLACK`) and the image view `VkComponentSwizzle` for any of the `VkComponentMapping` components is not the identity swizzle.

• The sampler `borderColor` is a custom color (`VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`) and the supplied `VkSamplerCustomBorderColorCreateInfoEXT::customBorderColor` is outside the bounds of the values representable in the image view's `format`.

• The `VkImageLayout` of any subresource in the image view does not match that specified in `VkDescriptorImageInfo::imageLayout` used to write the image descriptor.

• The SPIR-V Image Format is not compatible with the image view's `format`.

• The sampler `unnormalizedCoordinates` is `VK_TRUE` and any of the limitations of unnormalized coordinates are violated.

• The sampler was created with `flags` containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` and the image was not created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

• The sampler was not created with `flags` containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` and the image was created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

• The sampler was created with `flags` containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` and is used with a function that is not `OpImageSampleImplicitLod` or `OpImageSampleExplicitLod`, or is used with operands `Offset` or `ConstOffsets`.

• The SPIR-V instruction is one of the `OpImage*Dref*` instructions and the sampler `compareEnable` is `VK_FALSE`.

• The SPIR-V instruction is not one of the `OpImage*Dref*` instructions and the sampler `compareEnable` is `VK_TRUE`.

• The SPIR-V instruction is one of the `OpImage*Dref*` instructions and the image view `format` is not one of the depth/stencil formats with a depth component, or the image view aspect is not `VK_IMAGE_ASPECT_DEPTH_BIT`.

• The SPIR-V instruction's image variable's properties are not compatible with the image view:
  - Rules for `viewType`:
    - `VK_IMAGE_VIEW_TYPE_1D` must have `Dim = 1D`, `Arrayed = 0`, `MS = 0`.
    - `VK_IMAGE_VIEW_TYPE_2D` must have `Dim = 2D`, `Arrayed = 0`.
    - `VK_IMAGE_VIEW_TYPE_3D` must have `Dim = 3D`, `Arrayed = 0`, `MS = 0`.
    - `VK_IMAGE_VIEW_TYPE_CUBE` must have `Dim = Cube`, `Arrayed = 0`, `MS = 0`.
    - `VK_IMAGE_VIEW_TYPE_1D_ARRAY` must have `Dim = 1D`, `Arrayed = 1`, `MS = 0`.
    - `VK_IMAGE_VIEW_TYPE_2D_ARRAY` must have `Dim = 2D`, `Arrayed = 1`.
    - `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` must have `Dim = Cube`, `Arrayed = 1`, `MS = 0`.
  - If the image was created with `VkImageCreateInfo::samples` equal to `VK_SAMPLE_COUNT_1_BIT`, the instruction must have `MS = 0`.
If the image was created with `VkImageCreateInfo::samples` not equal to `VK_SAMPLE_COUNT_1_BIT`, the instruction must have `MS = 1`.

If the `Sampled Type` of the `OpTypeImage` does not match the numeric format of the image, as shown in the `SPIR-V Sampled Type` column of the `Interpretation of Numeric Format` table.

If the signedness of any read or sample operation does not match the signedness of the image's format.

- If the image was created with `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV`, the sampler addressing modes must only use a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- The SPIR-V instruction is `OpImageSampleFootprintNV` with `Dim = 2D` and `addressModeU` or `addressModeV` in the sampler is not `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- The SPIR-V instruction is `OpImageSampleFootprintNV` with `Dim = 3D` and `addressModeU`, `addressModeV`, or `addressModeW` in the sampler is not `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- The sampler was created with a specified `VkSamplerCustomBorderColorCreateInfoEXT::format` which does not match the `VkFormat` of the image view(s) it is sampling.

- The sampler is sampling an image view of `VK_FORMAT_B4G4R4A4_UNORM_PACK16`, `VK_FORMAT_B5G6R5_UNORM_PACK16`, or `VK_FORMAT_B5G5R5A1_UNORM_PACK16` format without a specified `VkSamplerCustomBorderColorCreateInfoEXT::format`.

Only `OpImageSample*` and `OpImageSparseSample*` can be used with a sampler that enables `sampler Y’C_bC_R` conversion.

The `ConstOffset` and `Offset` operands must not be used with a sampler that enables `sampler Y’C_bC_R` conversion.

### Integer Texel Coordinate Validation

Integer texel coordinates are validated against the size of the image level, and the number of layers and number of samples in the image. For SPIR-V instructions that use integer texel coordinates, this is performed directly on the integer coordinates. For instructions that use normalized or unnormalized texel coordinates, this is performed on the coordinates that result after conversion to integer texel coordinates.

If the integer texel coordinates do not satisfy all of the conditions

\[
0 \leq i < w_s
\]

\[
0 \leq j < h_s
\]

\[
0 \leq k < d_s
\]
$0 \leq l < \text{layers}$

$0 \leq n < \text{samples}$

where:

$w_s = \text{width of the image level}$

$h_s = \text{height of the image level}$

$d_s = \text{depth of the image level}$

layers = \text{number of layers in the image}$

samples = \text{number of samples per texel in the image}$

then the texel fails integer texel coordinate validation.

There are four cases to consider:

1. Valid Texel Coordinates

   ◦ If the texel coordinates pass validation (that is, the coordinates lie within the image),
   then the texel value comes from the value in image memory.

2. Border Texel

   ◦ If the texel coordinates fail validation, and
   ◦ If the read is the result of an image sample instruction or image gather instruction, and
   ◦ If the image is not a cube image,
   then the texel is a border texel and \text{texel replacement} is performed.

3. Invalid Texel

   ◦ If the texel coordinates fail validation, and
   ◦ If the read is the result of an image fetch instruction, image read instruction, or atomic instruction,
   then the texel is an invalid texel and \text{texel replacement} is performed.

4. Cube Map Edge or Corner
Otherwise the texel coordinates lie beyond the edges or corners of the selected cube map face, and Cube map edge handling is performed.

**Cube Map Edge Handling**

If the texel coordinates lie beyond the edges or corners of the selected cube map face, the following steps are performed. Note that this does not occur when using `VK_FILTER_NEAREST` filtering within a mip level, since `VK_FILTER_NEAREST` is treated as using `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **Cube Map Edge Texel**
  - If the texel lies beyond the selected cube map face in either only i or only j, then the coordinates (i,j) and the array layer l are transformed to select the adjacent texel from the appropriate neighboring face.

- **Cube Map Corner Texel**
  - If the texel lies beyond the selected cube map face in both i and j, then there is no unique neighboring face from which to read that texel. The texel should be replaced by the average of the three values of the adjacent texels in each incident face. However, implementations may replace the cube map corner texel by other methods. The methods are subject to the constraint that for linear filtering if the three available texels have the same value, the resulting filtered texel must have that value, and for cubic filtering if the twelve available samples have the same value, the resulting filtered texel must have that value.

**Sparse Validation**

If the texel reads from an unbound region of a sparse image, the texel is a sparse unbound texel, and processing continues with texel replacement.

**Layout Validation**

If all planes of a disjoint multi-planar image are not in the same image layout, the image must not be sampled with sampler Y’C\_p,C\_n conversion enabled.

### 16.3.2. Format Conversion

Texels undergo a format conversion from the `VkFormat` of the image view to a vector of either floating point or signed or unsigned integer components, with the number of components based on the number of components present in the format.

- Color formats have one, two, three, or four components, according to the format.
- Depth/stencil formats are one component. The depth or stencil component is selected by the `aspectMask` of the image view.

Each component is converted based on its type and size (as defined in the Format Definition section for each `VkFormat`), using the appropriate equations in [16-Bit Floating-Point Numbers, Unsigned 11-Bit Floating-Point Numbers, Unsigned 10-Bit Floating-Point Numbers, Fixed-Point Data Conversion], and Shared Exponent to RGB. Signed integer components smaller than 32 bits are sign-extended.
If the image view format is sRGB, the color components are first converted as if they are UNORM, and then sRGB to linear conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the Khronos Data Format Specification. The A component, if present, is unchanged.

If the image view format is block-compressed, then the texel value is first decoded, then converted based on the type and number of components defined by the compressed format.

### 16.3.3. Texel Replacement

A texel is replaced if it is one (and only one) of:

- a border texel,
- an invalid texel, or
- a sparse unbound texel.

Border texels are replaced with a value based on the image format and the borderColor of the sampler. The border color is:

<table>
<thead>
<tr>
<th>Sampler Border Color</th>
<th>Corresponding Border Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK</td>
<td>[B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 0.0]</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK</td>
<td>[B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 1.0]</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE</td>
<td>[B_r, B_g, B_b, B_a] = [1.0, 1.0, 1.0, 1.0]</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_TRANSPARENT_BLACK</td>
<td>[B_r, B_g, B_b, B_a] = [0, 0, 0, 0]</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_OPAQUE_BLACK</td>
<td>[B_r, B_g, B_b, B_a] = [0, 0, 0, 1]</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_OPAQUE_WHITE</td>
<td>[B_r, B_g, B_b, B_a] = [1, 1, 1, 1]</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_CUSTOM_EXT</td>
<td>[B_r, B_g, B_b, B_a] = [U_r, U_g, U_b, U_a]</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_CUSTOM_EXT</td>
<td>[B_r, B_g, B_b, B_a] = [U_r, U_g, U_b, U_a]</td>
</tr>
</tbody>
</table>

The custom border color (U) may be rounded by implementations prior to texel replacement, but the error introduced by such a rounding must not exceed one ULP of the image’s format.

![Note](image)

The names VK_BORDER_COLOR_*_TRANSPARENT_BLACK, VK_BORDER_COLOR_*_OPAQUE_BLACK, and VK_BORDER_COLOR_*_OPAQUE_WHITE are meant to describe which components are zeros and ones in the vocabulary of compositing, and are not meant to imply that the numerical value of VK_BORDER_COLOR_INT_OPAQUE_WHITE is a saturating value for integers.

This is substituted for the texel value by replacing the number of components in the image format.

<p>| Table 25. Border Texel Components After Replacement |</p>
<table>
<thead>
<tr>
<th>Texel Aspect or Format</th>
<th>Component Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth aspect</td>
<td>( D = B_r )</td>
</tr>
<tr>
<td>Stencil aspect</td>
<td>( S = B_r )</td>
</tr>
<tr>
<td>One component color format</td>
<td>( \text{Color}_r = B_r )</td>
</tr>
<tr>
<td>Two component color format</td>
<td>([\text{Color}_r, \text{Color}_g] = [B_r, B_g] )</td>
</tr>
<tr>
<td>Three component color format</td>
<td>([\text{Color}_r, \text{Color}_g, \text{Color}_b] = [B_r, B_g, B_b] )</td>
</tr>
<tr>
<td>Four component color format</td>
<td>([\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [B_r, B_g, B_b, B_a] )</td>
</tr>
</tbody>
</table>

The value returned by a read of an invalid texel is undefined, unless that read operation is from a buffer resource and the `robustBufferAccess` feature is enabled. In that case, an invalid texel is replaced as described by the `robustBufferAccess` feature. If the access is to an image resource and the x, y, z, or layer coordinate validation fails and `robustImageAccess` is enabled then zero must be returned for the R, G, and B channels, if present. Either zero or one must be returned for the A channel, if present. If `robustImageAccess2` is enabled, zero values must be returned. If only the sample index was invalid, the values returned are undefined.

Additionally, if `robustImageAccess` is enabled, but `robustImageAccess2` is not, any invalid texels may be expanded to four components prior to texel replacement. This means that components not present in the image format may be replaced with 0 or may undergo conversion to RGBA as normal.

Loads from a null descriptor return a four component color value of all zeros. However, for storage images and storage texel buffers using an explicit SPIR-V Image Format, loads from a null descriptor may return an alpha value of 1 (float or integer, depending on format) if the format does not include alpha.

If the `VkPhysicalDeviceSparseProperties::residencyNonResidentStrict` property is `VK_TRUE`, a sparse unbound texel is replaced with 0 or 0.0 values for integer and floating-point components of the image format, respectively.

If `residencyNonResidentStrict` is `VK_FALSE`, the value of the sparse unbound texel is undefined.

### 16.3.4. Depth Compare Operation

If the image view has a depth/stencil format, the depth component is selected by the `aspectMask`, and the operation is a `Dref` instruction, a depth comparison is performed. The value of the result \( D \) is 1.0 if the result of the compare operation is true, and 0.0 otherwise. The compare operation is selected by the `compareOp` member of the sampler.

\[
\begin{align*}
D &= \begin{cases} 
1.0 & \text{for LEQUAL} \\
D_{\text{ref}} \leq D_{\text{tex}} & \text{for GEQUAL} \\
D_{\text{ref}} \geq D_{\text{tex}} & \text{for LESS} \\
D_{\text{ref}} < D_{\text{tex}} & \text{for GREATER} \\
D_{\text{ref}} = D_{\text{tex}} & \text{for EQUAL} \\
D_{\text{ref}} \neq D_{\text{tex}} & \text{for NOTEQUAL} \\
true & \text{for ALWAYS} \\
false & \text{for NEVER} \\
\end{cases}
\end{align*}
\]
where $D_{\text{tex}}$ is the texel depth value and $D_{\text{ref}}$ is the reference value from the SPIR-V operand. If the image being sampled has a fixed-point format then the reference value is clamped to $[0, 1]$ before the comparison operation.

### 16.3.5. Conversion to RGBA

The texel is expanded from one, two, or three components to four components based on the image base color:

<table>
<thead>
<tr>
<th>Texel Aspect or Format</th>
<th>RGBA Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth aspect</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [D, 0, 0, \text{one}]$</td>
</tr>
<tr>
<td>Stencil aspect</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [S, 0, 0, \text{one}]$</td>
</tr>
<tr>
<td>One component color format</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [\text{Color}_r, 0, 0, \text{one}]$</td>
</tr>
<tr>
<td>Two component color format</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [\text{Color}_r, \text{Color}_g, 0, \text{one}]$</td>
</tr>
<tr>
<td>Three component color format</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{one}]$</td>
</tr>
<tr>
<td>Four component color format</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a]$</td>
</tr>
</tbody>
</table>

where one = 1.0f for floating-point formats and depth aspects, and one = 1 for integer formats and stencil aspects.

### 16.3.6. Component Swizzle

All texel input instructions apply a swizzle based on:

- the `VkComponentSwizzle` enums in the `components` member of the `VkImageViewCreateInfo` structure for the image being read if sampler Y’C_bC_r conversion is not enabled, and
- the `VkComponentSwizzle` enums in the `components` member of the `VkSamplerYcbcrConversionCreateInfo` structure for the sampler Y’C_bC_r conversion if sampler Y’C_bC_r conversion is enabled.

The swizzle can rearrange the components of the texel, or substitute zero or one for any components. It is defined as follows for each color component:

$$\text{Color}'_{\text{component}} = \begin{cases} 
\text{Color}_r & \text{for RED swizzle} \\
\text{Color}_g & \text{for GREEN swizzle} \\
\text{Color}_b & \text{for BLUE swizzle} \\
\text{Color}_a & \text{for ALPHA swizzle} \\
0 & \text{for ZERO swizzle} \\
\text{one} & \text{for ONE swizzle} \\
\text{identity} & \text{for IDENTITY swizzle}
\end{cases}$$

where:
If the border color is one of the `VK_BORDER_COLOR_*_OPAQUE_BLACK` enums and the `VkComponentSwizzle` is not the `identity swizzle` for all components, the value of the texel after swizzle is undefined.

### 16.3.7. Sparse Residency

`OpImageSparse*` instructions return a structure which includes a `residency code` indicating whether any texels accessed by the instruction are sparse unbound texels. This code can be interpreted by the `OpImageSparseTexelsResident` instruction which converts the residency code to a boolean value.

### 16.3.8. Chroma Reconstruction

In some color models, the color representation is defined in terms of monochromatic light intensity (often called “luma”) and color differences relative to this intensity, often called “chroma”. It is common for color models other than RGB to represent the chroma channels at lower spatial resolution than the luma channel. This approach is used to take advantage of the eye’s lower spatial sensitivity to color compared with its sensitivity to brightness. Less commonly, the same approach is used with additive color, since the green channel dominates the eye’s sensitivity to light intensity and the spatial sensitivity to color introduced by red and blue is lower.

Lower-resolution channels are “downsampled” by resizing them to a lower spatial resolution than the channel representing luminance. This process is also commonly known as “chroma subsampling”. There is one luminance sample in each texture texel, but each chrominance sample may be shared among several texels in one or both texture dimensions.

- “.444” formats do not spatially downsample chroma values compared with luma: there are unique chroma samples for each texel.
- “.422” formats have downsampling in the x dimension (corresponding to $u$ or $s$ coordinates): they are sampled at half the resolution of luma in that dimension.
- “.420” formats have downsampling in the x dimension (corresponding to $u$ or $s$ coordinates) and the y dimension (corresponding to $v$ or $t$ coordinates): they are sampled at half the resolution of luma in both dimensions.

The process of reconstructing a full color value for texture access involves accessing both chroma and luma values at the same location. To generate the color accurately, the values of the lower-resolution channels at the location of the luma samples must be reconstructed from the lower-resolution sample locations, an operation known here as “chroma reconstruction” irrespective of the actual color model.

The location of the chroma samples relative to the luma coordinates is determined by the `xChromaOffset` and `yChromaOffset` members of the `VkSamplerYcbcrConversionCreateInfo` structure.
used to create the sampler $Y' C_b C_r$ conversion.

The following diagrams show the relationship between unnormalized $(u,v)$ coordinates and $(i,j)$ integer texel positions in the luma channel (shown in black, with circles showing integer sample positions) and the texel coordinates of reduced-resolution chroma channels, shown as crosses in red.

**Note**

If the chroma values are reconstructed at the locations of the luma samples by means of interpolation, chroma samples from outside the image bounds are needed; these are determined according to Wrapping Operation. These diagrams represent this by showing the bounds of the “chroma texel” extending beyond the image bounds, and including additional chroma sample positions where required for interpolation. The limits of a sample for NEAREST sampling is shown as a grid.

*Figure 6. 422 downsampling, xChromaOffset=COSITED_EVEN*
Figure 7. 422 downsampling, xChromaOffset=MIDPOINT

Figure 8. 420 downsampling, xChromaOffset=COSITED_EVEN, yChromaOffset=COSITED_EVEN
Figure 9. 420 downsampling, xChromaOffset=MIDPOINT, yChromaOffset=COSITED_EVEN

Figure 10. 420 downsampling, xChromaOffset=COSITED_EVEN, yChromaOffset=MIDPOINT
Reconstruction is implemented in one of two ways:

If the format of the image that is to be sampled sets `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT`, or the `VkSamplerYcbcrConversionCreateInfo`'s `forceExplicitReconstruction` is set to `VK_TRUE`, reconstruction is performed as an explicit step independent of filtering, described in the Explicit Reconstruction section.

If the format of the image that is to be sampled does not set `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` and if the `VkSamplerYcbcrConversionCreateInfo`'s `forceExplicitReconstruction` is set to `VK_FALSE`, reconstruction is performed as an implicit part of filtering prior to color model conversion, with no separate post-conversion texel filtering step, as described in the Implicit Reconstruction section.

**Explicit Reconstruction**

- If the `chromaFilter` member of the `VkSamplerYcbcrConversionCreateInfo` structure is `VK_FILTER.nearest`:
  - If the format's R and B channels are reduced in resolution in just width by a factor of two relative to the G channel (i.e. this is a “.422” format), the $\tau_{ijk}[level]$ values accessed by texel filtering are reconstructed as follows:
    \[
    \tau_R(i, j) = \tau_R(i \times 0.5, j)[level]
    \]
    \[
    \tau_B(i, j) = \tau_B(i \times 0.5, j)[level]
    \]
  - If the format's R and B channels are reduced in resolution in width and height by a factor of two relative to the G channel (i.e. this is a “.420” format), the $\tau_{ijk}[level]$ values accessed by...
texel filtering are reconstructed as follows:
\[
\begin{align*}
\tau_R'(i, j) &= \tau_R([i \times 0.5], [j \times 0.5])[\text{level}] \\
\tau_B'(i, j) &= \tau_B([i \times 0.5], [j \times 0.5])[\text{level}]
\end{align*}
\]

\textbf{Note}

\texttt{xChromaOffset} and \texttt{yChromaOffset} have no effect if \texttt{chromaFilter} is \texttt{VK_FILTER_NEAREST} for explicit reconstruction.

- If the \texttt{chromaFilter} member of the \texttt{VkSamplerYcbcrConversionCreateInfo} structure is \texttt{VK_FILTER_LINEAR}:
  - If the format’s R and B channels are reduced in resolution in just width by a factor of two relative to the G channel (i.e. this is a “\_422” format):
    - If \texttt{xChromaOffset} is \texttt{VK_CHROMA_LOCATION_COSITED_EVEN}:
      \[
      \tau_{RB}'(i, j) = \begin{cases} 
      \tau_{RB}([i \times 0.5], [j \times 0.5])[\text{level}], & 0.5 \times i = [0.5 \times i] \\
      0.5 \times \tau_{RB}([i \times 0.5], [j \times 0.5])[\text{level}] + 0.5 \times \tau_{RB}([i \times 0.5] + 1, [j \times 0.5])[\text{level}], & 0.5 \times i \neq [0.5 \times i]
      \end{cases}
      \]
    - If \texttt{xChromaOffset} is \texttt{VK_CHROMA_LOCATION_MIDPOINT}:
      \[
      \tau_{RB}'(i, j) = \begin{cases} 
      0.25 \times \tau_{RB}([i \times 0.5] - 1, [j \times 0.5])[\text{level}] + 0.75 \times \tau_{RB}([i \times 0.5], [j \times 0.5])[\text{level}], & 0.5 \times i = [0.5 \times i] \\
      0.75 \times \tau_{RB}([i \times 0.5], [j \times 0.5])[\text{level}] + 0.25 \times \tau_{RB}([i \times 0.5] + 1, [j \times 0.5])[\text{level}], & 0.5 \times i \neq [0.5 \times i]
      \end{cases}
      \]
  - If the format’s R and B channels are reduced in resolution in width and height by a factor of two relative to the G channel (i.e. this is a “\_420” format), a similar relationship applies. Due to the number of options, these formulae are expressed more concisely as follows:

\[
\begin{align*}
i_{RB} &= \begin{cases} 
0.5 \times (i) & \text{xChromaOffset=\text{COSITED\_EVEN}} \\
0.5 \times (i - 0.5) & \text{xChromaOffset=\text{MIDPOINT}}
\end{cases} \\
\text{floor} &= \lfloor i_{RB} \rfloor \\
\text{frac} &= i_{RB} - \text{floor}
\end{align*}
\]

\[
\begin{align*}
\tau_{RB}'(i, j) &= \tau_{RB}(i_{\text{floor}}, j_{\text{floor}})[\text{level}] \times (1 - \text{frac}) \times (1 - j_{\text{frac}}) + \\
\tau_{RB}(1 + i_{\text{floor}}, j_{\text{floor}})[\text{level}] \times (i_{\text{frac}}) \times (1 - j_{\text{frac}}) + \\
\tau_{RB}(i_{\text{floor}}, 1 + j_{\text{floor}})[\text{level}] \times (1 - i_{\text{frac}}) \times (j_{\text{frac}}) + \\
\tau_{RB}(1 + i_{\text{floor}}, 1 + j_{\text{floor}})[\text{level}] \times (i_{\text{frac}}) \times (j_{\text{frac}})
\end{align*}
\]
Note
In the case where the texture itself is bilinearly interpolated as described in Texel Filtering, thus requiring four full-color samples for the filtering operation, and where the reconstruction of these samples uses bilinear interpolation in the chroma channels due to `chromaFilter=VK_FILTER_LINEAR`, up to nine chroma samples may be required, depending on the sample location.

Implicit Reconstruction

Implicit reconstruction takes place by the samples being interpolated, as required by the filter settings of the sampler, except that `chromaFilter` takes precedence for the chroma samples.

If `chromaFilter` is `VK_FILTER_NEAREST`, an implementation may behave as if `xChromaOffset` and `yChromaOffset` were both `VK_CHROMA_LOCATION_MIDPOINT`, irrespective of the values set.

Note
This will not have any visible effect if the locations of the luma samples coincide with the location of the samples used for rasterization.

The sample coordinates are adjusted by the downsample factor of the channel (such that, for example, the sample coordinates are divided by two if the channel has a downsample factor of two relative to the luma channel):

\[
\begin{align*}
  u_{RB}' &= \begin{cases} 
  0.5 \times (u + 0.5), & xChromaOffset = \text{COSITED\_EVEN} \\ 0.5 \times u, & xChromaOffset = \text{MIDPOINT} 
  \end{cases} \\
  v_{RB}' &= \begin{cases} 
  0.5 \times (v + 0.5), & yChromaOffset = \text{COSITED\_EVEN} \\ 0.5 \times v, & yChromaOffset = \text{MIDPOINT} 
  \end{cases}
\end{align*}
\]

16.3.9. Sampler Y'C_bC_R Conversion

Sampler Y'C_bC_R conversion performs the following operations, which an implementation may combine into a single mathematical operation:

- **Sampler Y'C_bC_R Range Expansion**
- **Sampler Y'C_bC_R Model Conversion**

Sampler Y'C_bC_R Range Expansion

Sampler Y'C_bC_R range expansion is applied to color channel values after all texel input operations which are not specific to sampler Y'C_bC_R conversion. For example, the input values to this stage have been converted using the normal format conversion rules.

Sampler Y'C_bC_R range expansion is not applied if `ycbcrModel` is `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY`. That is, the shader receives the vector C'_rgba as output by the Component Swizzle stage without further modification.

For other values of `ycbcrModel`, range expansion is applied to the texel channel values output by the Component Swizzle defined by the `components` member of `VkSamplerYcbcrConversionCreateInfo`. 

Chapter 16. Image Operations | 1077
Range expansion applies independently to each channel of the image. For the purposes of range expansion and Y'CbCr model conversion, the R and B channels contain color difference (chroma) values and the G channel contains luma. The A channel is not modified by sampler Y'CbCr range expansion.

The range expansion to be applied is defined by the ycbcrRange member of the VkSamplerYcbcrConversionCreateInfo structure:

- If ycbcrRange is VK_SAMPLER_YCBCR_RANGE_ITU_FULL, the following transformations are applied:

  \[
  \begin{align*}
  Y' &= C'_\text{rgba} \times (2^n - 1) - 16 \times 2^n - 8 \\
  C_B &= C'_\text{rgba} \times (2^n - 1) - 128 \times 2^n - 8 \\
  C_R &= C'_\text{rgba} \times (2^n - 1) - 128 \times 2^n - 8 \\
  \end{align*}
  \]

  \textbf{Note}

  These formulae correspond to the “full range” encoding in the “Quantization schemes” chapter of the Khronos Data Format Specification.

  Should any future amendments be made to the ITU specifications from which these equations are derived, the formulae used by Vulkan may also be updated to maintain parity.

- If ycbcrRange is VK_SAMPLER_YCBCR_RANGE_ITU_NARROW, the following transformations are applied:

  \[
  \begin{align*}
  Y' &= C'_\text{rgba} \times (2^n - 1) - 16 \times 2^n - 8 \\
  C_B &= C'_\text{rgba} \times (2^n - 1) - 128 \times 2^n - 8 \\
  C_R &= C'_\text{rgba} \times (2^n - 1) - 128 \times 2^n - 8 \\
  \end{align*}
  \]

  \textbf{Note}

  These formulae correspond to the “narrow range” encoding in the “Quantization schemes” chapter of the Khronos Data Format Specification.

- \( n \) is the bit-depth of the channels in the format.

The precision of the operations performed during range expansion must be at least that of the source format.

An implementation may clamp the results of these range expansion operations such that \( Y' \) falls in the range \([0,1]\), and/or such that \( C_B \) and \( C_R \) fall in the range \([-0.5,0.5]\).

**Sampler Y'CbCr Model Conversion**

The range-expanded values are converted between color models, according to the color model conversion specified in the ycbcrModel member:
VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY

The color channels are not modified by the color model conversion since they are assumed already to represent the desired color model in which the shader is operating; $Y'C_bC_R$ range expansion is also ignored.

VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY

The color channels are not modified by the color model conversion and are assumed to be treated as though in $Y'C_bC_R$ form both in memory and in the shader; $Y'C_bC_R$ range expansion is applied to the channels as for other $Y'C_bC_R$ models, with the vector $(C_R,Y',C_B,A)$ provided to the shader.

VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709

The color channels are transformed from a $Y'C_bC_R$ representation to an $R'G'B'$ representation as described in the “BT.709 $Y'C_bC_R$ conversion” section of the Khronos Data Format Specification.

VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601

The color channels are transformed from a $Y'C_bC_R$ representation to an $R'G'B'$ representation as described in the “BT.601 $Y'C_bC_R$ conversion” section of the Khronos Data Format Specification.

VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020

The color channels are transformed from a $Y'C_bC_R$ representation to an $R'G'B'$ representation as described in the “BT.2020 $Y'C_bC_R$ conversion” section of the Khronos Data Format Specification.

In this operation, each output channel is dependent on each input channel.

An implementation may clamp the $R'G'B'$ results of these conversions to the range $[0,1]$.

The precision of the operations performed during model conversion must be at least that of the source format.

The alpha channel is not modified by these model conversions.
Note

Sampling operations in a non-linear color space can introduce color and intensity shifts at sharp transition boundaries. To avoid this issue, the technically precise color correction sequence described in the “Introduction to Color Conversions” chapter of the Khronos Data Format Specification may be performed as follows:

- Calculate the unnormalized texel coordinates corresponding to the desired sample position.
- For a `minFilter` or `magFilter` of `VK_FILTER_NEAREST`:
  1. Calculate \((i,j)\) for the sample location as described under the “nearest filtering” formulae in \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection
  2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
  3. Sample using `sampler Y'CbCr conversion` at this location.
- For a `minFilter` or `magFilter` of `VK_FILTER_LINEAR`:
  1. Calculate \((i_{0.1},j_{0.1})\) for the sample location as described under the “linear filtering” formulae in \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection
  2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
  3. Sample using `sampler Y'CbCr conversion` at each of these locations.
  4. Convert the non-linear A'R'G'B' outputs of the Y'CbCr conversions to linear ARGB values as described in the “Transfer Functions” chapter of the Khronos Data Format Specification.
  5. Interpolate the linear ARGB values using the \(\alpha\) and \(\beta\) values described in the “linear filtering” section of \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection and the equations in Texel Filtering.

The additional calculations and, especially, additional number of sampling operations in the `VK_FILTER_LINEAR` case can be expected to have a performance impact compared with using the outputs directly. Since the variations from “correct” results are subtle for most content, the application author should determine whether a more costly implementation is strictly necessary.

If `chromaFilter`, and `minFilter` or `magFilter` are both `VK_FILTER_NEAREST`, these operations are redundant and sampling using `sampler Y'CbCr conversion` at the desired sample coordinates will produce the “correct” results without further processing.

16.4. Texel Output Operations

`Texel output instructions` are SPIR-V image instructions that write to an image. `Texel output`
operations are a set of steps that are performed on state, coordinates, and texel values while processing a texel output instruction, and which are common to some or all texel output instructions. They include the following steps, which are performed in the listed order:

- Validation operations
  - Format validation
  - Type validation
  - Coordinate validation
  - Sparse validation
- Texel output format conversion

### 16.4.1. Texel Output Validation Operations

Texel output validation operations inspect instruction/image state or coordinates, and in certain circumstances cause the write to have no effect. There are a series of validations that the texel undergoes.

**Texel Format Validation**

If the image format of the `OpTypeImage` is not compatible with the `VkImageView`'s format, the write causes the contents of the image's memory to become undefined.

**Texel Type Validation**

If the `Sampled Type` of the `OpTypeImage` does not match the type defined for the format, as specified in the SPIR-V Sampled Type column of the Interpretation of Numeric Format table, the write causes the value of the texel to become undefined. For integer types, if the Signedness of the `Sampled Type` of the `OpTypeImage` does not match the signedness of the accessed resource, the write causes the value of the texel to become undefined.

### 16.4.2. Integer Texel Coordinate Validation

The integer texel coordinates are validated according to the same rules as for texel input coordinate validation.

If the texel fails integer texel coordinate validation, then the write has no effect.

### 16.4.3. Sparse Texel Operation

If the texel attempts to write to an unbound region of a sparse image, the texel is a sparse unbound texel. In such a case, if the `VkPhysicalDeviceSparseProperties::residencyNonResidentStrict` property is VK_TRUE, the sparse unbound texel write has no effect. If residencyNonResidentStrict is VK_FALSE, the write may have a side effect that becomes visible to other accesses to unbound texels in any resource, but will not be visible to any device memory allocated by the application.
16.4.4. Texel Output Format Conversion

If the image format is sRGB, a linear to sRGB conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the Khronos Data Format Specification. The A component, if present, is unchanged.

Texels then undergo a format conversion from the floating point, signed, or unsigned integer type of the texel data to the VkFormat of the image view. Any unused components are ignored.

Each component is converted based on its type and size (as defined in the Format Definition section for each VkFormat). Floating-point outputs are converted as described in Floating-Point Format Conversions and Fixed-Point Data Conversion. Integer outputs are converted such that their value is preserved. The converted value of any integer that cannot be represented in the target format is undefined.

16.5. Normalized Texel Coordinate Operations

If the image sampler instruction provides normalized texel coordinates, some of the following operations are performed.

16.5.1. Projection Operation

For Proj image operations, the normalized texel coordinates \((s,t,r,q,a)\) and (if present) the \(D_{\text{ref}}\) coordinate are transformed as follows:

\[
\begin{align*}
  s &= \frac{s}{q}, & \text{for } 1\text{D, } 2\text{D, or } 3\text{D image} \\
  t &= \frac{t}{q}, & \text{for } 2\text{D or } 3\text{D image} \\
  r &= \frac{r}{q}, & \text{for } 3\text{D image} \\
  D_{\text{ref}} &= \frac{D_{\text{ref}}}{q}, & \text{if provided}
\end{align*}
\]

16.5.2. Derivative Image Operations

Derivatives are used for LOD selection. These derivatives are either implicit (in an ImplicitLod image instruction in a fragment shader) or explicit (provided explicitly by shader to the image instruction in any shader).

For implicit derivatives image instructions, the derivatives of texel coordinates are calculated in the same manner as derivative operations. That is:

\[
\begin{align*}
  \frac{\partial s}{\partial x} &= dPdx(s), & \frac{\partial s}{\partial y} &= dPdy(s), & \text{for } 1\text{D, } 2\text{D, Cube, or } 3\text{D image} \\
  \frac{\partial t}{\partial x} &= dPdx(t), & \frac{\partial t}{\partial y} &= dPdy(t), & \text{for } 2\text{D, Cube, or } 3\text{D image} \\
  \frac{\partial r}{\partial x} &= dPdx(r), & \frac{\partial r}{\partial y} &= dPdy(r), & \text{for } \text{Cube or } 3\text{D image}
\end{align*}
\]

Partial derivatives not defined above for certain image dimensionalities are set to zero.

For explicit LOD image instructions, if the optional SPIR-V operand Grad is provided, then the operand values are used for the derivatives. The number of components present in each derivative
for a given image dimensionality matches the number of partial derivatives computed above.

If the **optional** SPIR-V operand `Lod` is provided, then derivatives are set to zero, the cube map derivative transformation is skipped, and the scale factor operation is skipped. Instead, the floating point scalar coordinate is directly assigned to $\lambda_{\text{base}}$ as described in [Level-of-Detail Operation](#).

If the image or sampler object used by an implicit derivative image instruction is not uniform across the quad and `quadDivergentImplicitLod` is not supported, then the derivative and LOD values are undefined. Implicit derivatives are well-defined when the image and sampler and control flow are uniform across the quad, even if they diverge between different quads.

If `quadDivergentImplicitLod` is supported, then derivatives and implicit LOD values are well-defined even if the image or sampler object are not uniform within a quad. The derivatives are computed as specified above, and the implicit LOD calculation proceeds for each shader invocation using its respective image and sampler object.

### 16.5.3. Cube Map Face Selection and Transformations

For cube map image instructions, the (s,t,r) coordinates are treated as a direction vector ($r_x$, $r_y$, $r_z$). The direction vector is used to select a cube map face. The direction vector is transformed to a per-face texel coordinate system ($s_{\text{face}}$, $t_{\text{face}}$). The direction vector is also used to transform the derivatives to per-face derivatives.

### 16.5.4. Cube Map Face Selection

The direction vector selects one of the cube map's faces based on the largest magnitude coordinate direction (the major axis direction). Since two or more coordinates can have identical magnitude, the implementation must have rules to disambiguate this situation.

The rules should have as the first rule that $r_z$ wins over $r_y$ and $r_x$, and the second rule that $r_y$ wins over $r_x$. An implementation may choose other rules, but the rules must be deterministic and depend only on ($r_x$, $r_y$, $r_z$).

The layer number (corresponding to a cube map face), the coordinate selections for $s_c$, $t_c$, $r_c$, and the selection of derivatives, are determined by the major axis direction as specified in the following two tables.

**Table 27. Cube map face and coordinate selection**

16.5.5. Cube Map Coordinate Transformation

\[
s_{face} = \frac{1}{2} \times \frac{s_c}{r_c} + \frac{1}{2} \\
t_{face} = \frac{1}{2} \times \frac{t_c}{r_c} + \frac{1}{2}
\]

16.5.6. Cube Map Derivative Transformation

\[
\frac{\partial s_{face}}{\partial x} = \frac{\partial}{\partial x} \left( \frac{1}{2} \times \frac{s_c}{r_c} + \frac{1}{2} \right) \\
\frac{\partial s_{face}}{\partial y} = \frac{1}{2} \times \frac{\partial}{\partial y} \left( \frac{s_c}{r_c} \right) \\
\frac{\partial s_{face}}{\partial z} = \frac{1}{2} \times \left( \frac{r_c \times \partial s_c / \partial x - s_c \times \partial r_c / \partial x}{(r_c)^2} \right)
\]

\[
\frac{\partial t_{face}}{\partial x} = \frac{1}{2} \times \left( \frac{r_c \times \partial t_c / \partial x - t_c \times \partial r_c / \partial x}{(r_c)^2} \right) \\
\frac{\partial t_{face}}{\partial y} = \frac{1}{2} \times \left( \frac{r_c \times \partial t_c / \partial y - t_c \times \partial r_c / \partial y}{(r_c)^2} \right)
\]

16.5.7. Scale Factor Operation, Level-of-Detail Operation and Image Level(s) Selection

LOD selection can be either explicit (provided explicitly by the image instruction) or implicit (determined from a scale factor calculated from the derivatives). The LOD must be computed with \texttt{mipmapPrecisionBits} of accuracy.
Scale Factor Operation

The magnitude of the derivatives are calculated by:

\[ m_{ux} = |\partial s/\partial x| \times w_{base} \]

\[ m_{vx} = |\partial t/\partial x| \times h_{base} \]

\[ m_{wx} = |\partial r/\partial x| \times d_{base} \]

\[ m_{uy} = |\partial s/\partial y| \times w_{base} \]

\[ m_{vy} = |\partial t/\partial y| \times h_{base} \]

\[ m_{wy} = |\partial r/\partial y| \times d_{base} \]

where:

\[ \partial t/\partial x = \partial t/\partial y = 0 \] (for 1D images)

\[ \partial r/\partial x = \partial r/\partial y = 0 \] (for 1D, 2D or Cube images)

and:

\[ w_{base} = \text{image.w} \]

\[ h_{base} = \text{image.h} \]

\[ d_{base} = \text{image.d} \]

(for the \textit{baseMipLevel}, from the image descriptor).

For corner-sampled images, the \textit{w}_{base}, \textit{h}_{base}, and \textit{d}_{base} are instead:

\[ w_{base} = \text{image.w} - 1 \]

\[ h_{base} = \text{image.h} - 1 \]
d_{base} = \text{image.d} - 1

A point sampled in screen space has an elliptical footprint in texture space. The minimum and maximum scale factors ($\rho_{\min}$, $\rho_{\max}$) should be the minor and major axes of this ellipse.

The scale factors $\rho_x$ and $\rho_y$, calculated from the magnitude of the derivatives in x and y, are used to compute the minimum and maximum scale factors.

$\rho_x$ and $\rho_y$ may be approximated with functions $f_x$ and $f_y$, subject to the following constraints:

- $f_x$ is continuous and monotonically increasing in each of $m_{ux}$, $m_{vx}$, and $m_{wx}$
- $f_y$ is continuous and monotonically increasing in each of $m_{uy}$, $m_{vy}$, and $m_{wy}$

$$\max(|m_{ux}|, |m_{vx}|, |m_{wx}|) \leq f_x \leq \sqrt{2}(|m_{ux}| + |m_{vx}| + |m_{wx}|)$$

$$\max(|m_{uy}|, |m_{vy}|, |m_{wy}|) \leq f_y \leq \sqrt{2}(|m_{uy}| + |m_{vy}| + |m_{wy}|)$$

The minimum and maximum scale factors ($\rho_{\min}$, $\rho_{\max}$) are determined by:

$$\rho_{\max} = \max(\rho_x, \rho_y)$$

$$\rho_{\min} = \min(\rho_x, \rho_y)$$

The ratio of anisotropy is determined by:

$$\eta = \min(\rho_{\max}/\rho_{\min}, \text{maxAniso})$$

where:

$$\text{sampler.max}_{\text{Aniso}} = \text{maxAnisotropy} \text{ (from sampler descriptor)}$$

$$\text{limits.max}_{\text{Aniso}} = \text{maxSamplerAnisotropy} \text{ (from physical device limits)}$$

$$\text{max}_{\text{Aniso}} = \min(\text{sampler.max}_{\text{Aniso}}, \text{limits.max}_{\text{Aniso}})$$

If $\rho_{\max} = \rho_{\min} = 0$, then all the partial derivatives are zero, the fragment's footprint in texel space is a point, and $\eta$ should be treated as 1. If $\rho_{\max} \neq 0$ and $\rho_{\min} = 0$ then all partial derivatives along one axis are zero, the fragment's footprint in texel space is a line segment, and $\eta$ should be treated as $\text{max}_{\text{Aniso}}$. However, anytime the footprint is small in texel space the implementation may use a smaller value of $\eta$, even when $\rho_{\min}$ is zero or close to zero. If either $\text{VkPhysicalDeviceFeatures}::\text{samplerAnisotropy}$ or $\text{VkSamplerCreateInfo}::\text{anisotropyEnable}$ are $\text{VK_FALSE}$, $\text{max}_{\text{Aniso}}$ is set to 1.

If $\eta = 1$, sampling is isotropic. If $\eta > 1$, sampling is anisotropic.
The sampling rate (N) is derived as:

\[ N = \lceil \eta \rceil \]

An implementation may round N up to the nearest supported sampling rate. An implementation may use the value of N as an approximation of \( \eta \).

**Level-of-Detail Operation**

The LOD parameter \( \lambda \) is computed as follows:

\[
\lambda_{\text{base}}(x, y) = \begin{cases} 
\text{shaderOp.Lod} & \text{(from optional SPIR-V operand)} \\
\log_2 \left( \frac{P_{\text{max}}}{\eta} \right) & \text{otherwise}
\end{cases}
\]

\[
\lambda'(x, y) = \lambda_{\text{base}} + \text{clamp}(\text{sampler.bias} + \text{shaderOp.bias}, -\text{maxSamplerLodBias}, \text{maxSamplerLodBias})
\]

\[
\lambda = \begin{cases} 
\text{lod}_{\text{max}}, & \lambda > \text{lod}_{\text{max}} \\
\lambda', & \text{lod}_{\text{min}} \leq \lambda' \leq \text{lod}_{\text{max}} \\
\text{lod}_{\text{min}}, & \lambda < \text{lod}_{\text{min}} \\
\text{undefined}, & \text{lod}_{\text{min}} > \text{lod}_{\text{max}}
\end{cases}
\]

where:

- \( \text{sampler.bias} = \text{mipLodBias} \) (from sampler descriptor)
- \( \text{shaderOp.bias} = \begin{cases} 
\text{Bias} & \text{(from optional SPIR-V operand)} \\
0 & \text{otherwise}
\end{cases} \) (from sampler descriptor)
- \( \text{sampler.lod}_{\text{min}} = \text{minLod} \) (from sampler descriptor)
- \( \text{shaderOp.lod}_{\text{min}} = \begin{cases} 
\text{MinLod} & \text{(from optional SPIR-V operand)} \\
0 & \text{otherwise}
\end{cases} \) (from sampler descriptor)
- \( \text{lod}_{\text{max}} = \text{max}(\text{sampler.lod}_{\text{min}}, \text{shaderOp.lod}_{\text{min}}) \) (from sampler descriptor)

and \( \text{maxSamplerLodBias} \) is the value of the \text{VkPhysicalDeviceLimits} feature \( \text{maxSamplerLodBias} \).

**Image Level(s) Selection**

The image level(s) \( d, d_{hi}, \) and \( d_{lo} \) which texels are read from are determined by an image-level parameter \( d_{l} \), which is computed based on the LOD parameter, as follows:

\[
d_{l} = \begin{cases} 
\text{nearest}(d'), & \text{mipmapMode is VK_SAMPLER_MIPMAP_MODE_NEAREST} \\
d', & \text{otherwise}
\end{cases}
\]

where:

\[
d' = \text{level}_{\text{base}} + \text{clamp}(\lambda, 0, q)
\]

\[
\text{nearest}(d') = \begin{cases} 
[d' + 0.5] - 1, & \text{preferred} \\
[d' + 0.5], & \text{alternative}
\end{cases}
\]

and:

\[
\text{level}_{\text{base}} = \text{baseMipLevel}
\]
\[
q = \text{levelCount} - 1
\]

\text{baseMipLevel} \text{ and } \text{levelCount} \text{ are taken from the subresourceRange of the image view.}

If the sampler’s \text{mipmapMode} is \text{VK_SAMPLER_MIPMAP_MODE_NEAREST}, then the level selected is \(d = d_i\).

If the sampler’s \text{mipmapMode} is \text{VK_SAMPLER_MIPMAP_MODE_LINEAR}, two neighboring levels are selected:

\[
\begin{align*}
    d_{hi} &= |d_i| \\
    d_{lo} &= \min(d_{hi} + 1, q) \\
    \delta &= d_i - d_{hi}
\end{align*}
\]

\(\delta\) is the fractional value, quantized to the number of \text{mipmap precision bits}, used for linear filtering between levels.

### 16.5.8. (s,t,r,q,a) to (u,v,w,a) Transformation

The normalized texel coordinates are scaled by the image level dimensions and the array layer is selected.

This transformation is performed once for each level used in \text{filtering} (either \(d\), or \(d_{hi}\) and \(d_{lo}\)).

\[
\begin{align*}
    u(x, y) &= s(x, y) \times width\text{scale} + \Delta_i & \text{for 1D images} \\
    v(x, y) &= \begin{cases} 0 & \text{for 2D or Cube images} \\
    t(x, y) \times height\text{scale} + \Delta_j & \text{otherwise} \\
    \end{cases} \\
    w(x, y) &= \begin{cases} 0 & \text{for 2D or Cube images} \\
    r(x, y) \times depth\text{scale} + \Delta_k & \text{otherwise} \\
    \end{cases} \\
    a(x, y) &= \begin{cases} a(x, y) & \text{for array images} \\
    0 & \text{otherwise} \\
    \end{cases}
\end{align*}
\]

where:

\[
width\text{scale} = width\text{level}
\]

\[
height\text{scale} = height\text{level}
\]

\[
dept\text{scale} = depth\text{level}
\]

for conventional images, and:

\[
width\text{scale} = width\text{level} - 1
\]

\[
height\text{scale} = height\text{level} - 1
\]
\[
\text{depth}_{\text{scale}} = \text{depth}_{\text{level}} - 1
\]
for corner-sampled images.

and where \((\Delta_i, \Delta_j, \Delta_k)\) are taken from the image instruction if it includes a `ConstOffset` or `Offset` operand, otherwise they are taken to be zero.

Operations then proceed to Unnormalized Texel Coordinate Operations.

### 16.6. Unnormalized Texel Coordinate Operations

#### 16.6.1. \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection

The unnormalized texel coordinates are transformed to integer texel coordinates relative to the selected mipmap level.

The layer index \(l\) is computed as:

\[
l = \text{clamp}(\text{RNE}(a), 0, \text{layerCount} - 1) + \text{baseArrayLayer}
\]

where \(\text{layerCount}\) is the number of layers in the image subresource range of the image view, \(\text{baseArrayLayer}\) is the first layer from the subresource range, and where:

\[
\text{RNE}(a) = \begin{cases} 
\text{roundTiesToEven}(a) & \text{preferred, from IEEE Std 754-2008 Floating-Point Arithmetic} \\
\lfloor a + 0.5 \rfloor & \text{alternative}
\end{cases}
\]

The sample index \(n\) is assigned the value 0.

Nearest filtering (`VK_FILTER_NEAREST`) computes the integer texel coordinates that the unnormalized coordinates lie within:

\[
i = \lfloor u + \text{shift} \rfloor \\
j = \lfloor v + \text{shift} \rfloor \\
k = \lfloor w + \text{shift} \rfloor
\]

where:

\[
\text{shift} = 0.0
\]

for conventional images, and:

\[
\text{shift} = 0.5
\]

for corner-sampled images.

Linear filtering (`VK_FILTER_LINEAR`) computes a set of neighboring coordinates which bound the unnormalized coordinates. The integer texel coordinates are combinations of \(i_0\) or \(i_1\), \(j_0\) or \(j_1\), \(k_0\) or \(k_1\),
as well as weights $\alpha$, $\beta$, and $\gamma$.

\[
\begin{align*}
  i_0 &= |u - \text{shift}| \\
  i_1 &= i_0 + 1 \\
  j_0 &= |v - \text{shift}| \\
  j_1 &= j_0 + 1 \\
  k_0 &= |w - \text{shift}| \\
  k_1 &= k_0 + 1 \\

  \alpha &= \text{frac}(u - \text{shift}) \\
  \beta &= \text{frac}(v - \text{shift}) \\
  \gamma &= \text{frac}(w - \text{shift})
\end{align*}
\]

where:

\begin{align*}
  \text{shift} &= 0.5 \\
  \text{for conventional images, and:} \\
  \text{shift} &= 0.0 \\
  \text{for corner-sampled images, and where:}
\end{align*}

\[
\text{frac}(x) = x - \lfloor x \rfloor
\]

where the number of fraction bits retained is specified by `VkPhysicalDeviceLimits::subTexelPrecisionBits`.

Cubic filtering (`VK_FILTER_CUBIC_EXT`) computes a set of neighboring coordinates which bound the unnormalized coordinates. The integer texel coordinates are combinations of $i_0$, $i_1$, $i_2$ or $i_3$, $j_0$, $j_1$, $j_2$ or $j_3$, $k_0$, $k_1$, $k_2$ or $k_3$, as well as weights $\alpha$, $\beta$, and $\gamma$.

\[
\begin{align*}
  i_0 &= |u - \frac{3}{2}| \\
  i_1 &= i_0 + 1 \\
  i_2 &= i_1 + 1 \\
  i_3 &= i_2 + 1 \\
  j_0 &= |v - \frac{3}{2}| \\
  j_1 &= j_0 + 1 \\
  j_2 &= j_1 + 1 \\
  j_3 &= j_2 + 1 \\
  k_0 &= |w - \frac{3}{2}| \\
  k_1 &= k_0 + 1 \\
  k_2 &= k_1 + 1 \\
  k_3 &= k_2 + 1 \\

  \alpha &= \text{frac}(u - \frac{1}{2}) \\
  \beta &= \text{frac}(v - \frac{1}{2}) \\
  \gamma &= \text{frac}(w - \frac{1}{2})
\end{align*}
\]

where:

\[
\text{frac}(x) = x - \lfloor x \rfloor
\]

where the number of fraction bits retained is specified by `VkPhysicalDeviceLimits`.
16.7. Integer Texel Coordinate Operations

Integer texel coordinate operations may supply a LOD which texels are to be read from or written to using the optional SPIR-V operand Lod. If the Lod is provided then it must be an integer.

The image level selected is:

\[
\text{level} = \text{level}_{\text{base}} + \begin{cases} \text{Lod} & \text{(from optional SPIR-V operand)} \\ 0 & \text{otherwise} \end{cases}
\]

If d does not lie in the range \([\text{baseMipLevel}, \text{baseMipLevel} + \text{levelCount})\) then any values fetched are zero if robustImageAccess2 is enabled, otherwise are undefined, and any writes (if supported) are discarded.

16.8. Image Sample Operations

16.8.1. Wrapping Operation

Cube images ignore the wrap modes specified in the sampler. Instead, if VK_FILTER_NEAREST is used within a mip level then VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE is used, and if VK_FILTER_LINEAR is used within a mip level then sampling at the edges is performed as described earlier in the Cube map edge handling section.

The first integer texel coordinate i is transformed based on the addressModeU parameter of the sampler.

\[
i = \begin{cases} i \text{ mod } \text{size} & \text{for repeat} \\ (\text{size} - 1) - \text{mirror} ((i \text{ mod } (2 \times \text{size})) - \text{size}) & \text{for mirrored repeat} \\ \text{clamp} (i, 0, \text{size} - 1) & \text{for clamp to edge} \\ \text{clamp} (i, -1, \text{size}) & \text{for clamp to border} \\ \text{clamp} (\text{mirror} (i), 0, \text{size} - 1) & \text{for mirror clamp to edge} \end{cases}
\]

where:

\[
\text{mirror} (n) = \begin{cases} n & \text{for } n \geq 0 \\ -(1 + n) & \text{otherwise} \end{cases}
\]

j (for 2D and Cube image) and k (for 3D image) are similarly transformed based on the addressModeV and addressModeW parameters of the sampler, respectively.

16.8.2. Texel Gathering

SPIR-V instructions with Gather in the name return a vector derived from 4 texels in the base level of the image view. The rules for the VK_FILTER_LINEAR minification filter are applied to identify the four selected texels. Each texel is then converted to an RGBA value according to conversion to RGBA and then swizzled. A four-component vector is then assembled by taking the component indicated by the Component value in the instruction from the swizzled color value of the four texels. If the
operation does not use the **ConstOffsets** image operand then the four texels form the $2 \times 2$ rectangle used for texture filtering:

\[
\begin{align*}
\tau[R] &= \tau_{i0,j0}[\text{level}_\text{base}, \text{comp}] \\
\tau[G] &= \tau_{i0,j0}[\text{level}_\text{base}, \text{comp}] \\
\tau[B] &= \tau_{i0,j0}[\text{level}_\text{base}, \text{comp}] \\
\tau[A] &= \tau_{i0,j0}[\text{level}_\text{base}, \text{comp}]
\end{align*}
\]

If the operation does use the **ConstOffsets** image operand then the offsets allow a custom filter to be defined:

\[
\begin{align*}
\tau[R] &= \tau_{i0,j0} + \Delta_i[\text{level}_\text{base}, \text{comp}] \\
\tau[G] &= \tau_{i0,j0} + \Delta_i[\text{level}_\text{base}, \text{comp}] \\
\tau[B] &= \tau_{i0,j0} + \Delta_i[\text{level}_\text{base}, \text{comp}] \\
\tau[A] &= \tau_{i0,j0} + \Delta_i[\text{level}_\text{base}, \text{comp}]
\end{align*}
\]

where:

\[
\tau[\text{level}_\text{base}, \text{comp}] = \begin{cases} 
\tau[\text{level}_\text{base}, R], & \text{for } \text{comp} = 0 \\
\tau[\text{level}_\text{base}, G], & \text{for } \text{comp} = 1 \\
\tau[\text{level}_\text{base}, B], & \text{for } \text{comp} = 2 \\
\tau[\text{level}_\text{base}, A], & \text{for } \text{comp} = 3
\end{cases}
\]

\(\text{comp}\) from SPIR-V operand Component

**OpImage*Gather** must not be used on a sampled image with **sampler Y'CbCr conversion** enabled.

### 16.8.3. Texel Filtering

Texel filtering is first performed for each level (either \(d\) or \(d_{hi}\) and \(d_{lo}\)).

If \(\lambda\) is less than or equal to zero, the texture is said to be **magnified**, and the filter mode within a mip level is selected by the **magFilter** in the sampler. If \(\lambda\) is greater than zero, the texture is said to be **minified**, and the filter mode within a mip level is selected by the **minFilter** in the sampler.

#### Texel Nearest Filtering

Within a mip level, **VK_FILTER_NEAREST** filtering selects a single value using the \((i, j, k)\) texel coordinates, with all texels taken from layer \(l\).

\[
\tau[\text{level}] = \begin{cases} 
\tau_{i,j,k}[\text{level}], & \text{for 3D image} \\
\tau_{i,j}[\text{level}], & \text{for 2D or Cube image} \\
\tau_{i,j}[\text{level}], & \text{for 1D image}
\end{cases}
\]

#### Texel Linear Filtering

Within a mip level, **VK_FILTER_LINEAR** filtering combines 8 (for 3D), 4 (for 2D or Cube), or 2 (for 1D) texel values, together with their linear weights. The linear weights are derived from the fractions computed earlier:
The values of multiple texels, together with their weights, are combined to produce a filtered value.

The `VkSamplerReductionModeCreateInfo::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, a weighted average is computed:

\[
\tau_{3D} = \sum_{k = k_0}^{k_1} \sum_{j = j_0}^{j_1} \sum_{i = i_0}^{i_1} (w_j)(w_k)(w_i)\tau_{ijk}
\]

\[
\tau_{2D} = \sum_{j = j_0}^{j_1} \sum_{i = i_0}^{i_1} (w_j)(w_i)\tau_{ij}
\]

\[
\tau_{1D} = \sum_{i = i_0}^{i_1} (w_i)\tau_{i}
\]

However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the set of texels with non-zero weights.

**Texel Cubic Filtering**

Within a mip level, `VK_FILTER_CUBIC_EXT`, filtering computes a weighted average of 64 (for 3D), 16 (for 2D), or 4 (for 1D) texel values, together with their Catmull-Rom weights.

Catmull-Rom weights are derived from the fractions computed earlier.

\[
\begin{bmatrix}
  w_0 \\
  w_1 \\
  w_2 \\
  w_3
\end{bmatrix} = \frac{1}{2}\begin{bmatrix}
  1 \\
  \alpha \\
  \alpha^2 \\
  \alpha^3
\end{bmatrix}
\begin{bmatrix}
  0 & 2 & 0 & 0 \\
  -1 & 0 & 1 & 0 \\
  2 & -5 & 4 & -1 \\
  -1 & 3 & -3 & 1
\end{bmatrix}
\]

\[
\begin{bmatrix}
  w_j \\
  w_i \\
  w_j \\
  w_k
\end{bmatrix} = \frac{1}{2}\begin{bmatrix}
  1 \\
  \beta \\
  \beta^2 \\
  \beta^3
\end{bmatrix}
\begin{bmatrix}
  0 & 2 & 0 & 0 \\
  -1 & 0 & 1 & 0 \\
  2 & -5 & 4 & -1 \\
  -1 & 3 & -3 & 1
\end{bmatrix}
\]

\[
\begin{bmatrix}
  w_k \\
  w_i \\
  w_k \\
  w_l
\end{bmatrix} = \frac{1}{2}\begin{bmatrix}
  1 \\
  \gamma \\
  \gamma^2 \\
  \gamma^3
\end{bmatrix}
\begin{bmatrix}
  0 & 2 & 0 & 0 \\
  -1 & 0 & 1 & 0 \\
  2 & -5 & 4 & -1 \\
  -1 & 3 & -3 & 1
\end{bmatrix}
\]

The values of multiple texels, together with their weights, are combined to produce a filtered value.

The `VkSamplerReductionModeCreateInfo::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to...
VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE, a weighted average is computed:

\[
\tau_{3D} = \sum_{k}^{k_{0}} \sum_{j}^{j_{0}} \sum_{l}^{l_{0}} (w_{k})(w_{j})(w_{l})\tau_{ijk}
\]

\[
\tau_{2D} = \sum_{i}^{i_{0}} (w_{i})\tau_{ij}
\]

\[
\tau_{1D} = \sum_{i}^{i_{0}} (w_{i})\tau_{i}
\]

However, if the reduction mode is VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the set of texels with non-zero weights.

**Texel Mipmap Filtering**

VK_SAMPLER_MIPMAP_MODE_NEAREST filtering returns the value of a single mipmap level,

\[ \tau = \tau[d]. \]

VK_SAMPLER_MIPMAP_MODE_LINEAR filtering combines the values of multiple mipmap levels (\(\tau[hi]\) and \(\tau[lo]\)), together with their linear weights.

The linear weights are derived from the fraction computed earlier:

\[
w_{hi} = (1 - \delta) \\
w_{lo} = (\delta)
\]

The values of multiple mipmap levels, together with their weights, are combined to produce a final filtered value.

The VkSamplerReductionModeCreateInfo::reductionMode can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the reductionMode is set (explicitly or implicitly) to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE, a weighted average is computed:

\[ \tau = (w_{hi})\tau[hi] + (w_{lo})\tau[lo] \]

**Texel Anisotropic Filtering**

Anisotropic filtering is enabled by the anisotropyEnable in the sampler. When enabled, the image filtering scheme accounts for a degree of anisotropy.

The particular scheme for anisotropic texture filtering is implementation dependent. Implementations should consider the magFilter, minFilter and mipmapMode of the sampler to control the specifics of the anisotropic filtering scheme used. In addition, implementations should consider minLod and maxLod of the sampler.

The following describes one particular approach to implementing anisotropic filtering for the 2D Image case, implementations may choose other methods:
Given a `magFilter`, `minFilter` of `VK_FILTER_LINEAR` and a `mipmapMode` of `VK_SAMPLER_MIPMAP_MODE_NEAREST`:

Instead of a single isotropic sample, N isotropic samples are sampled within the image footprint of the image level d to approximate an anisotropic filter. The sum $\tau_{2D_{\text{aniso}}}$ is defined using the single isotropic $\tau_{2D}(u,v)$ at level d.

$$\tau_{2D_{\text{aniso}}} = \frac{1}{N} \sum_{i=1}^{N} \tau_{2D}(u - \frac{1}{N} + \frac{i}{N+1}, v - \frac{1}{N} + \frac{i}{N+1}),$$

where $\rho_y > \rho_x$.

$$\tau_{2D_{\text{aniso}}} = \frac{1}{N} \sum_{i=1}^{N} \tau_{2D}(u, v - \frac{1}{N} + \frac{i}{N+1}),$$

when $\rho_y \geq \rho_x$.

When `VkSamplerReductionModeCreateInfo::reductionMode` is set to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, the above summation is used. However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above values, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the values with non-zero weights.

### 16.9. Texel Footprint Evaluation

The SPIR-V instruction `OpImageSampleFootprintNV` evaluates the set of texels from a single mip level that would be accessed during a texel filtering operation. In addition to the inputs that would be accepted by an equivalent `OpImageSample*` instruction, `OpImageSampleFootprintNV` accepts two additional inputs. The `Granularity` input is an integer identifying the size of texel groups used to evaluate the footprint. Each bit in the returned footprint mask corresponds to an aligned block of texels whose size is given by the following table:

#### Table 29. Texel footprint granularity values

<table>
<thead>
<tr>
<th>Granularity</th>

</tbody>
</table>
The **Coarse** input is used to select between the two mip levels that **may** be accessed during texel filtering when using a **mipmapMode** of **VK_SAMPLER_MIPMAP_MODE_LINEAR**. When filtering between two mip levels, a **Coarse** value of **true** requests the footprint in the lower-resolution mip level (higher level number), while **false** requests the footprint in the higher-resolution mip level. If texel filtering would access only a single mip level, the footprint in that level would be returned when **Coarse** is set to **false**; an empty footprint would be returned when **Coarse** is set to **true**.

The footprint for **OpImageSampleFootprintNV** is returned in a structure with six members:

- The first member is a boolean value that is true if the texel filtering operation would access only a single mip level.
- The second member is a two- or three-component integer vector holding the footprint anchor location. For two-dimensional images, the returned components are in units of eight texel groups. For three-dimensional images, the returned components are in units of four texel groups.
- The third member is a two- or three-component integer vector holding a footprint offset relative to the anchor. All returned components are in units of texel groups.
- The fourth member is a two-component integer vector mask, which holds a bitfield identifying the set of texel groups in an 8x8 or 4x4x4 neighborhood relative to the anchor and offset.
- The fifth member is an integer identifying the mip level containing the footprint identified by the anchor, offset, and mask.
- The sixth member is an integer identifying the granularity of the returned footprint.

For footprints in two-dimensional images (**Dim2D**), the mask returned by **OpImageSampleFootprintNV** indicates whether each texel group in a 8x8 local neighborhood of texel groups would have one or more texels accessed during texel filtering. In the mask, the texel group with local group coordinates (**lgx**, **lgy**) is considered covered if and only if

\[ 0 \neq ((mask.x + (mask.y << 32)) \& (1<<(lgy \times 8 + lgx))) \]

where:

- \( 0 \leq lgx < 8 \) and \( 0 \leq lgy < 8 \); and
- **mask** is the returned two-component mask.

The local group with coordinates (**lgx**, **lgy**) in the mask is considered covered if and only if the texel filtering operation would access one or more texels \( t_{ij} \) in the returned mipmap level where:
\[
\begin{align*}
i_0 &= \begin{cases} 
gran.x \times (8 \times anchor.x + lgx), & \text{if } lgx + offset.x < 8 \\
gran.x \times (8 \times (anchor.x - 1) + lgx), & \text{otherwise}
\end{cases} \\
i_1 &= i_0 + gran.x - 1 \\
j_0 &= \begin{cases} 
gran.y \times (8 \times anchor.y + lgy), & \text{if } lgy + offset.y < 8 \\
gran.y \times (8 \times (anchor.y - 1) + lgy), & \text{otherwise}
\end{cases} \\
j_1 &= j_0 + gran.y - 1
\end{align*}
\]

and

- \(i_0 \leq i \leq i_1\) and \(j_0 \leq j \leq j_1\);
- \(\text{gran}\) is a two-component vector holding the width and height of the texel group identified by the granularity;
- \(\text{anchor}\) is the returned two-component anchor vector; and
- \(\text{offset}\) is the returned two-component offset vector.

For footprints in three-dimensional images (\texttt{Dim3D}), the mask returned by \texttt{OpImageSampleFootprintNV} indicates whether each texel group in a 4x4x4 local neighborhood of texel groups would have one or more texels accessed during texel filtering. In the mask, the texel group with local group coordinates \((lgx, lgy, lgz)\), is considered covered if and only if:

\[
0 \neq ((mask.x + (mask.y<<<32))&&((1<<((lgz+16)+lgy+4+lgx))
\]

where:

- \(0 \leq lgx < 4, 0 \leq lgy < 4,\) and \(0 \leq lgz < 4;\) and
- \(\text{mask}\) is the returned two-component mask.

The local group with coordinates \((lgx, lgy, lgz)\) in the mask is considered covered if and only if the texel filtering operation would access one or more texels \(\tau_{ijk}\) in the returned miplevel where:

\[
\begin{align*}
i_0 &= \begin{cases} 
gran.x \times (4 \times anchor.x + lgx), & \text{if } lgx + offset.x < 4 \\
gran.x \times (4 \times (anchor.x - 1) + lgx), & \text{otherwise}
\end{cases} \\
i_1 &= i_0 + gran.x - 1 \\
j_0 &= \begin{cases} 
gran.y \times (4 \times anchor.y + lgy), & \text{if } lgy + offset.y < 4 \\
gran.y \times (4 \times (anchor.y - 1) + lgy), & \text{otherwise}
\end{cases} \\
j_1 &= j_0 + gran.y - 1 \\
k_0 &= \begin{cases} 
gran.z \times (4 \times anchor.z + lgz), & \text{if } lgz + offset.z < 4 \\
gran.z \times (4 \times (anchor.z - 1) + lgz), & \text{otherwise}
\end{cases} \\
k_1 &= k_0 + gran.z - 1
\end{align*}
\]

and

- \(i_0 \leq i \leq i_1, j_0 \leq j \leq j_1, k_0 \leq k \leq k_1;\)
- \(\text{gran}\) is a three-component vector holding the width, height, and depth of the texel group identified by the granularity;
- \(\text{anchor}\) is the returned three-component anchor vector; and
- \(\text{offset}\) is the returned three-component offset vector.

If the sampler used by \texttt{OpImageSampleFootprintNV} enables anisotropic texel filtering via
anisotropyEnable, it is possible that the set of texel groups accessed in a mip level may be too large to be expressed using an 8x8 or 4x4x4 mask using the granularity requested in the instruction. In this case, the implementation uses a texel group larger than the requested granularity. When a larger texel group size is used, OpImageSampleFootprintNV returns an integer granularity value that can be interpreted in the same manner as the granularity value provided to the instruction to determine the texel group size used. If anisotropic texel filtering is disabled in the sampler, or if an anisotropic footprint can be represented as an 8x8 or 4x4x4 mask with the requested granularity, OpImageSampleFootprintNV will use the requested granularity as-is and return a granularity value of zero.

OpImageSampleFootprintNV supports only two- and three-dimensional image accesses (Dim2D and Dim3D), and the footprint returned is undefined if a sampler uses an addressing mode other than VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

16.10. Image Operation Steps

Each step described in this chapter is performed by a subset of the image instructions:

- Texel Input Validation Operations, Format Conversion, Texel Replacement, Conversion to RGBA, and Component Swizzle: Performed by all instructions except OpImageWrite.

- Depth Comparison: Performed by OpImage*Dref instructions.

- All Texel output operations: Performed by OpImageWrite.

- Projection: Performed by all OpImage*Proj instructions.

- Derivative Image Operations, Cube Map Operations, Scale Factor Operation, Level-of-Detail Operation and Image Level(s) Selection, and Texel Anisotropic Filtering: Performed by all OpImageSample* and OpImageSparseSample* instructions.

- (s,t,r,q,a) to (u,v,w,a) Transformation, Wrapping, and (u,v,w,a) to (i,j,k,l,n) Transformation And Array Layer Selection: Performed by all OpImageSample, OpImageSparseSample, and OpImage*Gather instructions.

- Texel Filtering: Performed by all OpImageSample* and OpImageSparseSample* instructions.

- Sparse Residency: Performed by all OpImageSparse* instructions.

16.11. Image Query Instructions

16.11.1. Image Property Queries

OpImageQuerySize, OpImageQuerySizeLod, OpImageQueryLevels, and OpImageQuerySamples query properties of the image descriptor that would be accessed by a shader image operation. They return 0 if the bound descriptor is a null descriptor.

OpImageQuerySizeLod returns the size of the image level identified by the Level of Detail operand. If that level does not exist in the image, and the descriptor is not null, then the value returned is
16.11.2. Lod Query

OpImageQueryLod returns the Lod parameters that would be used in an image operation with the given image and coordinates. If the descriptor that would be accessed is a null descriptor then (0, 0) is returned. Otherwise, the steps described in this chapter are performed as if for OpImageSampleImplicitLod, up to Scale Factor Operation, Level-of-Detail Operation and Image Level(s) Selection. The return value is the vector \((\lambda', d)\). These values may be subject to implementation-specific maxima and minima for very large, out-of-range values.
Chapter 17. Fragment Density Map Operations

17.1. Fragment Density Map Operations Overview

When a fragment is generated in a render pass that has a fragment density map attachment, its area is determined by the properties of the local framebuffer region that the fragment occupies. The framebuffer is divided into a uniform grid of these local regions, and their fragment area property is derived from the density map with the following operations:

- Fetch density value
  - Component swizzle
  - Component mapping
- Fragment area conversion
  - Fragment area filter
  - Fragment area clamp

17.2. Fetch Density Value

Each local framebuffer region at center coordinate (x,y) fetches a texel from the fragment density map at integer coordinates:

\[
i = \left\lfloor \frac{x}{\text{Fragment Density Texel Size}_\text{width}} \right\rfloor
\]
\[
j = \left\lfloor \frac{y}{\text{Fragment Density Texel Size}_\text{height}} \right\rfloor
\]

Where the size of each region in the framebuffer is:

\[
\text{Fragment Density Texel Size}_\text{width} = 2^{\left\lceil \log_2\left(\frac{\text{framebuffer width}}{\text{Fragment Density Map width}}\right)\right\rceil}
\]
\[
\text{Fragment Density Texel Size}_\text{height} = 2^{\left\lceil \log_2\left(\frac{\text{framebuffer height}}{\text{Fragment Density Map height}}\right)\right\rceil}
\]

This region is subject to the limits in VkPhysicalDeviceFragmentDensityMapPropertiesEXT and therefore the final region size is clamped:

\[
\text{Fragment Density Texel Size}_\text{width} = \text{clamp}\left(\text{Fragment Density Texel Size}_\text{width}, \text{minFragment Density Texel Size}_\text{width}, \text{maxFragment Density Texel Size}_\text{width}\right)
\]
When multiview is enabled for the render pass and the fragment density map attachment view was created with `layerCount` greater than 1, the density map layer that the texel is fetched from is:

\[
\text{layer} = \text{baseArrayLayer} + \text{ViewIndex}
\]

Otherwise:

\[
\text{layer} = \text{baseArrayLayer}
\]

The texel fetched from the density map at (i,j,layer) is next converted to density with the following operations.

### 17.2.1. Component Swizzle

The `components` member of `VkImageViewCreateInfo` is applied to the fetched texel as defined in Image component swizzle.

### 17.2.2. Component Mapping

The swizzled texel's components are mapped to a density value:

\[
\text{densityValue}_{xy} = \langle C^r, C^g \rangle
\]

### 17.3. Fragment Area Conversion

Fragment area for the framebuffer region is undefined if the density fetched is not a normalized floating-point value greater than 0.0. Otherwise, the fetched fragment area for that region is derived as:

\[
\text{fragmentArea}_{\text{wh}} = \frac{1.0}{\text{densityValue}_{xy}}
\]

### 17.3.1. Fragment Area Filter

Optionally, the implementation may fetch additional density map texels in an implementation defined window around (i,j). The texels follow the standard conversion steps up to and including fragment area conversion.

A single fetched fragment area for the framebuffer region is chosen by the implementation and must have an area between the `min` and `max` areas of the fetched set.
17.3.2. Fragment Area Clamp

The implementation may clamp the fetched fragment area to one that it supports. The clamped fragment area must have a size less than or equal to the original fetched value. Implementations may vary the supported set of fragment areas per framebuffer region. Fragment area (1,1) must always be in the supported set.

Note

For example, if the fetched fragment area is (1,4) but the implementation only supports areas of {(1,1),(2,2)}, it could choose to clamp the area to (2,2) since it has the same size as (1,4). While this would produce fragments that have lower quality strictly in the x-axis, the overall density is maintained.

The clamped fragment area is assigned to the corresponding framebuffer region.
Chapter 18. Queries

Queries provide a mechanism to return information about the processing of a sequence of Vulkan commands. Query operations are asynchronous, and as such, their results are not returned immediately. Instead, their results, and their availability status are stored in a Query Pool. The state of these queries can be read back on the host, or copied to a buffer object on the device.

The supported query types are Occlusion Queries, Pipeline Statistics Queries, Result Status Queries, Video Encode Bitstream Queries, and Timestamp Queries. Performance Queries are supported if the associated extension is available. Transform Feedback Queries are supported if the associated extension is available. Intel performance queries are supported if the associated extension is available.

Several additional queries with specific purposes associated with ray tracing are available if the corresponding extensions are supported, as described for VkQueryType.

18.1. Query Pools

Queries are managed using query pool objects. Each query pool is a collection of a specific number of queries of a particular type.

Query pools are represented by VkQueryPool handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkQueryPool)
```

To create a query pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateQueryPool(
    VkDevice device,
    const VkQueryPoolCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkQueryPool* pQueryPool);
```

- `device` is the logical device that creates the query pool.
- `pCreateInfo` is a pointer to a VkQueryPoolCreateInfo structure containing the number and type of queries to be managed by the pool.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pQueryPool` is a pointer to a VkQueryPool handle in which the resulting query pool object is returned.
Valid Usage (Implicit)

- **VUID-vkCreateQueryPool-device-parameter**
  
  _device_ must be a valid _VkDevice_ handle

- **VUID-vkCreateQueryPool-pCreateInfo-parameter**
  
  _pCreateInfo_ must be a valid pointer to a valid _VkQueryPoolCreateInfo_ structure

- **VUID-vkCreateQueryPool-pAllocator-parameter**
  
  If _pAllocator_ is not NULL, _pAllocator_ must be a valid pointer to a valid _VkAllocationCallbacks_ structure

- **VUID-vkCreateQueryPool-pQueryPool-parameter**
  
  _pQueryPool_ must be a valid pointer to a _VkQueryPool_ handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The _VkQueryPoolCreateInfo_ structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkQueryPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkQueryPoolCreateFlags flags;
    VkQueryType queryType;
    uint32_t queryCount;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkQueryPoolCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **queryType** is a _VkQueryType_ value specifying the type of queries managed by the pool.
- **queryCount** is the number of queries managed by the pool.
- **pipelineStatistics** is a bitmask of _VkQueryPipelineStatisticFlagBits_ specifying which counters will be returned in queries on the new pool, as described below in Pipeline Statistics Queries.

_pipelineStatistics_ is ignored if _queryType_ is not _VK_QUERY_TYPE_PIPELINE_STATISTICS_. 
Valid Usage

- VUID-VkQueryPoolCreateInfo-queryType-00791
  If the pipeline statistics queries feature is not enabled, queryType must not be VK_QUERY_TYPE_PIPELINE_STATISTICS

- VUID-VkQueryPoolCreateInfo-queryType-00792
  If queryType is VK_QUERY_TYPE_PIPELINE_STATISTICS, pipelineStatistics must be a valid combination of VkQueryPipelineStatisticFlagBits values

- VUID-VkQueryPoolCreateInfo-queryType-03222
  If queryType is VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the pNext chain must include a VkQueryPoolPerformanceCreateInfoKHR structure

- VUID-VkQueryPoolCreateInfo-queryCount-02763
  queryCount must be greater than 0

Valid Usage (Implicit)

- VUID-VkQueryPoolCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO

- VUID-VkQueryPoolCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkQueryPoolPerformanceCreateInfoKHR, VkQueryPoolPerformanceQueryCreateInfoINTEL, or VkVideoProfileKHR

- VUID-VkQueryPoolCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkQueryPoolCreateInfo-flags-zerobitmask
  flags must be 0

- VUID-VkQueryPoolCreateInfo-queryType-parameter
  queryType must be a valid VkQueryType value

// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryPoolCreateFlags;

VkQueryPoolCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The VkQueryPoolPerformanceCreateInfoKHR structure is defined as:
typedef struct VkQueryPoolPerformanceCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           queueFamilyIndex;
    uint32_t           counterIndexCount;
    const uint32_t*    pCounterIndices;
} VkQueryPoolPerformanceCreateInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **queueFamilyIndex** is the queue family index to create this performance query pool for.
- **counterIndexCount** is size of the **pCounterIndices** array.
- **pCounterIndices** is the array of indices into the `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR::pCounters` to enable in this performance query pool.

**Valid Usage**

- VUID-VkQueryPoolPerformanceCreateInfoKHR-queueFamilyIndex-03236
  - **queueFamilyIndex** must be a valid queue family index of the device
- VUID-VkQueryPoolPerformanceCreateInfoKHR-performanceCounterQueryPools-03237
  - The performanceCounterQueryPools feature must be enabled
- VUID-VkQueryPoolPerformanceCreateInfoKHR-pCounterIndices-03321
  - Each element of **pCounterIndices** must be in the range of counters reported by `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR` for the queue family specified in **queueFamilyIndex**

**Valid Usage (Implicit)**

- VUID-VkQueryPoolPerformanceCreateInfoKHR-sType-sType
  - **sType** must be `VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR`
- VUID-VkQueryPoolPerformanceCreateInfoKHR-pCounterIndices-parameter
  - **pCounterIndices** must be a valid pointer to an array of `counterIndexCount uint32_t` values
- VUID-VkQueryPoolPerformanceCreateInfoKHR-counterIndexCount-arraylength
  - **counterIndexCount** must be greater than 0

To query the number of passes required to query a performance query pool on a physical device, call:
void vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR(
    VkPhysicalDevice                            physicalDevice,
    const VkQueryPoolPerformanceCreateInfoKHR*  pPerformanceQueryCreateInfo,
    uint32_t*                                   pNumPasses);

• `physicalDevice` is the handle to the physical device whose queue family performance query counter properties will be queried.
• `pPerformanceQueryCreateInfo` is a pointer to a `VkQueryPoolPerformanceCreateInfoKHR` of the performance query that is to be created.
• `pNumPasses` is a pointer to an integer related to the number of passes required to query the performance query pool, as described below.

The `pPerformanceQueryCreateInfo` member `VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex` must be a queue family of `physicalDevice`. The number of passes required to capture the counters specified in the `pPerformanceQueryCreateInfo` member `VkQueryPoolPerformanceCreateInfoKHR::pCounters` is returned in `pNumPasses`.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pPerformanceQueryCreateInfo-parameter
  `pPerformanceQueryCreateInfo` must be a valid pointer to a valid `VkQueryPoolPerformanceCreateInfoKHR` structure
- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pNumPasses-parameter
  `pNumPasses` must be a valid pointer to a `uint32_t` value

To destroy a query pool, call:

void vkDestroyQueryPool(
    VkDevice                                    device,
    VkQueryPool                                 queryPool,
    const VkAllocationCallbacks*                pAllocator);

• `device` is the logical device that destroys the query pool.
• `queryPool` is the query pool to destroy.
• `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage

- VUID-vkDestroyQueryPool-queryPool-00793
  All submitted commands that refer to `queryPool` must have completed execution

- VUID-vkDestroyQueryPool-queryPool-00794
  If `VkAllocationCallbacks` were provided when `queryPool` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyQueryPool-queryPool-00795
  If no `VkAllocationCallbacks` were provided when `queryPool` was created, `pAllocator` must be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyQueryPool-device-parameter
device must be a valid `VkDevice` handle

- VUID-vkDestroyQueryPool-queryPool-parameter
  If `queryPool` is not `VK_NULL_HANDLE`, `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkDestroyQueryPool-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyQueryPool-queryPool-parent
  If `queryPool` is a valid handle, it must have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `queryPool` must be externally synchronized

Possible values of `VkQueryPoolCreateInfo::queryType`, specifying the type of queries managed by the pool, are:
typedef enum VkQueryType {
    VK_QUERY_TYPE_OCCLUSION = 0,
    VK_QUERY_TYPE_PIPELINE_STATISTICS = 1,
    VK_QUERY_TYPE_TIMESTAMP = 2,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_queue
    VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR = 1000023000,
    #endif
    // Provided by VK_KHR_video_queue
    VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR = 1000299000,
    #endif
    // Provided by VK_EXT_transform_feedback
    VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT = 1000028004,
    // Provided by VK_KHR_performance_query
    VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR = 1000116000,
    // Provided by VK_KHR_acceleration_structure
    VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR = 1000150000,
    // Provided by VK_KHR_acceleration_structure
    VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR = 1000150001,
    // Provided by VK_NV_ray_tracing
    VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV = 1000165000,
    // Provided by VK_INTEL_performance_query
    VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL = 1000210000,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_encode_queue
    VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR = 1000299000,
    #endif
} VkQueryType;

• VK_QUERY_TYPE_OCCLUSION specifies an occlusion query.
• VK_QUERY_TYPE_PIPELINE_STATISTICS specifies a pipeline statistics query.
• VK_QUERY_TYPE_TIMESTAMP specifies a timestamp query.
• VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR specifies a performance query.
• VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT specifies a transform feedback query.
• VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR specifies a acceleration structure size query for use with vkCmdWriteAccelerationStructuresPropertiesKHR or vkWriteAccelerationStructuresPropertiesKHR.
• VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR specifies a serialization acceleration structure size query.
• VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV specifies a acceleration structure size query for use with vkCmdWriteAccelerationStructuresPropertiesNV.
• VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL specifies a Intel performance query.
• VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR specifies a result status query.
• VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR specifies a video encode bitstream range query.
18.2. Query Operation

The operation of queries is controlled by the commands `vkCmdBeginQuery`, `vkCmdEndQuery`, `vkCmdBeginQueryIndexedEXT`, `vkCmdEndQueryIndexedEXT`, `vkCmdResetQueryPool`, `vkCmdCopyQueryPoolResults`, `vkCmdWriteTimestamp2KHR`, and `vkCmdWriteTimestamp`.

In order for a `VkCommandBuffer` to record query management commands, the queue family for which its `VkCommandPool` was created must support the appropriate type of operations (graphics, compute) suitable for the query type of a given query pool.

Each query in a query pool has a status that is either unavailable or available, and also has state to store the numerical results of a query operation of the type requested when the query pool was created. Resetting a query via `vkCmdResetQueryPool` or `vkResetQueryPool` sets the status to unavailable and makes the numerical results undefined. Performing a query operation with `vkCmdBeginQuery` and `vkCmdEndQuery` changes the status to available when the query finishes, and updates the numerical results. Both the availability status and numerical results are retrieved by calling either `vkGetQueryPoolResults` or `vkCmdCopyQueryPoolResults`.

Query commands, for the same query and submitted to the same queue, execute in their entirety in submission order, relative to each other. In effect there is an implicit execution dependency from each such query command to all query commands previously submitted to the same queue. There is one significant exception to this; if the `flags` parameter of `vkCmdCopyQueryPoolResults` does not include `VK_QUERY_RESULT_WAIT_BIT`, execution of `vkCmdCopyQueryPoolResults` may happen-before the results of `vkCmdEndQuery` are available.

After query pool creation, each query must be reset before it is used. Queries must also be reset between uses.

If a logical device includes multiple physical devices, then each command that writes a query must execute on a single physical device, and any call to `vkCmdBeginQuery` must execute the corresponding `vkCmdEndQuery` command on the same physical device.

To reset a range of queries in a query pool on a queue, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdResetQueryPool(
    VkCommandBuffer                             commandBuffer,
    VkQueryPool                                 queryPool,
    uint32_t                                    firstQuery,
    uint32_t                                    queryCount);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the handle of the query pool managing the queries being reset.
- `firstQuery` is the initial query index to reset.
- `queryCount` is the number of queries to reset.

When executed on a queue, this command sets the status of query indices `[firstQuery, firstQuery + queryCount)` to unavailable.
If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command sets the status of query indices `[firstQuery, firstQuery + queryCount - 1]` to unavailable for each pass of `queryPool`, as indicated by a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

**Note**

Because `vkCmdResetQueryPool` resets all the passes of the indicated queries, applications must not record a `vkCmdResetQueryPool` command for a `queryPool` created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` in a command buffer that needs to be submitted multiple times as indicated by a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`. Otherwise applications will never be able to complete the recorded queries.

**Valid Usage**

- **VUID-vkCmdResetQueryPool-firstQuery-00796**
  
  `firstQuery` **must** be less than the number of queries in `queryPool`.

- **VUID-vkCmdResetQueryPool-firstQuery-00797**
  
  The sum of `firstQuery` and `queryCount` **must** be less than or equal to the number of queries in `queryPool`.

- **VUID-vkCmdResetQueryPool-None-02841**
  
  All queries used by the command **must** not be active.

- **VUID-vkCmdResetQueryPool-firstQuery-02862**
  
  If `queryPool` was created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command **must** not be recorded in a command buffer that, either directly or through secondary command buffers, also contains begin commands for a query from the set of queries `[firstQuery, firstQuery + queryCount - 1]`. 
Valid Usage (Implicit)

- VUID-vkCmdResetQueryPool-commandBuffer-parameter  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdResetQueryPool-queryPool-parameter  
  `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkCmdResetQueryPool-commandBuffer-recording  
  `commandBuffer` must be in the recording state

- VUID-vkCmdResetQueryPool-commandBuffer-cmdpool  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdResetQueryPool-renderpass  
  This command must only be called outside of a render pass instance

- VUID-vkCmdResetQueryPool-commonparent  
  Both of `commandBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

To reset a range of queries in a query pool on the host, call:

```
// Provided by VK_EXT_host_query_reset
void vkResetQueryPoolEXT(
    VkDevice device,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount);
```

- `device` is the logical device that owns the query pool.
• **queryPool** is the handle of the query pool managing the queries being reset.

• **firstQuery** is the initial query index to reset.

• **queryCount** is the number of queries to reset.

This command sets the status of query indices \([firstQuery, firstQuery + queryCount - 1]\) to unavailable.

If **queryPool** is **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR** this command sets the status of query indices \([firstQuery, firstQuery + queryCount - 1]\) to unavailable for each pass.

### Valid Usage

- **VUID-vkResetQueryPool-None-02665**
  - The **hostQueryReset** feature must be enabled

- **VUID-vkResetQueryPool-firstQuery-02666**
  - **firstQuery** must be less than the number of queries in **queryPool**

- **VUID-vkResetQueryPool-firstQuery-02667**
  - The sum of **firstQuery** and **queryCount** must be less than or equal to the number of queries in **queryPool**

- **VUID-vkResetQueryPool-firstQuery-02741**
  - Submitted commands that refer to the range specified by **firstQuery** and **queryCount** in **queryPool** must have completed execution

- **VUID-vkResetQueryPool-firstQuery-02742**
  - The range of queries specified by **firstQuery** and **queryCount** in **queryPool** must not be in use by calls to **vkGetQueryPoolResults** or **vkResetQueryPool** in other threads

### Valid Usage (Implicit)

- **VUID-vkResetQueryPool-device-parameter**
  - **device** must be a valid **VkDevice** handle

- **VUID-vkResetQueryPool-queryPool-parameter**
  - **queryPool** must be a valid **VkQueryPool** handle

- **VUID-vkResetQueryPool-queryPool-parent**
  - **queryPool** must have been created, allocated, or retrieved from **device**

Once queries are reset and ready for use, query commands can be issued to a command buffer. Occlusion queries and pipeline statistics queries count events - drawn samples and pipeline stage invocations, respectively - resulting from commands that are recorded between a **vkCmdBeginQuery** command and a **vkCmdEndQuery** command within a specified command buffer, effectively scoping a set of drawing and/or dispatch commands. Timestamp queries write timestamps to a query pool. Performance queries record performance counters to a query pool.

A query must begin and end in the same command buffer, although if it is a primary command
buffer, and the **inherited queries** feature is enabled, it can execute secondary command buffers during the query operation. For a secondary command buffer to be executed while a query is active, it **must** set the `occlusionQueryEnable`, `queryFlags`, and/or `pipelineStatistics` members of `VkCommandBufferInheritanceInfo` to conservative values, as described in the Command Buffer Recording section. A query **must** either begin and end inside the same subpass of a render pass instance, or **must** both begin and end outside of a render pass instance (i.e. contain entire render pass instances).

If queries are used while executing a render pass instance that has multiview enabled, the query uses N consecutive query indices in the query pool (starting at `query`) where N is the number of bits set in the view mask in the subpass the query is used in. How the numerical results of the query are distributed among the queries is implementation-dependent. For example, some implementations may write each view’s results to a distinct query, while other implementations may write the total result to the first query and write zero to the other queries. However, the sum of the results in all the queries **must** accurately reflect the total result of the query summed over all views. Applications can sum the results from all the queries to compute the total result.

Queries used with multiview rendering **must** not span subpasses, i.e. they **must** begin and end in the same subpass.

To begin a query, call:

```c
void vkCmdBeginQuery(
    VkCommandBuffer   commandBuffer,  // Provided by VK_VERSION_1_0
    VkQueryPool       queryPool,
    uint32_t          query,
    VkQueryControlFlags flags);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that will manage the results of the query.
- `query` is the query index within the query pool that will contain the results.
- `flags` is a bitmask of `VkQueryControlFlagBits` specifying constraints on the types of queries that can be performed.

If the `queryType` of the pool is `VK_QUERY_TYPE_OCCLUSION` and `flags` contains `VK_QUERY_CONTROL_PRECISE_BIT`, an implementation **must** return a result that matches the actual number of samples passed. This is described in more detail in Occlusion Queries.

Calling `vkCmdBeginQuery` is equivalent to calling `vkCmdBeginQueryIndexedEXT` with the `index` parameter set to zero.

After beginning a query, that query is considered **active** within the command buffer it was called in until that same query is ended. Queries active in a primary command buffer when secondary command buffers are executed are considered active for those secondary command buffers.
Valid Usage

- **VUID-vkCmdBeginQuery-None-00807**
  All queries used by the command must be unavailable.

- **VUID-vkCmdBeginQuery-queryType-02804**
  The `queryType` used to create `queryPool` must not be `VK_QUERY_TYPE_TIMESTAMP`.

- **VUID-vkCmdBeginQuery-queryType-04728**
  The `queryType` used to create `queryPool` must not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE.Serialization_SIZE_KHR`.

- **VUID-vkCmdBeginQuery-queryType-04729**
  The `queryType` used to create `queryPool` must not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`.

- **VUID-vkCmdBeginQuery-queryType-00800**
  If the precise occlusion queries feature is not enabled, or the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_OCCLUSION`, flags must not contain `VK_QUERY_CONTROL_PRECISE_BIT`.

- **VUID-vkCmdBeginQuery-query-00802**
  `query` must be less than the number of queries in `queryPool`.

- **VUID-vkCmdBeginQuery-queryType-00803**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_OCCLUSION`, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdBeginQuery-queryType-00804**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate graphics operations, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdBeginQuery-queryType-00805**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate compute operations, the `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.

- **VUID-vkCmdBeginQuery-query-00808**
  If called within a render pass instance, the sum of `query` and the number of bits set in the current subpass’s view mask must be less than or equal to the number of queries in `queryPool`.

- **VUID-vkCmdBeginQuery-queryType-04862**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR` the `VkCommandPool` that `commandBuffer` was allocated from must support video encode operations.

- **VUID-vkCmdBeginQuery-queryPool-01922**
  `queryPool` must have been created with a `queryType` that differs from that of any queries that are active within `commandBuffer`.

- **VUID-vkCmdBeginQuery-queryType-02327**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
operations

- VUID-vkCmdBeginQuery-queryType-02328
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT then VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackQueries must be supported

- VUID-vkCmdBeginQuery-queryPool-03223
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the profiling lock must have been held before vkBeginCommandBuffer was called on commandBuffer

- VUID-vkCmdBeginQuery-queryPool-03224
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and one of the counters used to create queryPool was VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR, the query begin must be the first recorded command in commandBuffer

- VUID-vkCmdBeginQuery-queryPool-03225
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and one of the counters used to create queryPool was VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR, the begin command must not be recorded within a render pass instance

- VUID-vkCmdBeginQuery-queryPool-03226
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and another query pool with a queryType VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR has been used within commandBuffer, its parent primary command buffer or secondary command buffer recorded within the same parent primary command buffer as commandBuffer, the performanceCounterMultipleQueryPools feature must be enabled

- VUID-vkCmdBeginQuery-None-02863
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, this command must not be recorded in a command buffer that, either directly or through secondary command buffers, also contains a vkCmdResetQueryPool command affecting the same query
Valid Usage (Implicit)

• VUID-vkCmdBeginQuery-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdBeginQuery-queryPool-parameter
queryPool must be a valid VkQueryPool handle

• VUID-vkCmdBeginQuery-flags-parameter
flags must be a valid combination of VkQueryControlFlagBits values

• VUID-vkCmdBeginQuery-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdBeginQuery-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

• VUID-vkCmdBeginQuery-commonparent
Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

To begin an indexed query, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBeginQueryIndexedEXT(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t query,
    VkQueryControlFlags flags,
    uint32_t index);
```

• commandBuffer is the command buffer into which this command will be recorded.
• `queryPool` is the query pool that will manage the results of the query.
• `query` is the query index within the query pool that will contain the results.
• `flags` is a bitmask of `VkQueryControlFlagBits` specifying constraints on the types of queries that can be performed.
• `index` is the query type specific index. When the query type is `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the index represents the vertex stream.

The `vkCmdBeginQueryIndexedEXT` command operates the same as the `vkCmdBeginQuery` command, except that it also accepts a query type specific `index` parameter.
Valid Usage

- **VUID-vkCmdBeginQueryIndexedEXT-None-00807**
  All queries used by the command **must** be unavailable

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-02804**
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_TIMESTAMP`

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-04728**
  The `queryType` used to create `queryPool` **must** not be
  
  - `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`
  - `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-04729**
  The `queryType` used to create `queryPool` **must** not be
  
  - `VKQUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`

- **VUID-vkCmdBeginQueryIndexedEXT-query-00802**
  `query` **must** be less than the number of queries in `queryPool`

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-00803**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_OCCLUSION`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-00804**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPEPIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate graphics operations, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-00805**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPEPIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate compute operations, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-00806**
  If called within a render pass instance, the sum of `query` and the number of bits set in the current subpass’s view mask **must** be less than or equal to the number of queries in `queryPool`

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-04862**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR` the `VkCommandPool` that `commandBuffer` was allocated from **must** support video encode operations

- **VUID-vkCmdBeginQueryIndexedEXT-queryPool-00800**
  If the `queryPool` was created with the same `queryType` as that of another active query within `commandBuffer`, then `index` **must** not match the index used for the active query

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-02338**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics
• VUID-vkCmdBeginQueryIndexedEXT-queryType-02339
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT the index parameter must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams

• VUID-vkCmdBeginQueryIndexedEXT-queryType-02340
  If the queryType used to create queryPool was not VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT the index must be zero

• VUID-vkCmdBeginQueryIndexedEXT-queryType-02341
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT then VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackQueries must be supported

• VUID-vkCmdBeginQueryIndexedEXT-queryPool-03223
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the profiling lock must have been held before vkBeginCommandBuffer was called on commandBuffer

• VUID-vkCmdBeginQueryIndexedEXT-queryPool-03224
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and one of the counters used to create queryPool was VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR, the query begin must be the first recorded command in commandBuffer

• VUID-vkCmdBeginQueryIndexedEXT-queryPool-03225
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and one of the counters used to create queryPool was VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR, the begin command must not be recorded within a render pass instance

• VUID-vkCmdBeginQueryIndexedEXT-queryPool-03226
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and another query pool with a queryType VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR has been used within commandBuffer, its parent primary command buffer or secondary command buffer recorded within the same parent primary command buffer as commandBuffer, the performanceCounterMultipleQueryPools feature must be enabled

• VUID-vkCmdBeginQueryIndexedEXT-None-02863
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, this command must not be recorded in a command buffer that, either directly or through secondary command buffers, also contains a vkCmdResetQueryPool command affecting the same query
Valid Usage (Implicit)

- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdBeginQueryIndexedEXT-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle
- VUID-vkCmdBeginQueryIndexedEXT-flags-parameter
  `flags` must be a valid combination of `VkQueryControlFlagBits` values
- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations
- VUID-vkCmdBeginQueryIndexedEXT-commonparent
  Both of `commandBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

Bits which can be set in `vkCmdBeginQuery::flags`, specifying constraints on the types of queries that can be performed, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkQueryControlFlagBits {
    VK_QUERY_CONTROL_PRECISE_BIT = 0x00000001,
} VkQueryControlFlagBits;
```

- `VK_QUERY_CONTROL_PRECISE_BIT` specifies the precision of occlusion queries.
VkQueryControlFlags is a bitmask type for setting a mask of zero or more VkQueryControlFlagBits.

To end a query after the set of desired draw or dispatch commands is executed, call:

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryControlFlags;

// Provided by VK_VERSION_1_0
void vkCmdEndQuery(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t query);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that is managing the results of the query.
- `query` is the query index within the query pool where the result is stored.

Calling `vkCmdEndQuery` is equivalent to calling `vkCmdEndQueryIndexedEXT` with the `index` parameter set to zero.

As queries operate asynchronously, ending a query does not immediately set the query's status to available. A query is considered finished when the final results of the query are ready to be retrieved by `vkGetQueryPoolResults` and `vkCmdCopyQueryPoolResults`, and this is when the query's status is set to available.

Once a query is ended the query must finish in finite time, unless the state of the query is changed using other commands, e.g. by issuing a reset of the query.
Valid Usage

- **VUID-vkCmdEndQuery-None-01923**
  All queries used by the command **must** be active

- **VUID-vkCmdEndQuery-query-00810**
  query **must** be less than the number of queries in queryPool

- **VUID-vkCmdEndQuery-query-00812**
  If `vkCmdEndQuery` is called within a render pass instance, the sum of query and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in queryPool

- **VUID-vkCmdEndQuery-queryPool-03227**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one or more of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR`, the `vkCmdEndQuery` **must** be the last recorded command in `commandBuffer`

- **VUID-vkCmdEndQuery-queryPool-03228**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one or more of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR`, the `vkCmdEndQuery` **must** not be recorded within a render pass instance

Valid Usage (Implicit)

- **VUID-vkCmdEndQuery-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdEndQuery-queryPool-parameter**
  `queryPool` **must** be a valid `VkQueryPool` handle

- **VUID-vkCmdEndQuery-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdEndQuery-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations

- **VUID-vkCmdEndQuery-commonparent**
  Both of `commandBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
To end an indexed query after the set of desired draw or dispatch commands is recorded, call:

```c
// Provided by VK_EXT_transform_feedback
donkey void vkCmdEndQueryIndexedEXT(
  VkCommandBuffer   commandBuffer,  
  VkQueryPool      queryPool,      
  uint32_t          query,          
  uint32_t          index);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that is managing the results of the query.
- `query` is the query index within the query pool where the result is stored.
- `index` is the query type specific index.

The `vkCmdEndQueryIndexedEXT` command operates the same as the `vkCmdEndQuery` command, except that it also accepts a query type specific `index` parameter.
Valid Usage

- VUID-vkCmdEndQueryIndexedEXT-None-02342
  All queries used by the command must be active

- VUID-vkCmdEndQueryIndexedEXT-query-02343
  query must be less than the number of queries in queryPool

- VUID-vkCmdEndQueryIndexedEXT-query-02345
  If vkCmdEndQueryIndexedEXT is called within a render pass instance, the sum of query and the number of bits set in the current subpass's view mask must be less than or equal to the number of queries in queryPool

- VUID-vkCmdEndQueryIndexedEXT-queryType-02346
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT the index parameter must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams

- VUID-vkCmdEndQueryIndexedEXT-queryType-02347
  If the queryType used to create queryPool was not VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT the index must be zero

- VUID-vkCmdEndQueryIndexedEXT-queryType-02723
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT index must equal the index used to begin the query

Valid Usage (Implicit)

- VUID-vkCmdEndQueryIndexedEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdEndQueryIndexedEXT-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

- VUID-vkCmdEndQueryIndexedEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdEndQueryIndexedEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdEndQueryIndexedEXT-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

An application can retrieve results either by requesting they be written into application-provided memory, or by requesting they be copied into a `VkBuffer`. In either case, the layout in memory is defined as follows:

- The first query's result is written starting at the first byte requested by the command, and each subsequent query's result begins `stride` bytes later.

- Occlusion queries, pipeline statistics queries, transform feedback queries, and timestamp queries store results in a tightly packed array of unsigned integers, either 32- or 64-bits as requested by the command, storing the numerical results and, if requested, the availability status.

- Performance queries store results in a tightly packed array whose type is determined by the `unit` member of the corresponding `VkPerformanceCounterKHR`.

- If `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is used, the final element of each query's result is an integer indicating whether the query's result is available, with any non-zero value indicating that it is available.

- If `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` is used, the final element of each query's result is an integer value indicating that status of the query result. Positive values indicate success, negative values indicate failure, and 0 indicates that the result is not yet available. Specific error codes are encoded in the `VkQueryResultStatusKHR` enumeration.

- Occlusion queries write one integer value - the number of samples passed. Pipeline statistics queries write one integer value for each bit that is enabled in the `pipelineStatistics` when the pool is created, and the statistics values are written in bit order starting from the least significant bit. Timestamp queries write one integer value. Performance queries write one `VkPerformanceCounterResultKHR` value for each `VkPerformanceCounterKHR` in the query. Transform feedback queries write two integers; the first integer is the number of primitives successfully written to the corresponding transform feedback buffer and the second is the number of primitives output to the vertex stream, regardless of whether they were successfully captured or not. In other words, if the transform feedback buffer was sized too small for the number of primitives output by the vertex stream, the first integer represents the number of primitives actually written and the second is the number that would have been written if all the...
transform feedback buffers associated with that vertex stream were large enough.

- If more than one query is retrieved and `stride` is not at least as large as the size of the array of values corresponding to a single query, the values written to memory are undefined.

To retrieve status and results for a set of queries, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetQueryPoolResults(
    VkDevice device,           // Logical device that owns the query pool.
    VkQueryPool queryPool,     // Query pool managing the queries containing the desired results.
    uint32_t firstQuery,       // Initial query index.
    uint32_t queryCount,       // Number of queries to read.
    size_t dataSize,           // Size in bytes of the buffer pointed to by `pData`.
    void* pData,               // Pointer to a user-allocated buffer where the results will be written.
    VkDeviceSize stride,       // Stride in bytes between results for individual queries within `pData`.
    VkQueryResultFlags flags); // Bitmask of `VkQueryResultFlagBits` specifying how and when results are returned.
```

- `device` is the logical device that owns the query pool.
- `queryPool` is the query pool managing the queries containing the desired results.
- `firstQuery` is the initial query index.
- `queryCount` is the number of queries to read.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to a user-allocated buffer where the results will be written.
- `stride` is the stride in bytes between results for individual queries within `pData`.
- `flags` is a bitmask of `VkQueryResultFlagBits` specifying how and when results are returned.

The range of queries read is defined by \([\text{firstQuery}, \text{firstQuery} + \text{queryCount} - 1]\). For pipeline statistics queries, each query index in the pool contains one integer value for each bit that is enabled in `VkQueryPoolCreateInfo::pipelineStatistics` when the pool is created.

If no bits are set in `flags`, and all requested queries are in the available state, results are written as an array of 32-bit unsigned integer values. The behavior when not all queries are available, is described below.

If `VK_QUERY_RESULT_64_BIT` is not set and the result overflows a 32-bit value, the value may either wrap or saturate. Similarly, if `VK_QUERY_RESULT_64_BIT` is set and the result overflows a 64-bit value, the value may either wrap or saturate.

If `VK_QUERY_RESULT_WAIT_BIT` is set, Vulkan will wait for each query to be in the available state before retrieving the numerical results for that query. In this case, `vkGetQueryPoolResults` is guaranteed to succeed and return `VK_SUCCESS` if the queries become available in a finite time (i.e. if they have been issued and not reset). If queries will never finish (e.g. due to being reset but not issued), then `vkGetQueryPoolResults` may not return in finite time.

If `VK_QUERY_RESULT_WAIT_BIT` and `VK_QUERY_RESULT_PARTIAL_BIT` are both not set then no result values are written to `pData` for queries that are in the unavailable state at the time of the call, and
vkGetQueryPoolResults returns VK_NOT_READY. However, availability state is still written to pData for those queries if VK_QUERY_RESULT_WITH_AVAILABILITY_BIT is set. Similarly, the status is still written to pData for those queries if VK_QUERY_RESULT_WITH_STATUS_BIT_KHR is set.

Note
Applications must take care to ensure that use of the VK_QUERY_RESULT_WAIT_BIT bit has the desired effect.

For example, if a query has been used previously and a command buffer records the commands vkCmdResetQueryPool, vkCmdBeginQuery, and vkCmdEndQuery for that query, then the query will remain in the available state until vkResetQueryPool is called or the vkCmdResetQueryPool command executes on a queue. Applications can use fences or events to ensure that a query has already been reset before checking for its results or availability status. Otherwise, a stale value could be returned from a previous use of the query.

The above also applies when VK_QUERY_RESULT_WAIT_BIT is used in combination with VK_QUERY_RESULT_WITH_AVAILABILITY_BIT. In this case, the returned availability status may reflect the result of a previous use of the query unless vkResetQueryPool is called or the vkCmdResetQueryPool command has been executed since the last use of the query.

A similar situation can arise with the VK_QUERY_RESULT_WITH_STATUS_BIT_KHR flag.

Note
Applications can double-buffer query pool usage, with a pool per frame, and reset queries at the end of the frame in which they are read.

If VK_QUERY_RESULT_PARTIAL_BIT is set, VK_QUERY_RESULT_WAIT_BIT is not set, and the query's status is unavailable, an intermediate result value between zero and the final result value is written to pData for that query.

If VK_QUERY_RESULT_WITH_AVAILABILITY_BIT is set, the final integer value written for each query is non-zero if the query's status was available or zero if the status was unavailable. When VK_QUERY_RESULT_WITH_AVAILABILITY_BIT is used, implementations must guarantee that if they return a non-zero availability value then the numerical results must be valid, assuming the results are not reset by a subsequent command.

Note
Satisfying this guarantee may require careful ordering by the application, e.g. to read the availability status before reading the results.

If VK_QUERY_RESULT_WITH_STATUS_BIT_KHR is set, the final integer value written for each query indicates whether the result is available or not, and whether an error occurred. A value of zero indicates that the results are not yet available. Positive values indicate that the operations within the query completed successfully, and the query results are valid. Negative values indicate that the operations within the query completed unsuccessfully.
Specific result codes are defined by the `VkQueryResultStatusKHR` enumeration.

### Valid Usage

- **VUID-vkGetQueryPoolResults-firstQuery-00813**
  
  - `firstQuery` **must** be less than the number of queries in `queryPool`

- **VUID-vkGetQueryPoolResults-flags-02828**
  
  - If `VK_QUERY_RESULT_64_BIT` is not set in `flags` and the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then `pData` and `stride` **must** be multiples of 4

- **VUID-vkGetQueryPoolResults-flags-00815**
  
  - If `VK_QUERY_RESULT_64_BIT` is set in `flags` then `pData` and `stride` **must** be multiples of 8

- **VUID-vkGetQueryPoolResults-queryType-03229**
  
  - If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then `pData` and `stride` **must** be multiples of the size of `VkPerformanceCounterResultKHR`

- **VUID-vkGetQueryPoolResults-queryType-04519**
  
  - If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then `stride` **must** be large enough to contain `VkQueryPoolPerformanceCreateInfoKHR::counterIndexCount` used to create `queryPool` times the size of `VkPerformanceCounterResultKHR`.

- **VUID-vkGetQueryPoolResults-firstQuery-00816**
  
  - The sum of `firstQuery` and `queryCount` **must** be less than or equal to the number of queries in `queryPool`

- **VUID-vkGetQueryPoolResults-dataSize-00817**
  
  - `dataSize` **must** be large enough to contain the result of each query, as described [here](#)

- **VUID-vkGetQueryPoolResults-queryType-00818**
  
  - If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TIMESTAMP`, `flags` **must** not contain `VK_QUERY_RESULT_PARTIAL_BIT`

- **VUID-vkGetQueryPoolResults-queryType-03230**
  
  - If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, `flags` **must** not contain `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`, `VK_QUERY_RESULT_PARTIAL_BIT` or `VK_QUERY_RESULT_64_BIT`

- **VUID-vkGetQueryPoolResults-queryType-03231**
  
  - If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `queryPool` **must** have been recorded once for each pass as retrieved via a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`

- **VUID-vkGetQueryPoolResults-queryType-04810**
  
  - If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR`, `flags` **must** include `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR`

- **VUID-vkGetQueryPoolResults-flags-04811**
  
  - If `flags` includes `VK_QUERYRESULT_WITH_STATUS_BIT_KHR`, it **must** not include `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`
Valid Usage (Implicit)

- VUID-vkGetQueryPoolResults-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkGetQueryPoolResults-queryPool-parameter
  
  `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkGetQueryPoolResults-pData-parameter
  
  `pData` must be a valid pointer to an array of `dataSize` bytes

- VUID-vkGetQueryPoolResults-flags-parameter
  
  `flags` must be a valid combination of `VkQueryResultFlagBits` values

- VUID-vkGetQueryPoolResults-dataSize-arraylength
  
  `dataSize` must be greater than 0

- VUID-vkGetQueryPoolResults-queryPool-parent
  
  `queryPool` must have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`
- `VK_NOT_READY`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

Bits which can be set in `vkGetQueryPoolResults::flags` and `vkCmdCopyQueryPoolResults::flags`, specifying how and when results are returned, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryResultFlagBits {
    VK_QUERY_RESULT_64_BIT = 0x00000001,
    VK_QUERY_RESULT_WAIT_BIT = 0x00000002,
    VK_QUERY_RESULT_WITH_AVAILABILITY_BIT = 0x00000004,
    VK_QUERY_RESULT_PARTIAL_BIT = 0x00000008,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_queue
    VK_QUERY_RESULT_WITH_STATUS_BIT_KHR = 0x00000010,
    #endif
} VkQueryResultFlagBits;
```

- `VK_QUERY_RESULT_64_BIT` specifies the results will be written as an array of 64-bit unsigned
integer values. If this bit is not set, the results will be written as an array of 32-bit unsigned integer values.

- **VK_QUERY_RESULT_WAIT_BIT** specifies that Vulkan will wait for each query’s status to become available before retrieving its results.
- **VK_QUERY_RESULT_WITH_AVAILABILITY_BIT** specifies that the availability status accompanies the results.
- **VK_QUERY_RESULT_PARTIAL_BIT** specifies that returning partial results is acceptable.
- **VK_QUERY_RESULT_WITH_STATUS_BIT_KHR** specifies that the last value returned in the query is a `VkQueryResultStatusKHR` value.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryResultFlags;
```

`VkQueryResultFlags` is a bitmask type for setting a mask of zero or more `VkQueryResultFlagBits`.

Specific status codes that **can** be returned from a query are:

```c
// Provided by VK_KHR_video_queue
typedef enum VkQueryResultStatusKHR {
    VK_QUERY_RESULT_STATUS_ERROR_KHR = -1,
    VK_QUERY_RESULT_STATUS_NOT_READY_KHR = 0,
    VK_QUERY_RESULT_STATUS_COMPLETE_KHR = 1,
} VkQueryResultStatusKHR;
```

- **VK_QUERY_RESULT_STATUS_NOT_READY_KHR** specifies that the query result is not yet available.
- **VK_QUERY_RESULT_STATUS_ERROR_KHR** specifies that operations did not complete successfully.
- **VK_QUERY_RESULT_STATUS_COMPLETE_KHR** specifies that operations completed successfully and the query result is available.

To copy query statuses and numerical results directly to buffer memory, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyQueryPoolResults(
    VkCommandBuffer commandBuffer,          commandBuffer,
    VkQueryPool queryPool,                  queryPool,
    uint32_t firstQuery,                    firstQuery,
    uint32_t queryCount,                    queryCount,
    VkBuffer dstBuffer,                     dstBuffer,
    VkDeviceSize dstOffset,                 dstOffset,
    VkDeviceSize stride,                    stride,
    VkQueryResultFlags flags);              flags);
```

- **commandBuffer** is the command buffer into which this command will be recorded.
- **queryPool** is the query pool managing the queries containing the desired results.
• firstQuery is the initial query index.
• queryCount is the number of queries. firstQuery and queryCount together define a range of queries.
• dstBuffer is a VkBuffer object that will receive the results of the copy command.
• dstOffset is an offset into dstBuffer.
• stride is the stride in bytes between results for individual queries within dstBuffer. The required size of the backing memory for dstBuffer is determined as described above for vkGetQueryPoolResults.
• flags is a bitmask of VkQueryResultFlagBits specifying how and when results are returned.

vkCmdCopyQueryPoolResults is guaranteed to see the effect of previous uses of vkCmdResetQueryPool in the same queue, without any additional synchronization. Thus, the results will always reflect the most recent use of the query.

flags has the same possible values described above for the flags parameter of vkGetQueryPoolResults, but the different style of execution causes some subtle behavioral differences. Because vkCmdCopyQueryPoolResults executes in order with respect to other query commands, there is less ambiguity about which use of a query is being requested.

Results for all requested occlusion queries, pipeline statistics queries, transform feedback queries, and timestamp queries are written as 64-bit unsigned integer values if VK_QUERY_RESULT_64_BIT is set or 32-bit unsigned integer values otherwise. Performance queries store results in a tightly packed array whose type is determined by the unit member of the corresponding VkPerformanceCounterKHR.

If neither of VK_QUERY_RESULT_WAIT_BIT and VK_QUERY_RESULT_WITH_AVAILABILITY_BIT are set, results are only written out for queries in the available state.

If VK_QUERY_RESULT_WAIT_BIT is set, the implementation will wait for each query’s status to be in the available state before retrieving the numerical results for that query. This is guaranteed to reflect the most recent use of the query on the same queue, assuming that the query is not being simultaneously used by other queues. If the query does not become available in a finite amount of time (e.g. due to not issuing a query since the last reset), a VK_ERROR_DEVICE_LOST error may occur.

Similarly, if VK_QUERY_RESULT_WITH_AVAILABILITY_BIT is set and VK_QUERY_RESULT_WAIT_BIT is not set, the availability is guaranteed to reflect the most recent use of the query on the same queue, assuming that the query is not being simultaneously used by other queues. As with vkGetQueryPoolResults, implementations must guarantee that if they return a non-zero availability value, then the numerical results are valid.

If VK_QUERY_RESULT_PARTIAL_BIT is set, VK_QUERY_RESULT_WAIT_BIT is not set, and the query's status is unavailable, an intermediate result value between zero and the final result value is written for that query.

VK_QUERY_RESULT_PARTIAL_BIT must not be used if the pool’s queryType is VK_QUERY_TYPE_TIMESTAMP.

vkCmdCopyQueryPoolResults is considered to be a transfer operation, and its writes to buffer memory must be synchronized using VK_PIPELINE_STAGE_TRANSFER_BIT and VK_ACCESS_TRANSFER_WRITE_BIT.
before using the results.
Valid Usage

- VUID-vkCmdCopyQueryPoolResults-dstOffset-00819
dstOffset must be less than the size of dstBuffer

- VUID-vkCmdCopyQueryPoolResults-firstQuery-00820
firstQuery must be less than the number of queries in queryPool

- VUID-vkCmdCopyQueryPoolResults-firstQuery-00821
The sum of firstQuery and queryCount must be less than or equal to the number of queries in queryPool

- VUID-vkCmdCopyQueryPoolResults-flags-00822
If VK_QUERY_RESULT_64_BIT is not set in flags then dstOffset and stride must be multiples of 4

- VUID-vkCmdCopyQueryPoolResults-flags-00823
If VK_QUERY_RESULT_64_BIT is set in flags then dstOffset and stride must be multiples of 8

- VUID-vkCmdCopyQueryPoolResults-dstBuffer-00824
dstBuffer must have enough storage, from dstOffset, to contain the result of each query, as described here

- VUID-vkCmdCopyQueryPoolResults-dstBuffer-00825
dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag

- VUID-vkCmdCopyQueryPoolResults-dstBuffer-00826
If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyQueryPoolResults-queryType-00827
If the queryType used to create queryPool was VK_QUERY_TYPE_TIMESTAMP, flags must not contain VK_QUERY_RESULT_PARTIAL_BIT

- VUID-vkCmdCopyQueryPoolResults-queryType-03232
If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, VkPhysicalDevicePerformanceQueryPropertiesKHR::allowCommandBufferQueryCopies must be VK_TRUE

- VUID-vkCmdCopyQueryPoolResults-queryType-03233
If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, flags must not contain VK_QUERY_RESULT_WITH_AVAILABILITY_BIT, VK_QUERY_RESULT_PARTIAL_BIT or VK_QUERY_RESULT_64_BIT

- VUID-vkCmdCopyQueryPoolResults-queryType-03234
If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the queryPool must have been submitted once for each pass as retrieved via a call to vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR

- VUID-vkCmdCopyQueryPoolResults-queryType-02734
vkCmdCopyQueryPoolResults must not be called if the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL

- VUID-vkCmdCopyQueryPoolResults-queryType-04812
vkCmdCopyQueryPoolResults must not be called if the queryType used to create queryPool
was

VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR or

VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR.

Valid Usage (Implicit)

- VUID-vkCmdCopyQueryPoolResults-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyQueryPoolResults-queryPool-parameter
  
  `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkCmdCopyQueryPoolResults-dstBuffer-parameter
  
  `dstBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdCopyQueryPoolResults-flags-parameter
  
  `flags` must be a valid combination of `VkQueryResultFlagBits` values

- VUID-vkCmdCopyQueryPoolResults-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdCopyQueryPoolResults-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdCopyQueryPoolResults-renderpass
  
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyQueryPoolResults-commonparent
  
  Each of `commandBuffer`, `dstBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

Rendering operations such as clears, MSAA resolves, attachment load/store operations, and blits may count towards the results of queries. This behavior is implementation-dependent and may vary depending on the path used within an implementation. For example, some implementations
have several types of clears, some of which may include vertices and some not.

### 18.3. Occlusion Queries

Occlusion queries track the number of samples that pass the per-fragment tests for a set of drawing commands. As such, occlusion queries are only available on queue families supporting graphics operations. The application can then use these results to inform future rendering decisions. An occlusion query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively. When an occlusion query begins, the count of passing samples always starts at zero. For each drawing command, the count is incremented as described in Sample Counting. If flags does not contain `VK_QUERY_CONTROL_PRECISE_BIT` an implementation may generate any non-zero result value for the query if the count of passing samples is non-zero.

**Note**

Not setting `VK_QUERY_CONTROL_PRECISE_BIT` mode may be more efficient on some implementations, and should be used where it is sufficient to know a boolean result on whether any samples passed the per-fragment tests. In this case, some implementations may only return zero or one, indifferent to the actual number of samples passing the per-fragment tests.

When an occlusion query finishes, the result for that query is marked as available. The application can then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

**Note**

If occluding geometry is not drawn first, samples can pass the depth test, but still not be visible in a final image.

### 18.4. Pipeline Statistics Queries

Pipeline statistics queries allow the application to sample a specified set of `VkPipeline` counters. These counters are accumulated by Vulkan for a set of either draw or dispatch commands while a pipeline statistics query is active. As such, pipeline statistics queries are available on queue families supporting either graphics or compute operations. The availability of pipeline statistics queries is indicated by the `pipelineStatisticsQuery` member of the `VkPhysicalDeviceFeatures` object (see `vkGetPhysicalDeviceFeatures` and `vkCreateDevice` for detecting and requesting this query type on a `VkDevice`).

A pipeline statistics query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively. When a pipeline statistics query begins, all statistics counters are set to zero. While the query is active, the pipeline type determines which set of statistics are available, but these must be configured on the query pool when it is created. If a statistic counter is issued on a command buffer that does not support the corresponding operation, the value of that counter is undefined after the query has finished. At least one statistic counter relevant to the operations supported on the recording command buffer must be enabled.

Bits which can be set to individually enable pipeline statistics counters for query pools with
VkQueryPoolCreateInfo::pipelineStatistics, and for secondary command buffers with VkCommandBufferInheritanceInfo::pipelineStatistics, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryPipelineStatisticFlagBits {
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT = 0x00000001,
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT = 0x00000002,
    VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT = 0x00000004,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT = 0x00000008,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT = 0x00000010,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT = 0x00000020,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT = 0x00000040,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT = 0x00000080,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT = 0x00000100,
    VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT = 0x00000200,
} VkQueryPipelineStatisticFlagBits;
```

- **VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT** specifies that queries managed by the pool will count the number of vertices processed by the input assembly stage. Vertices corresponding to incomplete primitives may contribute to the count.
- **VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives processed by the input assembly stage. If primitive restart is enabled, restarting the primitive topology has no effect on the count. Incomplete primitives may be counted.
- **VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of vertex shader invocations. This counter's value is incremented each time a vertex shader is invoked.
- **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of geometry shader invocations. This counter's value is incremented each time a geometry shader is invoked. In the case of instanced geometry shaders, the geometry shader invocations count is incremented for each separate instanced invocation.
- **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives generated by geometry shader invocations. The counter's value is incremented each time the geometry shader emits a primitive. Restarting primitive topology using the SPIR-V instructions `OpEndPrimitive` or `OpEndStreamPrimitive` has no effect on the geometry shader output primitives count.
- **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of primitives processed by the Primitive Clipping stage of the pipeline. The counter's value is incremented each time a primitive reaches the primitive clipping stage.
- **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives output by the Primitive Clipping stage of the pipeline.
The counter’s value is incremented each time a primitive passes the primitive clipping stage. The actual number of primitives output by the primitive clipping stage for a particular input primitive is implementation-dependent but **must** satisfy the following conditions:

- If at least one vertex of the input primitive lies inside the clipping volume, the counter is incremented by one or more.
- Otherwise, the counter is incremented by zero or more.

- **VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of fragment shader invocations. The counter’s value is incremented each time the fragment shader is **invoked**.

- **VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT** specifies that queries managed by the pool will count the number of patches processed by the tessellation control shader. The counter’s value is incremented once for each patch for which a tessellation control shader is **invoked**.

- **VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of invocations of the tessellation evaluation shader. The counter’s value is incremented each time the tessellation evaluation shader is **invoked**.

- **VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of compute shader invocations. The counter’s value is incremented every time the compute shader is invoked. Implementations **may** skip the execution of certain compute shader invocations or execute additional compute shader invocations for implementation-dependent reasons as long as the results of rendering otherwise remain unchanged.

These values are intended to measure relative statistics on one implementation. Various device architectures will count these values differently. Any or all counters **may** be affected by the issues described in Query Operation.

**Note**

For example, tile-based rendering devices **may** need to replay the scene multiple times, affecting some of the counts.

If a pipeline has `rasterizerDiscardEnable` enabled, implementations **may** discard primitives after the final vertex processing stage. As a result, if `rasterizerDiscardEnable` is enabled, the clipping input and output primitives counters **may** not be incremented.

When a pipeline statistics query finishes, the result for that query is marked as available. The application **can** copy the result to a buffer (via `vkCmdCopyQueryPoolResults`), or request it be put into host memory (via `vkGetQueryPoolResults`).

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryPipelineStatisticFlags;
```

**VkQueryPipelineStatisticFlags** is a bitmask type for setting a mask of zero or more **VkQueryPipelineStatisticFlagBits**.
18.5. Timestamp Queries

Timestamps provide applications with a mechanism for timing the execution of commands. A timestamp is an integer value generated by the VkPhysicalDevice. Unlike other queries, timestamps do not operate over a range, and so do not use vkCmdBeginQuery or vkCmdEndQuery. The mechanism is built around a set of commands that allow the application to tell the VkPhysicalDevice to write timestamp values to a query pool and then either read timestamp values on the host (using vkGetQueryPoolResults) or copy timestamp values to a VkBuffer (using vkCmdCopyQueryPoolResults). The application can then compute differences between timestamps to determine execution time.

The number of valid bits in a timestamp value is determined by the VkQueueFamilyProperties::timestampValidBits property of the queue on which the timestamp is written. Timestamps are supported on any queue which reports a non-zero value for timestampValidBits via vkGetPhysicalDeviceQueueFamilyProperties. If the timestampComputeAndGraphics limit is VK_TRUE, timestamps are supported by every queue family that supports either graphics or compute operations (see VkQueueFamilyProperties).

The number of nanoseconds it takes for a timestamp value to be incremented by 1 can be obtained from VkPhysicalDeviceLimits::timestampPeriod after a call to vkGetPhysicalDeviceProperties.

To request a timestamp, call:

```c
// Provided by VK_KHR_synchronization2
void vkCmdWriteTimestamp2KHR(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags2KHR stage,
    VkQueryPool queryPool,
    uint32_t query);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stage` specifies a stage of the pipeline.
- `queryPool` is the query pool that will manage the timestamp.
- `query` is the query within the query pool that will contain the timestamp.

When vkCmdWriteTimestamp2KHR is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and writes a timestamp to a query pool.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations on the pipeline stage specified by pipelineStage.

The second synchronization scope includes only the timestamp write operation.

When the timestamp value is written, the availability status of the query is set to available.
Note
If an implementation is unable to detect completion and latch the timer at any specific stage of the pipeline, it may instead do so at any logically later stage.

Timestamps may only be meaningfully compared if they are written by commands submitted to the same queue.

Note
An example of such a comparison is determining the execution time of a sequence of commands.

If `vkCmdWriteTimestamp2KHR` is called while executing a render pass instance that has multiview enabled, the timestamp uses N consecutive query indices in the query pool (starting at `query`) where N is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

- The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the difference between the first query written by each command.

- All N queries are timestamp values. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the sum of the difference between corresponding queries written by each command. The difference between corresponding queries may be the execution time of a single view.

In either case, the application can sum the differences between all N queries to determine the total execution time.
Valid Usage

- VUID-vkCmdWriteTimestamp2KHR-stage-03929
  If the geometry shaders feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR`.

- VUID-vkCmdWriteTimestamp2KHR-stage-03930
  If the tessellation shaders feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT_KHR` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT_KHR`.

- VUID-vkCmdWriteTimestamp2KHR-stage-03931
  If the conditional rendering feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`.

- VUID-vkCmdWriteTimestamp2KHR-stage-03932
  If the fragment density map feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.

- VUID-vkCmdWriteTimestamp2KHR-stage-03933
  If the transform feedback feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`.

- VUID-vkCmdWriteTimestamp2KHR-stage-03934
  If the mesh shaders feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_NV`.

- VUID-vkCmdWriteTimestamp2KHR-stage-03935
  If the task shaders feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_NV`.

- VUID-vkCmdWriteTimestamp2KHR-stage-03936
  If the shading rate image feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV`.

- VUID-vkCmdWriteTimestamp2KHR-synchronization2-03858
  The synchronization2 feature must be enabled.

- VUID-vkCmdWriteTimestamp2KHR-stage-03859
  stage must only include a single pipeline stage.

- VUID-vkCmdWriteTimestamp2KHR-stage-03860
  stage must only include stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from.

- VUID-vkCmdWriteTimestamp2KHR-queryPool-03861
  `queryPool` must have been created with a `queryType` of `VK_QUERY_TYPE_TIMESTAMP`.

- VUID-vkCmdWriteTimestamp2KHR-queryPool-03862
  The query identified by `queryPool` and `query` must be unavailable.

- VUID-vkCmdWriteTimestamp2KHR-timestampValidBits-03863
  The command pool’s queue family must support a non-zero `timestampValidBits`.

- VUID-vkCmdWriteTimestamp2KHR-None-03864
  All queries used by the command must be unavailable.

- VUID-vkCmdWriteTimestamp2KHR-query-03865
  If `vkCmdWriteTimestamp2KHR` is called within a render pass instance, the sum of `query` and
the number of bits set in the current subpass’s view mask must be less than or equal to the number of queries in queryPool

**Valid Usage (Implicit)**

- VUID-vkCmdWriteTimestamp2KHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdWriteTimestamp2KHR-stage-parameter
  stage must be a valid combination of VkPipelineStageFlagBits2KHR values
- VUID-vkCmdWriteTimestamp2KHR-stage-requiredbitmask
  stage must not be 0
- VUID-vkCmdWriteTimestamp2KHR-queryPool-parameter
  queryPool must be a valid VkQueryPool handle
- VUID-vkCmdWriteTimestamp2KHR-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdWriteTimestamp2KHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations
- VUID-vkCmdWriteTimestamp2KHR-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Transfer Graphics Compute</td>
<td>Transfer</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To request a timestamp, call:
void vkCmdWriteTimestamp(
    VkCommandBuffer                             commandBuffer,
    VkPipelineStageFlagBits                     pipelineStage,
    VkQueryPool                                 queryPool,
    uint32_t                                    query);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **pipelineStage** is a `VkPipelineStageFlagBits` value, specifying a stage of the pipeline.
- **queryPool** is the query pool that will manage the timestamp.
- **query** is the query within the query pool that will contain the timestamp.

vkCmdWriteTimestamp latches the value of the timer when all previous commands have completed executing as far as the specified pipeline stage, and writes the timestamp value to memory. When the timestamp value is written, the availability status of the query is set to available.

**Note**

If an implementation is unable to detect completion and latch the timer at any specific stage of the pipeline, it may instead do so at any logically later stage.

Timestamps may only be meaningfully compared if they are written by commands submitted to the same queue.

**Note**

An example of such a comparison is determining the execution time of a sequence of commands.

If vkCmdWriteTimestamp is called while executing a render pass instance that has multiview enabled, the timestamp uses N consecutive query indices in the query pool (starting at query) where N is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

- The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the difference between the first query written by each command.
- All N queries are timestamp values. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the sum of the difference between corresponding queries written by each command. The difference between corresponding queries may be the execution time of a single view.

In either case, the application can sum the differences between all N queries to determine the total execution time.
Valid Usage

- VUID-vkCmdWriteTimestamp-pipelineStage-04074
  `pipelineStage` must be a valid stage for the queue family that was used to create the command pool that `commandBuffer` was allocated from.

- VUID-vkCmdWriteTimestamp-pipelineStage-04075
  If the geometry shaders feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- VUID-vkCmdWriteTimestamp-pipelineStage-04076
  If the tessellation shaders feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- VUID-vkCmdWriteTimestamp-pipelineStage-04077
  If the conditional rendering feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`.

- VUID-vkCmdWriteTimestamp-pipelineStage-04078
  If the fragment density map feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.

- VUID-vkCmdWriteTimestamp-pipelineStage-04079
  If the transform feedback feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

- VUID-vkCmdWriteTimestamp-pipelineStage-04080
  If the mesh shaders feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV` or `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`.

- VUID-vkCmdWriteTimestamp-pipelineStage-04081
  If the shading rate image feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV`.

- VUID-vkCmdWriteTimestamp-queryPool-01416
  `queryPool` must have been created with a `queryType` of `VK_QUERY_TYPE_TIMESTAMP`.

- VUID-vkCmdWriteTimestamp-queryPool-00828
  The query identified by `queryPool` and `query` must be unavailable.

- VUID-vkCmdWriteTimestamp-timestampValidBits-00829
  The command pool's queue family must support a non-zero `timestampValidBits`.

- VUID-vkCmdWriteTimestamp-None-00830
  All queries used by the command must be unavailable.

- VUID-vkCmdWriteTimestamp-query-00831
  If `vkCmdWriteTimestamp` is called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask must be less than or equal to the number of queries in `queryPool`. 
### Valid Usage (Implicit)

- **VUID-vkCmdWriteTimestamp-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdWriteTimestamp-pipelineStage-parameter**
  - `pipelineStage` must be a valid `VkPipelineStageFlagBits` value

- **VUID-vkCmdWriteTimestamp-queryPool-parameter**
  - `queryPool` must be a valid `VkQueryPool` handle

- **VUID-vkCmdWriteTimestamp-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdWriteTimestamp-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- **VUID-vkCmdWriteTimestamp-commonparent**
  - Both of `commandBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### 18.6. Performance Queries

*Performance queries* provide applications with a mechanism for getting performance counter information about the execution of command buffers, render passes, and commands.

Each queue family advertises the performance counters that can be queried on a queue of that family via a call to `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR`. Implementations may limit access to performance counters based on platform requirements or only to specialized drivers for development purposes.
This may include no performance counters being enumerated, or a reduced set. Please refer to platform-specific documentation for guidance on any such restrictions.

Performance queries use the existing `vkCmdBeginQuery` and `vkCmdEndQuery` to control what command buffers, render passes, or commands to get performance information for.

Implementations may require multiple passes where the command buffer, render passes, or commands being recorded are the same and are executed on the same queue to record performance counter data. This is achieved by submitting the same batch and providing a `VkPerformanceQuerySubmitInfoKHR` structure containing a counter pass index. The number of passes required for a given performance query pool can be queried via a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

Command buffers created with `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` must not be re-submitted. Changing command buffer usage bits may affect performance. To avoid this, the application should re-record any command buffers with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` when multiple counter passes are required.

Performance counter results from a performance query pool can be obtained with the command `vkGetQueryPoolResults`.

Performance query results are returned in an array of `VkPerformanceCounterResultKHR` unions containing the data associated with each counter in the query, stored in the same order as the counters supplied in `pCounterIndices` when creating the performance query. The `VkPerformanceCounterKHR::unit` enumeration specifies how to parse the counter data.

```c
// Provided by VK_KHR_performance_query
typedef union VkPerformanceCounterResultKHR {
    int32_t     int32;
    int64_t     int64;
    uint32_t    uint32;
    uint64_t    uint64;
    float       float32;
    double      float64;
} VkPerformanceCounterResultKHR;
```

### 18.6.1. Profiling Lock

To record and submit a command buffer that contains a performance query pool the profiling lock must be held. The profiling lock must be acquired prior to any call to `vkBeginCommandBuffer` that will be using a performance query pool. The profiling lock must be held while any command buffer that contains a performance query pool is in the recording, executable, or pending state. To acquire the profiling lock, call:
VkResult vkAcquireProfilingLockKHR(
  VkDevice                                    device,
  const VkAcquireProfilingLockInfoKHR*        pInfo);

- **device** is the logical device to profile.
- **pInfo** is a pointer to a **VkAcquireProfilingLockInfoKHR** structure which contains information about how the profiling is to be acquired.

Implementations **may** allow multiple actors to hold the profiling lock concurrently.

**Valid Usage (Implicit)**

- **VUID-vkAcquireProfilingLockKHR-device-parameter**
  - **device** must be a valid **VkDevice** handle
- **VUID-vkAcquireProfilingLockKHR-pInfo-parameter**
  - **pInfo** must be a valid pointer to a valid **VkAcquireProfilingLockInfoKHR** structure

**Return Codes**

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_TIMEOUT**

The **VkAcquireProfilingLockInfoKHR** structure is defined as:

```c
typedef struct VkAcquireProfilingLockInfoKHR {
  VkStructureType                   sType;
  const void*                       pNext;
  VkAcquireProfilingLockFlagsKHR    flags;
  uint64_t                          timeout;
} VkAcquireProfilingLockInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **timeout** indicates how long the function waits, in nanoseconds, if the profiling lock is not available.
Valid Usage (Implicit)

- VUID-VkAcquireProfilingLockInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR`
- VUID-VkAcquireProfilingLockInfoKHR-pNext-pNext
  `pNext` must be `NULL`
- VUID-VkAcquireProfilingLockInfoKHR-flags-zerobitmask
  `flags` must be `0`

If `timeout` is `0`, `vkAcquireProfilingLockKHR` will not block while attempting to acquire the profiling lock. If `timeout` is `UINT64_MAX`, the function will not return until the profiling lock was acquired.

```c
// Provided by VK_KHR_performance_query
typedef enum VkAcquireProfilingLockFlagBitsKHR {
} VkAcquireProfilingLockFlagBitsKHR;
```

```c
// Provided by VK_KHR_performance_query
typedef VkFlags VkAcquireProfilingLockFlagsKHR;
```

`VkAcquireProfilingLockFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To release the profiling lock, call:

```c
// Provided by VK_KHR_performance_query
void vkReleaseProfilingLockKHR(
    VkDevice device);
```

- `device` is the logical device to cease profiling on.

Valid Usage

- VUID-vkReleaseProfilingLockKHR-device-03235
  The profiling lock of `device` must have been held via a previous successful call to `vkAcquireProfilingLockKHR`

Valid Usage (Implicit)

- VUID-vkReleaseProfilingLockKHR-device-parameter
  `device` must be a valid `VkDevice` handle
18.7. Transform Feedback Queries

Transform feedback queries track the number of primitives attempted to be written and actually written, by the vertex stream being captured, to a transform feedback buffer. This query is updated during draw commands while transform feedback is active. The number of primitives actually written will be less than the number attempted to be written if the bound transform feedback buffer size was too small for the number of primitives actually drawn. Primitives are not written beyond the bound range of the transform feedback buffer. A transform feedback query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively to query for vertex stream zero. `vkCmdBeginQueryIndexedEXT` and `vkCmdEndQueryIndexedEXT` can be used to begin and end transform feedback queries for any supported vertex stream. When a transform feedback query begins, the count of primitives written and primitives needed starts from zero. For each drawing command, the count is incremented as vertex attribute outputs are captured to the transform feedback buffers while transform feedback is active.

When a transform feedback query finishes, the result for that query is marked as available. The application can then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

18.8. Intel performance queries

Intel performance queries allow an application to capture performance data for a set of commands. Performance queries are used in a similar way than other types of queries. A main difference with existing queries is that the resulting data should be handed over to a library capable to produce human readable results rather than being read directly by an application.

Prior to creating a performance query pool, initialize the device for performance queries with the call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkInitializePerformanceApiINTEL(
    VkDevice device,
    const VkInitializePerformanceApiInfoINTEL* pInitializeInfo);
```

- `device` is the logical device used for the queries.
- `pInitializeInfo` is a pointer to a `VkInitializePerformanceApiInfoINTEL` structure specifying initialization parameters.

**Valid Usage (Implicit)**

- `VUID-vkInitializePerformanceApiINTEL-device-parameter`  
  `device` must be a valid `VkDevice` handle

- `VUID-vkInitializePerformanceApiINTEL-pInitializeInfo-parameter`  
  `pInitializeInfo` must be a valid pointer to a valid `VkInitializePerformanceApiInfoINTEL` structure
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

The `VkInitializePerformanceApiInfoINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkInitializePerformanceApiInfoINTEL {
    VkStructureType    sType;
    const void*        pNext;
    void*              pUserData;
} VkInitializePerformanceApiInfoINTEL;
```

• `sType` is the type of this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `pUserData` is a pointer for application data.

Valid Usage (Implicit)

• VUID-VkInitializePerformanceApiInfoINTEL-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_INITIALIZE_PERFORMANCE_API_INFO_INTEL`
• VUID-VkInitializePerformanceApiInfoINTEL-pNext-pNext
  `pNext` must be NULL

Once performance query operations have completed, uninitialize the device for performance queries with the call:

```c
// Provided by VK_INTEL_performance_query
void vkUninitializePerformanceApiINTEL(
    VkDevice                                    device);
```

• `device` is the logical device used for the queries.

Valid Usage (Implicit)

• VUID-vkUninitializePerformanceApiINTEL-device-parameter
  `device` must be a valid `VkDevice` handle
Some performance query features of a device can be discovered with the call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkGetPerformanceParameterINTEL(
    VkDevice                                    device,
    VkPerformanceParameterTypeINTEL             parameter,
    VkPerformanceValueINTEL*                    pValue);
```

- **device** is the logical device to query.
- **parameter** is the parameter to query.
- **pValue** is a pointer to a `VkPerformanceValueINTEL` structure in which the type and value of the parameter are returned.

### Valid Usage (Implicit)

- **VUID-vkGetPerformanceParameterINTEL-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkGetPerformanceParameterINTEL-parameter-parameter**
  - `parameter` must be a valid `VkPerformanceParameterTypeINTEL` value
- **VUID-vkGetPerformanceParameterINTEL-pValue-parameter**
  - `pValue` must be a valid pointer to a `VkPerformanceValueINTEL` structure

### Return Codes

#### Success

- **VK_SUCCESS**

#### Failure

- **VK_ERROR_TOO_MANY_OBJECTS**
- **VK_ERROR_OUT_OF_HOST_MEMORY**

Possible values of `vkGetPerformanceParameterINTEL::parameter`, specifying a performance query feature, are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceParameterTypeINTEL {
    VK_PERFORMANCE_PARAMETER_TYPE_HW_COUNTERS_SUPPORTED_INTEL = 0,
    VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL = 1,
} VkPerformanceParameterTypeINTEL;
```

- **VK_PERFORMANCE_PARAMETER_TYPE_HW_COUNTERS_SUPPORTED_INTEL** has a boolean result which tells whether hardware counters can be captured.
VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL has a 32 bits integer result which tells how many bits can be written into the VkPerformanceValueINTEL value.

The VkPerformanceValueINTEL structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceValueINTEL {
    VkPerformanceValueTypeINTEL type;
    VkPerformanceValueDataINTEL data;
} VkPerformanceValueINTEL;
```

- **type** is a VkPerformanceValueTypeINTEL value specifying the type of the returned data.
- **data** is a VkPerformanceValueDataINTEL union specifying the value of the returned data.

### Valid Usage (Implicit)

- VUID-VkPerformanceValueINTEL-type-parameter
  - `type` must be a valid VkPerformanceValueTypeINTEL value
- VUID-VkPerformanceValueINTEL-valueString-parameter
  - If `type` is VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL, the `valueString` member of `data` must be a null-terminated UTF-8 string

Possible values of VkPerformanceValueINTEL::type, specifying the type of the data returned in VkPerformanceValueINTEL::data, are:

- **VK_PERFORMANCE_VALUE_TYPE_UINT32_INTEL** specifies that unsigned 32-bit integer data is returned in `data.value32`.
- **VK_PERFORMANCE_VALUE_TYPE_UINT64_INTEL** specifies that unsigned 64-bit integer data is returned in `data.value64`.
- **VK_PERFORMANCE_VALUE_TYPE_FLOAT_INTEL** specifies that floating-point data is returned in `data.valueFloat`.
- **VK_PERFORMANCE_VALUE_TYPE_BOOL_INTEL** specifies that `Bool32` data is returned in `data.valueBool`.
- **VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL** specifies that a pointer to a null-terminated UTF-8 string is returned in `data.valueString`. The pointer is valid for the lifetime of the `device` parameter passed to `vkGetPerformanceParameterINTEL`.

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceValueTypeINTEL {
    VK_PERFORMANCE_VALUE_TYPE_UINT32_INTEL = 0,
    VK_PERFORMANCE_VALUE_TYPE_UINT64_INTEL = 1,
    VK_PERFORMANCE_VALUE_TYPE_FLOAT_INTEL = 2,
    VK_PERFORMANCE_VALUE_TYPE_BOOL_INTEL = 3,
    VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL = 4,
} VkPerformanceValueTypeINTEL;
```
The `VkPerformanceValueDataINTEL` union is defined as:

```c
typedef union VkPerformanceValueDataINTEL {
    uint32_t       value32;
    uint64_t       value64;
    float         valueFloat;
    VkBool32       valueBool;
    const char*    valueString;
} VkPerformanceValueDataINTEL;
```

- `data.value32` represents 32-bit integer data.
- `data.value64` represents 64-bit integer data.
- `data.valueFloat` represents floating-point data.
- `data.valueBool` represents `Bool32` data.
- `data.valueString` represents a pointer to a null-terminated UTF-8 string.

The correct member of the union is determined by the associated `VkPerformanceValueTypeINTEL` value.

The `VkQueryPoolPerformanceQueryCreateInfoINTEL` structure is defined as:

```c
typedef struct VkQueryPoolPerformanceQueryCreateInfoINTEL {
    VkStructureType                 sType;
    const void*                     pNext;
    VkQueryPoolSamplingModeINTEL    performanceCountersSampling;
} VkQueryPoolPerformanceQueryCreateInfoINTEL;
```

To create a pool for Intel performance queries, set `VkQueryPoolCreateInfo::queryType` to `VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL` and add a `VkQueryPoolPerformanceQueryCreateInfoINTEL` structure to the `pNext` chain of the `VkQueryPoolCreateInfo` structure.

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `performanceCountersSampling` describes how performance queries should be captured.

**Valid Usage (Implicit)**

- `VUID-VkQueryPoolPerformanceQueryCreateInfoINTEL-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_QUERY_CREATE_INFO_INTEL`

- `VUID-VkQueryPoolPerformanceQueryCreateInfoINTEL-performanceCountersSampling-parameter`  
  `performanceCountersSampling` must be a valid `VkQueryPoolSamplingModeINTEL` value
Possible values of `VkQueryPoolPerformanceQueryCreateInfoINTEL::performanceCountersSampling` are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkQueryPoolSamplingModeINTEL {
    VK_QUERY_POOL_SAMPLING_MODE_MANUAL_INTEL = 0,
} VkQueryPoolSamplingModeINTEL;
```

- `VK_QUERY_POOL_SAMPLING_MODE_MANUAL_INTEL` is the default mode in which the application calls `vkCmdBeginQuery` and `vkCmdEndQuery` to record performance data.

To help associate query results with a particular point at which an application emitted commands, markers can be set into the command buffers with the call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkCmdSetPerformanceMarkerINTEL(
    VkCommandBuffer                             commandBuffer,
    const VkPerformanceMarkerInfoINTEL*         pMarkerInfo);
```

The last marker set onto a command buffer before the end of a query will be part of the query result.

**Valid Usage (Implicit)**

- `VUID-vkCmdSetPerformanceMarkerINTEL-commandBuffer-parameter` 
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- `VUID-vkCmdSetPerformanceMarkerINTEL-pMarkerInfo-parameter` 
  `pMarkerInfo` must be a valid pointer to a valid `VkPerformanceMarkerInfoINTEL` structure
- `VUID-vkCmdSetPerformanceMarkerINTEL-commandBuffer-recording` 
  `commandBuffer` must be in the recording state
- `VUID-vkCmdSetPerformanceMarkerINTEL-commandBuffer-cmdpool` 
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, or transfer operations

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

## Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_TOO_MANY_OBJECTS**
- **VK_ERROR_OUT_OF_HOST_MEMORY**

The `VkPerformanceMarkerInfoINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceMarkerInfoINTEL {
    VkStructureType    sType;
    const void*        pNext;
    uint64_t           marker;
} VkPerformanceMarkerInfoINTEL;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `marker` is the marker value that will be recorded into the opaque query results.

## Valid Usage (Implicit)

- **VUID-VkPerformanceMarkerInfoINTEL-sType-sType**
  - `sType` must be **VK_STRUCTURE_TYPE_PERFORMANCE_MARKER_INFO_INTEL**
- **VUID-VkPerformanceMarkerInfoINTEL-pNext-pNext**
  - `pNext` must be `NULL`

When monitoring the behavior of an application within the dataset generated by the entire set of applications running on the system, it is useful to identify draw calls within a potentially huge amount of performance data. To do so, application can generate stream markers that will be used to trace back a particular draw call with a particular performance data item.
// Provided by VK_INTEL_performance_query

VkResult vkCmdSetPerformanceStreamMarkerINTEL(
    VkCommandBuffer                             commandBuffer,
    const VkPerformanceStreamMarkerInfoINTEL*   pMarkerInfo);

Valid Usage (Implicit)

- VUID-vkCmdSetPerformanceStreamMarkerINTEL-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetPerformanceStreamMarkerINTEL-pMarkerInfo-parameter
  pMarkerInfo must be a valid pointer to a valid VkPerformanceStreamMarkerInfoINTEL structure

- VUID-vkCmdSetPerformanceStreamMarkerINTEL-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetPerformanceStreamMarkerINTEL-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, or transfer operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

</table>
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

The `VkPerformanceStreamMarkerInfoINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceStreamMarkerInfoINTEL {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           marker;
} VkPerformanceStreamMarkerInfoINTEL;
```

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `marker` is the marker value that will be recorded into the reports consumed by an external application.

Valid Usage

• VUID-VkPerformanceStreamMarkerInfoINTEL-marker-02735

The value written by the application into `marker` must only used the valid bits as reported by `vkGetPerformanceParameterINTEL` with the `VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL`

Valid Usage (Implicit)

• VUID-VkPerformanceStreamMarkerInfoINTEL-sType-sType

`sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_STREAM_MARKER_INFO_INTEL`

• VUID-VkPerformanceStreamMarkerInfoINTEL-pNext-pNext

`pNext` must be `NULL`

Some applications might want measure the effect of a set of commands with a different settings. It is possible to override a particular settings using:
// Provided by VK_INTEL_performance_query

VkResult vkCmdSetPerformanceOverrideINTEL(
    VkCommandBuffer                             commandBuffer,
    const VkPerformanceOverrideInfoINTEL*       pOverrideInfo);

• commandBuffer is the command buffer where the override takes place.
• pOverrideInfo is a pointer to a VkPerformanceOverrideInfoINTEL structure selecting the parameter to override.

Valid Usage

• VUID-vkCmdSetPerformanceOverrideINTEL-pOverrideInfo-02736
  pOverrideInfo must not be used with a VkPerformanceOverrideTypeINTEL that is not reported available by vkGetPerformanceParameterINTEL

Valid Usage (Implicit)

• VUID-vkCmdSetPerformanceOverrideINTEL-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetPerformanceOverrideINTEL-pOverrideInfo-parameter
  pOverrideInfo must be a valid pointer to a valid VkPerformanceOverrideInfoINTEL structure

• VUID-vkCmdSetPerformanceOverrideINTEL-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetPerformanceOverrideINTEL-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, or transfer operations

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
</tr>
<tr>

<td></td>
<td>Transfer</td>
</tr>
</tbody>
</table>

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The **VkPerformanceOverrideInfoINTEL** structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceOverrideInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    VkPerformanceOverrideTypeINTEL type;
    VkBool32 enable;
    uint64_t parameter;
} VkPerformanceOverrideInfoINTEL;
```

- **type** is the particular **VkPerformanceOverrideTypeINTEL** to set.
- **enable** defines whether the override is enabled.
- **parameter** is a potential required parameter for the override.

### Valid Usage (Implicit)

- **VUID-VkPerformanceOverrideInfoINTEL-sType-sType**
  - **sType must be** VK_STRUCTURE_TYPE_PERFORMANCE_OVERRIDE_INFO_INTEL
- **VUID-VkPerformanceOverrideInfoINTEL-pNext-pNext**
  - **pNext must be** NULL
- **VUID-VkPerformanceOverrideInfoINTEL-type-parameter**
  - **type must be** a valid **VkPerformanceOverrideTypeINTEL** value
Possible values of `VkPerformanceOverrideInfoINTEL::type`, specifying performance override types, are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceOverrideTypeINTEL {
    VK_PERFORMANCE_OVERRIDE_TYPE_NULL_HARDWARE_INTEL = 0,
    VK_PERFORMANCE_OVERRIDE_TYPE_FLUSH_GPU_CACHES_INTEL = 1,
} VkPerformanceOverrideTypeINTEL;
```

- **VK_PERFORMANCE_OVERRIDE_TYPE_NULL_HARDWARE_INTEL** turns all rendering operations into noop.
- **VK_PERFORMANCE_OVERRIDE_TYPE_FLUSH_GPU_CACHES_INTEL** stalls the stream of commands until all previously emitted commands have completed and all caches been flushed and invalidated.

Before submitting command buffers containing performance queries commands to a device queue, the application must acquire and set a performance query configuration. The configuration can be released once all command buffers containing performance query commands are not in a pending state.

```c
// Provided by VK_INTEL_performance_query
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPerformanceConfigurationINTEL)
```

To acquire a device performance configuration, call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkAcquirePerformanceConfigurationINTEL(
    VkDevice device,
    const VkPerformanceConfigurationAcquireInfoINTEL* pAcquireInfo,
    VkPerformanceConfigurationINTEL* pConfiguration);
```

- **device** is the logical device that the performance query commands will be submitted to.
- **pAcquireInfo** is a pointer to a `VkPerformanceConfigurationAcquireInfoINTEL` structure, specifying the performance configuration to acquire.
- **pConfiguration** is a pointer to a `VkPerformanceConfigurationINTEL` handle in which the resulting configuration object is returned.
Valid Usage (Implicit)

- VUID-vkAcquirePerformanceConfigurationINTEL-device-parameter
device must be a valid VkDevice handle

- VUID-vkAcquirePerformanceConfigurationINTEL-pAcquireInfo-parameter
pAcquireInfo must be a valid pointer to a valid VkPerformanceConfigurationAcquireInfoINTEL structure

- VUID-vkAcquirePerformanceConfigurationINTEL-pConfiguration-parameter
pConfiguration must be a valid pointer to a VkPerformanceConfigurationINTEL handle

Return Codes

Success
- VK_SUCCESS

Failure
-VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkPerformanceConfigurationAcquireInfoINTEL structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceConfigurationAcquireInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    VkPerformanceConfigurationTypeINTEL type;
} VkPerformanceConfigurationAcquireInfoINTEL;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- type is one of the VkPerformanceConfigurationTypeINTEL type of performance configuration that will be acquired.

Valid Usage (Implicit)

- VUID-VkPerformanceConfigurationAcquireInfoINTEL-sType-sType
sType must be VK_STRUCTURE_TYPE_PERFORMANCE_CONFIGURATION_ACQUIRE_INFO_INTEL

- VUID-VkPerformanceConfigurationAcquireInfoINTEL-pNext-pNext
pNext must be NULL

- VUID-VkPerformanceConfigurationAcquireInfoINTEL-type-parameter
type must be a valid VkPerformanceConfigurationTypeINTEL value
Possible values of `VkPerformanceConfigurationAcquireInfoINTEL::type`, specifying performance configuration types, are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceConfigurationTypeINTEL {
    VK_PERFORMANCE_CONFIGURATION_TYPE_COMMAND_QUEUE_METRICS_DISCOVERY_ACTIVATED_INTEL = 0,
} VkPerformanceConfigurationTypeINTEL;
```

to set a performance configuration, call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkQueueSetPerformanceConfigurationINTEL(
    VkQueue                                    queue,
    VkPerformanceConfigurationINTEL             configuration);
```

- `queue` is the queue on which the configuration will be used.
- `configuration` is the configuration to use.

### Valid Usage (Implicit)

- VUID-vkQueueSetPerformanceConfigurationINTEL-queue-parameter
  `queue` must be a valid `VkQueue` handle
- VUID-vkQueueSetPerformanceConfigurationINTEL-configuration-parameter
  `configuration` must be a valid `VkPerformanceConfigurationINTEL` handle
- VUID-vkQueueSetPerformanceConfigurationINTEL-commonparent
  Both of `configuration`, and `queue` must have been created, allocated, or retrieved from the same `VkDevice`

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>Any</td>
<td>-</td>
</tr>
</tbody>
</table>
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

To release a device performance configuration, call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkReleasePerformanceConfigurationINTEL(
    VkDevice                                    device,
    VkPerformanceConfigurationINTEL             configuration);
```

• `device` is the device associated to the configuration object to release.
• `configuration` is the configuration object to release.

Valid Usage

• VUID-vkReleasePerformanceConfigurationINTEL-configuration-02737
  `configuration` must not be released before all command buffers submitted while the configuration was set are in pending state

Valid Usage (Implicit)

• VUID-vkReleasePerformanceConfigurationINTEL-device-parameter
  `device` must be a valid VkDevice handle

• VUID-vkReleasePerformanceConfigurationINTEL-configuration-parameter
  If `configuration` is not VK_NULL_HANDLE, `configuration` must be a valid VkPerformanceConfigurationINTEL handle

• VUID-vkReleasePerformanceConfigurationINTEL-configuration-parent
  If `configuration` is a valid handle, it must have been created, allocated, or retrieved from `device`

Host Synchronization

• Host access to `configuration` must be externally synchronized
### 18.9. Result Status Queries

Result status queries are used for a single purpose - to check whether a set of operations has completed successfully or not, using the `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` flag.

No other data is written to such a query.

### 18.10. Video Encode Bitstream Buffer Range

Bitstream buffer range queries describe the range of bytes written in the bitstream buffer by video encode commands.

When an encode command is recorded within a bitstream buffer range query, two values are written to the query slot. The first value is an offset into the bitstream buffer where the encoded video data was written. This offset is an additional offset from the start of the range specified by the application. The second value is a size value describing the number of bytes written to the bitstream buffer beyond the offset.

One slot is consumed for each slice in each command recorded between a begin and end query pair.
Chapter 19. Clear Commands

19.1. Clearing Images Outside A Render Pass Instance

Color and depth/stencil images can be cleared outside a render pass instance using vkCmdClearColorImage or vkCmdClearDepthStencilImage, respectively. These commands are only allowed outside of a render pass instance.

To clear one or more subranges of a color image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdClearColorImage(
    VkCommandBuffer                            commandBuffer,
    VkImage                                     image,
    VkImageLayout                               imageLayout,
    const VkClearColorValue*                    pColor,
    uint32_t                                    rangeCount,
    const VkImageSubresourceRange*              pRanges);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `image` is the image to be cleared.
- `imageLayout` specifies the current layout of the image subresource ranges to be cleared, and must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`.
- `pColor` is a pointer to a `VkClearColorValue` structure containing the values that the image subresource ranges will be cleared to (see Clear Values below).
- `rangeCount` is the number of image subresource range structures in `pRanges`.
- `pRanges` is a pointer to an array of `VkImageSubresourceRange` structures describing a range of.mipmap levels, array layers, and aspects to be cleared, as described in Image Views.

Each specified range in `pRanges` is cleared to the value specified by `pColor`. 
Valid Usage

- **VUID-vkCmdClearColorImage-image-01993**
  The format features of *image* must contain **VK_FORMAT_FEATURE_TRANSFER_DST_BIT**

- **VUID-vkCmdClearColorImage-image-00002**
  *image* must have been created with **VK_IMAGE_USAGE_TRANSFER_DST_BIT** usage flag

- **VUID-vkCmdClearColorImage-image-01545**
  *image* must not use a format listed in Formats requiring sampler Y’CbCr conversion for **VK_IMAGE_ASPECT_COLOR_BIT** image views

- **VUID-vkCmdClearColorImage-image-00003**
  If *image* is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-vkCmdClearColorImage-imageLayout-00004**
  *imageLayout* must specify the layout of the image subresource ranges of *image* specified in *pRanges* at the time this command is executed on a **VkDevice**

- **VUID-vkCmdClearColorImage-imageLayout-01394**
  *imageLayout* must be **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL**, **VK_IMAGE_LAYOUT_GENERAL**, or **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**

- **VUID-vkCmdClearColorImage-aspectMask-02498**
  The **VkImageSubresourceRange::*aspectMask** members of the elements of the *pRanges* array must each only include **VK_IMAGE_ASPECT_COLOR_BIT**

- **VUID-vkCmdClearColorImage-baseMipLevel-01470**
  The ** VkImageSubresourceRange::*baseMipLevel** members of the elements of the *pRanges* array must each be less than the **mipLevels** specified in **VkImageCreateInfo** when *image* was created

- **VUID-vkCmdClearColorImage-pRanges-01692**
  For each **VkImageSubresourceRange** element of *pRanges*, if the **levelCount** member is not **VK_REMAINING_MIP_LEVELS**, then **baseMipLevel + levelCount** must be less than the **mipLevels** specified in **VkImageCreateInfo** when *image* was created

- **VUID-vkCmdClearColorImage-baseArrayLayer-01472**
  The ** VkImageSubresourceRange::*baseArrayLevel** members of the elements of the *pRanges* array must each be less than the **arrayLayers** specified in **VkImageCreateInfo** when *image* was created

- **VUID-vkCmdClearColorImage-pRanges-01693**
  For each **VkImageSubresourceRange** element of *pRanges*, if the **layerCount** member is not **VK_REMAINING_ARRAY_LAYERS**, then **baseArrayLayer + layerCount** must be less than the **arrayLayers** specified in **VkImageCreateInfo** when *image* was created

- **VUID-vkCmdClearColorImage-image-00007**
  *image* must not have a compressed or depth/stencil format
Valid Usage (Implicit)

- VUID-vkCmdClearColorImage-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdClearColorImage-image-parameter
  `image` must be a valid `VkImage` handle

- VUID-vkCmdClearColorImage-imageLayout-parameter
  `imageLayout` must be a valid `VkImageLayout` value

- VUID-vkCmdClearColorImage-pRanges-parameter
  `pRanges` must be a valid pointer to an array of `rangeCount` valid `VkImageSubresourceRange` structures

- VUID-vkCmdClearColorImage-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdClearColorImage-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdClearColorImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdClearColorImage-rangeCount-arraylength
  `rangeCount` must be greater than 0

- VUID-vkCmdClearColorImage-commonparent
  Both of `commandBuffer`, and `image` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Graphics</td>
<td>Transfer</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

To clear one or more subranges of a depth/stencil image, call:
void vkCmdClearDepthStencilImage(
    VkCommandBuffer commandBuffer,
    VkImage image,
    VkImageLayout imageLayout,
    const VkClearDepthStencilValue* pDepthStencil,
    uint32_t rangeCount,
    const VkImageSubresourceRange* pRanges);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **image** is the image to be cleared.
- **imageLayout** specifies the current layout of the image subresource ranges to be cleared, and **must** be **VK_IMAGE_LAYOUT_GENERAL** or **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL**.
- **pDepthStencil** is a pointer to a **VkClearDepthStencilValue** structure containing the values that the depth and stencil image subresource ranges will be cleared to (see **Clear Values** below).
- **rangeCount** is the number of image subresource range structures in **pRanges**.
- **pRanges** is a pointer to an array of **VkImageSubresourceRange** structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in **Image Views**.
Valid Usage

- **VUID-vkCmdClearDepthStencilImage-image-01994**
  The format features of image must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT

- **VUID-vkCmdClearDepthStencilImage-pRanges-02658**
  If the aspect member of any element of pRanges includes VK_IMAGE_ASPECT_STENCIL_BIT, and image was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create image

- **VUID-vkCmdClearDepthStencilImage-pRanges-02659**
  If the aspect member of any element of pRanges includes VK_IMAGE_ASPECT_STENCIL_BIT, and image was not created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo::usage used to create image

- **VUID-vkCmdClearDepthStencilImage-pRanges-02660**
  If the aspect member of any element of pRanges includes VK_IMAGE_ASPECT_DEPTH_BIT, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo::usage used to create image

- **VUID-vkCmdClearDepthStencilImage-image-00010**
  If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdClearDepthStencilImage-imageLayout-00011**
  imageLayout must specify the layout of the image subresource ranges of image specified in pRanges at the time this command is executed on a VkDevice

- **VUID-vkCmdClearDepthStencilImage-imageLayout-00012**
  imageLayout must be either of VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- **VUID-vkCmdClearDepthStencilImage-aspectMask-02824**
  The VkImageSubresourceRange::aspectMask member of each element of the pRanges array must not include bits other than VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

- **VUID-vkCmdClearDepthStencilImage-image-02825**
  If the image’s format does not have a stencil component, then the VkImageSubresourceRange::aspectMask member of each element of the pRanges array must not include the VK_IMAGE_ASPECT_STENCIL_BIT bit

- **VUID-vkCmdClearDepthStencilImage-image-02826**
  If the image’s format does not have a depth component, then the VkImageSubresourceRange::aspectMask member of each element of the pRanges array must not include the VK_IMAGE_ASPECT_DEPTH_BIT bit

- **VUID-vkCmdClearDepthStencilImage-baseMipLevel-01474**
  The VkImageSubresourceRange::baseMipLevel members of the elements of the pRanges array must each be less than the mipLevels specified in VkImageCreateInfo when image was created

- **VUID-vkCmdClearDepthStencilImage-pRanges-01694**
  For each VkImageSubresourceRange element of pRanges, if the levelCount member is not
VK_REMAINING_MIP_LEVELS, then baseMipLevel + levelCount must be less than the mipLevels specified in VkImageCreateInfo when image was created

• VUID-vkCmdClearDepthStencilImage-baseArrayLayer-01476
  The VkImageSubresourceRange::baseArrayLayer members of the elements of the pRanges array must each be less than the arrayLayers specified in VkImageCreateInfo when image was created

• VUID-vkCmdClearDepthStencilImage-pRanges-01695
  For each VkImageSubresourceRange element of pRanges, if the layerCount member is not VK_REMAINING_ARRAY_LAYERS, then baseArrayLayer + layerCount must be less than the arrayLayers specified in VkImageCreateInfo when image was created

• VUID-vkCmdClearDepthStencilImage-image-00014
  image must have a depth/stencil format

Valid Usage (Implicit)

• VUID-vkCmdClearDepthStencilImage-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdClearDepthStencilImage-image-parameter
  image must be a valid VkImage handle

• VUID-vkCmdClearDepthStencilImage-imageLayout-parameter
  imageLayout must be a valid VkImageLayout value

• VUID-vkCmdClearDepthStencilImage-pDepthStencil-parameter
  pDepthStencil must be a valid pointer to a valid VkClearDepthStencilValue structure

• VUID-vkCmdClearDepthStencilImage-pRanges-parameter
  pRanges must be a valid pointer to an array of rangeCount valid VkImageSubresourceRange structures

• VUID-vkCmdClearDepthStencilImage-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdClearDepthStencilImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdClearDepthStencilImage-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdClearDepthStencilImage-rangeCount-arraylength
  rangeCount must be greater than 0

• VUID-vkCmdClearDepthStencilImage-commonparent
  Both of commandBuffer, and image must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>

Clears outside render pass instances are treated as transfer operations for the purposes of memory barriers.

19.2. Clearing Images Inside A Render Pass Instance

To clear one or more regions of color and depth/stencil attachments inside a render pass instance, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdClearAttachments(
    VkCommandBuffer commandBuffer,
    uint32_t attachmentCount,
    const VkClearAttachment* pAttachments,
    uint32_t rectCount,
    const VkClearRect* pRects);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `attachmentCount` is the number of entries in the `pAttachments` array.
- `pAttachments` is a pointer to an array of `VkClearAttachment` structures defining the attachments to clear and the clear values to use. If any attachment to be cleared in the current subpass is `VK_ATTACHMENT_UNUSED`, then the clear has no effect on that attachment.
- `rectCount` is the number of entries in the `pRects` array.
- `pRects` is a pointer to an array of `VkClearRect` structures defining regions within each selected attachment to clear.

`vkCmdClearAttachments` can clear multiple regions of each attachment used in the current subpass of a render pass instance. This command must be called only inside a render pass instance, and implicitly selects the images to clear based on the current framebuffer attachments and the command parameters.
If the render pass has a fragment density map attachment, clears follow the operations of fragment density maps as if each clear region was a primitive which generates fragments. The clear color is applied to all pixels inside each fragment's area regardless if the pixels lie outside of the clear region. Clears may have a different set of supported fragment areas than draws.

Unlike other clear commands, vkCmdClearAttachments executes as a drawing command, rather than a transfer command, with writes performed by it executing in rasterization order. Clears to color attachments are executed as color attachment writes, by the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT stage. Clears to depth/stencil attachments are executed as depth writes and writes by the VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT and VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT stages.

Valid Usage

- **VUID-vkCmdClearAttachments-aspectMask-02501**
  If the aspectMask member of any element of pAttachments contains VK_IMAGE_ASPECT_COLOR_BIT, then the colorAttachment member of that element must either refer to a color attachment which is VK_ATTACHMENT_UNUSED, or must be a valid color attachment.

- **VUID-vkCmdClearAttachments-aspectMask-02502**
  If the aspectMask member of any element of pAttachments contains VK_IMAGE_ASPECT_DEPTH_BIT, then the current subpass' depth/stencil attachment must either be VK_ATTACHMENT_UNUSED, or must have a depth component.

- **VUID-vkCmdClearAttachments-aspectMask-02503**
  If the aspectMask member of any element of pAttachments contains VK_IMAGE_ASPECT_STENCIL_BIT, then the current subpass' depth/stencil attachment must either be VK_ATTACHMENT_UNUSED, or must have a stencil component.

- **VUID-vkCmdClearAttachments-rect-02682**
  The rect member of each element of pRects must have an extent.width greater than 0.

- **VUID-vkCmdClearAttachments-rect-02683**
  The rect member of each element of pRects must have an extent.height greater than 0.

- **VUID-vkCmdClearAttachments-pRects-00016**
  The rectangular region specified by each element of pRects must be contained within the render area of the current render pass instance.

- **VUID-vkCmdClearAttachments-pRects-00017**
  The layers specified by each element of pRects must be contained within every attachment that pAttachments refers to.

- **VUID-vkCmdClearAttachments-layerCount-01934**
  The layerCount member of each element of pRects must not be 0.

- **VUID-vkCmdClearAttachments-baseArrayLayer-00018**
  If the render pass instance this is recorded in uses multiview, then baseArrayLayer must be zero and layerCount must be one.
Valid Usage (Implicit)

- VUID-vkCmdClearAttachments-commandBuffer-parameter
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdClearAttachments-pAttachments-parameter
  - `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkClearAttachment` structures

- VUID-vkCmdClearAttachments-pRects-parameter
  - `pRects` must be a valid pointer to an array of `rectCount` `VkClearRect` structures

- VUID-vkCmdClearAttachments-commandBuffer-recording
  - `commandBuffer` must be in the recording state

- VUID-vkCmdClearAttachments-commandBuffer-cmdpool
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdClearAttachments-renderpass
  - This command must only be called inside of a render pass instance

- VUID-vkCmdClearAttachments-attachmentCount-arraylength
  - `attachmentCount` must be greater than 0

- VUID-vkCmdClearAttachments-rectCount-arraylength
  - `rectCount` must be greater than 0

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Graphics</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkClearRect` structure is defined as:
typedef struct VkClearColor {
    VkRect2D rect;
    uint32_t baseArrayLayer;
    uint32_t layerCount;
} VkClearColor;

- `rect` is the two-dimensional region to be cleared.
- `baseArrayLayer` is the first layer to be cleared.
- `layerCount` is the number of layers to clear.

The layers `[baseArrayLayer, baseArrayLayer + layerCount)` counting from the base layer of the attachment image view are cleared.

The `VkClearColor` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkClearColor {
    VkImageAspectFlags aspectMask;
    uint32_t colorAttachment;
    VkClearColor clearValue;
} VkClearColor;
```

- `aspectMask` is a mask selecting the color, depth and/or stencil aspects of the attachment to be cleared.
- `colorAttachment` is only meaningful if `VK_IMAGE_ASPECT_COLOR_BIT` is set in `aspectMask`, in which case it is an index to the `pColorAttachments` array in the `VkSubpassDescription` structure of the current subpass which selects the color attachment to clear.
- `clearValue` is the color or depth/stencil value to clear the attachment to, as described in `Clear Values` below.

No memory barriers are needed between `vkCmdClearAttachments` and preceding or subsequent draw or attachment clear commands in the same subpass.

The `vkCmdClearAttachments` command is not affected by the bound pipeline state.

Attachments can also be cleared at the beginning of a render pass instance by setting `loadOp` (or `stencilLoadOp`) of `VkAttachmentDescription` to `VK_ATTACHMENT_LOAD_OP_CLEAR`, as described for `vkCreateRenderPass`. 

1174 | Chapter 19. Clear Commands
Valid Usage

- VUID-VkClearAttachment-aspectMask-00019
  If aspectMask includes VK_IMAGE_ASPECT_COLOR_BIT, it must not include VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkClearAttachment-aspectMask-00020
  aspectMask must not include VK_IMAGE_ASPECT_METADATA_BIT

- VUID-VkClearAttachment-aspectMask-02246
  aspectMask must not include VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT for any index i

- VUID-VkClearAttachment-clearValue-00021
  clearValue must be a valid VkClearColorValue union

Valid Usage (Implicit)

- VUID-VkClearAttachment-aspectMask-parameter
  aspectMask must be a valid combination of VkImageAspectFlagBits values

- VUID-VkClearAttachment-aspectMask-requiredbitmask
  aspectMask must not be 0

19.3. Clear Values

The VkClearColorValue structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef union VkClearColorValue {
    float  float32[4];
    int32_t int32[4];
    uint32_t uint32[4];
} VkClearColorValue;
```

- **float32** are the color clear values when the format of the image or attachment is one of the formats in the Interpretation of Numeric Format table other than signed integer (SINT) or unsigned integer (UINT). Floating point values are automatically converted to the format of the image, with the clear value being treated as linear if the image is sRGB.

- **int32** are the color clear values when the format of the image or attachment is signed integer (SINT). Signed integer values are converted to the format of the image by casting to the smaller type (with negative 32-bit values mapping to negative values in the smaller type). If the integer clear value is not representable in the target type (e.g. would overflow in conversion to that type), the clear value is undefined.

- **uint32** are the color clear values when the format of the image or attachment is unsigned integer (UINT). Unsigned integer values are converted to the format of the image by casting to the integer type with fewer bits.
The four array elements of the clear color map to R, G, B, and A components of image formats, in order.

If the image has more than one sample, the same value is written to all samples for any pixels being cleared.

The $\text{VkClearDepthStencilValue}$ structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearDepthStencilValue {
    float  depth;
    uint32_t stencil;
} VkClearDepthStencilValue;
```

- **depth** is the clear value for the depth aspect of the depth/stencil attachment. It is a floating-point value which is automatically converted to the attachment's format.
- **stencil** is the clear value for the stencil aspect of the depth/stencil attachment. It is a 32-bit integer value which is converted to the attachment's format by taking the appropriate number of LSBs.

**Valid Usage**

- VUID-VkClearDepthStencilValue-depth-00022
  Unless the VK_EXT_depth_range_unrestricted extension is enabled depth must be between 0.0 and 1.0, inclusive

The $\text{VkClearValue}$ union is defined as:

```c
// Provided by VK_VERSION_1_0
typedef union VkClearValue {
    VkClearColorValue          color;
    VkClearDepthStencilValue   depthStencil;
} VkClearValue;
```

- **color** specifies the color image clear values to use when clearing a color image or attachment.
- **depthStencil** specifies the depth and stencil clear values to use when clearing a depth/stencil image or attachment.

This union is used where part of the API requires either color or depth/stencil clear values, depending on the attachment, and defines the initial clear values in the $\text{VkRenderPassBeginInfo}$ structure.

### 19.4. Filling Buffers

To clear buffer data, call:
void vkCmdFillBuffer(
    VkCommandBuffer                             commandBuffer,
    VkBuffer                                    dstBuffer,
    VkDeviceSize                                dstOffset,
    VkDeviceSize                                size,
    uint32_t                                    data);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `dstBuffer` is the buffer to be filled.
- `dstOffset` is the byte offset into the buffer at which to start filling, and **must** be a multiple of 4.
- `size` is the number of bytes to fill, and **must** be either a multiple of 4, or `VK_WHOLE_SIZE` to fill the range from `offset` to the end of the buffer. If `VK_WHOLE_SIZE` is used and the remaining size of the buffer is not a multiple of 4, then the nearest smaller multiple is used.
- `data` is the 4-byte word written repeatedly to the buffer to fill `size` bytes of data. The data word is written to memory according to the host endianness.

`vkCmdFillBuffer` is treated as “transfer” operation for the purposes of synchronization barriers. The `VK_BUFFER_USAGE_TRANSFER_DST_BIT` **must** be specified in `usage` of `VkBufferCreateInfo` in order for the buffer to be compatible with `vkCmdFillBuffer`.

### Valid Usage

- VUID-vkCmdFillBuffer-dstOffset-00024
  
  **dstOffset** **must** be less than the size of `dstBuffer`

- VUID-vkCmdFillBuffer-dstOffset-00025
  
  **dstOffset** **must** be a multiple of 4

- VUID-vkCmdFillBuffer-size-00026
  
  If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be greater than 0

- VUID-vkCmdFillBuffer-size-00027
  
  If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be less than or equal to the size of `dstBuffer` minus `dstOffset`

- VUID-vkCmdFillBuffer-size-00028
  
  If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be a multiple of 4

- VUID-vkCmdFillBuffer-dstBuffer-00029
  
  `dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag

- VUID-vkCmdFillBuffer-dstBuffer-00031
  
  If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
Valid Usage (Implicit)

- **VUID-vkCmdFillBuffer-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdFillBuffer-dstBuffer-parameter**
  
  `dstBuffer` must be a valid `VkBuffer` handle

- **VUID-vkCmdFillBuffer-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdFillBuffer-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics or compute operations

- **VUID-vkCmdFillBuffer-renderpass**
  
  This command must only be called outside of a render pass instance

- **VUID-vkCmdFillBuffer-commonparent**
  
  Both of `commandBuffer`, and `dstBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>

<td></td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

19.5. Updating Buffers

To update buffer data inline in a command buffer, call:
void vkCmdUpdateBuffer(
    VkCommandBuffer                             commandBuffer,
    VkBuffer                                    dstBuffer,
    VkDeviceSize                                dstOffset,
    VkDeviceSize                                dataSize,
    const void*                                 pData);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `dstBuffer` is a handle to the buffer to be updated.
- `dstOffset` is the byte offset into the buffer to start updating, and **must** be a multiple of 4.
- `dataSize` is the number of bytes to update, and **must** be a multiple of 4.
- `pData` is a pointer to the source data for the buffer update, and **must** be at least `dataSize` bytes in size.

`dataSize` **must** be less than or equal to 65536 bytes. For larger updates, applications can use buffer to buffer copies.

**Note**

Buffer updates performed with `vkCmdUpdateBuffer` first copy the data into command buffer memory when the command is recorded (which requires additional storage and may incur an additional allocation), and then copy the data from the command buffer into `dstBuffer` when the command is executed on a device.

The additional cost of this functionality compared to buffer to buffer copies means it is only recommended for very small amounts of data, and is why it is limited to only 65536 bytes.

Applications can work around this by issuing multiple `vkCmdUpdateBuffer` commands to different ranges of the same buffer, but it is strongly recommended that they **should not**.

The source data is copied from the user pointer to the command buffer when the command is called.

`vkCmdUpdateBuffer` is only allowed outside of a render pass. This command is treated as “transfer” operation, for the purposes of synchronization barriers. The `VK_BUFFER_USAGE_TRANSFER_DST_BIT` must be specified in `usage` of `VkBufferCreateInfo` in order for the buffer to be compatible with `vkCmdUpdateBuffer`. 
Valid Usage

- **VUID-vkCmdUpdateBuffer-dstOffset-00032**
  
  `dstOffset` **must** be less than the size of `dstBuffer`.

- **VUID-vkCmdUpdateBuffer-dataSize-00033**
  
  `dataSize` **must** be less than or equal to the size of `dstBuffer` minus `dstOffset`.

- **VUID-vkCmdUpdateBuffer-dstBuffer-00034**
  
  `dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag.

- **VUID-vkCmdUpdateBuffer-dstBuffer-00035**
  
  If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdUpdateBuffer-dstOffset-00036**
  
  `dstOffset` **must** be a multiple of 4.

- **VUID-vkCmdUpdateBuffer-dataSize-00037**
  
  `dataSize` **must** be less than or equal to 65536.

- **VUID-vkCmdUpdateBuffer-dataSize-00038**
  
  `dataSize` **must** be a multiple of 4.

Valid Usage (Implicit)

- **VUID-vkCmdUpdateBuffer-commandBuffer-parameter**
  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdUpdateBuffer-dstBuffer-parameter**
  
  `dstBuffer` **must** be a valid `VkBuffer` handle.

- **VUID-vkCmdUpdateBuffer-pData-parameter**
  
  `pData` **must** be a valid pointer to an array of `dataSize` bytes.

- **VUID-vkCmdUpdateBuffer-commandBuffer-recording**
  
  `commandBuffer` **must** be in the recording state.

- **VUID-vkCmdUpdateBuffer-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations.

- **VUID-vkCmdUpdateBuffer-renderpass**
  
  This command **must** only be called outside of a render pass instance.

- **VUID-vkCmdUpdateBuffer-dataSize-arraylength**
  
  `dataSize` **must** be greater than 0.

- **VUID-vkCmdUpdateBuffer-commonparent**
  
  Both of `commandBuffer`, and `dstBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Transfer</td>
<td>Transfer</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Graphics Compute</td>
<td></td>
</tr>
</tbody>
</table>

Note

The `pData` parameter was of type `uint32_t*` instead of `void*` prior to version 1.0.19 of the Specification and `VK_HEADER_VERSION` 19 of the Vulkan Header Files. This was a historical anomaly, as the source data may be of other types.
Chapter 20. Copy Commands

An application can copy buffer and image data using several methods depending on the type of data transfer. Data can be copied between buffer objects with `vkCmdCopyBuffer2KHR` and `vkCmdCopyBuffer` and a portion of an image can be copied to another image with `vkCmdCopyImage2KHR` and `vkCmdCopyImage`. Image data can also be copied to and from buffer memory using `vkCmdCopyImageToBuffer2KHR`, `vkCmdCopyImageToBuffer`, `vkCmdCopyBufferToImage2KHR`, and `vkCmdCopyBufferToImage`. Image data can be blitted (with or without scaling and filtering) with `vkCmdBlitImage2KHR` and `vkCmdBlitImage`. Multisampled images can be resolved to a non-multisampled image with `vkCmdResolveImage2KHR` and `vkCmdResolveImage`.

20.1. Common Operation

The following valid usage rules apply to all copy commands:

- Copy commands must be recorded outside of a render pass instance.
- The set of all bytes bound to all the source regions must not overlap the set of all bytes bound to the destination regions.
- The set of all bytes bound to each destination region must not overlap the set of all bytes bound to another destination region.
- Copy regions must be non-empty.
- Regions must not extend outside the bounds of the buffer or image level, except that regions of compressed images can extend as far as the dimension of the image level rounded up to a complete compressed texel block.
- Source image subresources must be in either the `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` layout. Destination image subresources must be in the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` layout. As a consequence, if an image subresource is used as both source and destination of a copy, it must be in the `VK_IMAGE_LAYOUT_GENERAL` layout.
- Source images must have `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT` in their format features.
- Destination images must have `VK_FORMAT_FEATURE_TRANSFER_DST_BIT` in their format features.
- Source buffers must have been created with the `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage bit enabled and destination buffers must have been created with the `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage bit enabled.
- Source images must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` set in `VkImageCreateInfo::usage`.
- Destination images must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` set in `VkImageCreateInfo::usage`.
- If the stencil aspect of source image is accessed, and the source image was not created with separate stencil usage, the source image must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` set in `VkImageCreateInfo::usage`.
- If the stencil aspect of destination image is accessed, and the destination image was not created...
with separate stencil usage, the destination image must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT set in VkImageCreateInfo::usage

- If the stencil aspect of source image is accessed, and the source image was created with separate stencil usage, the source image must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT set in VkImageStencilUsageCreateInfo::stencilUsage

- If the stencil aspect of destination image is accessed, and the destination image was created with separate stencil usage, the destination image must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT set in VkImageStencilUsageCreateInfo::stencilUsage

- If non-stencil aspects of a source image are accessed, the source image must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT set in VkImageCreateInfo::usage

- If non-stencil aspects of a destination image are accessed, the destination image must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT set in VkImageCreateInfo::usage

All copy commands are treated as “transfer” operations for the purposes of synchronization barriers.

All copy commands that have a source format with an X component in its format description read undefined values from those bits.

All copy commands that have a destination format with an X component in its format description write undefined values to those bits.

## 20.2. Copying Data Between Buffers

To copy data between buffer objects, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer srcBuffer,
    VkBuffer dstBuffer,
    uint32_t regionCount,
    const VkBufferCopy* pRegions);
```

- commandBuffer is the command buffer into which the command will be recorded.
- srcBuffer is the source buffer.
- dstBuffer is the destination buffer.
- regionCount is the number of regions to copy.
- pRegions is a pointer to an array of VkBufferCopy structures specifying the regions to copy.

Each region in pRegions is copied from the source buffer to the same region of the destination buffer. srcBuffer and dstBuffer can be the same buffer or alias the same memory, but the resulting values are undefined if the copy regions overlap in memory.
Valid Usage

- **VUID-vkCmdCopyBuffer-srcOffset-00113**
  The `srcOffset` member of each element of `pRegions` **must** be less than the size of `srcBuffer`.

- **VUID-vkCmdCopyBuffer-dstOffset-00114**
  The `dstOffset` member of each element of `pRegions` **must** be less than the size of `dstBuffer`.

- **VUID-vkCmdCopyBuffer-size-00115**
  The `size` member of each element of `pRegions` **must** be less than or equal to the size of `srcBuffer` minus `srcOffset`.

- **VUID-vkCmdCopyBuffer-size-00116**
  The `size` member of each element of `pRegions` **must** be less than or equal to the size of `dstBuffer` minus `dstOffset`.

- **VUID-vkCmdCopyBuffer-pRegions-00117**
  The union of the source regions, and the union of the destination regions, specified by the elements of `pRegions`, **must** not overlap in memory.

- **VUID-vkCmdCopyBuffer-srcBuffer-00118**
  `srcBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag.

- **VUID-vkCmdCopyBuffer-srcBuffer-00119**
  If `srcBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdCopyBuffer-dstBuffer-00120**
  `dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag.

- **VUID-vkCmdCopyBuffer-dstBuffer-00121**
  If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.
Valid Usage (Implicit)

- VUID-vkCmdCopyBuffer-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyBuffer-srcBuffer-parameter
  
  `srcBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdCopyBuffer-dstBuffer-parameter
  
  `dstBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdCopyBuffer-pRegions-parameter
  
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkBufferCopy` structures

- VUID-vkCmdCopyBuffer-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdCopyBuffer-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdCopyBuffer-renderpass
  
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyBuffer-regionCount-arraylength
  
  `regionCount` must be greater than 0

- VUID-vkCmdCopyBuffer-commonparent
  
  Each of `commandBuffer`, `dstBuffer`, and `srcBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

The `VkBufferCopy` structure is defined as:
typedef struct VkBufferCopy {
    VkDeviceSize srcOffset;
    VkDeviceSize dstOffset;
    VkDeviceSize size;
} VkBufferCopy;

- `srcOffset` is the starting offset in bytes from the start of `srcBuffer`.
- `dstOffset` is the starting offset in bytes from the start of `dstBuffer`.
- `size` is the number of bytes to copy.

Valid Usage

- VUID-VkBufferCopy-size-01988
  The size must be greater than 0

A more extensible version of the copy buffer command is defined below.

To copy data between buffer objects, call:

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyBuffer2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyBufferInfo2KHR* pCopyBufferInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyBufferInfo` is a pointer to a `VkCopyBufferInfo2KHR` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyBuffer`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

Valid Usage
Valid Usage (Implicit)

- **VUID-vkCmdCopyBuffer2KHR-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyBuffer2KHR-pCopyBufferInfo-parameter**
  
  `pCopyBufferInfo` must be a valid pointer to a valid `VkCopyBufferInfo2KHR` structure

- **VUID-vkCmdCopyBuffer2KHR-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdCopyBuffer2KHR-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- **VUID-vkCmdCopyBuffer2KHR-renderpass**
  
  This command must only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Transfer</td>
<td>Transfer</td>

</tbody>
</table>

The `VkCopyBufferInfo2KHR` structure is defined as:

```c
// Provided by VK_KHR_copy_commands2
typedef struct VkCopyBufferInfo2KHR {
    VkStructureType            sType;
    const void*                pNext;
    VkBuffer                   srcBuffer;
    VkBuffer                   dstBuffer;
    uint32_t                   regionCount;
    const VkBufferCopy2KHR*    pRegions;
} VkCopyBufferInfo2KHR;
```

- `sType` is the type of this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `srcBuffer` is the source buffer.
• `dstBuffer` is the destination buffer.
• `regionCount` is the number of regions to copy.
• `pRegions` is a pointer to an array of `VkBufferCopy2KHR` structures specifying the regions to copy.

Members defined by this structure with the same name as parameters in `vkCmdCopyBuffer` have the identical effect to those parameters; the child structure `VkBufferCopy2KHR` is a variant of `VkBufferCopy` which includes `sType` and `pNext` parameters, allowing it to be extended.

### Valid Usage

- **VUID-VkCopyBufferInfo2KHR-srcOffset-00113**
  The `srcOffset` member of each element of `pRegions` **must** be less than the size of `srcBuffer`.

- **VUID-VkCopyBufferInfo2KHR-dstOffset-00114**
  The `dstOffset` member of each element of `pRegions` **must** be less than the size of `dstBuffer`.

- **VUID-VkCopyBufferInfo2KHR-size-00115**
  The `size` member of each element of `pRegions` **must** be less than or equal to the size of `srcBuffer` minus `srcOffset`.

- **VUID-VkCopyBufferInfo2KHR-size-00116**
  The `size` member of each element of `pRegions` **must** be less than or equal to the size of `dstBuffer` minus `dstOffset`.

- **VUID-VkCopyBufferInfo2KHR-pRegions-00117**
  The union of the source regions, and the union of the destination regions, specified by the elements of `pRegions`, **must** not overlap in memory.

- **VUID-VkCopyBufferInfo2KHR-srcBuffer-00118**
  `srcBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag.

- **VUID-VkCopyBufferInfo2KHR-srcBuffer-00119**
  If `srcBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkCopyBufferInfo2KHR-dstBuffer-00120**
  `dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag.

- **VUID-VkCopyBufferInfo2KHR-dstBuffer-00121**
  If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.
Valid Usage (Implicit)

- **VUID-VkCopyBufferInfo2KHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_COPY_BUFFER_INFO_2_KHR`.

- **VUID-VkCopyBufferInfo2KHR-pNext-pNext**
  
  `pNext` must be `NULL`.

- **VUID-VkCopyBufferInfo2KHR-srcBuffer-parameter**
  
  `srcBuffer` must be a valid `VkBuffer` handle.

- **VUID-VkCopyBufferInfo2KHR-dstBuffer-parameter**
  
  `dstBuffer` must be a valid `VkBuffer` handle.

- **VUID-VkCopyBufferInfo2KHR-pRegions-parameter**
  
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkBufferCopy2KHR` structures.

- **VUID-VkCopyBufferInfo2KHR-regionCount-arraylength**
  
  `regionCount` must be greater than 0.

- **VUID-VkCopyBufferInfo2KHR-commonparent**
  
  Both of `dstBuffer`, and `srcBuffer` must have been created, allocated, or retrieved from the same `VkDevice`.

The `VkBufferCopy2KHR` structure is defined as:

```c
// Provided by VK_KHR_copy_commands2
typedef struct VkBufferCopy2KHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize srcOffset;
    VkDeviceSize dstOffset;
    VkDeviceSize size;
} VkBufferCopy2KHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcOffset** is the starting offset in bytes from the start of `srcBuffer`.
- **dstOffset** is the starting offset in bytes from the start of `dstBuffer`.
- **size** is the number of bytes to copy.

Valid Usage

- **VUID-VkBufferCopy2KHR-size-01988**
  
  The `size` must be greater than 0.
20.3. Copying Data Between Images

`vkCmdCopyImage` performs image copies in a similar manner to a host memcpy. It does not perform general-purpose conversions such as scaling, resizing, blending, color-space conversion, or format conversions. Rather, it simply copies raw image data. `vkCmdCopyImage` can copy between images with different formats, provided the formats are compatible as defined below.

To copy data between image objects, call:

```
// Provided by VK_VERSION_1_0
void vkCmdCopyImage(
    VkCommandBuffer                             commandBuffer,
    VkImage                                     srcImage,
    VkImageLayout                               srcImageLayout,
    VkImage                                     dstImage,
    VkImageLayout                               dstImageLayout,
    uint32_t                                    regionCount,
    const VkImageCopy*                          pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the current layout of the source image subresource.
- `dstImage` is the destination image.
- `dstImageLayout` is the current layout of the destination image subresource.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy` structures specifying the regions to copy.

Each region in `pRegions` is copied from the source image to the same region of the destination image. `srcImage` and `dstImage` can be the same image or alias the same memory.

The formats of `srcImage` and `dstImage` must be compatible. Formats are compatible if they share the same class, as shown in the Compatible Formats table. Depth/stencil formats must match exactly.

If the format of `srcImage` or `dstImage` is a `multi-planar image format`, regions of each plane to be copied must be specified separately using the `srcSubresource` and `dstSubresource` members of the `VkImageCopy` structure. In this case, the `aspectMask` of the `srcSubresource` or `dstSubresource` that refers to the multi-planar image must be `VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, ...`
or VK_IMAGE_ASPECT_PLANE_2_BIT. For the purposes of `vkCmdCopyImage`, each plane of a multi-planar image is treated as having the format listed in Compatible formats of planes of multi-planar formats for the plane identified by the `aspectMask` of the corresponding subresource. This applies both to `VkFormat` and to coordinates used in the copy, which correspond to texels in the `plane` rather than how these texels map to coordinates in the image as a whole.

**Note**

For example, the `VK_IMAGE_ASPECT_PLANE_1_BIT` plane of a `VK_FORMAT_G8_B8R8_2PLANE_420_UNORM` image is compatible with an image of format `VK_FORMAT_R8G8_UNORM` and (less usefully) with the `VK_IMAGE_ASPECT_PLANE_0_BIT` plane of an image of format `VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_420_UNORM_3PACK16`, as each texel is 2 bytes in size.

`vkCmdCopyImage` allows copying between size-compatible compressed and uncompressed internal formats. Formats are size-compatible if the texel block size of the uncompressed format is equal to the texel block size of the compressed format. Such a copy does not perform on-the-fly compression or decompression. When copying from an uncompressed format to a compressed format, each texel of uncompressed data of the source image is copied as a raw value to the corresponding compressed texel block of the destination image. When copying from a compressed format to an uncompressed format, each compressed texel block of the source image is copied as a raw value to the corresponding texel of uncompressed data in the destination image. Thus, for example, it is legal to copy between a 128-bit uncompressed format and a compressed format which has a 128-bit sized compressed texel block representing $4 \times 4$ texels (using 8 bits per texel), or between a 64-bit uncompressed format and a compressed format which has a 64-bit sized compressed texel block representing $4 \times 4$ texels (using 4 bits per texel).

When copying between compressed and uncompressed formats the `extent` members represent the texel dimensions of the source image and not the destination. When copying from a compressed image to an uncompressed image the image texel dimensions written to the uncompressed image will be source extent divided by the compressed texel block dimensions. When copying from an uncompressed image to a compressed image the image texel dimensions written to the compressed image will be the source extent multiplied by the compressed texel block dimensions. In both cases the number of bytes read and the number of bytes written will be identical.

Copying to or from block-compressed images is typically done in multiples of the compressed texel block size. For this reason the `extent` must be a multiple of the compressed texel block dimension. There is one exception to this rule which is required to handle compressed images created with dimensions that are not a multiple of the compressed texel block dimensions: if the `srcImage` is compressed, then:

- If `extent.width` is not a multiple of the compressed texel block width, then `(extent.width + srcOffset.x)` must equal the image subresource width.
- If `extent.height` is not a multiple of the compressed texel block height, then `(extent.height + srcOffset.y)` must equal the image subresource height.
- If `extent.depth` is not a multiple of the compressed texel block depth, then `(extent.depth + srcOffset.z)` must equal the image subresource depth.

Chapter 20. Copy Commands | 1191
Similarly, if the dstImage is compressed, then:

- If extent.width is not a multiple of the compressed texel block width, then (extent.width + dstOffset.x) must equal the image subresource width.
- If extent.height is not a multiple of the compressed texel block height, then (extent.height + dstOffset.y) must equal the image subresource height.
- If extent.depth is not a multiple of the compressed texel block depth, then (extent.depth + dstOffset.z) must equal the image subresource depth.

This allows the last compressed texel block of the image in each non-multiple dimension to be included as a source or destination of the copy.

“422” image formats that are not multi-planar are treated as having a 2×1 compressed texel block for the purposes of these rules.

vkCmdCopyImage can be used to copy image data between multisample images, but both images must have the same number of samples.
Valid Usage

- VUID-vkCmdCopyImage-pRegions-00124
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory.

- VUID-vkCmdCopyImage-srcImage-01995
  The format features of `srcImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`.

- VUID-vkCmdCopyImage-srcImage-00126
  `srcImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag.

- VUID-vkCmdCopyImage-srcImage-01546
  If `srcImage` is non-sparse then the image or disjoint plane to be copied **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdCopyImage-srcImageLayout-00128
  `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

- VUID-vkCmdCopyImage-srcImageLayout-01917
  `srcImageLayout` **must** be `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`.

- VUID-vkCmdCopyImage-dstImage-01996
  The format features of `dstImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.

- VUID-vkCmdCopyImage-dstImage-00131
  `dstImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag.

- VUID-vkCmdCopyImage-dstImage-01547
  If `dstImage` is non-sparse then the image or disjoint plane that is the destination of the copy **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdCopyImage-dstImageLayout-00133
  `dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

- VUID-vkCmdCopyImage-dstImageLayout-01395
  `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`.

- VUID-vkCmdCopyImage-srcImage-01548
  If the `VkFormat` of each of `srcImage` and `dstImage` is not a **multi-planar format**, the `VkFormat` of each of `srcImage` and `dstImage` **must** be compatible, as defined above.

- VUID-vkCmdCopyImage-None-01549
  In a copy to or from a plane of a **multi-planar image**, the `VkFormat` of the image and plane **must** be compatible according to the description of compatible planes for the plane being copied.

- VUID-vkCmdCopyImage-srcImage-00136
  The sample count of `srcImage` and `dstImage` **must** match.

- VUID-vkCmdCopyImage-srcSubresource-01696
  The `srcSubresource.mipLevel` member of each element of `pRegions` **must** be less than the
mipLevels specified in VkImageCreateInfo when srcImage was created

• VUID-vkCmdCopyImage-dstSubresource-01697
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

• VUID-vkCmdCopyImage-srcSubresource-01698
  The srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

• VUID-vkCmdCopyImage-dstSubresource-01699
  The dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

• VUID-vkCmdCopyImage-srcOffset-01783
  The srcOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

• VUID-vkCmdCopyImage-dstOffset-01784
  The dstOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

• VUID-vkCmdCopyImage-dstImage-02542
  dstImage and srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

• VUID-vkCmdCopyImage-srcImage-01551
  If neither srcImage nor dstImage has a multi-planar image format then for each element of pRegions, srcSubresource.aspectMask and dstSubresource.aspectMask must match

• VUID-vkCmdCopyImage-srcImage-01552
  If srcImage has a VkFormat with two planes then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT

• VUID-vkCmdCopyImage-srcImage-01553
  If srcImage has a VkFormat with three planes then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT

• VUID-vkCmdCopyImage-dstImage-01554
  If dstImage has a VkFormat with two planes then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT

• VUID-vkCmdCopyImage-dstImage-01555
  If dstImage has a VkFormat with three planes then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT

• VUID-vkCmdCopyImage-srcImage-01556
  If srcImage has a multi-planar image format and the dstImage does not have a multi-planar
image format, then for each element of `pRegions`, `dstSubresource.aspectMask` must be `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-vkCmdCopyImage-dstImage-01557
  If `dstImage` has a multi-planar image format and the `srcImage` does not have a multi-planar image format, then for each element of `pRegions`, `srcSubresource.aspectMask` must be `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-vkCmdCopyImage-srcImage-04443
  If `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` must be 0 and `srcSubresource.layerCount` must be 1

- VUID-vkCmdCopyImage-srcOffset-00144
  For each element of `pRegions`, `srcOffset.x` and `(extent.width + srcOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`

- VUID-vkCmdCopyImage-srcOffset-00145
  For each element of `pRegions`, `srcOffset.y` and `(extent.height + srcOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`

- VUID-vkCmdCopyImage-srcImage-01785
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` must be 0 and `extent.height` must be 1

- VUID-vkCmdCopyImage-srcOffset-00146
  For each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`

- VUID-vkCmdCopyImage-dstImage-01786
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.z` must be 0 and `extent.depth` must be 1

- VUID-vkCmdCopyImage-dstImage-01787
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.x` must be 0

- VUID-vkCmdCopyImage-dstOffset-00147
  For each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`

- VUID-vkCmdCopyImage-dstImage-01788
  If `dstImage` is of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `dstOffset.z` must be 0

- VUID-vkCmdCopyImage-dstOffset-00148
  For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`

- VUID-vkCmdCopyImage-dstOffset-00149
  For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`
must be 0

- VUID-vkCmdCopyImage-srcImage-01790
  If `srcImage` and `dstImage` are both of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `extent.depth` must be 1

- VUID-vkCmdCopyImage-srcImage-01791
  If `srcImage` is of type `VK_IMAGE_TYPE_2D`, and `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` must equal `srcSubresource.layerCount`

- VUID-vkCmdCopyImage-dstImage-01792
  If `dstImage` is of type `VK_IMAGE_TYPE_2D`, and `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` must equal `dstSubresource.layerCount`

- VUID-vkCmdCopyImage-dstOffset-00150
  For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`

- VUID-vkCmdCopyImage-dstOffset-00151
  For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`

- VUID-vkCmdCopyImage-dstOffset-00152
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.y` must be 0 and `extent.height` must be 1

- VUID-vkCmdCopyImage-dstOffset-00153
  For each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`

- VUID-vkCmdCopyImage-srcImage-01727
  If `srcImage` is a blocked image, then for each element of `pRegions`, all members of `srcOffset` must be a multiple of the corresponding dimensions of the compressed texel block

- VUID-vkCmdCopyImage-srcImage-01728
  If `srcImage` is a blocked image, then for each element of `pRegions`, `extent.width` must be a multiple of the compressed texel block width or `(extent.width + srcOffset.x)` must equal the width of the specified `srcSubresource` of `srcImage`

- VUID-vkCmdCopyImage-srcImage-01729
  If `srcImage` is a blocked image, then for each element of `pRegions`, `extent.height` must be a multiple of the compressed texel block height or `(extent.height + srcOffset.y)` must equal the height of the specified `srcSubresource` of `srcImage`

- VUID-vkCmdCopyImage-srcImage-01730
  If `srcImage` is a blocked image, then for each element of `pRegions`, `extent.depth` must be a multiple of the compressed texel block depth or `(extent.depth + srcOffset.z)` must equal the depth of the specified `srcSubresource` of `srcImage`

- VUID-vkCmdCopyImage-dstImage-01731
  If `dstImage` is a blocked image, then for each element of `pRegions`, all members of `dstOffset` must be a multiple of the corresponding dimensions of the compressed texel block
If $dstImage$ is a blocked image, then for each element of $pRegions$, $extent.width$ must be a multiple of the compressed texel block width or $(extent.width + dstOffset.x)$ must equal the width of the specified $dstSubresource$ of $dstImage$

If $dstImage$ is a blocked image, then for each element of $pRegions$, $extent.height$ must be a multiple of the compressed texel block height or $(extent.height + dstOffset.y)$ must equal the height of the specified $dstSubresource$ of $dstImage$

If $dstImage$ is a blocked image, then for each element of $pRegions$, $extent.depth$ must be a multiple of the compressed texel block depth or $(extent.depth + dstOffset.z)$ must equal the depth of the specified $dstSubresource$ of $dstImage$

Valid Usage (Implicit)

- $commandBuffer$ must be a valid $VkCommandBuffer$ handle
- $srcImage$ must be a valid $VkImage$ handle
- $srcImageLayout$ must be a valid $VkImageLayout$ value
- $dstImage$ must be a valid $VkImage$ handle
- $dstImageLayout$ must be a valid $VkImageLayout$ value
- $pRegions$ must be a valid pointer to an array of $regionCount$ valid $VkImageCopy$ structures
- $commandBuffer$ must be in the recording state
- The $VkCommandPool$ that $commandBuffer$ was allocated from must support transfer, graphics, or compute operations
- This command must only be called outside of a render pass instance
- $regionCount$ must be greater than 0
- Each of $commandBuffer$, $dstImage$, and $srcImage$ must have been created, allocated, or retrieved from the same $VkDevice$
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Transfer, Graphics, Compute</td>
<td>Transfer</td>

The VkImageCopy structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageCopy {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageCopy;
```

- `srcSubresource` and `dstSubresource` are VkImageSubresourceLayers structures specifying the image subresources of the images used for the source and destination image data, respectively.
- `srcOffset` and `dstOffset` select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the image to copy in width, height and depth.

For VK_IMAGE_TYPE_3D images, copies are performed slice by slice starting with the z member of the `srcOffset` or `dstOffset`, and copying `depth` slices. For images with multiple layers, copies are performed layer by layer starting with the `baseArrayLayer` member of the `srcSubresource` or `dstSubresource` and copying `layerCount` layers. Image data can be copied between images with different image types. If one image is VK_IMAGE_TYPE_3D and the other image is VK_IMAGE_TYPE_2D with multiple layers, then each slice is copied to or from a different layer.

Copies involving a multi-planar image format specify the region to be copied in terms of the plane to be copied, not the coordinates of the multi-planar image. This means that copies accessing the R/B planes of “_422” format images must fit the copied region within half the width of the parent image, and that copies accessing the R/B planes of “_420” format images must fit the copied region within half the width and height of the parent image.
Valid Usage

• VUID-VkImageCopy-extent-00140
  The number of slices of the extent (for 3D) or layers of the srcSubresource (for non-3D) must match the number of slices of the extent (for 3D) or layers of the dstSubresource (for non-3D)

Valid Usage (Implicit)

• VUID-VkImageCopy-srcSubresource-parameter
  srcSubresource must be a valid VkImageSubresourceLayers structure

• VUID-VkImageCopy-dstSubresource-parameter
  dstSubresource must be a valid VkImageSubresourceLayers structure

The VkImageSubresourceLayers structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresourceLayers {
    VkImageAspectFlags aspectMask;
    uint32_t mipLevel;
    uint32_t baseArrayLayer;
    uint32_t layerCount;
} VkImageSubresourceLayers;
```

• aspectMask is a combination of VkImageAspectFlagBits, selecting the color, depth and/or stencil aspects to be copied.

• mipLevel is the mipmap level to copy

• baseArrayLayer and layerCount are the starting layer and number of layers to copy.

Valid Usage

• VUID-VkImageSubresourceLayers-aspectMask-00167
  If aspectMask contains VK_IMAGE_ASPECT_COLOR_BIT, it must not contain either of VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

• VUID-VkImageSubresourceLayers-aspectMask-00168
  aspectMask must not contain VK_IMAGE_ASPECT_METADATA_BIT

• VUID-VkImageSubresourceLayers-aspectMask-02247
  aspectMask must not include VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT for any index i

• VUID-VkImageSubresourceLayers-layerCount-01700
  layerCount must be greater than 0
A more extensible version of the copy image command is defined below.

To copy data between image objects, call:

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImage2KHR(
    VkCommandBuffer                             commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    const VkCopyImageInfo2KHR*                  pCopyImageInfo);   // pCopyImageInfo is a pointer to a VkCopyImageInfo2KHR structure describing the copy parameters.
```

This command is functionally identical to `vkCmdCopyImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

**Valid Usage**

- **VUID-vkCmdCopyImage2KHR-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyImage2KHR-pCopyImageInfo-parameter**
  - `pCopyImageInfo` must be a valid pointer to a `VkCopyImageInfo2KHR` structure

- **VUID-vkCmdCopyImage2KHR-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdCopyImage2KHR-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- **VUID-vkCmdCopyImage2KHR-renderpass**
  - This command must only be called outside of a render pass instance
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

</tbody>
</table>

The `VkCopyImageInfo2KHR` structure is defined as:

```c
// Provided by VK_KHR_copy_commands2
typedef struct VkCopyImageInfo2KHR {
    VkStructureType           sType;
    const void*               pNext;
    VkImage                   srcImage;
    VkImageLayout             srcImageLayout;
    VkImage                   dstImage;
    VkImageLayout             dstImageLayout;
    uint32_t                  regionCount;
    const VkImageCopy2KHR*    pRegions;
} VkCopyImageInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the current layout of the source image subresource.
- `dstImage` is the destination image.
- `dstImageLayout` is the current layout of the destination image subresource.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy2KHR` structures specifying the regions to copy.
Valid Usage

- **VUID-VkCopyImageInfo2KHR-pRegions-00124**
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory

- **VUID-VkCopyImageInfo2KHR-srcImage-01995**
  The **format features** of `srcImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`

- **VUID-VkCopyImageInfo2KHR-srcImage-00126**
  `srcImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag

- **VUID-VkCopyImageInfo2KHR-srcImage-01546**
  If `srcImage` is non-sparse then the image or disjoint plane to be copied **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkCopyImageInfo2KHR-srcImageLayout-00128**
  `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-VkCopyImageInfo2KHR-srcImageLayout-01917**
  `srcImageLayout` **must** be `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`

- **VUID-VkCopyImageInfo2KHR-dstImage-01996**
  The **format features** of `dstImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`

- **VUID-VkCopyImageInfo2KHR-dstImage-00131**
  `dstImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag

- **VUID-VkCopyImageInfo2KHR-dstImage-01547**
  If `dstImage` is non-sparse then the image or disjoint plane that is the destination of the copy **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkCopyImageInfo2KHR-dstImageLayout-00133**
  `dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-VkCopyImageInfo2KHR-dstImageLayout-01395**
  `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`

- **VUID-VkCopyImageInfo2KHR-srcImage-01548**
  If the `VkFormat` of each of `srcImage` and `dstImage` is not a **multi-planar format**, the `VkFormat` of each of `srcImage` and `dstImage` **must** be compatible, as defined above

- **VUID-VkCopyImageInfo2KHR-None-01549**
  In a copy to or from a plane of a multi-planar image, the `VkFormat` of the image and plane **must** be compatible according to the description of compatible planes for the plane being copied

- **VUID-VkCopyImageInfo2KHR-srcImage-00136**
  The sample count of `srcImage` and `dstImage` **must** match

- **VUID-VkCopyImageInfo2KHR-srcSubresource-01696**
  The `srcSubresource.mipLevel` member of each element of `pRegions` **must** be less than the
mipLevels specified in VkImageCreateInfo when srcImage was created

- VUID-VkCopyImageInfo2KHR-dstSubresource-01697
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

- VUID-VkCopyImageInfo2KHR-srcSubresource-01698
  The srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

- VUID-VkCopyImageInfo2KHR-dstSubresource-01699
  The dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

- VUID-VkCopyImageInfo2KHR-srcOffset-01783
  The srcOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer's command pool's queue family, as described in VkQueueFamilyProperties

- VUID-VkCopyImageInfo2KHR-dstOffset-01784
  The dstOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer's command pool's queue family, as described in VkQueueFamilyProperties

- VUID-VkCopyImageInfo2KHR-dstImage-02542
dstImage and srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

- VUID-VkCopyImageInfo2KHR-srcImage-01551
  If neither srcImage nor dstImage has a multi-planar image format then for each element of pRegions, srcSubresource.aspectMask and dstSubresource.aspectMask must match

- VUID-VkCopyImageInfo2KHR-srcImage-01552
  If srcImage has a VkFormat with two planes then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT

- VUID-VkCopyImageInfo2KHR-srcImage-01553
  If srcImage has a VkFormat with three planes then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT

- VUID-VkCopyImageInfo2KHR-dstImage-01554
  If dstImage has a VkFormat with two planes then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT

- VUID-VkCopyImageInfo2KHR-dstImage-01555
  If dstImage has a VkFormat with three planes then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT

- VUID-VkCopyImageInfo2KHR-srcImage-01556
  If srcImage has a multi-planar image format and the dstImage does not have a multi-planar
image format, then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT

• VUID-VkCopyImageInfo2KHR-dstImage-01557
  If dstImage has a multi-planar image format and the srcImage does not have a multi-planar image format, then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT

• VUID-VkCopyImageInfo2KHR-srcImage-04443
  If srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer must be 0 and srcSubresource.layerCount must be 1

• VUID-VkCopyImageInfo2KHR-srcImage-01785
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.z must be 0 and extent.depth must be 1

• VUID-VkCopyImageInfo2KHR-dstImage-01788
  If dstImage is of type VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffset.z must be 0
must be 0

- VUID-VkCopyImageInfo2KHR-srcImage-01790
  If srcImage and dstImage are both of type VK_IMAGE_TYPE_2D, then for each element of pRegions, extent.depth must be 1

- VUID-VkCopyImageInfo2KHR-srcImage-01791
  If srcImage is of type VK_IMAGE_TYPE_2D, and dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, extent.depth must equal srcSubresource.layerCount

- VUID-VkCopyImageInfo2KHR-dstImage-01792
  If dstImage is of type VK_IMAGE_TYPE_2D, and srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, extent.depth must equal dstSubresource.layerCount

- VUID-VkCopyImageInfo2KHR-dstOffset-00150
  For each element of pRegions, dstOffset.x and (extent.width + dstOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage

- VUID-VkCopyImageInfo2KHR-dstOffset-00151
  For each element of pRegions, dstOffset.y and (extent.height + dstOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified dstSubresource of dstImage

- VUID-VkCopyImageInfo2KHR-dstImage-00152
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.y must be 0 and extent.height must be 1

- VUID-VkCopyImageInfo2KHR-dstOffset-00153
  For each element of pRegions, dstOffset.z and (extent.depth + dstOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage

- VUID-VkCopyImageInfo2KHR-srcImage-01727
  If srcImage is a blocked image, then for each element of pRegions, all members of srcOffset must be a multiple of the corresponding dimensions of the compressed texel block

- VUID-VkCopyImageInfo2KHR-srcImage-01728
  If srcImage is a blocked image, then for each element of pRegions, extent.width must be a multiple of the compressed texel block width or (extent.width + srcOffset.x) must equal the width of the specified srcSubresource of srcImage

- VUID-VkCopyImageInfo2KHR-srcImage-01729
  If srcImage is a blocked image, then for each element of pRegions, extent.height must be a multiple of the compressed texel block height or (extent.height + srcOffset.y) must equal the height of the specified srcSubresource of srcImage

- VUID-VkCopyImageInfo2KHR-srcImage-01730
  If srcImage is a blocked image, then for each element of pRegions, extent.depth must be a multiple of the compressed texel block depth or (extent.depth + srcOffset.z) must equal the depth of the specified srcSubresource of srcImage

- VUID-VkCopyImageInfo2KHR-dstImage-01731
  If dstImage is a blocked image, then for each element of pRegions, all members of dstOffset must be a multiple of the corresponding dimensions of the compressed texel block
If \texttt{dstImage} is a \textit{blocked image}, then for each element of \texttt{pRegions}, \texttt{extent.width} must be a multiple of the compressed texel block width or \((\texttt{extent.width + dstOffset.x})\) must equal the width of the specified \texttt{dstSubresource} of \texttt{dstImage}

If \texttt{dstImage} is a \textit{blocked image}, then for each element of \texttt{pRegions}, \texttt{extent.height} must be a multiple of the compressed texel block height or \((\texttt{extent.height + dstOffset.y})\) must equal the height of the specified \texttt{dstSubresource} of \texttt{dstImage}

If \texttt{dstImage} is a \textit{blocked image}, then for each element of \texttt{pRegions}, \texttt{extent.depth} must be a multiple of the compressed texel block depth or \((\texttt{extent.depth + dstOffset.z})\) must equal the depth of the specified \texttt{dstSubresource} of \texttt{dstImage}

### Valid Usage (Implicit)

- **sType** must be \texttt{VK_STRUCTURE_TYPE_COPY_IMAGE_INFO_2_KHR}
- **pNext** must be \texttt{NULL}
- \texttt{srcImage} must be a valid \texttt{VkImage} handle
- \texttt{srcImageLayout} must be a valid \texttt{VkImageLayout} value
- \texttt{dstImage} must be a valid \texttt{VkImage} handle
- \texttt{dstImageLayout} must be a valid \texttt{VkImageLayout} value
- \texttt{pRegions} must be a valid pointer to an array of \texttt{regionCount} valid \texttt{VkImageCopy2KHR} structures
- \texttt{regionCount} must be greater than \texttt{0}
- Both of \texttt{dstImage}, and \texttt{srcImage} must have been created, allocated, or retrieved from the same \texttt{VkDevice}

The \texttt{VkImageCopy2KHR} structure is defined as:
// Provided by VK_KHR_copy_commands2

typedef struct VkImageCopy2KHR {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageCopy2KHR;

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively.
- `srcOffset` and `dstOffset` select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the image to copy in width, height and depth.

Valid Usage

- VUID-VkImageCopy2KHR-extent-00140
  The number of slices of the `extent` (for 3D) or layers of the `srcSubresource` (for non-3D) **must** match the number of slices of the `extent` (for 3D) or layers of the `dstSubresource` (for non-3D)

Valid Usage (Implicit)

- VUID-VkImageCopy2KHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_COPY_2_KHR`

- VUID-VkImageCopy2KHR-pNext-pNext
  `pNext` **must** be NULL

- VUID-VkImageCopy2KHR-srcSubresource-parameter
  `srcSubresource` **must** be a valid `VkImageSubresourceLayers` structure

- VUID-VkImageCopy2KHR-dstSubresource-parameter
  `dstSubresource` **must** be a valid `VkImageSubresourceLayers` structure

20.4. Copying Data Between Buffers and Images

To copy data from a buffer object to an image object, call:
// Provided by VK_VERSION_1_0
void vkCmdCopyBufferToImage(
    VkCommandBuffer                             commandBuffer,
    VkBuffer                                    srcBuffer,
    VkImage                                     dstImage,
    VkImageLayout                               dstImageLayout,
    uint32_t                                    regionCount,
    const VkBufferImageCopy*                    pRegions);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **srcBuffer** is the source buffer.
- **dstImage** is the destination image.
- **dstImageLayout** is the layout of the destination image subresources for the copy.
- **regionCount** is the number of regions to copy.
- **pRegions** is a pointer to an array of **VkBufferImageCopy** structures specifying the regions to copy.

Each region in **pRegions** is copied from the specified region of the source buffer to the specified region of the destination image.

If the format of **dstImage** is a multi-planar image format, regions of each plane to be a target of a copy **must** be specified separately using the **pRegions** member of the **VkBufferImageCopy** structure. In this case, the **aspectMask** of **imageSubresource** **must** be **VK_IMAGE_ASPECT_PLANE_0_BIT**, **VK_IMAGE_ASPECT_PLANE_1_BIT**, or **VK_IMAGE_ASPECT_PLANE_2_BIT**. For the purposes of **vkCmdCopyBufferToImage**, each plane of a multi-planar image is treated as having the format listed in **Compatible formats of planes of multi-planar formats** for the plane identified by the **aspectMask** of the corresponding subresource. This applies both to **VkFormat** and to coordinates used in the copy, which correspond to texels in the **plane** rather than how these texels map to coordinates in the image as a whole.
Valid Usage

- VUID-vkCmdCopyBufferToImage-pRegions-00172
  The image region specified by each element of `pRegions` must be a region that is contained within `dstImage` if the `dstImage`'s `VkFormat` is not a multi-planar format, and must be a region that is contained within the plane being copied to if the `dstImage`'s `VkFormat` is a multi-planar format.

- VUID-vkCmdCopyBufferToImage-pRegions-00171
  `srcBuffer` must be large enough to contain all buffer locations that are accessed according to `Buffer and Image Addressing`, for each element of `pRegions`.

- VUID-vkCmdCopyBufferToImage-pRegions-00173
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory.

- VUID-vkCmdCopyBufferToImage-srcBuffer-00174
  `srcBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag.

- VUID-vkCmdCopyBufferToImage-dstImage-00177
  The `format features` of `dstImage` must contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.

- VUID-vkCmdCopyBufferToImage-dstImage-00176
  If `srcBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdCopyBufferToImage-dstImage-00177
  `dstImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag.

- VUID-vkCmdCopyBufferToImage-dstImage-00178
  If `dstImage` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdCopyBufferToImage-dstImage-00179
  `dstImage` must have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`.

- VUID-vkCmdCopyBufferToImage-dstImageLayout-00180
  `dstImageLayout` must specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

- VUID-vkCmdCopyBufferToImage-dstImageLayout-01396
  `dstImageLayout` must be `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`.

- VUID-vkCmdCopyBufferToImage-imageSubresource-01701
  The `imageSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created.

- VUID-vkCmdCopyBufferToImage-imageSubresource-01702
  The `imageSubresource.baseArrayLayer` + `imageSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

- VUID-vkCmdCopyBufferToImage-imageOffset-01793
  The `imageOffset` and `imageExtent` members of each element of `pRegions` must respect the...
image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`

- VUID-vkCmdCopyBufferToImage-dstImage-02543
  `dstImage` must not have been created with flags containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`

- VUID-vkCmdCopyBufferToImage-commandBuffer-04477
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT`, for each element of `pRegions`, the `aspectMask` member of `imageSubresource` must not be `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`.

- VUID-vkCmdCopyBufferToImage-imageOffset-00197
  For each element of `pRegions`, `imageOffset.x` and `(imageExtent.width + imageOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `imageSubresource` of `dstImage` where this refers to the width of the `plane` of the image involved in the copy in the case of a multi-planar format

- VUID-vkCmdCopyBufferToImage-imageOffset-00198
  For each element of `pRegions`, `imageOffset.y` and `(imageExtent.height + imageOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `imageSubresource` of `dstImage` where this refers to the height of the `plane` of the image involved in the copy in the case of a multi-planar format

- VUID-vkCmdCopyBufferToImage-bufferOffset-01558
  If `dstImage` does not have either a depth/stencil or a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the format's texel block size

- VUID-vkCmdCopyBufferToImage-bufferOffset-01559
  If `dstImage` has a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the element size of the compatible format for the format and the `aspectMask` of the `imageSubresource` as defined in Compatible formats of planes of multi-planar formats

- VUID-vkCmdCopyBufferToImage-srcImage-00199
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `imageOffset.y` must be 0 and `imageExtent.height` must be 1

- VUID-vkCmdCopyBufferToImage-imageOffset-00200
  For each element of `pRegions`, `imageOffset.z` and `(imageExtent.depth + imageOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `imageSubresource` of `dstImage`

- VUID-vkCmdCopyBufferToImage-srcImage-00201
  If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `imageOffset.z` must be 0 and `imageExtent.depth` must be 1

- VUID-vkCmdCopyBufferToImage-bufferRowLength-00203
  If `dstImage` is a blocked image, for each element of `pRegions`, `bufferRowLength` must be a multiple of the compressed texel block width

- VUID-vkCmdCopyBufferToImage-bufferImageHeight-00204
  If `dstImage` is a blocked image, for each element of `pRegions`, `bufferImageHeight` must be a
multiple of the compressed texel block height

- VUID-vkCmdCopyBufferToImage-imageOffset-00205
  If \textit{dstImage} is a \textit{blocked image}, for each element of \textit{pRegions}, all members of \textit{imageOffset} must be a multiple of the corresponding dimensions of the compressed texel block.

- VUID-vkCmdCopyBufferToImage-bufferOffset-00206
  If \textit{dstImage} is a \textit{blocked image}, for each element of \textit{pRegions}, \textit{bufferOffset} must be a multiple of the compressed texel block size in bytes.

- VUID-vkCmdCopyBufferToImage-imageExtent-00207
  If \textit{dstImage} is a \textit{blocked image}, for each element of \textit{pRegions}, \textit{imageExtent.width} must be a multiple of the compressed texel block width or \((\textit{imageExtent.width} + \textit{imageOffset.x})\) must equal the width of the specified \textit{imageSubresource} of \textit{dstImage}.

- VUID-vkCmdCopyBufferToImage-imageExtent-00208
  If \textit{dstImage} is a \textit{blocked image}, for each element of \textit{pRegions}, \textit{imageExtent.height} must be a multiple of the compressed texel block height or \((\textit{imageExtent.height} + \textit{imageOffset.y})\) must equal the height of the specified \textit{imageSubresource} of \textit{dstImage}.

- VUID-vkCmdCopyBufferToImage-imageExtent-00209
  If \textit{dstImage} is a \textit{blocked image}, for each element of \textit{pRegions}, \textit{imageExtent.depth} must be a multiple of the compressed texel block depth or \((\textit{imageExtent.depth} + \textit{imageOffset.z})\) must equal the depth of the specified \textit{imageSubresource} of \textit{dstImage}.

- VUID-vkCmdCopyBufferToImage-aspectMask-00211
  For each element of \textit{pRegions}, \textit{imageSubresource.aspectMask} must specify aspects present in \textit{dstImage}.

- VUID-vkCmdCopyBufferToImage-aspectMask-01560
  If \textit{dstImage} has a multi-planar format, then for each element of \textit{pRegions}, \textit{imageSubresource.aspectMask} must be \texttt{VK_IMAGE_ASPECT_PLANE_0_BIT}, \texttt{VK_IMAGE_ASPECT_PLANE_1_BIT}, or \texttt{VK_IMAGE_ASPECT_PLANE_2_BIT} (with \texttt{VK_IMAGE_ASPECT_PLANE_2_BIT} valid only for image formats with three planes).

- VUID-vkCmdCopyBufferToImage-baseArrayLayer-00213
  If \textit{dstImage} is of type \texttt{VK_IMAGE_TYPE_3D}, for each element of \textit{pRegions}, \textit{imageSubresource.baseArrayLayer} must be 0 and \textit{imageSubresource.layerCount} must be 1.

- VUID-vkCmdCopyBufferToImage-pRegions-04725
  If \textit{dstImage} is not a \textit{blocked image}, for each element of \textit{pRegions}, \textit{bufferRowLength} multiplied by the texel block size of \textit{dstImage} must be less than or equal to \(2^{31} - 1\).

- VUID-vkCmdCopyBufferToImage-pRegions-04726
  If \textit{dstImage} is a \textit{blocked image}, for each element of \textit{pRegions}, \textit{bufferRowLength} divided by the compressed texel block width and then multiplied by the texel block size of \textit{dstImage} must be less than or equal to \(2^{31} - 1\).

- VUID-vkCmdCopyBufferToImage-commandBuffer-04052
  If the queue family used to create the \texttt{VkCommandPool} which \textit{commandBuffer} was allocated from does not support \texttt{VK_QUEUE_GRAPHICS_BIT} or \texttt{VK_QUEUE_COMPUTE_BIT}, the \textit{bufferOffset} member of any element of \textit{pRegions} must be a multiple of 4.

- VUID-vkCmdCopyBufferToImage-srcImage-04053
  If \textit{dstImage} has a depth/stencil format, the \textit{bufferOffset} member of any element of
Valid Usage (Implicit)

- VUID-vkCmdCopyBufferToImage-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyBufferToImage-srcBuffer-parameter
  srcBuffer must be a valid VkBuffer handle

- VUID-vkCmdCopyBufferToImage-dstImage-parameter
  dstImage must be a valid VkImage handle

- VUID-vkCmdCopyBufferToImage-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

- VUID-vkCmdCopyBufferToImage-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkBufferImageCopy structures

- VUID-vkCmdCopyBufferToImage-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdCopyBufferToImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdCopyBufferToImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyBufferToImage-regionCount-arraylength
  regionCount must be greater than 0

- VUID-vkCmdCopyBufferToImage-commonparent
  Each of commandBuffer, dstImage, and srcBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To copy data from an image object to a buffer object, call:

```c
// Provided by VK_VERSION_1_0
do id vkCmdCopyImageToBuffer(
    VkCommandBuffer                             commandBuffer,
    VkImage                                     srcImage,
    VkImageLayout                               srcImageLayout,
    VkBuffer                                    dstBuffer,
    uint32_t                                    regionCount,
    const VkBufferImageCopy*                    pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the copy.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferImageCopy` structures specifying the regions to copy.

Each region in `pRegions` is copied from the specified region of the source image to the specified region of the destination buffer.

If the `VkFormat` of `srcImage` is a **multi-planar image format**, regions of each plane to be a source of a copy **must** be specified separately using the `pRegions` member of the `VkBufferImageCopy` structure. In this case, the `aspectMask` of `imageSubresource` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`. For the purposes of `vkCmdCopyBufferToImage`, each plane of a multi-planar image is treated as having the format listed in **Compatible formats of planes of multi-planar formats** for the plane identified by the `aspectMask` of the corresponding subresource. This applies both to `VkFormat` and to coordinates used in the copy, which correspond to texels in the `plane` rather than how these texels map to coordinates in the image as a whole.
Valid Usage

- VUID-vkCmdCopyImageToBuffer-pRegions-00182
  The image region specified by each element of \texttt{pRegions} must be a region that is contained within \texttt{srcImage} if the \texttt{srcImage}’s \texttt{VkFormat} is not a multi-planar format, and must be a region that is contained within the plane being copied if the \texttt{srcImage}’s \texttt{VkFormat} is a multi-planar format.

- VUID-vkCmdCopyImageToBuffer-pRegions-00183
  \texttt{dstBuffer} must be large enough to contain all buffer locations that are accessed according to \texttt{Buffer and Image Addressing}, for each element of \texttt{pRegions}.

- VUID-vkCmdCopyImageToBuffer-pRegions-00184
  The union of all source regions, and the union of all destination regions, specified by the elements of \texttt{pRegions}, must not overlap in memory.

- VUID-vkCmdCopyImageToBuffer-srcImage-00186
  \texttt{srcImage} must have been created with \texttt{VK_IMAGE_USAGE_TRANSFER_SRC_BIT} usage flag.

- VUID-vkCmdCopyImageToBuffer-srcImage-00187
  \texttt{srcImage} must have a sample count equal to \texttt{VK_SAMPLE_COUNT_1_BIT}.

- VUID-vkCmdCopyImageToBuffer-srcImage-00188
  \texttt{srcImage} must have been created with \texttt{VK_IMAGE_USAGE_TRANSFER_DST_BIT} usage flag.

- VUID-vkCmdCopyImageToBuffer-srcImage-00189
  \texttt{srcImageLayout} must specify the layout of the image subresources of \texttt{srcImage} specified in \texttt{pRegions} at the time this command is executed on a \texttt{VkDevice}.

- VUID-vkCmdCopyImageToBuffer-srcImageLayout-00189
  \texttt{srcImageLayout} must be \texttt{VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL}, \texttt{VK_IMAGE_LAYOUT_GENERAL}, or \texttt{VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR}.

- VUID-vkCmdCopyImageToBuffer-imageSubresource-01703
  The \texttt{imageSubresource.mipLevel} member of each element of \texttt{pRegions} must be less than the \texttt{mipLevels} specified in \texttt{VkImageCreateInfo} when \texttt{srcImage} was created.

- VUID-vkCmdCopyImageToBuffer-imageSubresource-01704
  The \texttt{imageSubresource.baseArrayLayer + imageSubresource.layerCount} of each element of \texttt{pRegions} must be less than or equal to the \texttt{arrayLayers} specified in \texttt{VkImageCreateInfo} when \texttt{srcImage} was created.

- VUID-vkCmdCopyImageToBuffer-imageOffset-01794
  The \texttt{imageOffset} and \texttt{imageExtent} members of each element of \texttt{pRegions} must respect the
image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

- VUID-vkCmdCopyImageToBuffer-srcImage-02544
  srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

- VUID-vkCmdCopyImageToBuffer-imageOffset-00197
  For each element of pRegions, imageOffset.x and (imageExtent.width + imageOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified imageSubresource of srcImage where this refers to the width of the plane of the image involved in the copy in the case of a multi-planar format

- VUID-vkCmdCopyImageToBuffer-imageOffset-00198
  For each element of pRegions, imageOffset.y and (imageExtent.height + imageOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified imageSubresource of srcImage where this refers to the height of the plane of the image involved in the copy in the case of a multi-planar format

- VUID-vkCmdCopyImageToBuffer-bufferOffset-01558
  If srcImage does not have either a depth/stencil or a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the format’s texel block size

- VUID-vkCmdCopyImageToBuffer-bufferOffset-01559
  If srcImage has a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the element size of the compatible format for the format and the aspectMask of the imageSubresource as defined in Compatible formats of planes of multi-planar formats

- VUID-vkCmdCopyImageToBuffer-srcImage-00199
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y must be 0 and imageExtent.height must be 1

- VUID-vkCmdCopyImageToBuffer-imageOffset-00200
  For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of srcImage

- VUID-vkCmdCopyImageToBuffer-srcImage-00201
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1

- VUID-vkCmdCopyImageToBuffer-bufferRowLength-00203
  If srcImage is a blocked image, for each element of pRegions, bufferRowLength must be a multiple of the compressed texel block width

- VUID-vkCmdCopyImageToBuffer-bufferImageHeight-00204
  If srcImage is a blocked image, for each element of pRegions, bufferImageHeight must be a multiple of the compressed texel block height

- VUID-vkCmdCopyImageToBuffer-imageOffset-00205
  If srcImage is a blocked image, for each element of pRegions, all members of imageOffset must be a multiple of the corresponding dimensions of the compressed texel block

- VUID-vkCmdCopyImageToBuffer-bufferOffset-00206
If `srcImage` is a **blocked image**, for each element of `pRegions, bufferOffset` must be a multiple of the compressed texel block size in bytes

- VUID-vkCmdCopyImageToBuffer-imageExtent-00207
  If `srcImage` is a **blocked image**, for each element of `pRegions, imageExtent.width` must be a multiple of the compressed texel block width or `(imageExtent.width + imageOffset.x)` must equal the width of the specified `imageSubresource of srcImage`

- VUID-vkCmdCopyImageToBuffer-imageExtent-00208
  If `srcImage` is a **blocked image**, for each element of `pRegions, imageExtent.height` must be a multiple of the compressed texel block height or `(imageExtent.height + imageOffset.y)` must equal the height of the specified `imageSubresource of srcImage`

- VUID-vkCmdCopyImageToBuffer-imageExtent-00209
  If `srcImage` is a **blocked image**, for each element of `pRegions, imageExtent.depth` must be a multiple of the compressed texel block depth or `(imageExtent.depth + imageOffset.z)` must equal the depth of the specified `imageSubresource of srcImage`

- VUID-vkCmdCopyImageToBuffer-aspectMask-00211
  For each element of `pRegions, imageSubresource.aspectMask` must specify aspects present in `srcImage`

- VUID-vkCmdCopyImageToBuffer-aspectMask-01560
  If `srcImage` has a multi-planar format, then for each element of `pRegions, imageSubresource.aspectMask` must be `VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT` (with `VK_IMAGE_ASPECT_PLANE_2_BIT` valid only for image formats with three planes)

- VUID-vkCmdCopyImageToBuffer-baseArrayLayer-00213
  If `srcImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions, imageSubresource.baseArrayLayer` must be 0 and `imageSubresource.layerCount` must be 1

- VUID-vkCmdCopyImageToBuffer-pRegions-04725
  If `srcImage` is not a **blocked image**, for each element of `pRegions, bufferRowLength` multiplied by the texel block size of `srcImage` must be less than or equal to `2^{31}-1`

- VUID-vkCmdCopyImageToBuffer-pRegions-04726
  If `srcImage` is a **blocked image**, for each element of `pRegions, bufferRowLength` divided by the compressed texel block width and then multiplied by the texel block size of `srcImage` must be less than or equal to `2^{31}-1`

- VUID-vkCmdCopyImageToBuffer-commandBuffer-04052
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4

- VUID-vkCmdCopyImageToBuffer-srcImage-04053
  If `srcImage` has a depth/stencil format, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4
Valid Usage (Implicit)

- VUID-vkCmdCopyImageToBuffer-commandBuffer-parameter
  `commandBuffer must be a valid VkCommandBuffer handle`

- VUID-vkCmdCopyImageToBuffer-srcImage-parameter
  `srcImage must be a valid VkImage handle`

- VUID-vkCmdCopyImageToBuffer-srcImageLayout-parameter
  `srcImageLayout must be a valid VkImageLayout value`

- VUID-vkCmdCopyImageToBuffer-dstBuffer-parameter
  `dstBuffer must be a valid VkBuffer handle`

- VUID-vkCmdCopyImageToBuffer-pRegions-parameter
  `pRegions must be a valid pointer to an array of regionCount valid VkBufferImageCopy structures`

- VUID-vkCmdCopyImageToBuffer-commandBuffer-recording
  `commandBuffer must be in the recording state`

- VUID-vkCmdCopyImageToBuffer-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer was allocated from must support transfer, graphics, or compute operations`

- VUID-vkCmdCopyImageToBuffer-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyImageToBuffer-regionCount-arraylength
  `regionCount must be greater than 0`

- VUID-vkCmdCopyImageToBuffer-commonparent
  Each of `commandBuffer, dstBuffer, and srcImage must have been created, allocated, or retrieved from the same VkDevice`

Host Synchronization

- Host access to `commandBuffer must be externally synchronized`
- Host access to the `VkCommandPool` that `commandBuffer was allocated from must be externally synchronized`

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Transfer</td>
<td>Transfer</td>

<tr>
<td>Secondary</td>
<td></td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>
For both `vkCmdCopyBufferToImage` and `vkCmdCopyImageToBuffer`, each element of `pRegions` is a structure defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferImageCopy {
    VkDeviceSize bufferOffset;
    uint32_t bufferRowLength;
    uint32_t bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkBufferImageCopy;
```

- `bufferOffset` is the offset in bytes from the start of the buffer object where the image data is copied from or to.
- `bufferRowLength` and `bufferImageHeight` specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the `imageExtent`.
- `imageSubresource` is a `VkImageSubresourceLayers` used to specify the specific image subresources of the image used for the source or destination image data.
- `imageOffset` selects the initial `x`, `y`, `z` offsets in texels of the sub-region of the source or destination image data.
- `imageExtent` is the size in texels of the image to copy in `width`, `height` and `depth`.

When copying to or from a depth or stencil aspect, the data in buffer memory uses a layout that is a (mostly) tightly packed representation of the depth or stencil data. Specifically:

- data copied to or from the stencil aspect of any depth/stencil format is tightly packed with one `VK_FORMAT_S8_UINT` value per texel.
- data copied to or from the depth aspect of a `VK_FORMAT_D16_UNORM` or `VK_FORMAT_D16_UNORM_S8_UINT` format is tightly packed with one `VK_FORMAT_D16_UNORM` value per texel.
- data copied to or from the depth aspect of a `VK_FORMAT_D32_SFLOAT` or `VK_FORMAT_D32_SFLOAT_S8_UINT` format is tightly packed with one `VK_FORMAT_D32_SFLOAT` value per texel.
- data copied to or from the depth aspect of a `VK_FORMAT_X8_D24_UNORM_PACK32` or `VK_FORMAT_D24_UNORM_S8_UINT` format is packed with one 32-bit word per texel with the D24 value in the LSBs of the word, and undefined values in the eight MSBs.

**Note**

To copy both the depth and stencil aspects of a depth/stencil format, two entries in `pRegions` can be used, where one specifies the depth aspect in `imageSubresource`, and the other specifies the stencil aspect.

Because depth or stencil aspect buffer to image copies may require format conversions on some...
implementations, they are not supported on queues that do not support graphics.

When copying to a depth aspect, and the `VK_EXT_depth_range_unrestricted` extension is not enabled, the data in buffer memory must be in the range $[0,1]$, or the resulting values are undefined.

Copies are done layer by layer starting with image layer `baseArrayLayer` member of `imageSubresource.layerCount` layers are copied from the source image or to the destination image.

For purpose of valid usage statements here and in related copy commands, a *blocked image* is defined as:

- an image with a *single-plane, “_422”* format, which is treated as a format with a $2 \times 1$ compressed texel block, or
- a compressed image.

### Valid Usage

- VUID-VkBufferImageCopy-bufferRowLength-00195
  
  `bufferRowLength` must be 0, or greater than or equal to the *width* member of `imageExtent`

- VUID-VkBufferImageCopy-bufferImageHeight-00196
  
  `bufferImageHeight` must be 0, or greater than or equal to the *height* member of `imageExtent`

- VUID-VkBufferImageCopy-aspectMask-00212
  
  The `aspectMask` member of `imageSubresource` must only have a single bit set

### Valid Usage (Implicit)

- VUID-VkBufferImageCopy-imageSubresource-parameter
  
  `imageSubresource` must be a valid `VkImageSubresourceLayers` structure

More extensible versions of the commands to copy between buffers and images are defined below.

To copy data from a buffer object to an image object, call:

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyBufferToImage2KHR(
    VkCommandBuffer                             commandBuffer,
    const VkCopyBufferToImageInfo2KHR*          pCopyBufferToImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyBufferToImageInfo` is a pointer to a `VkCopyBufferToImageInfo2KHR` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyBufferToImage`, but includes extensible substructures that include `sType` and `pNext` parameters, allowing them to be more easily extended.
Valid Usage

Valid Usage (Implicit)

- VUID-vkCmdCopyBufferToImage2KHR-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyBufferToImage2KHR-pCopyBufferToImageInfo-parameter
  `pCopyBufferToImageInfo` must be a valid pointer to a valid `VkCopyBufferToImageInfo2KHR` structure

- VUID-vkCmdCopyBufferToImage2KHR-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdCopyBufferToImage2KHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdCopyBufferToImage2KHR-renderpass
  This command must only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>

</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Outside</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkCopyBufferToImageInfo2KHR` structure is defined as:
typedef struct VkCopyBufferToImageInfo2KHR {
    VkStructureType                        sType;
    const void*                            pNext;
    VkBuffer                               srcBuffer;
    VkImage                                dstImage;
    VkImageLayout                          dstImageLayout;
    uint32_t                                regionCount;
    const VkBufferImageCopy2KHR*           pRegions;
} VkCopyBufferToImageInfo2KHR;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **srcBuffer** is the source buffer.
- **dstImage** is the destination image.
- **dstImageLayout** is the layout of the destination image subresources for the copy.
- **regionCount** is the number of regions to copy.
- **pRegions** is a pointer to an array of VkBufferImageCopy2KHR structures specifying the regions to copy.
Valid Usage

- VUID-VkCopyBufferToImageInfo2KHR-pRegions-04565
  If the image region specified by each element of `pRegions` does not contain `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, it must be a region that is contained within `dstImage` if the `dstImage`'s `VkFormat` is not a multi-planar format, and must be a region that is contained within the plane being copied to if the `dstImage`'s `VkFormat` is a multi-planar format.

- VUID-VkCopyBufferToImageInfo2KHR-pRegions-04554
  If the image region specified by each element of `pRegions` does contain `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, the rotated destination region as described in Buffer and Image Addressing with Rotation must be contained within `dstImage`.

- VUID-VkCopyBufferToImageInfo2KHR-pRegions-04555
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then the `dstImage` must not be a blocked image.

- VUID-VkCopyBufferToImageInfo2KHR-pRegions-04556
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then the `dstImage` must be of type `VK_IMAGE_TYPE_2D` and must not be a multi-planar format.

- VUID-VkCopyBufferToImageInfo2KHR-pRegions-00171
  `srcBuffer` must be large enough to contain all buffer locations that are accessed according to Buffer and Image Addressing, for each element of `pRegions`.

- VUID-VkCopyBufferToImageInfo2KHR-pRegions-00173
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory.

- VUID-VkCopyBufferToImageInfo2KHR-srcBuffer-00174
  `srcBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag.

- VUID-VkCopyBufferToImageInfo2KHR-dstImage-01997
  The `format features` of `dstImage` must contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.

- VUID-VkCopyBufferToImageInfo2KHR-dstImage-00177
  If `srcBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-VkCopyBufferToImageInfo2KHR-dstImageLayout-00180
  `dstImageLayout` must have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`.

- VUID-VkCopyBufferToImageInfo2KHR-dstImage-00178
  `dstImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag.

- VUID-VkCopyBufferToImageInfo2KHR-dstImage-00179
  `dstImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag.

- VUID-VkCopyBufferToImageInfo2KHR-dstImageLayout-00180
  `dstImageLayout` must specify the layout of the image subresources of `dstImage` specified in...
pRegions at the time this command is executed on a VkDevice

- VUID-VkCopyBufferToImageInfo2KHR-dstImageLayout-01396
dstImageLayout must be VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, VK_IMAGE_LAYOUT_GENERAL, or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR

- VUID-VkCopyBufferToImageInfo2KHR-imageSubresource-01701
The imageSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

- VUID-VkCopyBufferToImageInfo2KHR-imageSubresource-01702
The imageSubresource.baseArrayLayer + imageSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

- VUID-VkCopyBufferToImageInfo2KHR-imageOffset-01793
The imageOffset and imageExtent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

- VUID-VkCopyBufferToImageInfo2KHR-dstImage-02543
dstImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

- VUID-VkCopyBufferToImageInfo2KHR-commandBuffer-04477
If the queue family used to create the VkCommandPool which commandBuffer was allocated from does not support VK_QUEUE_GRAPHICS_BIT, for each element of pRegions, the aspectMask member of imageSubresource must not be VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT.

- VUID-VkCopyBufferToImageInfo2KHR-imageOffset-00197
For each element of pRegions not containing VkCopyCommandTransformInfoQCOM in its pNext chain, imageOffset.x and (imageExtent.width + imageOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified imageSubresource of dstImage where this refers to the width of the plane of the image involved in the copy in the case of a multi-planar format

- VUID-VkCopyBufferToImageInfo2KHR-imageOffset-00198
For each element of pRegions not containing VkCopyCommandTransformInfoQCOM in its pNext chain, imageOffset.y and (imageExtent.height + imageOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified imageSubresource of dstImage where this refers to the height of the plane of the image involved in the copy in the case of a multi-planar format

- VUID-VkCopyBufferToImageInfo2KHR-bufferOffset-01558
If dstImage does not have either a depth/stencil or a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the format’s texel block size

- VUID-VkCopyBufferToImageInfo2KHR-bufferOffset-01559
If dstImage has a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the element size of the compatible format for the format and the aspectMask of the imageSubresource as defined in Compatible formats of planes of multi-planar formats
If \( \text{dstImage} \) is of type \( \text{VK_IMAGE_TYPE_1D} \), then for each element of \( \text{pRegions} \), \( \text{imageOffset.y} \) must be 0 and \( \text{imageExtent.height} \) must be 1.

For each element of \( \text{pRegions} \), \( \text{imageOffset.z} \) and \( \text{imageExtent.depth} + \text{imageOffset.z} \) must both be greater than or equal to 0 and less than or equal to the depth of the specified \( \text{imageSubresource} \) of \( \text{dstImage} \).

If \( \text{dstImage} \) is of type \( \text{VK_IMAGE_TYPE_1D} \) or \( \text{VK_IMAGE_TYPE_2D} \), then for each element of \( \text{pRegions} \), \( \text{imageOffset.z} \) must be 0 and \( \text{imageExtent.depth} \) must be 1.

If \( \text{dstImage} \) is a blocked image, for each element of \( \text{pRegions} \), \( \text{bufferRowLength} \) must be a multiple of the compressed texel block width.

If \( \text{dstImage} \) is a blocked image, for each element of \( \text{pRegions} \), \( \text{bufferImageHeight} \) must be a multiple of the compressed texel block height.

If \( \text{dstImage} \) is a blocked image, for each element of \( \text{pRegions} \), all members of \( \text{imageOffset} \) must be a multiple of the corresponding dimensions of the compressed texel block.

If \( \text{dstImage} \) is a blocked image, for each element of \( \text{pRegions} \), \( \text{bufferOffset} \) must be a multiple of the compressed texel block size in bytes.

If \( \text{dstImage} \) is a blocked image, for each element of \( \text{pRegions} \), \( \text{imageExtent.width} \) must be a multiple of the compressed texel block width or \( \text{imageExtent.width} + \text{imageOffset.x} \) must equal the width of the specified \( \text{imageSubresource} \) of \( \text{dstImage} \).

If \( \text{dstImage} \) is a blocked image, for each element of \( \text{pRegions} \), \( \text{imageExtent.height} \) must be a multiple of the compressed texel block height or \( \text{imageExtent.height} + \text{imageOffset.y} \) must equal the height of the specified \( \text{imageSubresource} \) of \( \text{dstImage} \).

If \( \text{dstImage} \) is a blocked image, for each element of \( \text{pRegions} \), \( \text{imageExtent.depth} \) must be a multiple of the compressed texel block depth or \( \text{imageExtent.depth} + \text{imageOffset.z} \) must equal the depth of the specified \( \text{imageSubresource} \) of \( \text{dstImage} \).

For each element of \( \text{pRegions} \), \( \text{imageSubresource.aspectMask} \) must specify aspects present in \( \text{dstImage} \).

If \( \text{dstImage} \) has a multi-planar format, then for each element of \( \text{pRegions} \), \( \text{imageSubresource.aspectMask} \) must be \( \text{VK_IMAGE_ASPECT_PLANE_0_BIT} \), \( \text{VK_IMAGE_ASPECT_PLANE_1_BIT} \), or \( \text{VK_IMAGE_ASPECT_PLANE_2_BIT} \) (with \( \text{VK_IMAGE_ASPECT_PLANE_2_BIT} \) valid only for image formats with three planes).
If \( \text{dstImage} \) is of type \( \text{VK_IMAGE_TYPE_3D} \), for each element of \( \text{pRegions} \), \( \text{imageSubresource.baseArrayLayer} \) must be 0 and \( \text{imageSubresource.layerCount} \) must be 1.

- VUID-VkCopyBufferToImageInfo2KHR-pRegions-04725
  If \( \text{dstImage} \) is not a blocked image, for each element of \( \text{pRegions} \), \( \text{bufferRowLength} \) multiplied by the texel block size of \( \text{dstImage} \) must be less than or equal to \( 2^{31} - 1 \).

- VUID-VkCopyBufferToImageInfo2KHR-pRegions-04726
  If \( \text{dstImage} \) is a blocked image, for each element of \( \text{pRegions} \), \( \text{bufferRowLength} \) divided by the compressed texel block width and then multiplied by the texel block size of \( \text{dstImage} \) must be less than or equal to \( 2^{31} - 1 \).

- VUID-VkCopyBufferToImageInfo2KHR-commandBuffer-04052
  If the queue family used to create the \( \text{VkCommandPool} \) which \( \text{commandBuffer} \) was allocated from does not support \( \text{VK_QUEUE_GRAPHICS_BIT} \) or \( \text{VK_QUEUE_COMPUTE_BIT} \), the \( \text{bufferOffset} \) member of any element of \( \text{pRegions} \) must be a multiple of 4.

- VUID-VkCopyBufferToImageInfo2KHR-srcImage-04053
  If \( \text{dstImage} \) has a depth/stencil format, the \( \text{bufferOffset} \) member of any element of \( \text{pRegions} \) must be a multiple of 4.

**Valid Usage (Implicit)**

- VUID-VkCopyBufferToImageInfo2KHR-sType-sType
  \( \text{sType} \) must be \( \text{VK_STRUCTURE_TYPE_COPY_BUFFER_TO_IMAGE_INFO_2_KHR} \)

- VUID-VkCopyBufferToImageInfo2KHR-pNext-pNext
  \( \text{pNext} \) must be \( \text{NULL} \)

- VUID-VkCopyBufferToImageInfo2KHR-srcBuffer-parameter
  \( \text{srcBuffer} \) must be a valid \( \text{VkBuffer} \) handle

- VUID-VkCopyBufferToImageInfo2KHR-dstImage-parameter
  \( \text{dstImage} \) must be a valid \( \text{VkImage} \) handle

- VUID-VkCopyBufferToImageInfo2KHR-dstImageLayout-parameter
  \( \text{dstImageLayout} \) must be a valid \( \text{VkImageLayout} \) value

- VUID-VkCopyBufferToImageInfo2KHR-pRegions-parameter
  \( \text{pRegions} \) must be a valid pointer to an array of \( \text{regionCount} \) valid \( \text{VkBufferImageCopy2KHR} \) structures

- VUID-VkCopyBufferToImageInfo2KHR-regionCount-arraylength
  \( \text{regionCount} \) must be greater than 0

- VUID-VkCopyBufferToImageInfo2KHR-commonparent
  Both of \( \text{dstImage} \), and \( \text{srcBuffer} \) must have been created, allocated, or retrieved from the same \( \text{VkDevice} \)

To copy data from an image object to a buffer object, call:
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImageToBuffer2KHR(
    VkCommandBuffer                             commandBuffer,
    const VkCopyImageToBufferInfo2KHR*          pCopyImageToBufferInfo);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyImageToBufferInfo` is a pointer to a `VkCopyImageToBufferInfo2KHR` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyImageToBuffer`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

**Valid Usage (Implicit)**

- VUID-vkCmdCopyImageToBuffer2KHR-commandBuffer-parameter
  - `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdCopyImageToBuffer2KHR-pCopyImageToBufferInfo-parameter
  - `pCopyImageToBufferInfo` must be a valid pointer to a valid `VkCopyImageToBufferInfo2KHR` structure
- VUID-vkCmdCopyImageToBuffer2KHR-commandBuffer-recording
  - `commandBuffer` must be in the recording state
- VUID-vkCmdCopyImageToBuffer2KHR-commandBuffer-cmdpool
  - The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations
- VUID-vkCmdCopyImageToBuffer2KHR-renderpass
  - This command must only be called outside of a render pass instance

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
The **VkCopyImageToBufferInfo2KHR** structure is defined as:

```c
// Provided by VK_KHR_copy_commands2
typedef struct VkCopyImageToBufferInfo2KHR {
    VkStructureType                 sType;
    const void*                     pNext;
    VkImage                         srcImage;
    VkImageLayout                   srcImageLayout;
    VkBuffer                        dstBuffer;
    uint32_t                        regionCount;
    const VkBufferImageCopy2KHR*    pRegions;
} VkCopyImageToBufferInfo2KHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the copy.
- **dstBuffer** is the destination buffer.
- **regionCount** is the number of regions to copy.
- **pRegions** is a pointer to an array of **VkBufferImageCopy2KHR** structures specifying the regions to copy.
Valid Usage

- VUID-VkCopyImageToBufferInfo2KHR-pRegions-04566
  If the image region specified by each element of `pRegions` does not contain `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, it must be a region that is contained within `srcImage` if the `srcImage`'s `VkFormat` is not a multi-planar format, and must be a region that is contained within the plane being copied if the `srcImage`'s `VkFormat` is a multi-planar format.

- VUID-VkCopyImageToBufferInfo2KHR-pRegions-04557
  If the image region specified by each element of `pRegions` does contain `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, the rotated source region as described in Buffer and Image Addressing with Rotation must be contained within `srcImage`.

- VUID-VkCopyImageToBufferInfo2KHR-pRegions-04558
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then the `srcImage` must not be a blocked image.

- VUID-VkCopyImageToBufferInfo2KHR-pRegions-04559
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then the `srcImage` must be of type `VK_IMAGE_TYPE_2D`, and must not be a multi-planar format.

- VUID-VkCopyImageToBufferInfo2KHR-pRegions-00183
  `dstBuffer` must be large enough to contain all buffer locations that are accessed according to Buffer and Image Addressing, for each element of `pRegions`.

- VUID-VkCopyImageToBufferInfo2KHR-pRegions-00184
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory.

- VUID-VkCopyImageToBufferInfo2KHR-srcImage-00186
  `srcImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag.

- VUID-VkCopyImageToBufferInfo2KHR-srcImage-01998
  The format features of `srcImage` must contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`.

- VUID-VkCopyImageToBufferInfo2KHR-srcImage-00187
  If `srcImage` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-VkCopyImageToBufferInfo2KHR-dstBuffer-00191
  `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag.

- VUID-VkCopyImageToBufferInfo2KHR-dstBuffer-00192
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-VkCopyImageToBufferInfo2KHR-srcImage-00188
  `srcImage` must have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`.

- VUID-VkCopyImageToBufferInfo2KHR-srcImageLayout-00189
  `srcImageLayout` must specify the layout of the image subresources of `srcImage` specified in.
**pRegions** at the time this command is executed on a **VkDevice**

- **VUID-VkCopyImageToBufferInfo2KHR-srcImageLayout-01397**
  
  *srcImageLayout must be* **VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL**, **VK_IMAGE_LAYOUT_GENERAL**, or **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**

- **VUID-VkCopyImageToBufferInfo2KHR-imageSubresource-01703**
  
  The **imageSubresource.mipLevel** member of each element of **pRegions** must be less than the **mipLevels** specified in **VkImageCreateInfo** when **srcImage** was created

- **VUID-VkCopyImageToBufferInfo2KHR-imageSubresource-01704**
  
  The **imageSubresource.baseArrayLayer + imageSubresource.layerCount** of each element of **pRegions** must be less than or equal to the **arrayLayers** specified in **VkImageCreateInfo** when **srcImage** was created

- **VUID-VkCopyImageToBufferInfo2KHR-imageOffset-01794**
  
  The **imageOffset** and **imageExtent** members of each element of **pRegions** must respect the image transfer granularity requirements of **commandBuffer**’s command pool’s queue family, as described in **VkQueueFamilyProperties**

- **VUID-VkCopyImageToBufferInfo2KHR-srcImage-02544**
  
  **srcImage** must not have been created with flags containing **VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT**

- **VUID-VkCopyImageToBufferInfo2KHR-imageOffset-00197**
  
  For each element of **pRegions** not containing **VkCopyCommandTransformInfoQCOM** in its **pNext** chain, **imageOffset.x** and (**imageExtent.width + imageOffset.x**) must both be greater than or equal to 0 and less than or equal to the width of the specified **imageSubresource** of **srcImage** where this refers to the width of the **plane** of the image involved in the copy in the case of a **multi-planar format**

- **VUID-VkCopyImageToBufferInfo2KHR-imageOffset-00198**
  
  For each element of **pRegions** not containing **VkCopyCommandTransformInfoQCOM** in its **pNext** chain, **imageOffset.y** and (**imageExtent.height + imageOffset.y**) must both be greater than or equal to 0 and less than or equal to the height of the specified **imageSubresource** of **srcImage** where this refers to the height of the **plane** of the image involved in the copy in the case of a **multi-planar format**

- **VUID-VkCopyImageToBufferInfo2KHR-bufferOffset-01558**
  
  If **srcImage** does not have either a depth/stencil or a **multi-planar format**, then for each element of **pRegions**, **bufferOffset** must be a multiple of the format’s texel block size

- **VUID-VkCopyImageToBufferInfo2KHR-bufferOffset-01559**
  
  If **srcImage** has a **multi-planar format**, then for each element of **pRegions**, **bufferOffset** must be a multiple of the element size of the compatible format for the format and the **aspectMask** of the **imageSubresource** as defined in **Compatible formats of planes of multi-planar formats**

- **VUID-VkCopyImageToBufferInfo2KHR-srcImage-00199**
  
  If **srcImage** is of type **VK_IMAGE_TYPE_1D**, then for each element of **pRegions**, **imageOffset.y** must be 0 and **imageExtent.height** must be 1

- **VUID-VkCopyImageToBufferInfo2KHR-imageOffset-00200**
  
  For each element of **pRegions**, **imageOffset.z** and (**imageExtent.depth + imageOffset.z**) must
both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of srcImage

- VUID-VkCopyImageToBufferInfo2KHR-srcImage-00201
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1

- VUID-VkCopyImageToBufferInfo2KHR-bufferRowLength-00203
  If srcImage is a blocked image, for each element of pRegions, bufferRowLength must be a multiple of the compressed texel block width

- VUID-VkCopyImageToBufferInfo2KHR-bufferImageHeight-00204
  If srcImage is a blocked image, for each element of pRegions, bufferImageHeight must be a multiple of the compressed texel block height

- VUID-VkCopyImageToBufferInfo2KHR-imageOffset-00205
  If srcImage is a blocked image, for each element of pRegions, all members of imageOffset must be a multiple of the corresponding dimensions of the compressed texel block

- VUID-VkCopyImageToBufferInfo2KHR-bufferOffset-00206
  If srcImage is a blocked image, for each element of pRegions, bufferOffset must be a multiple of the compressed texel block size in bytes

- VUID-VkCopyImageToBufferInfo2KHR-imageExtent-00207
  If srcImage is a blocked image, for each element of pRegions, imageExtent.width must be a multiple of the compressed texel block width or (imageExtent.width + imageOffset.x) must equal the width of the specified imageSubresource of srcImage

- VUID-VkCopyImageToBufferInfo2KHR-imageExtent-00208
  If srcImage is a blocked image, for each element of pRegions, imageExtent.height must be a multiple of the compressed texel block height or (imageExtent.height + imageOffset.y) must equal the height of the specified imageSubresource of srcImage

- VUID-VkCopyImageToBufferInfo2KHR-imageExtent-00209
  If srcImage is a blocked image, for each element of pRegions, imageExtent.depth must be a multiple of the compressed texel block depth or (imageExtent.depth + imageOffset.z) must equal the depth of the specified imageSubresource of srcImage

- VUID-VkCopyImageToBufferInfo2KHR-aspectMask-00211
  For each element of pRegions, imageSubresource.aspectMask must specify aspects present in srcImage

- VUID-VkCopyImageToBufferInfo2KHR-aspectMask-01560
  If srcImage has a multi-planar format, then for each element of pRegions, imageSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT (with VK_IMAGE_ASPECT_PLANE_2_BIT valid only for image formats with three planes)

- VUID-VkCopyImageToBufferInfo2KHR-baseArrayLayer-00213
  If srcImage is of type VK_IMAGE_TYPE_3D, for each element of pRegions, imageSubresource.baseArrayLayer must be 0 and imageSubresource.layerCount must be 1

- VUID-VkCopyImageToBufferInfo2KHR-pRegions-04725
  If srcImage is not a blocked image, for each element of pRegions, bufferRowLength multiplied by the texel block size of srcImage must be less than or equal to \(2^{31}-1\)
If `srcImage` is a blocked image, for each element of `pRegions`, `bufferRowLength` divided by the compressed texel block width and then multiplied by the texel block size of `srcImage` must be less than or equal to $2^{31}-1$.

If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4.

If `srcImage` has a depth/stencil format, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4.

---

**Valid Usage (Implicit)**

- `sType` must be `VK_STRUCTURE_TYPE_COPY_IMAGE_TO_BUFFER_INFO_2_KHR`
- `pNext` must be `NULL`
- `srcImage` must be a valid `VkImage` handle
- `srcImageLayout` must be a valid `VkImageLayout` value
- `dstBuffer` must be a valid `VkBuffer` handle
- `pRegions` must be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy2KHR` structures
- `regionCount` must be greater than 0
- Both of `dstBuffer`, and `srcImage` must have been created, allocated, or retrieved from the same `VkDevice`

For both `vkCmdCopyBufferToImage2KHR` and `vkCmdCopyImageToBuffer2KHR`, each element of `pRegions` is a structure defined as:
Provided by VK_KHR_copy_commands2

```c
typedef struct VkBufferImageCopy2KHR {
    VkStructureType             sType;
    const void*                 pNext;
    VkDeviceSize                bufferOffset;
    uint32_t                    bufferRowLength;
    uint32_t                    bufferImageHeight;
    VkImageSubresourceLayers    imageSubresource;
    VkOffset3D                  imageOffset;
    VkExtent3D                  imageExtent;
} VkBufferImageCopy2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `bufferOffset` is the offset in bytes from the start of the buffer object where the image data is copied from or to.
- `bufferRowLength` and `bufferImageHeight` specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the `imageExtent`.
- `imageSubresource` is a `VkImageSubresourceLayers` used to specify the specific image subresources of the image used for the source or destination image data.
- `imageOffset` selects the initial `x`, `y`, `z` offsets in texels of the sub-region of the source or destination image data.
- `imageExtent` is the size in texels of the image to copy in `width`, `height` and `depth`.

This structure is functionally identical to `VkBufferImageCopy`, but adds `sType` and `pNext` parameters, allowing it to be more easily extended.

### Valid Usage

- VUID-VkBufferImageCopy2KHR-bufferRowLength-00195
  `bufferRowLength` must be `0`, or greater than or equal to the `width` member of `imageExtent`

- VUID-VkBufferImageCopy2KHR-bufferImageHeight-00196
  `bufferImageHeight` must be `0`, or greater than or equal to the `height` member of `imageExtent`

- VUID-VkBufferImageCopy2KHR-aspectMask-00212
  The `aspectMask` member of `imageSubresource` must only have a single bit set
Valid Usage (Implicit)

- VUID-VkBufferImageCopy2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_IMAGE_COPY_2_KHR

- VUID-VkBufferImageCopy2KHR-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkCopyCommandTransformInfoQCOM

- VUID-VkBufferImageCopy2KHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkBufferImageCopy2KHR-imageSubresource-parameter
  imageSubresource must be a valid VkImageSubresourceLayers structure

For both vkCmdCopyBufferToImage2KHR and vkCmdCopyImageToBuffer2KHR, each region copied can include a rotation. To specify a region with rotation, add the VkCopyCommandTransformInfoQCOM to the pNext chain of VkBufferImageCopy2KHR. When a rotation is specified, Buffer and Image Addressing with Rotation specifies how coordinates oftexels in the source region are rotated by transform to produce texel coordinates in the destination region. When rotation is specified, the source or destination image must be a 2D image and must not be blocked image or multi-planar format.

The VkRenderPassTransformBeginInfoQCOM structure is defined as:

```c
// Provided by VK_QCOM_rotated_copy_commands
typedef struct VkCopyCommandTransformInfoQCOM {
    VkStructureType          sType;
    const void*              pNext;
    VkSurfaceTransformFlagBitsKHR transform;
} VkCopyCommandTransformInfoQCOM;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- transform is a VkSurfaceTransformFlagBitsKHR value describing the transform to be applied.

Valid Usage

- VUID-VkCopyCommandTransformInfoQCOM-transform-04560
  transform must be VK_SURFACE_TRANSFORM.IDENTITY_BIT_KHR,
  VK_SURFACE_TRANSFORM.ROTATE_90_BIT_KHR,
  VK_SURFACE_TRANSFORM.ROTATE_180_BIT_KHR,
  or
  VK_SURFACE_TRANSFORM.ROTATE_270_BIT_KHR
20.4.1. Buffer and Image Addressing

Pseudocode for image/buffer addressing of uncompressed formats is:

```c
rowLength = region->bufferRowLength;
if (rowLength == 0)
    rowLength = region->imageExtent.width;

imageHeight = region->bufferImageHeight;
if (imageHeight == 0)
    imageHeight = region->imageExtent.height;

texelBlockSize = <texel block size of the format of the src/dstImage>;

address of (x,y,z) = region->bufferOffset + (((z * imageHeight) + y) * rowLength + x)
* texelBlockSize;

where x,y,z range from (0,0,0) to region->imageExtent.{width,height,depth}.
```

Note that imageOffset does not affect addressing calculations for buffer memory. Instead, bufferOffset can be used to select the starting address in buffer memory.

For block-compressed formats, all parameters are still specified in texels rather than compressed texel blocks, but the addressing math operates on whole compressed texel blocks. Pseudocode for compressed copy addressing is:
rowLength = region->bufferRowLength;
if (rowLength == 0)
    rowLength = region->imageExtent.width;

imageHeight = region->bufferImageHeight;
if (imageHeight == 0)
    imageHeight = region->imageExtent.height;

compressedTexelBlockSizeInBytes = <compressed texel block size taken from the src/dstImage>;
rowLength = (rowLength + compressedTexelBlockWidth - 1) / compressedTexelBlockWidth;
imageHeight = (imageHeight + compressedTexelBlockHeight - 1) / compressedTexelBlockHeight;

address of (x,y,z) = region->bufferOffset + (((z * imageHeight) + y) * rowLength + x) * compressedTexelBlockSizeInBytes;

where x,y,z range from (0,0,0) to region->imageExtent.{width/height/depth/compressedTexelBlockWidth/height/depth/compressedTexelBlockDepth}.

Copying to or from block-compressed images is typically done in multiples of the compressed texel block size. For this reason the imageExtent must be a multiple of the compressed texel block dimension. There is one exception to this rule which is required to handle compressed images created with dimensions that are not a multiple of the compressed texel block dimensions:

- If imageExtent.width is not a multiple of the compressed texel block width, then (imageExtent.width + imageOffset.x) must equal the image subresource width.
- If imageExtent.height is not a multiple of the compressed texel block height, then (imageExtent.height + imageOffset.y) must equal the image subresource height.
- If imageExtent.depth is not a multiple of the compressed texel block depth, then (imageExtent.depth + imageOffset.z) must equal the image subresource depth.

This allows the last compressed texel block of the image in each non-multiple dimension to be included as a source or destination of the copy.

20.4.2. Buffer and Image Addressing with Rotation

When VkCopyCommandTransformInfoQCOM is in the pNext chain of VkBufferImageCopy2KHR, a rotated copy is specified. For both vkCmdCopyImageToBuffer2KHR and vkCmdCopyBufferToImage2KHR, a rotation is applied to the region used for image accesses, but a non-rotated region is used for buffer accesses. In the case of rotated vkCmdCopyImageToBuffer2KHR, the source image region is rotated. In the case of rotated vkCmdCopyBufferToImage2KHR, the destination image region is rotated.

For a rotated copy, The following description of rotated addressing replaces the description in Buffer and Image Addressing.
The following code computes rotation of unnormalized coordinates.

```c
// Forward rotation of unnormalized coordinates
VkOffset2D RotateUV(VkOffset2D in, VkSurfaceTransformFlagBitsKHR flags)
{
    VkOffset2D output;
    switch (flags)
    {
        case VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR:
            out.x = in.x;
            out.y = in.y;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR:
            out.x = -in.y;
            out.y = in.x;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR:
            out.x = -in.x;
            out.y = -in.y;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR:
            out.x = in.y;
            out.y = -in.x;
            break;
    }
    return out;
}
```

Pseudocode for image/buffer addressing of uncompressed formats with rotation is:
rowLength = region->bufferRowLength;
if (rowLength == 0)
    rowLength = region->imageExtent.width;

imageHeight = region->bufferImageHeight;
if (imageHeight == 0)
    imageHeight = region->imageExtent.height;

texelBlockSize = <texel block size of the format of the src/dstImage>;

// Buffer addressing is unaffected by rotation:
address of (x,y,z) = region->bufferOffset + (((z * imageHeight) + y) * rowLength + x) * texelBlockSize;

// When copying from buffer to image, the source buffer coordinates x,y,z range from (0,0,0) to
// region->imageExtent.{width,height,depth}. The source extent is rotated by the specified
// VK_SURFACE_TRANSFORM, centered on the imageOffset, to define a rotated destination region.
// For each source buffer texel with coordinates (x,y) the rotated destination image texel has
// coordinates (x',y') defined as:
// (x',y') = RotateUV(x,y) + ImageOffset.{x,y}

// When copying from image to buffer, the destination buffer coordinates x,y,z range from (0,0,0) to
// region->imageExtent.{width,height,depth}. The destination extent is rotated by the specified
// VK_SURFACE_TRANSFORM, centered on the imageOffset, to define a rotated source region. For each destination
// buffer texel with coordinates (x,y) the rotated source image texel has coordinates
// (x',y') defined as:
// (x',y') = RotateUV(x,y) + ImageOffset.{x,y}

Note that imageOffset does not affect addressing calculations for buffer memory. Instead, bufferOffset can be used to select the starting address in buffer memory.

## 20.5. Image Copies with Scaling

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:
// Provided by VK_VERSION_1_0

```c
void vkCmdBlitImage(
    VkCommandBuffer                             commandBuffer,
    VkImage                                     srcImage,
    VkImageLayout                               srcImageLayout,
    VkImage                                     dstImage,
    VkImageLayout                               dstImageLayout,
    uint32_t                                    regionCount,
    const VkImageBlit*                          pRegions,
    VkFilter                                    filter);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the blit.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the blit.
- `regionCount` is the number of regions to blit.
- `pRegions` is a pointer to an array of `VkImageBlit` structures specifying the regions to blit.
- `filter` is a `VkFilter` specifying the filter to apply if the blits require scaling.

`vkCmdBlitImage` must not be used for multisampled source or destination images. Use `vkCmdResolveImage` for this purpose.

As the sizes of the source and destination extents can differ in any dimension, texels in the source extent are scaled and filtered to the destination extent. Scaling occurs via the following operations:

- For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in unnormalized to integer conversion:

  \[
  u_{\text{base}} = i + \frac{1}{2} \\
  v_{\text{base}} = j + \frac{1}{2} \\
  w_{\text{base}} = k + \frac{1}{2}
  \]

- These base coordinates are then offset by the first destination offset:

  \[
  u_{\text{offset}} = u_{\text{base}} - x_{\text{dst0}} \\
  v_{\text{offset}} = v_{\text{base}} - y_{\text{dst0}}
  \]
\[ w_{\text{offset}} = w_{\text{base}} - z_{\text{dst0}} \]

\[ a_{\text{offset}} = a - \text{baseArrayCount}_{\text{dst}} \]

- The scale is determined from the source and destination regions, and applied to the offset coordinates:

\[ \text{scale}_u = \frac{x_{\text{src1}} - x_{\text{src0}}}{x_{\text{dst1}} - x_{\text{dst0}}} \]

\[ \text{scale}_v = \frac{y_{\text{src1}} - y_{\text{src0}}}{y_{\text{dst1}} - y_{\text{dst0}}} \]

\[ \text{scale}_w = \frac{z_{\text{src1}} - z_{\text{src0}}}{z_{\text{dst1}} - z_{\text{dst0}}} \]

\[ u_{\text{scaled}} = u_{\text{offset}} \times \text{scale}_u \]

\[ v_{\text{scaled}} = v_{\text{offset}} \times \text{scale}_v \]

\[ w_{\text{scaled}} = w_{\text{offset}} \times \text{scale}_w \]

- Finally the source offset is added to the scaled coordinates, to determine the final unnormalized coordinates used to sample from \textit{srcImage}:

\[ u = u_{\text{scaled}} + x_{\text{src0}} \]

\[ v = v_{\text{scaled}} + y_{\text{src0}} \]

\[ w = w_{\text{scaled}} + z_{\text{src0}} \]

\[ q = \text{mipLevel} \]

\[ a = a_{\text{offset}} + \text{baseArrayCount}_{\text{src}} \]

These coordinates are used to sample from the source image, as described in Image Operations chapter, with the filter mode equal to that of \textit{filter}, a mipmap mode of \texttt{VK_SAMPLER_MIPMAP_MODE_NEAREST} and an address mode of \texttt{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE}.
Implementations **must** clamp at the edge of the source image, and **may** additionally clamp to the edge of the source region.

**Note**
Due to allowable rounding errors in the generation of the source texture coordinates, it is not always possible to guarantee exactly which source texels will be sampled for a given blit. As rounding errors are implementation dependent, the exact results of a blitting operation are also implementation dependent.

Blits are done layer by layer starting with the `baseArrayLayer` member of `srcSubresource` for the source and `dstSubresource` for the destination. `layerCount` layers are blitted to the destination image.

When blitting 3D textures, slices in the destination region bounded by `dstOffsets[0].z` and `dstOffsets[1].z` are sampled from slices in the source region bounded by `srcOffsets[0].z` and `srcOffsets[1].z`. If the `filter` parameter is `VK_FILTER_LINEAR` then the value sampled from the source image is taken by doing linear filtering using the interpolated `z` coordinate represented by `w` in the previous equations. If the `filter` parameter is `VK_FILTER_NEAREST` then the value sampled from the source image is taken from the single nearest slice, with an implementation-dependent arithmetic rounding mode.

The following filtering and conversion rules apply:

- Integer formats **can** only be converted to other integer formats with the same signedness.
- No format conversion is supported between depth/stencil images. The formats **must** match.
- Format conversions on unorm, snorm, unscaled and packed float formats of the copied aspect of the image are performed by first converting the pixels to float values.
- For sRGB source formats, nonlinear RGB values are converted to linear representation prior to filtering.
- After filtering, the float values are first clamped and then cast to the destination image format. In case of sRGB destination format, linear RGB values are converted to nonlinear representation before writing the pixel to the image.

Signed and unsigned integers are converted by first clamping to the representable range of the destination format, then casting the value.
Valid Usage

- VUID-vkCmdBlitImage-pRegions-00215
  The source region specified by each element of pRegions must be a region that is contained within srcImage

- VUID-vkCmdBlitImage-pRegions-00216
  The destination region specified by each element of pRegions must be a region that is contained within dstImage

- VUID-vkCmdBlitImage-pRegions-00217
  The union of all destination regions, specified by the elements of pRegions, must not overlap in memory with any texel that may be sampled during the blit operation

- VUID-vkCmdBlitImage-srcImage-01999
  The format features of srcImage must contain VK_FORMAT_FEATURE_BLIT_SRC_BIT

- VUID-vkCmdBlitImage-srcImage-01561
  srcImage must not use a format listed in Formats requiring sampler Y'CbCr conversion for VK_IMAGE_ASPECT_COLOR_BIT image views

- VUID-vkCmdBlitImage-srcImage-00219
  srcImage must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag

- VUID-vkCmdBlitImage-srcImage-00220
  If srcImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBlitImage-srcImageLayout-00221
  srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice

- VUID-vkCmdBlitImage-srcImageLayout-01398
  srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- VUID-vkCmdBlitImage-dstImage-02000
  The format features of dstImage must contain VK_FORMAT_FEATURE_BLIT_DST_BIT

- VUID-vkCmdBlitImage-dstImage-01562
  dstImage must not use a format listed in Formats requiring sampler Y'CbCr conversion for VK_IMAGE_ASPECT_COLOR_BIT image views

- VUID-vkCmdBlitImage-dstImage-00224
  dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag

- VUID-vkCmdBlitImage-dstImage-00225
  If dstImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBlitImage-dstImageLayout-00226
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice

- VUID-vkCmdBlitImage-dstImageLayout-01399
  dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL
VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

• VUID-vkCmdBlitImage-srcImage-00229
  If either of srcImage or dstImage was created with a signed integer VkFormat, the other must also have been created with a signed integer VkFormat

• VUID-vkCmdBlitImage-srcImage-00230
  If either of srcImage or dstImage was created with an unsigned integer VkFormat, the other must also have been created with an unsigned integer VkFormat

• VUID-vkCmdBlitImage-srcImage-00231
  If either of srcImage or dstImage was created with a depth/stencil format, the other must have exactly the same format

• VUID-vkCmdBlitImage-srcImage-00232
  If srcImage was created with a depth/stencil format, filter must be VK_FILTER_NEAREST

• VUID-vkCmdBlitImage-srcImage-00233
  srcImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

• VUID-vkCmdBlitImage-dstImage-00234
  dstImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

• VUID-vkCmdBlitImage-filter-02001
  If filter is VK_FILTER_LINEAR, then the format features of srcImage must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdBlitImage-filter-02002
  If filter is VK_FILTER_CUBIC_EXT, then the format features of srcImage must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

• VUID-vkCmdBlitImage-filter-00237
  If filter is VK_FILTER_CUBIC_EXT, srcImage must be of type VK_IMAGE_TYPE_2D

• VUID-vkCmdBlitImage-srcSubresource-01705
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

• VUID-vkCmdBlitImage-dstSubresource-01706
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

• VUID-vkCmdBlitImage-srcSubresource-01707
  The srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

• VUID-vkCmdBlitImage-dstSubresource-01708
  The dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

• VUID-vkCmdBlitImage-dstImage-02545
  dstImage and srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

• VUID-vkCmdBlitImage-srcImage-00240
  If either srcImage or dstImage is of type VK_IMAGE_TYPE_3D, then for each element of
pRegions, srcSubresource.baseArrayLayer and dstSubresource.baseArrayLayer must each be 0, and srcSubresource.layerCount and dstSubresource.layerCount must each be 1.

- **VUID-vkCmdBlitImage-aspectMask-00241**
  For each element of pRegions, srcSubresource.aspectMask must specify aspects present in srcImage

- **VUID-vkCmdBlitImage-aspectMask-00242**
  For each element of pRegions, dstSubresource.aspectMask must specify aspects present in dstImage

- **VUID-vkCmdBlitImage-srcOffset-00243**
  For each element of pRegions, srcOffsets[0].x and srcOffsets[1].x must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage

- **VUID-vkCmdBlitImage-srcOffset-00244**
  For each element of pRegions, srcOffsets[0].y and srcOffsets[1].y must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage

- **VUID-vkCmdBlitImage-srcImage-00245**
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffsets[0].y must be 0 and srcOffsets[1].y must be 1

- **VUID-vkCmdBlitImage-srcImage-00246**
  For each element of pRegions, srcOffsets[0].z and srcOffsets[1].z must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

- **VUID-vkCmdBlitImage-dstOffset-00248**
  For each element of pRegions, dstOffsets[0].x and dstOffsets[1].x must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage

- **VUID-vkCmdBlitImage-dstOffset-00249**
  For each element of pRegions, dstOffsets[0].y and dstOffsets[1].y must both be greater than or equal to 0 and less than or equal to the height of the specified dstSubresource of dstImage

- **VUID-vkCmdBlitImage-dstImage-00250**
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffsets[0].y must be 0 and dstOffsets[1].y must be 1

- **VUID-vkCmdBlitImage-dstImage-00251**
  For each element of pRegions, dstOffsets[0].z and dstOffsets[1].z must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage

- **VUID-vkCmdBlitImage-dstImage-00252**
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffsets[0].z must be 0 and dstOffsets[1].z must be 1
Valid Usage (Implicit)

- VUID-vkCmdBlitImage-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBlitImage-srcImage-parameter
  srcImage must be a valid VkImage handle

- VUID-vkCmdBlitImage-srcImageLayout-parameter
  srcImageLayout must be a valid VkImageLayout value

- VUID-vkCmdBlitImage-dstImage-parameter
  dstImage must be a valid VkImage handle

- VUID-vkCmdBlitImage-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

- VUID-vkCmdBlitImage-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkImageBlit structures

- VUID-vkCmdBlitImage-filter-parameter
  filter must be a valid VkFilter value

- VUID-vkCmdBlitImage-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBlitImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBlitImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBlitImage-regionCount-arraylength
  regionCount must be greater than 0

- VUID-vkCmdBlitImage-commonparent
  Each of commandBuffer, dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkImageBlit` structure is defined as:

```c
typedef struct VkImageBlit {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffsets[2];
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffsets[2];
} VkImageBlit;
```

- `srcSubresource` is the subresource to blit from.
- `srcOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the source region within `srcSubresource`.
- `dstSubresource` is the subresource to blit into.
- `dstOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the destination region within `dstSubresource`.

For each element of the `pRegions` array, a blit operation is performed for the specified source and destination regions.

### Valid Usage

- VUID-VkImageBlit-aspectMask-00238
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must match

- VUID-VkImageBlit-layerCount-00239
  The `layerCount` member of `srcSubresource` and `dstSubresource` must match

### Valid Usage (Implicit)

- VUID-VkImageBlit-srcSubresource-parameter
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure

- VUID-VkImageBlit-dstSubresource-parameter
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure

A more extensible version of the blit image command is defined below.
To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```c
// Provided by VK_KHR_copy_commands2
void vkCmdBlitImage2KHR(
    VkCommandBuffer                             commandBuffer,
    const VkBlitImageInfo2KHR*                  pBlitImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pBlitImageInfo` is a pointer to a `VkBlitImageInfo2KHR` structure describing the blit parameters.

This command is functionally identical to `vkCmdBlitImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

#### Valid Usage (Implicit)

- VUID-vkCmdBlitImage2KHR-commandBuffer-parameter
  * `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBlitImage2KHR-pBlitImageInfo-parameter
  * `pBlitImageInfo` must be a valid pointer to a valid `VkBlitImageInfo2KHR` structure

- VUID-vkCmdBlitImage2KHR-commandBuffer-recording
  * `commandBuffer` must be in the recording state

- VUID-vkCmdBlitImage2KHR-commandBuffer-cmdpool
  * The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdBlitImage2KHR-renderpass
  * This command must only be called outside of a render pass instance

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
The VkBlitImageInfo2KHR structure is defined as:

```c
// Provided by VK_KHR_copy_commands2
typedef struct VkBlitImageInfo2KHR {
    VkStructureType           sType;
    const void*               pNext;
    VkImage                   srcImage;
    VkImageLayout             srcImageLayout;
    VkImage                   dstImage;
    VkImageLayout             dstImageLayout;
    uint32_t                  regionCount;
    const VkImageBlit2KHR*    pRegions;
    VkFilter                  filter;
} VkBlitImageInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the blit.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the blit.
- `regionCount` is the number of regions to blit.
- `pRegions` is a pointer to an array of VkImageBlit2KHR structures specifying the regions to blit.
- `filter` is a VkFilter specifying the filter to apply if the blits require scaling.
Valid Usage

- VUID-VkBlitImageInfo2KHR-pRegions-00215
  The source region specified by each element of \texttt{pRegions} must be a region that is contained within \texttt{srcImage}

- VUID-VkBlitImageInfo2KHR-pRegions-00216
  The destination region specified by each element of \texttt{pRegions} must be a region that is contained within \texttt{dstImage}

- VUID-VkBlitImageInfo2KHR-pRegions-00217
  The union of all destination regions, specified by the elements of \texttt{pRegions}, must not overlap in memory with any texel that \texttt{may} be sampled during the blit operation

- VUID-VkBlitImageInfo2KHR-srcImage-01999
  The format features of \texttt{srcImage} must contain \texttt{VK_FORMAT_FEATURE_BLIT_SRC_BIT}

- VUID-VkBlitImageInfo2KHR-srcImage-01561
  \texttt{srcImage} must not use a format listed in Formats requiring sampler Y’C_bC_r conversion for \texttt{VK_IMAGE_ASPECT_COLOR_BIT} image views

- VUID-VkBlitImageInfo2KHR-srcImage-00219
  \texttt{srcImage} must have been created with \texttt{VK_IMAGE_USAGE_TRANSFER_SRC_BIT} usage flag

- VUID-VkBlitImageInfo2KHR-srcImage-00220
  If \texttt{srcImage} is non-sparse then it must be bound completely and contiguously to a single \texttt{VkDeviceMemory} object

- VUID-VkBlitImageInfo2KHR-srcImageLayout-00221
  \texttt{srcImageLayout} must specify the layout of the image subresources of \texttt{srcImage} specified in \texttt{pRegions} at the time this command is executed on a \texttt{VkDevice}

- VUID-VkBlitImageInfo2KHR-srcImageLayout-01398
  \texttt{srcImageLayout} must be \texttt{VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR}, \texttt{VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL} or \texttt{VK_IMAGE_LAYOUT_GENERAL}

- VUID-VkBlitImageInfo2KHR-dstImage-02000
  The format features of \texttt{dstImage} must contain \texttt{VK_FORMAT_FEATURE_BLIT_DST_BIT}

- VUID-VkBlitImageInfo2KHR-dstImage-01562
  \texttt{dstImage} must not use a format listed in Formats requiring sampler Y’C_bC_r conversion for \texttt{VK_IMAGE_ASPECT_COLOR_BIT} image views

- VUID-VkBlitImageInfo2KHR-dstImage-00224
  \texttt{dstImage} must have been created with \texttt{VK_IMAGE_USAGE_TRANSFER_DST_BIT} usage flag

- VUID-VkBlitImageInfo2KHR-dstImage-00225
  If \texttt{dstImage} is non-sparse then it must be bound completely and contiguously to a single \texttt{VkDeviceMemory} object

- VUID-VkBlitImageInfo2KHR-dstImageLayout-00226
  \texttt{dstImageLayout} must specify the layout of the image subresources of \texttt{dstImage} specified in \texttt{pRegions} at the time this command is executed on a \texttt{VkDevice}

- VUID-VkBlitImageInfo2KHR-dstImageLayout-01399
  \texttt{dstImageLayout} must be \texttt{VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR}, \texttt{VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL}
VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- **VUID-VkBlitImageInfo2KHR-srcImage-00229**
  If either of *srcImage* or *dstImage* was created with a signed integer *VkFormat*, the other must also have been created with a signed integer *VkFormat*

- **VUID-VkBlitImageInfo2KHR-srcImage-00230**
  If either of *srcImage* or *dstImage* was created with an unsigned integer *VkFormat*, the other must also have been created with an unsigned integer *VkFormat*

- **VUID-VkBlitImageInfo2KHR-srcImage-00231**
  If either of *srcImage* or *dstImage* was created with a depth/stencil format, the other must have exactly the same format

- **VUID-VkBlitImageInfo2KHR-srcImage-00232**
  If *srcImage* was created with a depth/stencil format, *filter* must be **VK_FILTER_NEAREST**

- **VUID-VkBlitImageInfo2KHR-srcImage-00233**
  *srcImage* must have been created with a value of **VK_SAMPLE_COUNT_1_BIT**

- **VUID-VkBlitImageInfo2KHR-dstImage-00234**
  *dstImage* must have been created with a value of **VK_SAMPLE_COUNT_1_BIT**

- **VUID-VkBlitImageInfo2KHR-filter-02001**
  If *filter* is **VK_FILTER_LINEAR**, then the format features of *srcImage* must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-VkBlitImageInfo2KHR-filter-02002**
  If *filter* is **VK_FILTER_CUBIC_EXT**, then the format features of *srcImage* must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT**

- **VUID-VkBlitImageInfo2KHR-filter-00237**
  If *filter* is **VK_FILTER_CUBIC_EXT**, *srcImage* must be of type **VK_IMAGE_TYPE_2D**

- **VUID-VkBlitImageInfo2KHR-srcSubresource-01705**
  The *srcSubresource.mipLevel* member of each element of *pRegions* must be less than the *mipLevels* specified in *VkImageCreateInfo* when *srcImage* was created

- **VUID-VkBlitImageInfo2KHR-dstSubresource-01706**
  The *dstSubresource.mipLevel* member of each element of *pRegions* must be less than the *mipLevels* specified in *VkImageCreateInfo* when *dstImage* was created

- **VUID-VkBlitImageInfo2KHR-srcSubresource-01707**
  The *srcSubresource.baseArrayLayer* + *srcSubresource.layerCount* of each element of *pRegions* must be less than or equal to the *arrayLayers* specified in *VkImageCreateInfo* when *srcImage* was created

- **VUID-VkBlitImageInfo2KHR-dstSubresource-01708**
  The *dstSubresource.baseArrayLayer* + *dstSubresource.layerCount* of each element of *pRegions* must be less than or equal to the *arrayLayers* specified in *VkImageCreateInfo* when *dstImage* was created

- **VUID-VkBlitImageInfo2KHR-dstImage-02545**
  *dstImage* and *srcImage* must not have been created with flags containing **VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT**

- **VUID-VkBlitImageInfo2KHR-srcImage-00240**
  If either *srcImage* or *dstImage* is of type **VK_IMAGE_TYPE_3D**, then for each element of
pRegions, srcSubresource.baseArrayLayer and dstSubresource.baseArrayLayer must each be 0, and srcSubresource.layerCount and dstSubresource.layerCount must each be 1.

- VUID-VkBlitImageInfo2KHR-aspectMask-00241
  For each element of pRegions, srcSubresource.aspectMask must specify aspects present in srcImage

- VUID-VkBlitImageInfo2KHR-aspectMask-00242
  For each element of pRegions, dstSubresource.aspectMask must specify aspects present in dstImage

- VUID-VkBlitImageInfo2KHR-srcOffset-00243
  For each element of pRegions, srcOffsets[0].x and srcOffsets[1].x must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage

- VUID-VkBlitImageInfo2KHR-srcOffset-00244
  For each element of pRegions, srcOffsets[0].y and srcOffsets[1].y must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage

- VUID-VkBlitImageInfo2KHR-srcImage-00245
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffsets[0].y must be 0 and srcOffsets[1].y must be 1

- VUID-VkBlitImageInfo2KHR-srcOffset-00246
  For each element of pRegions, srcOffsets[0].z and srcOffsets[1].z must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

- VUID-VkBlitImageInfo2KHR-srcImage-00247
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, srcOffsets[0].z must be 0 and srcOffsets[1].z must be 1

- VUID-VkBlitImageInfo2KHR-dstOffset-00248
  For each element of pRegions, dstOffsets[0].x and dstOffsets[1].x must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage

- VUID-VkBlitImageInfo2KHR-dstOffset-00249
  For each element of pRegions, dstOffsets[0].y and dstOffsets[1].y must both be greater than or equal to 0 and less than or equal to the height of the specified dstSubresource of dstImage

- VUID-VkBlitImageInfo2KHR-dstImage-00250
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffsets[0].y must be 0 and dstOffsets[1].y must be 1

- VUID-VkBlitImageInfo2KHR-dstOffset-00251
  For each element of pRegions, dstOffsets[0].z and dstOffsets[1].z must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage

- VUID-VkBlitImageInfo2KHR-dstImage-00252
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffsets[0].z must be 0 and dstOffsets[1].z must be 1

- VUID-VkBlitImageInfo2KHR-pRegions-04561
If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `srcImage` and `dstImage` must not be a block-compressed image.

- VUID-VkBlitImageInfo2KHR-pRegions-04562
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then the `srcImage` must be of type `VK_IMAGE_TYPE_2D` and must not be a multi-planar format.

### Valid Usage (Implicit)

- VUID-VkBlitImageInfo2KHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_BLIT_IMAGE_INFO_2_KHR`

- VUID-VkBlitImageInfo2KHR-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkBlitImageInfo2KHR-srcImage-parameter
  `srcImage` must be a valid `VkImage` handle

- VUID-VkBlitImageInfo2KHR-srcImageLayout-parameter
  `srcImageLayout` must be a valid `VkImageLayout` value

- VUID-VkBlitImageInfo2KHR-dstImage-parameter
  `dstImage` must be a valid `VkImage` handle

- VUID-VkBlitImageInfo2KHR-dstImageLayout-parameter
  `dstImageLayout` must be a valid `VkImageLayout` value

- VUID-VkBlitImageInfo2KHR-pRegions-parameter
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkImageBlit2KHR` structures

- VUID-VkBlitImageInfo2KHR-filter-parameter
  `filter` must be a valid `VkFilter` value

- VUID-VkBlitImageInfo2KHR-regionCount-arraylength
  `regionCount` must be greater than 0

  Both of `dstImage`, and `srcImage` must have been created, allocated, or retrieved from the same `VkDevice`

The `VkImageBlit2KHR` structure is defined as:
typedef struct VkImageBlit2KHR {
    VkStructureType             sType;
    const void*                 pNext;
    VkImageSubresourceLayers    srcSubresource;
    VkOffset3D                  srcOffsets[2];
    VkImageSubresourceLayers    dstSubresource;
    VkOffset3D                  dstOffsets[2];
} VkImageBlit2KHR;

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **srcSubresource** is the subresource to blit from.
• **srcOffsets** is a pointer to an array of two **VkOffset3D** structures specifying the bounds of the source region within **srcSubresource**.
• **dstSubresource** is the subresource to blit into.
• **dstOffsets** is a pointer to an array of two **VkOffset3D** structures specifying the bounds of the destination region within **dstSubresource**.

For each element of the **pRegions** array, a blit operation is performed for the specified source and destination regions.

### Valid Usage

- **VUID-VkImageBlit2KHR-aspectMask-00238**
  
  The **aspectMask** member of **srcSubresource** and **dstSubresource** must match

- **VUID-VkImageBlit2KHR-layerCount-00239**
  
  The **layerCount** member of **srcSubresource** and **dstSubresource** must match
Valid Usage (Implicit)

- **VUID-VkImageBlit2KHR-sType-sType**
  
  sType must be VK_STRUCTURE_TYPE_IMAGE_BLIT_2_KHR

- **VUID-VkImageBlit2KHR-pNext-pNext**
  
  pNext must be NULL or a pointer to a valid instance of VkCopyCommandTransformInfoQCOM

- **VUID-VkImageBlit2KHR-sType-unique**
  
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkImageBlit2KHR-srcSubresource-parameter**
  
  srcSubresource must be a valid VkImageSubresourceLayers structure

- **VUID-VkImageBlit2KHR-dstSubresource-parameter**
  
  dstSubresource must be a valid VkImageSubresourceLayers structure

For **vkCmdBlitImage2KHR**, each region copied can include a rotation. To specify a rotated region, add VkCopyCommandTransformInfoQCOM to the pNext chain of VkImageBlit2KHR. For each region with a rotation specified, Image Blits with Scaling and Rotation specifies how coordinates are rotated prior to sampling from the source image. When rotation is specified, the source and destination images must be a 2D image and must not be blocked image or multi-planar format.

<<formats-requiring-sampler-ycbcr-conversion,_multi-planar_image>>, or specify a destination <<blocked-image, blocked image>>.

### 20.5.1. Image Blits with Scaling and Rotation

When **VkCopyCommandTransformInfoQCOM** is in the pNext chain of VkImageBlit2KHR, the specified region is rotated during the blit. The following description of rotated addressing replaces the description in **vkCmdBlitImage**.

The following code computes rotation of normalized coordinates.
For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in unnormalized to integer conversion:

\[
\begin{align*}
\text{u}_{\text{base}} &= i + \frac{1}{2} \\
\text{v}_{\text{base}} &= j + \frac{1}{2} \\
\text{w}_{\text{base}} &= k + \frac{1}{2}
\end{align*}
\]

- These base coordinates are then offset by the first destination offset:

\[
\begin{align*}
\text{u}_{\text{offset}} &= \text{u}_{\text{base}} - x_{\text{dst0}} \\
\text{v}_{\text{offset}} &= \text{v}_{\text{base}} - y_{\text{dst0}} \\
\text{w}_{\text{offset}} &= \text{w}_{\text{base}} - z_{\text{dst0}}
\end{align*}
\]
a_{offset} = a - \text{baseArrayCount}_{\text{dst}}

- The UV destination coordinates are scaled by the destination region, rotated, and scaled by the source region.

\[ u_{\text{dest\_scaled}} = \frac{u_{\text{offset}}}{(x_{\text{dst1}} - x_{\text{dst0}})} \]

\[ v_{\text{dest\_scaled}} = \frac{v_{\text{offset}}}{(y_{\text{dst1}} - y_{\text{dst0}})} \]

\[(u_{\text{src\_scaled}}, v_{\text{src\_scaled}}) = \text{RotateNormUV}(u_{\text{dest\_scaled}}, v_{\text{dest\_scaled}}, \text{transform})\]

\[ u_{\text{scaled}} = u_{\text{src\_scaled}} \times (x_{\text{Src1}} - x_{\text{Src0}}) \]

\[ v_{\text{scaled}} = v_{\text{src\_scaled}} \times (y_{\text{Src1}} - y_{\text{Src0}}) \]

- The W coordinate is unaffected by rotation. The scale is determined from the ratio of source and destination regions, and applied to the offset coordinate:

\[ \text{scale}_w = \frac{(z_{\text{Src1}} - z_{\text{Src0}})}{(z_{\text{dst1}} - z_{\text{dst0}})} \]

\[ w_{\text{scaled}} = w_{\text{offset}} \times \text{scale}_w \]

- Finally the source offset is added to the scaled source coordinates, to determine the final unnormalized coordinates used to sample from \text{srcImage}:

\[ u = u_{\text{scaled}} + x_{\text{Src0}} \]

\[ v = v_{\text{scaled}} + y_{\text{Src0}} \]

\[ w = w_{\text{scaled}} + z_{\text{Src0}} \]

\[ q = \text{mipLevel} \]

\[ a = a_{\text{offset}} + \text{baseArrayCount}_{\text{src}} \]

These coordinates are used to sample from the source image, as described in Image Operations.
chapter, with the filter mode equal to that of filter, a mipmap mode of VK_SAMPLER_MIPMAP_MODE_NEAREST and an address mode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE. Implementations must clamp at the edge of the source image, and may additionally clamp to the edge of the source region.

### 20.6. Resolving Multisample Images

To resolve a multisample color image to a non-multisample color image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdResolveImage(
    VkCommandBuffer                             commandBuffer,
    VkImage                                     srcImage,
    VkImageLayout                               srcImageLayout,
    VkImage                                     dstImage,
    VkImageLayout                               dstImageLayout,
    uint32_t                                    regionCount,
    const VkImageResolve*                       pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the resolve.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the resolve.
- `regionCount` is the number of regions to resolve.
- `pRegions` is a pointer to an array of `VkImageResolve` structures specifying the regions to resolve.

During the resolve the samples corresponding to each pixel location in the source are converted to a single sample before being written to the destination. If the source formats are floating-point or normalized types, the sample values for each pixel are resolved in an implementation-dependent manner. If the source formats are integer types, a single sample’s value is selected for each pixel.

`srcOffset` and `dstOffset` select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data. `extent` is the size in texels of the source image to resolve in `width`, `height` and `depth`. Each element of `pRegions` must be a region that is contained within its corresponding image.

Resolves are done layer by layer starting with `baseArrayLayer` member of `srcSubresource` for the source and `dstSubresource` for the destination. `layerCount` layers are resolved to the destination image.
Valid Usage

- VUID-vkCmdResolveImage-pRegions-00255
  The union of all source regions, and the union of all destination regions, specified by the elements of pRegions, must not overlap in memory.

- VUID-vkCmdResolveImage-srcImage-00256
  If srcImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- VUID-vkCmdResolveImage-srcImage-00257
  srcImage must have a sample count equal to any valid sample count value other than VK_SAMPLE_COUNT_1_BIT.

- VUID-vkCmdResolveImage-dstImage-00258
  If dstImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- VUID-vkCmdResolveImage-dstImage-00259
  dstImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT.

- VUID-vkCmdResolveImage-srcImageLayout-00260
  srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice.

- VUID-vkCmdResolveImage-srcImageLayout-01400
  srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL.

- VUID-vkCmdResolveImage-dstImageLayout-00262
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice.

- VUID-vkCmdResolveImage-dstImageLayout-01401
  dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL.

- VUID-vkCmdResolveImage-dstImage-02003
  The format features of dstImage must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT.

- VUID-vkCmdResolveImage-srcImage-01386
  srcImage and dstImage must have been created with the same image format.

- VUID-vkCmdResolveImage-srcSubresource-01709
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created.

- VUID-vkCmdResolveImage-dstSubresource-01710
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created.

- VUID-vkCmdResolveImage-srcSubresource-01711
  The srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created.
The \( \text{dstSubresource.baseArrayLayer} + \text{dstSubresource.layerCount} \) of each element of \( \text{pRegions} \) must be less than or equal to the \text{arrayLayers} specified in \text{VkImageCreateInfo} when \text{dstImage} was created.

\( \text{dstImage} \) and \( \text{srcImage} \) must not have been created with flags containing \text{VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT}.

If either \( \text{srcImage} \) or \( \text{dstImage} \) are of type \text{VK_IMAGE_TYPE_3D}, then for each element of \( \text{pRegions} \), \( \text{srcSubresource.baseArrayLayer} \) must be 0 and \( \text{srcSubresource.layerCount} \) must be 1.

If either \( \text{srcImage} \) or \( \text{dstImage} \) are of type \text{VK_IMAGE_TYPE_3D}, then for each element of \( \text{pRegions} \), \( \text{dstSubresource.baseArrayLayer} \) must be 0 and \( \text{dstSubresource.layerCount} \) must be 1.

For each element of \( \text{pRegions} \), \( \text{srcOffset.x} \) and \( (\text{extent.width} + \text{srcOffset.x}) \) must both be greater than or equal to 0 and less than or equal to the width of the specified \text{srcSubresource} of \( \text{srcImage} \).

For each element of \( \text{pRegions} \), \( \text{srcOffset.y} \) and \( (\text{extent.height} + \text{srcOffset.y}) \) must both be greater than or equal to 0 and less than or equal to the height of the specified \text{srcSubresource} of \( \text{srcImage} \).

If \( \text{srcImage} \) is of type \text{VK_IMAGE_TYPE_1D}, then for each element of \( \text{pRegions} \), \( \text{srcOffset.y} \) must be 0 and \( \text{extent.height} \) must be 1.

For each element of \( \text{pRegions} \), \( \text{srcOffset.z} \) and \( (\text{extent.depth} + \text{srcOffset.z}) \) must both be greater than or equal to 0 and less than or equal to the depth of the specified \text{srcSubresource} of \( \text{srcImage} \).

If \( \text{srcImage} \) is of type \text{VK_IMAGE_TYPE_1D} or \text{VK_IMAGE_TYPE_2D}, then for each element of \( \text{pRegions} \), \( \text{srcOffset.z} \) must be 0 and \( \text{extent.depth} \) must be 1.

For each element of \( \text{pRegions} \), \( \text{dstOffset.x} \) and \( (\text{extent.width} + \text{dstOffset.x}) \) must both be greater than or equal to 0 and less than or equal to the width of the specified \text{dstSubresource} of \( \text{dstImage} \).

For each element of \( \text{pRegions} \), \( \text{dstOffset.y} \) and \( (\text{extent.height} + \text{dstOffset.y}) \) must both be greater than or equal to 0 and less than or equal to the height of the specified \text{dstSubresource} of \( \text{dstImage} \).

If \( \text{dstImage} \) is of type \text{VK_IMAGE_TYPE_1D}, then for each element of \( \text{pRegions} \), \( \text{dstOffset.y} \) must be 0 and \( \text{extent.height} \) must be 1.
For each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`.

If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `dstOffset.z` must be 0 and `extent.depth` must be 1.

---

**Valid Usage (Implicit)**

- `commandBuffer` must be a valid `VkCommandBuffer` handle
- `srcImage` must be a valid `VkImage` handle
- `srcImageLayout` must be a valid `VkImageLayout` value
- `dstImage` must be a valid `VkImage` handle
- `dstImageLayout` must be a valid `VkImageLayout` value
- `pRegions` must be a valid pointer to an array of `regionCount` valid `VkImageResolve` structures
- `commandBuffer` must be in the recording state
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- This command must only be called outside of a render pass instance
- `regionCount` must be greater than 0
- Each of `commandBuffer`, `dstImage`, and `srcImage` must have been created, allocated, or retrieved from the same `VkDevice`
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Graphics</td>
<td>Transfer</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkImageResolve` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageResolve {
    VkImageSubresourceLayers    srcSubresource;
    VkOffset3D                  srcOffset;
    VkImageSubresourceLayers    dstSubresource;
    VkOffset3D                  dstOffset;
    VkExtent3D                  extent;
} VkImageResolve;
```

- `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.
- `srcOffset` and `dstOffset` select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the source image to resolve in width, height and depth.

Valid Usage

- VUID-VkImageResolve-aspectMask-00266
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must only contain `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-VkImageResolve-layerCount-00267
  The `layerCount` member of `srcSubresource` and `dstSubresource` must match
Valid Usage (Implicit)

- VUID-VkImageResolve-srcSubresource-parameter
  
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure

- VUID-VkImageResolve-dstSubresource-parameter
  
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure

20.7. Buffer Markers

To write a 32-bit marker value into a buffer as a pipelined operation, call:

```c
void vkCmdWriteBufferMarker2AMD(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags2KHR stage,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    uint32_t marker);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stage` specifies the pipeline stage whose completion triggers the marker write.
- `dstBuffer` is the buffer where the marker will be written.
- `dstOffset` is the byte offset into the buffer where the marker will be written.
- `marker` is the 32-bit value of the marker.

The command will write the 32-bit marker value into the buffer only after all preceding commands have finished executing up to at least the specified pipeline stage. This includes the completion of other preceding `vkCmdWriteBufferMarker2AMD` commands so long as their specified pipeline stages occur either at the same time or earlier than this command’s specified `pipelineStage`.

While consecutive buffer marker writes with the same `pipelineStage` parameter implicitly complete in submission order, memory and execution dependencies between buffer marker writes and other operations must still be explicitly ordered using synchronization commands. The access scope for buffer marker writes falls under the `VK_ACCESS_TRANSFER_WRITE_BIT`, and the pipeline stages for identifying the synchronization scope must include both `pipelineStage` and `VK_PIPELINE_STAGE_TRANSFER_BIT`.

**Note**

Similar to `vkCmdWriteTimestamp2KHR`, if an implementation is unable to write a marker at any specific pipeline stage, it may instead do so at any logically later stage.
Implementations **may** only support a limited number of pipelined marker write operations in flight at a given time. Thus an excessive number of marker write operations **may** degrade command execution performance.
Valid Usage

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03929**
  If the **geometry shaders** feature is not enabled, **stage must not contain** 
  `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03930**
  If the **tessellation shaders** feature is not enabled, **stage must not contain** 
  `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT_KHR` or 
  `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT_KHR`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03931**
  If the **conditional rendering** feature is not enabled, **stage must not contain** 
  `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03932**
  If the **fragment density map** feature is not enabled, **stage must not contain** 
  `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03933**
  If the **transform feedback** feature is not enabled, **stage must not contain** 
  `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03934**
  If the **mesh shaders** feature is not enabled, **stage must not contain** 
  `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_NV`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03935**
  If the **task shaders** feature is not enabled, **stage must not contain** 
  `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_NV`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03936**
  If the **shading rate image** feature is not enabled, **stage must not contain** 
  `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV`

- **VUID-vkCmdWriteBufferMarker2AMD-synchronization2-03893**
  The **synchronization2** feature **must be enabled**

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03894**
  **stage must include only a single pipeline stage**

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03895**
  **stage must include only stages that are valid for the queue family that was used to create** 
  **the command pool that commandBuffer was allocated from**

- **VUID-vkCmdWriteBufferMarker2AMD-dstOffset-03896**
  **dstOffset must be less than or equal to the size of dstBuffer minus 4.**

- **VUID-vkCmdWriteBufferMarker2AMD-dstBuffer-03897**
  **dstBuffer must have been created with the VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag**

- **VUID-vkCmdWriteBufferMarker2AMD-dstBuffer-03898**
  If **dstBuffer** is non-sparse then it **must be bound completely and contiguously to a single** 
  **VkDeviceMemory object**

- **VUID-vkCmdWriteBufferMarker2AMD-dstOffset-03899**
  **dstOffset must be a multiple of 4**
Valid Usage (Implicit)

- VUID-vkCmdWriteBufferMarker2AMD-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdWriteBufferMarker2AMD-stage-parameter
  stage must be a valid combination of VkPipelineStageFlagBits2KHR values

- VUID-vkCmdWriteBufferMarker2AMD-stage-requiredbitmask
  stage must not be 0

- VUID-vkCmdWriteBufferMarker2AMD-dstBuffer-parameter
  dstBuffer must be a valid VkBuffer handle

- VUID-vkCmdWriteBufferMarker2AMD-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdWriteBufferMarker2AMD-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdWriteBufferMarker2AMD-commonparent
  Both of commandBuffer, and dstBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

To write a 32-bit marker value into a buffer as a pipelined operation, call:
vkCmdWriteBufferMarkerAMD(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlagBits pipelineStage,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    uint32_t marker);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **pipelineStage** is a `VkPipelineStageFlagBits` value specifying the pipeline stage whose completion triggers the marker write.
- **dstBuffer** is the buffer where the marker will be written to.
- **dstOffset** is the byte offset into the buffer where the marker will be written to.
- **marker** is the 32-bit value of the marker.

The command will write the 32-bit marker value into the buffer only after all preceding commands have finished executing up to at least the specified pipeline stage. This includes the completion of other preceding `vkCmdWriteBufferMarkerAMD` commands so long as their specified pipeline stages occur either at the same time or earlier than this command's specified `pipelineStage`.

While consecutive buffer marker writes with the same `pipelineStage` parameter are implicitly complete in submission order, memory and execution dependencies between buffer marker writes and other operations must still be explicitly ordered using synchronization commands. The access scope for buffer marker writes falls under the `VK_ACCESS_TRANSFER_WRITE_BIT`, and the pipeline stages for identifying the synchronization scope must include both `pipelineStage` and `VK_PIPELINE_STAGE_TRANSFER_BIT`.

**Note**
Similar to `vkCmdWriteTimestamp`, if an implementation is unable to write a marker at any specific pipeline stage, it may instead do so at any logically later stage.

**Note**
Implementations may only support a limited number of pipelined marker write operations in flight at a given time, thus excessive number of marker write operations may degrade command execution performance.
Valid Usage

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04074**
  
  `pipelineStage` **must** be a valid stage for the queue family that was used to create the command pool that `commandBuffer` was allocated from.

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04075**
  
  If the `geometry shaders` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04076**
  
  If the `tessellation shaders` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04077**
  
  If the `conditional rendering` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04078**
  
  If the `fragment density map` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04079**
  
  If the `transform feedback` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04080**
  
  If the `mesh shaders` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV` or `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04081**
  
  If the `shading rate image` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV`

- **VUID-vkCmdWriteBufferMarkerAMD-dstOffset-01798**
  
  `dstOffset` **must** be less than or equal to the size of `dstBuffer` minus 4

- **VUID-vkCmdWriteBufferMarkerAMD-dstBuffer-01799**
  
  `dstBuffer` **must** have been created with `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` usage flag

- **VUID-vkCmdWriteBufferMarkerAMD-dstBuffer-01800**
  
  If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdWriteBufferMarkerAMD-dstOffset-01801**
  
  `dstOffset` **must** be a multiple of 4
Valid Usage (Implicit)

- VUID-vkCmdWriteBufferMarkerAMD-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-parameter
  
  `pipelineStage` must be a valid `VkPipelineStageFlagBits` value

- VUID-vkCmdWriteBufferMarkerAMD-dstBuffer-parameter
  
  `dstBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdWriteBufferMarkerAMD-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdWriteBufferMarkerAMD-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdWriteBufferMarkerAMD-commonparent
  
  Both of `commandBuffer`, and `dstBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

A more extensible version of the resolve image command is defined below.

To resolve a multisample image to a non-multisample image, call:

```c
// Provided by VK_KHR_copy_commands2
void vkCmdResolveImage2KHR(
    VkCommandBuffer                             commandBuffer,  // Provided by VK_KHR_copy_commands2
    const VkResolveImageInfo2KHR*               pResolveImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
• `pResolveImageInfo` is a pointer to a `VkResolveImageInfo2KHR` structure describing the resolve parameters.

This command is functionally identical to `vkCmdResolveImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

#### Valid Usage (Implicit)

- VUID-vkCmdResolveImage2KHR-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdResolveImage2KHR-pResolveImageInfo-parameter
  `pResolveImageInfo` must be a valid pointer to a valid `VkResolveImageInfo2KHR` structure
- VUID-vkCmdResolveImage2KHR-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdResolveImage2KHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdResolveImage2KHR-renderpass
  This command must only be called outside of a render pass instance

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>

The `VkResolveImageInfo2KHR` structure is defined as:
// Provided by VK_KHR_copy_commands2

typedef struct VkResolveImageInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageResolve2KHR* pRegions;
} VkResolveImageInfo2KHR;

• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **srcImage** is the source image.

• **srcImageLayout** is the layout of the source image subresources for the resolve.

• **dstImage** is the destination image.

• **dstImageLayout** is the layout of the destination image subresources for the resolve.

• **regionCount** is the number of regions to resolve.

• **pRegions** is a pointer to an array of **VkImageResolve2KHR** structures specifying the regions to resolve.
Valid Usage

- **VUID-VkResolveImageInfo2KHR-pRegions-00255**
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory

- **VUID-VkResolveImageInfo2KHR-srcImage-00256**
  If `srcImage` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkResolveImageInfo2KHR-srcImage-00257**
  `srcImage` must have a sample count equal to any valid sample count value other than `VK_SAMPLE_COUNT_1_BIT`

- **VUID-VkResolveImageInfo2KHR-dstImage-00258**
  If `dstImage` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkResolveImageInfo2KHR-dstImage-00259**
  `dstImage` must have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`

- **VUID-VkResolveImageInfo2KHR-srcImageLayout-00260**
  `srcImageLayout` must specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-VkResolveImageInfo2KHR-dstImageLayout-00262**
  `dstImageLayout` must specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-VkResolveImageInfo2KHR-srcImageLayout-01400**
  `srcImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`

- **VUID-VkResolveImageInfo2KHR-dstImageLayout-01401**
  `dstImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`

- **VUID-VkResolveImageInfo2KHR-dstImage-02003**
  The format features of `dstImage` must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`

- **VUID-VkResolveImageInfo2KHR-srcImage-01386**
  `srcImage` and `dstImage` must have been created with the same image format

- **VUID-VkResolveImageInfo2KHR-srcSubresource-01709**
  The `srcSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created

- **VUID-VkResolveImageInfo2KHR-dstSubresource-01710**
  The `dstSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created

- **VUID-VkResolveImageInfo2KHR-srcSubresource-01711**
  The `srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created
The `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

`dstImage` and `srcImage` must not have been created with flags containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

If either `srcImage` or `dstImage` are of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` must be 0 and `srcSubresource.layerCount` must be 1.

If either `srcImage` or `dstImage` are of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstSubresource.baseArrayLayer` must be 0 and `dstSubresource.layerCount` must be 1.

For each element of `pRegions`, `srcOffset.x` and (`extent.width + srcOffset.x`) must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`.

For each element of `pRegions`, `srcOffset.y` and (`extent.height + srcOffset.y`) must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` must be 0 and `extent.height` must be 1.

For each element of `pRegions`, `srcOffset.z` and (`extent.depth + srcOffset.z`) must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffset.z` must be 0 and `extent.depth` must be 1.

For each element of `pRegions`, `dstOffset.x` and (`extent.width + dstOffset.x`) must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`.

For each element of `pRegions`, `dstOffset.y` and (`extent.height + dstOffset.y`) must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`.

If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.y` must be 0 and `extent.height` must be 1.
• VUID-VkResolveImageInfo2KHR-dstOffset-00277
  For each element of pRegions, dstOffset.z and (extent.depth + dstOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage.

• VUID-VkResolveImageInfo2KHR-dstImage-00278
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffset.z must be 0 and extent.depth must be 1.

Valid Usage (Implicit)

• VUID-VkResolveImageInfo2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_RESOLVE_IMAGE_INFO_2_KHR

• VUID-VkResolveImageInfo2KHR-pNext-pNext
  pNext must be NULL

• VUID-VkResolveImageInfo2KHR-srcImage-parameter
  srcImage must be a valid VkImage handle

• VUID-VkResolveImageInfo2KHR-srcImageLayout-parameter
  srcImageLayout must be a valid VkImageLayout value

• VUID-VkResolveImageInfo2KHR-dstImage-parameter
  dstImage must be a valid VkImage handle

• VUID-VkResolveImageInfo2KHR-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

• VUID-VkResolveImageInfo2KHR-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkImageResolve2KHR structures

• VUID-VkResolveImageInfo2KHR-regionCount-arraylength
  regionCount must be greater than 0

• VUID-VkResolveImageInfo2KHR-commonparent
  Both of dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice.

The VkImageResolve2KHR structure is defined as:
typedef struct VkImageResolve2KHR {
    VkStructureType             sType;
    const void*                 pNext;
    VkImageSubresourceLayers    srcSubresource;
    VkOffset3D                  srcOffset;
    VkImageSubresourceLayers    dstSubresource;
    VkOffset3D                  dstOffset;
    VkExtent3D                  extent;
} VkImageResolve2KHR;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **srcSubresource** and **dstSubresource** are **VkImageSubresourceLayers** structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.
• **srcOffset** and **dstOffset** select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
• **extent** is the size in texels of the source image to resolve in width, height and depth.

### Valid Usage

- **VUID-VkImageResolve2KHR-aspectMask-00266**
  The **aspectMask** member of **srcSubresource** and **dstSubresource** must only contain **VK_IMAGE_ASPECT_COLOR_BIT**
- **VUID-VkImageResolve2KHR-layerCount-00267**
  The **layerCount** member of **srcSubresource** and **dstSubresource** must match

### Valid Usage (Implicit)

- **VUID-VkImageResolve2KHR-sType-sType**
  **sType** must be **VK_STRUCTURE_TYPE_IMAGE_RESOLVE_2_KHR**
- **VUID-VkImageResolve2KHR-pNext-pNext**
  **pNext** must be **NULL**
- **VUID-VkImageResolve2KHR-srcSubresource-parameter**
  **srcSubresource** must be a valid **VkImageSubresourceLayers** structure
- **VUID-VkImageResolve2KHR-dstSubresource-parameter**
  **dstSubresource** must be a valid **VkImageSubresourceLayers** structure
Chapter 21. Drawing Commands

Drawing commands (commands with Draw in the name) provoke work in a graphics pipeline. Drawing commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound graphics pipeline. A graphics pipeline must be bound to a command buffer before any drawing commands are recorded in that command buffer.

Drawing can be achieved in two modes:

- **Programmable Mesh Shading**, the mesh shader assembles primitives, or
- **Programmable Primitive Shading**, the input primitives are assembled

as follows.

Each draw is made up of zero or more vertices and zero or more instances, which are processed by the device and result in the assembly of primitives. Primitives are assembled according to the `pInputAssemblyState` member of the `VkGraphicsPipelineCreateInfo` structure, which is of type `VkPipelineInputAssemblyStateCreateInfo`:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineInputAssemblyStateCreateInfo {
    VkStructureType                               sType;
    const void*                                    pNext;
    VkPipelineInputAssemblyStateCreateFlags        flags;
    VkPrimitiveTopology                            topology;
    VkBool32                                       primitiveRestartEnable;
} VkPipelineInputAssemblyStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `topology` is a `VkPrimitiveTopology` defining the primitive topology, as described below.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. This enable only applies to indexed draws (`vkCmdDrawIndexed` and `vkCmdDrawIndexedIndirect`), and the special index value is either 0xFFFFFFFF when the `indexType` parameter of `vkCmdBindIndexBuffer` is equal to `VK_INDEX_TYPE_UINT32`, 0xFF when `indexType` is equal to `VK_INDEX_TYPE_UINT8_EXT`, or 0xFFFF when `indexType` is equal to `VK_INDEX_TYPE_UINT16`. Primitive restart is not allowed for “list” topologies.

Restarting the assembly of primitives discards the most recent index values if those elements formed an incomplete primitive, and restarts the primitive assembly using the subsequent indices, but only assembling the immediately following element through the end of the originally specified elements. The primitive restart index value comparison is performed before adding the `vertexOffset` value to the index value.
Valid Usage

- **VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00428**
  If `topology` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, `primitiveRestartEnable` must be `VK_FALSE`

- **VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00429**
  If the geometry shaders feature is not enabled, `topology` must not be any of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`.

- **VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00430**
  If the tessellation shaders feature is not enabled, `topology` must not be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`.

- **VUID-VkPipelineInputAssemblyStateCreateInfo-triangleFans-04452**
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans` is `VK_FALSE`, `topology` must not be `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`.

Valid Usage (Implicit)

- **VUID-VkPipelineInputAssemblyStateCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO`.

- **VUID-VkPipelineInputAssemblyStateCreateInfo-pNext-pNext**
  `pNext` must be `NULL`.

- **VUID-VkPipelineInputAssemblyStateCreateInfo-flags-zerobitmask**
  `flags` must be `0`.

- **VUID-VkPipelineInputAssemblyStateCreateInfo-topology-parameter**
  `topology` must be a valid `VkPrimitiveTopology` value.

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineInputAssemblyStateCreateFlags;

`VkPipelineInputAssemblyStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To dynamically control whether a special vertex index value is treated as restarting the assembly of primitives:
// Provided by VK_EXT_extended_dynamic_state2

void vkCmdSetPrimitiveRestartEnableEXT(
    VkCommandBuffer                             commandBuffer,
    VkBool32                                    primitiveRestartEnable);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. It behaves in the same way as `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable`

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

### Valid Usage

- VUID-vkCmdSetPrimitiveRestartEnableEXT-None-04866
  The `extendedDynamicState2` feature **must** be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetPrimitiveRestartEnableEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetPrimitiveRestartEnableEXT-commandBuffer-recording
  `commandBuffer` **must** be in the `recording state`

- VUID-vkCmdSetPrimitiveRestartEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
21.1. Primitive Topologies

*Primitive topology* determines how consecutive vertices are organized into primitives, and determines the type of primitive that is used at the beginning of the graphics pipeline. The effective topology for later stages of the pipeline is altered by tessellation or geometry shading (if either is in use) and depends on the execution modes of those shaders. In the case of mesh shading the only effective topology is defined by the execution mode of the mesh shader.

The primitive topologies defined by `VkPrimitiveTopology` are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPrimitiveTopology {
    VK_PRIMITIVE_TOPOLOGY_POINT_LIST = 0,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST = 1,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP = 2,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST = 3,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP = 4,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN = 5,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY = 6,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY = 7,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY = 8,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY = 9,
    VK_PRIMITIVE_TOPOLOGY_PATCH_LIST = 10,
} VkPrimitiveTopology;
```

- **VK_PRIMITIVE_TOPOLOGY_POINT_LIST** specifies a series of separate point primitives.
- **VK_PRIMITIVE_TOPOLOGY_LINE_LIST** specifies a series of separate line primitives.
- **VK_PRIMITIVE_TOPOLOGY_LINE_STRIP** specifies a series of connected line primitives with consecutive lines sharing a vertex.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST** specifies a series of separate triangle primitives.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP** specifies a series of connected triangle primitives with consecutive triangles sharing an edge.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN** specifies a series of connected triangle primitives with all triangles sharing a common vertex. If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans` is `VK_FALSE`, then triangle fans are not supported by the implementation, and **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN** must not be used.
• **VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY** specifies a series of separate line primitives with adjacency.

• **VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY** specifies a series of connected line primitives with adjacency, with consecutive primitives sharing three vertices.

• **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY** specifies a series of separate triangle primitives with adjacency.

• **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY** specifies connected triangle primitives with adjacency, with consecutive triangles sharing an edge.

• **VK_PRIMITIVE_TOPOLOGY_PATCH_LIST** specifies separate patch primitives.

Each primitive topology, and its construction from a list of vertices, is described in detail below with a supporting diagram, according to the following key:

<table>
<thead>
<tr>
<th>•</th>
<th>Vertex</th>
<th>A point in 3-dimensional space. Positions chosen within the diagrams are arbitrary and for illustration only.</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Vertex Number</td>
<td>Sequence position of a vertex within the provided vertex data.</td>
</tr>
<tr>
<td>⬤</td>
<td>Provoking Vertex</td>
<td>Provoking vertex within the main primitive. The tail is angled towards the relevant primitive. Used in flat shading.</td>
</tr>
<tr>
<td>___</td>
<td>Primitive Edge</td>
<td>An edge connecting the points of a main primitive.</td>
</tr>
<tr>
<td>.......</td>
<td>Adjacency Edge</td>
<td>Points connected by these lines do not contribute to a main primitive, and are only accessible in a geometry shader.</td>
</tr>
<tr>
<td>▲</td>
<td>Winding Order</td>
<td>The relative order in which vertices are defined within a primitive, used in the facing determination. This ordering has no specific start or end point.</td>
</tr>
</tbody>
</table>

The diagrams are supported with mathematical definitions where the vertices (v) and primitives (p) are numbered starting from 0; v₀ is the first vertex in the provided data and p₀ is the first primitive in the set of primitives defined by the vertices and topology.

The primitive topology is specified by the `VkPipelineInputAssemblyStateCreateInfo::topology` property of the currently active pipeline, if the pipeline was not created with `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` enabled.

Otherwise, the primitive topology is set by calling:

```
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetPrimitiveTopologyEXT(
    VkCommandBuffer                          commandBuffer,
    VkPrimitiveTopology                     primitiveTopology);
```

• **commandBuffer** is the command buffer into which the command will be recorded.

• **topology** specifies the primitive topology to use for drawing.
Valid Usage

- VUID-vkCmdSetPrimitiveTopologyEXT-None-03347
  The `extendedDynamicState` feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetPrimitiveTopologyEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetPrimitiveTopologyEXT-primitiveTopology-parameter
  `primitiveTopology` must be a valid `VkPrimitiveTopology` value

- VUID-vkCmdSetPrimitiveTopologyEXT-commandBuffer-recording
  `commandBuffer` must be in the `recording state`

- VUID-vkCmdSetPrimitiveTopologyEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

</tbody>
</table>

### 21.1.2. Point Lists

When the topology is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, each consecutive vertex defines a single point primitive, according to the equation:

\[ p_i = \{v_i\} \]

As there is only one vertex, that vertex is the provoking vertex. The number of primitives generated is equal to `vertexCount`.

### 21.1.3. Line Lists

When the topology is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, each consecutive pair of vertices defines a single line primitive, according to the equation:

\[ p_i = \{v_{2i}, v_{2i+1}\} \]

The number of primitives generated is equal to \(\lfloor \text{vertexCount}/2 \rfloor\).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \(p_i\) is \(v_{2i}\).
When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{2i+1} \).

21.1.4. Line Strips

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, one line primitive is defined by each vertex and the following vertex, according to the equation:

\[
p_i = \{v_i, v_{i+1}\}
\]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-1) \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_i \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+1} \).

21.1.5. Triangle Lists

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, each consecutive set of three vertices defines a single triangle primitive, according to the equation:

\[
p_i = \{v_{3i}, v_{3i+1}, v_{3i+2}\}
\]

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/3 \rfloor \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{3i} \).
When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{3i+2}$.

### 21.1.6. Triangle Strips

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, one triangle primitive is defined by each vertex and the two vertices that follow it, according to the equation:

$$p_i = \{v_i, v_{i+(1+i\%2)}, v_{i+(2-i\%2)}\}$$

The number of primitives generated is equal to $\max(0, \text{vertexCount}-2)$.

When the `provokingVertexMode` is `VK_PROVOKINGVERTEXMODEFIRSTVERTEX_EXT`, the provoking vertex for $p_i$ is $v_i$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{i+2}$.

---

**Note**

The ordering of the vertices in each successive triangle is reversed, so that the winding order is consistent throughout the strip.

---

1282 | Chapter 21. Drawing Commands
21.1.7. Triangle Fans

When the topology is VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN, triangle primitives are defined around a shared common vertex, according to the equation:

\[ p_i = \{v_{i+1}, v_{i+2}, v_0\} \]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-2) \).

When the provokingVertexMode is VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT, the provoking vertex for \( p_i \) is \( v_{i+1} \).

When the provokingVertexMode is VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT, the provoking vertex for \( p_i \) is \( v_{i+2} \).

![Diagram](image)

Note

If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans is VK_FALSE, then triangle fans are not supported by the implementation, and VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN must not be used.

21.1.8. Line Lists With Adjacency

When the topology is VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY, each consecutive set of four vertices defines a single line primitive with adjacency, according to the equation:

\[ p_i = \{v_{4i}, v_{4i+1}, v_{4i+2}, v_{4i+3}\} \]

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a geometry shader.

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/4 \rfloor \).

When the provokingVertexMode is VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT, the provoking vertex for \( p_i \) is \( v_{4i+1} \).
When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{4i+2} \).

### 21.1.9. Line Strips With Adjacency

When the topology is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`, one line primitive with adjacency is defined by each vertex and the following vertex, according to the equation:

\[
p_i = \{v_i, v_{i+1}, v_{i+2}, v_{i+3}\}
\]

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a geometry shader.

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-3) \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_i \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+2} \).

### 21.1.10. Triangle Lists With Adjacency

When the topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, each consecutive set of six vertices defines a single triangle primitive with adjacency, according to the equations:

\[
p_i = \{v_{6i}, v_{6i+1}, v_{6i+2}, v_{6i+3}, v_{6i+4}, v_{6i+5}\}
\]

A triangle primitive is described by the first, third, and fifth vertices of the total primitive, with the remaining three vertices only accessible in a geometry shader.

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/6 \rfloor \).
When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{6i} \).

![Diagram of triangle strips with adjacency](image)

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{6i+4} \).

![Diagram of triangle strips with adjacency](image)

### 21.1.11. Triangle Strips With Adjacency

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`, one triangle primitive with adjacency is defined by each vertex and the following 5 vertices.

The number of primitives generated, \( n \), is equal to \( \lfloor \max(0, \text{vertexCount} - 4)/2 \rfloor \).

If \( n=1 \), the primitive is defined as:

\[
p = \{v_0, v_1, v_2, v_5, v_4, v_3\}
\]

If \( n>1 \), the total primitive consists of different vertices according to where it is in the strip:

\[
p_i = \{v_{2i}, v_{2i+1}, v_{2i+2}, v_{2i+6}, v_{2i+4}, v_{2i+3}\} \text{ when } i=0
\]

\[
p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+6}, v_{2i+2}, v_{2i+1}\} \text{ when } i>0, i<n-1, \text{ and } i\%2=1
\]

\[
p_i = \{v_{2i}, v_{2i+2}, v_{2i+3}, v_{2i+6}, v_{2i+4}, v_{2i+1}\} \text{ when } i>0, i<n-1, \text{ and } i\%2=0
\]

\[
p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+5}, v_{2i+2}, v_{2i+1}\} \text{ when } i=n-1 \text{ and } i\%2=1
\]
\[ p_i = \{v_{2i}, v_{2i+2}, v_{2i+5}, v_{2i+4}, v_{2i+3}\} \text{ when } i = n-1 \text{ and } i \% 2 = 0 \]

A triangle primitive is described by the first, third, and fifth vertices of the total primitive in all cases, with the remaining three vertices only accessible in a *geometry shader*.

*Note*

The ordering of the vertices in each successive triangle is altered so that the winding order is consistent throughout the strip.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is always \( v_{2i} \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is always \( v_{2i+4} \).
21.1.12. Patch Lists

When the topology is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, each consecutive set of m vertices defines a single patch primitive, according to the equation:

\[ p_i = \{v_{mi}, v_{mi+1}, \ldots, v_{mi+(m-2)}, v_{mi+(m-1)}\} \]

where m is equal to `VkPipelineTessellationStateCreateInfo::patchControlPoints`.

Patch lists are never passed to vertex post-processing, and as such no provoking vertex is defined for patch primitives. The number of primitives generated is equal to \[\text{vertexCount}/m\].

The vertices comprising a patch have no implied geometry, and are used as inputs to tessellation shaders and the fixed-function tessellator to generate new point, line, or triangle primitives.

21.2. Primitive Order

Primitives generated by drawing commands progress through the stages of the graphics pipeline in primitive order. Primitive order is initially determined in the following way:

1. Submission order determines the initial ordering
2. For indirect draw commands, the order in which accessed instances of the `VkDrawIndirectCommand` are stored in buffer, from lower indirect buffer addresses to higher addresses.
3. If a draw command includes multiple instances, the order in which instances are executed, from lower numbered instances to higher.

4. The order in which primitives are specified by a draw command:
   - For non-indexed draws, from vertices with a lower numbered `vertexIndex` to a higher numbered `vertexIndex`.
   - For indexed draws, vertices sourced from a lower index buffer addresses to higher addresses.
   - For draws using mesh shaders, the order is provided by `mesh shading`.

Within this order implementations further sort primitives:

5. If tessellation shading is active, by an implementation-dependent order of new primitives generated by `tessellation`.

6. If geometry shading is active, by the order new primitives are generated by `geometry shading`.

7. If the `polygon mode` is not `VK_POLYGON_MODE_FILL`, or `VK_POLYGON_MODE_FILL_RECTANGLE_NV`, by an implementation-dependent ordering of the new primitives generated within the original primitive.

Primitive order is later used to define `rasterization order`, which determines the order in which fragments output results to a framebuffer.

21.3. Programmable Primitive Shading

Once primitives are assembled, they proceed to the vertex shading stage of the pipeline. If the draw includes multiple instances, then the set of primitives is sent to the vertex shading stage multiple times, once for each instance.

It is implementation-dependent whether vertex shading occurs on vertices that are discarded as part of incomplete primitives, but if it does occur then it operates as if they were vertices in complete primitives and such invocations can have side effects.

Vertex shading receives two per-vertex inputs from the primitive assembly stage - the `vertexIndex` and the `instanceIndex`. How these values are generated is defined below, with each command.

Drawing commands fall roughly into two categories:

- Non-indexed drawing commands present a sequential `vertexIndex` to the vertex shader. The sequential index is generated automatically by the device (see Fixed-Function Vertex Processing for details on both specifying the vertex attributes indexed by `vertexIndex`, as well as binding vertex buffers containing those attributes to a command buffer). These commands are:
  - `vkCmdDraw`
  - `vkCmdDrawIndirect`
  - `vkCmdDrawIndirectCountKHR`
  - `vkCmdDrawIndirectCountAMD`

- Indexed drawing commands read index values from an index buffer and use this to compute the
vertexIndex value for the vertex shader. These commands are:
- `vkCmdDrawIndexed`
- `vkCmdDrawIndexedIndirect`
- `vkCmdDrawIndexedIndirectCountKHR`
- `vkCmdDrawIndexedIndirectCountAMD`

To bind an index buffer to a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindIndexBuffer(
    VkCommandBuffer                             commandBuffer,
    VkBuffer                                    buffer,
    VkDeviceSize                                offset,
    VkIndexType                                 indexType);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer being bound.
- `offset` is the starting offset in bytes within `buffer` used in index buffer address calculations.
- `indexType` is a `VkIndexType` value specifying whether indices are treated as 16 bits or 32 bits.

### Valid Usage

- **VUID-vkCmdBindIndexBuffer-offset-00431**
  `offset must be less than the size of buffer`

- **VUID-vkCmdBindIndexBuffer-offset-00432**
  The sum of `offset` and the address of the range of `VkDeviceMemory` object that is backing `buffer`, must be a multiple of the type indicated by `indexType`

- **VUID-vkCmdBindIndexBuffer-buffer-00433**
  `buffer must have been created with the VK_BUFFER_USAGE_INDEX_BUFFER_BIT flag`

- **VUID-vkCmdBindIndexBuffer-buffer-00434**
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBindIndexBuffer-indexType-02507**
  `indexType must not be VK_INDEX_TYPE_NONE_KHR`

- **VUID-vkCmdBindIndexBuffer-indexType-02765**
  If `indexType` is `VK_INDEX_TYPE_UINT8_EXT`, the `indexTypeUint8` feature must be enabled
Valid Usage (Implicit)

- **VUID-vkCmdBindIndexBuffer-commandBuffer-parameter**
  commandBuffer must be a valid VkCommandBuffer handle

- **VUID-vkCmdBindIndexBuffer-buffer-parameter**
  buffer must be a valid VkBuffer handle

- **VUID-vkCmdBindIndexBuffer-indexType-parameter**
  indexType must be a valid VkIndexType value

- **VUID-vkCmdBindIndexBuffer-commandBuffer-recording**
  commandBuffer must be in the recording state

- **VUID-vkCmdBindIndexBuffer-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- **VUID-vkCmdBindIndexBuffer-commonparent**
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Possible values of vkCmdBindIndexBuffer::indexType, specifying the size of indices, are:
// Provided by VK_VERSION_1_0
typedef enum VkIndexType {
    VK_INDEX_TYPE_UINT16 = 0,
    VK_INDEX_TYPE_UINT32 = 1,
    // Provided by VK_KHR_acceleration_structure
    VK_INDEX_TYPE_NONE_KHR = 1000165000,
    // Provided by VK_EXT_index_type_uint8
    VK_INDEX_TYPE_UINT8_EXT = 1000265000,
    // Provided by VK_NV_ray_tracing
    VK_INDEX_TYPE_NONE_NV = VK_INDEX_TYPE_NONE_KHR,
} VkIndexType;

• VK_INDEX_TYPE_UINT16 specifies that indices are 16-bit unsigned integer values.
• VK_INDEX_TYPE_UINT32 specifies that indices are 32-bit unsigned integer values.
• VK_INDEX_TYPE_NONE_KHR specifies that no indices are provided.
• VK_INDEX_TYPE_UINT8_EXT specifies that indices are 8-bit unsigned integer values.

The parameters for each drawing command are specified directly in the command or read from buffer memory, depending on the command. Drawing commands that source their parameters from buffer memory are known as indirect drawing commands.

All drawing commands interact with the Robust Buffer Access feature.

To record a non-indexed draw, call:

// Provided by VK_VERSION_1_0
void vkCmdDraw(
    VkCommandBuffer commandBuffer,
    uint32_t vertexCount,
    uint32_t instanceCount,
    uint32_t firstVertex,
    uint32_t firstInstance);

• commandBuffer is the command buffer into which the command is recorded.
• vertexCount is the number of vertices to draw.
• instanceCount is the number of instances to draw.
• firstVertex is the index of the first vertex to draw.
• firstInstance is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and vertexCount consecutive vertex indices with the first vertexIndex value equal to firstVertex. The primitives are drawn instanceCount times with instanceIndex starting with firstInstance and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.
Valid Usage

- VUID-vkCmdDraw-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDraw-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDraw-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdDraw-None-02692
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- VUID-vkCmdDraw-filterCubic-02694
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- VUID-vkCmdDraw-filterCubicMinmax-02695
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- VUID-vkCmdDraw-flags-02696
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- VUID-vkCmdDraw-None-02697
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in `Pipeline Layout Compatibility`

- VUID-vkCmdDraw-None-02698
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in `Pipeline Layout`
Compatibility

- VUID-vkCmdDraw-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- VUID-vkCmdDraw-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdDraw-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdDraw-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDraw-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- VUID-vkCmdDraw-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- VUID-vkCmdDraw-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDraw-None-02705
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDraw-None-02706
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDraw-None-04115
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the
Type of the Texel operand of that instruction **must** have at least as many components as the image view’s format.

- **VUID-vkCmdDraw-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the buffer view’s format.

- **VUID-vkCmdDraw-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction **must** have a Width of 64.

- **VUID-vkCmdDraw-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction **must** have a Width of 32.

- **VUID-vkCmdDraw-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit channel width is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction **must** have a Width of 64.

- **VUID-vkCmdDraw-SampledType-04473**
  If a `VkBufferView` with a `VkFormat` that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction **must** have a Width of 32.

- **VUID-vkCmdDraw-sparseImageInt64Atomics-04474**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a SampledType with a Width of 64 by this command.

- **VUID-vkCmdDraw-sparseImageInt64Atomics-04475**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a SampledType with a Width of 64 by this command.

- **VUID-vkCmdDraw-renderPass-02684**
  The current render pass **must** be compatible with the renderPass member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDraw-subpass-02685**
  The subpass index of the current render pass **must** be equal to the subpass member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDraw-None-02686**
  Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set

- **VUID-vkCmdDraw-None-04584**
  Image subresources used as attachments in the current render pass **must** not be accessed in any way other than as an attachment by this command, except for cases involving
read-only access to depth/stencil attachments as described in the Render Pass chapter

- VUID-vkCmdDraw-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- VUID-vkCmdDraw-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdDraw-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDraw-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDraw-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the scissorCount parameter of vkCmdSetScissorWithCountEXT

- VUID-vkCmdDraw-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDraw-viewportCount-04138
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDraw-viewCount-04139
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDraw-viewCount-04140
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDraw-VkPipelineViewportCreateInfo-04141
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled and an instance of VkPipelineViewportSwizzleStateCreateInfoNV chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDraw-VkPipelineViewportCreateInfo-04142
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled and an instance of VkPipelineViewportExclusiveScissorStateCreateInfoNV chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDraw-primitiveTopology-03420
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT dynamic state enabled then vkCmdSetPrimitiveTopologyEXT must have been called in the current command buffer prior to this draw command, and the primitiveTopology parameter of vkCmdSetPrimitiveTopologyEXT must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state

- VUID-vkCmdDraw-None-04875
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDraw-None-04876
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT  dynamic state enabled then

vkCmdSetRasterizerDiscardEnableEXT must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDraw-None-04877
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT  dynamic state enabled then
  vkCmdSetDepthBiasEnableEXT must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDraw-logicOp-04878
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT  dynamic state enabled then
  vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this draw command and the logicOp must be a valid VkLogicOp value

- VUID-vkCmdDraw-None-04879
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT  dynamic state enabled then
  vkCmdSetPrimitiveRestartEnableEXT must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDraw-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT  dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then
  vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must be 1

- VUID-vkCmdDraw-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

- VUID-vkCmdDraw-rasterizationSamples-04740
  If rasterization is not disabled in the bound graphics pipeline, and neither the VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are enabled, then
  VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdDraw-pStrides-04884
  If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT  dynamic state enabled, then
  vkCmdBindVertexBuffers2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL

- VUID-vkCmdDraw-None-04007
  All vertex input bindings accessed via vertex input variables declared in the vertex
shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound

- VUID-vkCmdDraw-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be VK_NULL_HANDLE

- VUID-vkCmdDraw-None-02721
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

### Valid Usage (Implicit)

- VUID-vkCmdDraw-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDraw-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDraw-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdDraw-renderpass
  This command must only be called inside of a render pass instance

### Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>

To record an indexed draw, call:
void vkCmdDrawIndexed(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    indexCount,
    uint32_t                                    instanceCount,
    uint32_t                                    firstIndex,
    int32_t                                     vertexOffset,
    uint32_t                                    firstInstance);

- `commandBuffer` is the command buffer into which the command is recorded.
- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
- `firstInstance` is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and `indexCount` vertices whose indices are retrieved from the index buffer. The index buffer is treated as an array of tightly packed unsigned integers of size defined by the `vkCmdBindIndexBuffer` ::`indexType` parameter with which the buffer was bound.

The first vertex index is at an offset of `firstIndex × indexSize + offset` within the bound index buffer, where `offset` is the offset specified by `vkCmdBindIndexBuffer` and `indexSize` is the byte size of the type specified by `indexType`. Subsequent index values are retrieved from consecutive locations in the index buffer. Indices are first compared to the primitive restart value, then zero extended to 32 bits (if the `indexType` is `VK_INDEX_TYPE_UINT8_EXT` or `VK_INDEX_TYPE_UINT16`) and have `vertexOffset` added to them, before being supplied as the `vertexIndex` value.

The primitives are drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.
Valid Usage

- **VUID-vkCmdDrawIndexed-magFilter-04553**
  
  If a *VkSampler* created with *magFilter* or *minFilter* equal to *VK_FILTER_LINEAR* and *compareEnable* equal to *VK_FALSE* is used to sample a *VkImageView* as a result of this command, then the image view’s *format features* must contain *VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT*

- **VUID-vkCmdDrawIndexed-mipmapMode-04770**
  
  If a *VkSampler* created with *mipmapMode* equal to *VK_SAMPLER_MIPMAP_MODE_LINEAR* and *compareEnable* equal to *VK_FALSE* is used to sample a *VkImageView* as a result of this command, then the image view’s *format features* must contain *VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT*

- **VUID-vkCmdDrawIndexed-None-02691**
  
  If a *VkImageView* is accessed using atomic operations as a result of this command, then the image view’s *format features* must contain *VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT*

- **VUID-vkCmdDrawIndexed-None-02692**
  
  If a *VkImageView* is sampled with *VK_FILTER_CUBIC_EXT* as a result of this command, then the image view’s *format features* must contain *VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT*

- **VUID-vkCmdDrawIndexed-filterCubic-02694**
  
  Any *VkImageView* being sampled with *VK_FILTER_CUBIC_EXT* as a result of this command must have a *VkImageViewType* and format that supports cubic filtering, as specified by *VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic* returned by *vkGetPhysicalDeviceImageFormatProperties2*

- **VUID-vkCmdDrawIndexed-filterCubicMinmax-02695**
  
  Any *VkImageView* being sampled with *VK_FILTER_CUBIC_EXT* with a reduction mode of either *VK_SAMPLER_REDUCTION_MODE_MIN* or *VK_SAMPLER_REDUCTION_MODE_MAX* as a result of this command must have a *VkImageViewType* and format that supports cubic filtering together with minmax filtering, as specified by *VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax* returned by *vkGetPhysicalDeviceImageFormatProperties2*

- **VUID-vkCmdDrawIndexed-flags-02696**
  
  Any *VkImage* created with a *VkImageCreateInfo::flags* containing *VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV* sampled as a result of this command must only be sampled using a *VkSamplerAddressMode* of *VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE*

- **VUID-vkCmdDrawIndexed-None-02697**
  
  For each set *n* that is statically used by the *VkPipeline* bound to the pipeline bind point used by this command, a descriptor set must have been bound to *n* at the same pipeline bind point, with a *VkPipelineLayout* that is compatible for set *n*, with the *VkPipelineLayout* used to create the current *VkPipeline*, as described in *Pipeline Layout Compatibility*

- **VUID-vkCmdDrawIndexed-None-02698**
  
  For each push constant that is statically used by the *VkPipeline* bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a *VkPipelineLayout* that is compatible for push constants, with the *VkPipelineLayout* used to create the current *VkPipeline*, as described in *Pipeline Layout Compatibility*
Compatibility

- **VUID-vkCmdDrawIndexed-None-02699**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndexed-None-02700**
  A valid pipeline must be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndexed-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- **VUID-vkCmdDrawIndexed-None-02859**
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDrawIndexed-None-02702**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDrawIndexed-None-02703**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDrawIndexed-None-02704**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDrawIndexed-None-02705**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexed-None-02706**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexed-None-04115**
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the
Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- VUID-vkCmdDrawIndexed-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- VUID-vkCmdDrawIndexed-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawIndexed-SampledType-04471
  If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawIndexed-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawIndexed-SampledType-04473
  If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawIndexed-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawIndexed-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawIndexed-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndexed-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndexed-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set

- VUID-vkCmdDrawIndexed-None-04584
  Image subresources used as attachments in the current render pass must not be accessed in any way other than as an attachment by this command, except for cases involving
read-only access to depth/stencil attachments as described in the Render Pass chapter

- VUID-vkCmdDrawIndexed-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to
  \(\text{VkPhysicalDeviceMultiviewProperties.maxMultiviewInstanceIndex}\)

- VUID-vkCmdDrawIndexed-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with \(\text{VkPipelineSampleLocationsStateCreateInfoEXT.sampleLocationsEnable}\) set to \(\text{VK_TRUE}\) and the current subpass has a depth/stencil attachment, then that attachment must have been created with the \(\text{VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT}\) bit set

- VUID-vkCmdDrawIndexed-viewportCount-03417
  If the bound graphics pipeline state was created with the \(\text{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT}\) dynamic state enabled, but not the \(\text{VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT}\) dynamic state enabled, then \(\text{vkCmdSetViewportWithCountEXT}\) must have been called in the current command buffer prior to this draw command, and the \(\text{viewportCount}\) parameter of \(\text{vkCmdSetViewportWithCountEXT}\) must match the \(\text{VkPipelineViewportStateCreateInfo.viewportCount}\) of the pipeline

- VUID-vkCmdDrawIndexed-scissorCount-03418
  If the bound graphics pipeline state was created with the \(\text{VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT}\) dynamic state enabled, but not the \(\text{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT}\) dynamic state enabled, then \(\text{vkCmdSetScissorWithCountEXT}\) must have been called in the current command buffer prior to this draw command, and the \(\text{scissorCount}\) parameter of \(\text{vkCmdSetScissorWithCountEXT}\) must match the \(\text{VkPipelineViewportStateCreateInfo.viewportCount}\) of the pipeline

- VUID-vkCmdDrawIndexed-viewportCount-03419
  If the bound graphics pipeline state was created with both the \(\text{VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT}\) and \(\text{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT}\) dynamic states enabled then both \(\text{vkCmdSetViewportWithCountEXT}\) and \(\text{vkCmdSetScissorWithCountEXT}\) must have been called in the current command buffer prior to this draw command, and the \(\text{viewportCount}\) parameter of \(\text{vkCmdSetViewportWithCountEXT}\) must match the \(\text{scissorCount}\) parameter of \(\text{vkCmdSetScissorWithCountEXT}\)

- VUID-vkCmdDrawIndexed-viewportCount-04137
  If the bound graphics pipeline state was created with the \(\text{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT}\) dynamic state enabled, but not the \(\text{VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV}\) dynamic state enabled, then the bound graphics pipeline must have been created with \(\text{VkPipelineViewportWScalingStateCreateInfoNV.viewportCount}\) greater or equal to the \(\text{viewportCount}\) parameter in the last call to \(\text{vkCmdSetViewportWithCountEXT}\)

- VUID-vkCmdDrawIndexed-viewportCount-04138
  If the bound graphics pipeline state was created with the \(\text{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT}\) and \(\text{VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV}\) dynamic states enabled then the \(\text{viewportCount}\) parameter in the last call to
**vkCmdSetViewportWScalingNV** must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndexed-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndexed-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndexed-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportSwizzleStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndexed-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndexed-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this draw command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

- **VUID-vkCmdDrawIndexed-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawIndexed-None-04876**
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT dynamic state enabled then
vkCmdSetRasterizerDiscardEnableEXT must have been called in the current command
buffer prior to this draw command

• VUID-vkCmdDrawIndexed-None-04877
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT dynamic state enabled then
vkCmdSetDepthBiasEnableEXT must have been called in the current command buffer
prior to this draw command

• VUID-vkCmdDrawIndexed-logicOp-04878
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT
dynamic state enabled then vkCmdSetLogicOpEXT must have been called in the current
command buffer prior to this draw command and the logicOp must be a valid VkLogicOp
value

• VUID-vkCmdDrawIndexed-None-04879
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT dynamic state enabled then
vkCmdSetPrimitiveRestartEnableEXT must have been called in the current command
buffer prior to this draw command

• VUID-vkCmdDrawIndexed-primitiveFragmentShadingRateWithMultipleViewports-04552
If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the
bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT
dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to
the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCountEXT must have
been called in the current command buffer prior to this draw command, and the
viewportCount parameter of vkCmdSetViewportWithCountEXT must be 1

• VUID-vkCmdDrawIndexed-blendEnable-04727
If rasterization is not disabled in the bound graphics pipeline, then for each color
attachment in the subpass, if the corresponding image view's format features do not
contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of
the corresponding element of the pAttachments member of pColorBlendState must be
VK_FALSE

• VUID-vkCmdDrawIndexed-rasterizationSamples-04740
If rasterization is not disabled in the bound graphics pipeline, and neither the
VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are
enabled, then VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the
same as the current subpass color and/or depth/stencil attachments

• VUID-vkCmdDrawIndexed-pStrides-04884
If the bound graphics pipeline was created with the
VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, then
vkCmdBindVertexBuffers2EXT must have been called in the current command buffer
prior to this draw command, and the pStrides parameter of
vkCmdBindVertexBuffers2EXT must not be NULL

• VUID-vkCmdDrawIndexed-None-04887
All vertex input bindings accessed via vertex input variables declared in the vertex
shader entry point's interface **must** have either valid or **VK_NULL_HANDLE** buffers bound

- VUID-vkCmdDrawIndexed-None-04008
  If the **nullDescriptor** feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** not be **VK_NULL_HANDLE**

- VUID-vkCmdDrawIndexed-None-02721
  For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in **Vertex Input Description**

- VUID-vkCmdDrawIndexed-indexSize-00463
  \((indexSize \times (firstIndex + indexCount) + offset)\) **must** be less than or equal to the size of the bound index buffer, with **indexSize** being based on the type specified by **indexType**, where the index buffer, **indexType**, and **offset** are specified via **vkCmdBindIndexBuffer**

---

**Valid Usage (Implicit)**

- VUID-vkCmdDrawIndexed-commandBuffer-parameter
  **commandBuffer** **must** be a valid **VkCommandBuffer** handle

- VUID-vkCmdDrawIndexed-commandBuffer-recording
  **commandBuffer** **must** be in the **recording state**

- VUID-vkCmdDrawIndexed-commandBuffer-cmpool
  The **VkCommandPool** that **commandBuffer** was allocated from **must** support graphics operations

- VUID-vkCmdDrawIndexed-renderpass
  This command **must** only be called inside of a render pass instance

---

**Host Synchronization**

- Host access to **commandBuffer** **must** be externally synchronized

- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

---

**Command Properties**

<table>

To record a non-indexed indirect draw, call:
// Provided by VK_VERSION_1_0

void vkCmdDrawIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    uint32_t drawCount,
    uint32_t stride);

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and **can be zero**.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirect` behaves similarly to `vkCmdDraw` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndirectCommand` structures. If `drawCount` is less than or equal to one, `stride` is ignored.
Valid Usage

- **VUID-vkCmdDrawIndirect-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndirect-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndirect-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDrawIndirect-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdDrawIndirect-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndirect-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndirect-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdDrawIndirect-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDrawIndirect-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.
Compatibility

- VUID-vkCmdDrawIndirect-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawIndirect-None-02700
  A valid pipeline **must** be bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawIndirect-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdDrawIndirect-None-02859
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDrawIndirect-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- VUID-vkCmdDrawIndirect-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- VUID-vkCmdDrawIndirect-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDrawIndirect-None-02705
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawIndirect-None-02706
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawIndirect-None-04115
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the
Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

• VUID-vkCmdDrawIndirect-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

• VUID-vkCmdDrawIndirect-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

• VUID-vkCmdDrawIndirect-SampledType-04471
  If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

• VUID-vkCmdDrawIndirect-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

• VUID-vkCmdDrawIndirect-SampledType-04473
  If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

• VUID-vkCmdDrawIndirect-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

• VUID-vkCmdDrawIndirect-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

• VUID-vkCmdDrawIndirect-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdDrawIndirect-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdDrawIndirect-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set

• VUID-vkCmdDrawIndirect-None-04584
  Image subresources used as attachments in the current render pass must not be accessed in any way other than as an attachment by this command, except for cases involving
read-only access to depth/stencil attachments as described in the Render Pass chapter

- **VUID-vkCmdDrawIndirect-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to \( \text{VkPhysicalDeviceMultiviewProperties} :: \text{maxMultiviewInstanceIndex} \)

- **VUID-vkCmdDrawIndirect-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with \( \text{VkPipelineSampleLocationsStateCreateInfoEXT} :: \text{sampleLocationsEnable} \) set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- **VUID-vkCmdDrawIndirect-viewportCount-03417**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the \( \text{VkPipelineViewportStateCreateInfo} :: \text{viewportCount} \) of the pipeline

- **VUID-vkCmdDrawIndirect-scissorCount-03418**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT must match the \( \text{VkPipelineViewportStateCreateInfo} :: \text{viewportCount} \) of the pipeline

- **VUID-vkCmdDrawIndirect-viewportCount-03419**
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the scissorCount parameter of vkCmdSetScissorWithCountEXT

- **VUID-vkCmdDrawIndirect-viewportCount-04137**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with \( \text{VkPipelineViewportWScalingStateCreateInfoNV} :: \text{viewportCount} \) greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- **VUID-vkCmdDrawIndirect-viewportCount-04138**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportWithCountEXT must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndirect-viewportCount-04139
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndirect-viewportCount-04140
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndirect-VkPipelineViewportCreateInfo-04141
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled and an instance of VkPipelineViewportSwizzleStateCreateInfoNV chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndirect-VkPipelineViewportCreateInfo-04142
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled and an instance of VkPipelineViewportExclusiveScissorStateCreateInfoNV chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndirect-primitiveTopology-03420
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT dynamic state enabled then vkCmdSetPrimitiveTopologyEXT must have been called in the current command buffer prior to this draw command, and the primitiveTopology parameter of vkCmdSetPrimitiveTopologyEXT must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state

- VUID-vkCmdDrawIndirect-None-04875
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndirect-None-04876
  If the bound graphics pipeline state was created with the
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this draw command and the `logicOp` must be a valid `VkLogicOp` value.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this draw command.

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this draw command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1.

If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be `NULL`.

All vertex input bindings accessed via vertex input variables declared in the vertex...
shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound

- VUID-vkCmdDrawIndirect-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be VK_NULL_HANDLE

- VUID-vkCmdDrawIndirect-None-02721
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- VUID-vkCmdDrawIndirect-buffer-02708
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdDrawIndirect-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDrawIndirect-offset-02710
  offset must be a multiple of 4

- VUID-vkCmdDrawIndirect-drawCount-02718
  If the multi-draw indirect feature is not enabled, drawCount must be 0 or 1

- VUID-vkCmdDrawIndirect-drawCount-02719
  drawCount must be less than or equal toVkPhysicalDeviceLimits::maxDrawIndirectCount

- VUID-vkCmdDrawIndirect-firstInstance-00478
  If the drawIndirectFirstInstance feature is not enabled, all the firstInstance members of the VkDrawIndirectCommand structures accessed by this command must be 0

- VUID-vkCmdDrawIndirect-drawCount-00476
  If drawCount is greater than 1, stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndirectCommand)

- VUID-vkCmdDrawIndirect-drawCount-00487
  If drawCount is equal to 1, (offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

- VUID-vkCmdDrawIndirect-drawCount-00488
  If drawCount is greater than 1, (stride × (drawCount - 1) + offset + sizeof (VkDrawIndirectCommand)) must be less than or equal to the size of buffer
Valid Usage (Implicit)

- VUID-vkCmdDrawIndirect-commandBuffer-parameter
  
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDrawIndirect-buffer-parameter
  
  buffer must be a valid VkBuffer handle

- VUID-vkCmdDrawIndirect-commandBuffer-recording
  
  commandBuffer must be in the recording state

- VUID-vkCmdDrawIndirect-commandBuffer-cmdpool
  
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdDrawIndirect-renderpass
  
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawIndirect-commonparent
  
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The VkDrawIndirectCommand structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndirectCommand {
    uint32_t vertexCount;
    uint32_t instanceCount;
    uint32_t firstVertex;
    uint32_t firstInstance;
} VkDrawIndirectCommand;
```

- vertexCount is the number of vertices to draw.
• `instanceCount` is the number of instances to draw.
• `firstVertex` is the index of the first vertex to draw.
• `firstInstance` is the instance ID of the first instance to draw.

The members of `VkDrawIndirectCommand` have the same meaning as the similarly named parameters of `vkCmdDraw`.

## Valid Usage

- **VUID-VkDrawIndirectCommand-None-00500**
  For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in `Vertex Input Description`.

- **VUID-VkDrawIndirectCommand-firstInstance-00501**
  If the `drawIndirectFirstInstance` feature is not enabled, `firstInstance` **must** be 0.

To record a non-indexed draw call with a draw call count sourced from a buffer, call:

```c
// Provided by VK_KHR_draw_indirect_count
void vkCmdDrawIndirectCountKHR(
    VkCommandBuffer commandBuffer,   
    VkBuffer buffer,                
    VkDeviceSize offset,            
    VkBuffer countBuffer,           
    VkDeviceSize countBufferOffset, 
    uint32_t maxDrawCount,          
    uint32_t stride);              
```

or the equivalent command:

```c
// Provided by VK_AMD_draw_indirect_count
void vkCmdDrawIndirectCountAMD(
    VkCommandBuffer commandBuffer,   
    VkBuffer buffer,                
    VkDeviceSize offset,            
    VkBuffer countBuffer,           
    VkDeviceSize countBufferOffset, 
    uint32_t maxDrawCount,          
    uint32_t stride);              
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `countBuffer` is the buffer containing the draw count.
- `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
• `maxDrawCount` specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.

• `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirectCount` behaves similarly to `vkCmdDrawIndirect` except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.
Valid Usage

- **VUID-vkCmdDrawIndirectCount-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndirectCount-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndirectCount-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDrawIndirectCount-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdDrawIndirectCount-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndirectCount-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndirectCount-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdDrawIndirectCount-None-02697**
  For each set \( n \) that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to \( n \) at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set \( n \), with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDrawIndirectCount-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.
Compatibility

- VUID-vkCmdDrawIndirectCount-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawIndirectCount-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawIndirectCount-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdDrawIndirectCount-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDrawIndirectCount-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- VUID-vkCmdDrawIndirectCount-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- VUID-vkCmdDrawIndirectCount-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDrawIndirectCount-None-02705
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawIndirectCount-None-02706
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawIndirectCount-None-04115
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the
Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- VUID-vkCmdDrawIndirectCount-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- VUID-vkCmdDrawIndirectCount-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawIndirectCount-SampledType-04471
  If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawIndirectCount-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawIndirectCount-SampledType-04473
  If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawIndirectCount-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawIndirectCount-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawIndirectCount-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndirectCount-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndirectCount-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set

- VUID-vkCmdDrawIndirectCount-None-04584
  Image subresources used as attachments in the current render pass must not be accessed in any way other than as an attachment by this command, except for cases involving
read-only access to depth/stencil attachments as described in the Render Pass chapter

- VUID-vkCmdDrawIndirectCount-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- VUID-vkCmdDrawIndirectCount-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdDrawIndirectCount-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawIndirectCount-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawIndirectCount-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the scissorCount parameter of vkCmdSetScissorWithCountEXT

- VUID-vkCmdDrawIndirectCount-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndirectCount-viewportCount-04138
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndirectCount-viewportCount-04139
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndirectCount-viewportCount-04140
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndirectCount-VkPipelineViewportCreateInfo-04141
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled and an instance of VkPipelineViewportSwizzleStateCreateInfoNV chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndirectCount-VkPipelineViewportCreateInfo-04142
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled and an instance of VkPipelineViewportExclusiveScissorStateCreateInfoNV chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndirectCount-primitiveTopology-03420
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT dynamic state enabled then vkCmdSetPrimitiveTopologyEXT must have been called in the current command buffer prior to this draw command, and the primitiveTopology parameter of vkCmdSetPrimitiveTopologyEXT must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state

- VUID-vkCmdDrawIndirectCount-None-04875
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndirectCount-None-04876
  If the bound graphics pipeline state was created with the
If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT** dynamic state enabled then **vkCmdSetDepthBiasEnableEXT** must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_LOGIC_OP_EXT** dynamic state enabled then **vkCmdSetLogicOpEXT** must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT** dynamic state enabled then **vkCmdSetPrimitiveRestartEnableEXT** must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT** dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the **PrimitiveShadingRateKHR** built-in, then **vkCmdSetViewportWithCountEXT** must have been called in the current command buffer prior to this draw command, and the **viewportCount** parameter of **vkCmdSetViewportWithCountEXT** must be 1.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain **VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT**, then the **blendEnable** member of the corresponding element of the **pAttachments** member of **pColorBlendState** must be **VK_FALSE**

If rasterization is not disabled in the bound graphics pipeline, and neither the **VK_AMD_mixed_attachment_samples** nor the **VK_NV_framebuffer_mixed_samples** extensions are enabled, then **VkPipelineMultisampleStateCreateInfo::rasterizationSamples** must be the same as the current subpass color and/or depth/stencil attachments.

If the bound graphics pipeline was created with the **VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT** dynamic state enabled, then **vkCmdBindVertexBuffers2EXT** must have been called in the current command buffer prior to this draw command, and the **pStrides** parameter of **vkCmdBindVertexBuffers2EXT** must not be **NULL**

All vertex input bindings accessed via vertex input variables declared in the vertex
shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound

- VUID-vkCmdDrawIndirectCount-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be VK_NULL_HANDLE

- VUID-vkCmdDrawIndirectCount-None-02721
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- VUID-vkCmdDrawIndirectCount-buffer-02708
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdDrawIndirectCount-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDrawIndirectCount-offset-02710
  offset must be a multiple of 4

- VUID-vkCmdDrawIndirectCount-countBuffer-02711
  countBuffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDrawIndirectCount-countBufferOffset-02712
  countBufferOffset must be a multiple of 4

- VUID-vkCmdDrawIndirectCount-countBuffer-02717
  The count stored in countBuffer must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

- VUID-vkCmdDrawIndirectCount-countBufferOffset-04129
  (countBufferOffset + sizeof(uint32_t)) must be less than or equal to the size of countBuffer

- VUID-vkCmdDrawIndirectCount-stride-03110
  stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndirectCommand)

- VUID-vkCmdDrawIndirectCount-maxDrawCount-03111
  If maxDrawCount is greater than or equal to 1, (stride × (maxDrawCount - 1) + offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

- VUID-vkCmdDrawIndirectCount-countBuffer-03121
  If the count stored in countBuffer is equal to 1, (offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

- VUID-vkCmdDrawIndirectCount-countBuffer-03122
  If the count stored in countBuffer is greater than 1, (stride × (drawCount - 1) + offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer
Valid Usage (Implicit)

- VUID-vkCmdDrawIndirectCount-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDrawIndirectCount-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-vkCmdDrawIndirectCount-countBuffer-parameter
  countBuffer must be a valid VkBuffer handle

- VUID-vkCmdDrawIndirectCount-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDrawIndirectCount-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdDrawIndirectCount-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawIndirectCount-commonparent
  Each of buffer, commandBuffer, and countBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

To record an indexed indirect draw, call:
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexedIndirect(
    VkCommandBuffer                             commandBuffer,
    VkBuffer                                    buffer,
    VkDeviceSize                                offset,
    uint32_t                                    drawCount,
    uint32_t                                    stride);

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and can be zero.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndexedIndirect` behaves similarly to `vkCmdDrawIndexed` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndexedIndirectCommand` structures. If `drawCount` is less than or equal to one, `stride` is ignored.
Valid Usage

- **VUID-vkCmdDrawIndexedIndirect-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndexedIndirect-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndexedIndirect-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDrawIndexedIndirect-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdDrawIndexedIndirect-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndexedIndirect-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndexedIndirect-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdDrawIndexedIndirect-None-02697**
  For each set $n$ that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set $n$, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in `Pipeline Layout Compatibility`.

- **VUID-vkCmdDrawIndexedIndirect-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in `Pipeline Layout Compatibility`.
Compatibility

• VUID-vkCmdDrawIndexedIndirect-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

• VUID-vkCmdDrawIndexedIndirect-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command.

• VUID-vkCmdDrawIndexedIndirect-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

• VUID-vkCmdDrawIndexedIndirect-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

• VUID-vkCmdDrawIndexedIndirect-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

• VUID-vkCmdDrawIndexedIndirect-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

• VUID-vkCmdDrawIndexedIndirect-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

• VUID-vkCmdDrawIndexedIndirect-None-02705
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

• VUID-vkCmdDrawIndexedIndirect-None-02706
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

• VUID-vkCmdDrawIndexedIndirect-None-04115
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the
Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- VUID-vkCmdDrawIndexedIndirect-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- VUID-vkCmdDrawIndexedIndirect-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawIndexedIndirect-SampledType-04471
  If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawIndexedIndirect-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawIndexedIndirect-SampledType-04473
  If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawIndexedIndirect-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawIndexedIndirect-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawIndexedIndirect-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdDrawIndexedIndirect-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdDrawIndexedIndirect-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

- VUID-vkCmdDrawIndexedIndirect-None-04584
  Image subresources used as attachments in the current render pass must not be accessed in any way other than as an attachment by this command, except for cases involving...
• VUID-vkCmdDrawIndexedIndirect-maxMultiviewInstanceIndex-02688
If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

• VUID-vkCmdDrawIndexedIndirect-sampleLocationsEnable-02689
If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

• VUID-vkCmdDrawIndexedIndirect-viewportCount-03417
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

• VUID-vkCmdDrawIndexedIndirect-scissorCount-03418
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

• VUID-vkCmdDrawIndexedIndirect-viewportCount-03419
If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the scissorCount parameter of vkCmdSetScissorWithCountEXT

• VUID-vkCmdDrawIndexedIndirect-viewportCount-04137
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

• VUID-vkCmdDrawIndexedIndirect-viewportCount-04138
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportWScalingNV must be greater than or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCountEXT}

- VUID-vkCmdDrawIndexedIndirect-viewportCount-04139
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT} dynamic state enabled, but not the \texttt{VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV} dynamic state enabled, then the bound graphics pipeline must have been created with \texttt{VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCountEXT}

- VUID-vkCmdDrawIndexedIndirect-viewportCount-04140
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT} and \texttt{VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV} dynamic states enabled then the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportShadingRatePaletteNV} must be greater than or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCountEXT}

- VUID-vkCmdDrawIndexedIndirect-VkPipelineViewportCreateInfo-04141
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT} dynamic state enabled and an instance of \texttt{VkPipelineViewportSwizzleStateCreateInfoNV} chained from \texttt{VkPipelineViewportCreateInfo}, then the bound graphics pipeline must have been created with \texttt{VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCountEXT}

- VUID-vkCmdDrawIndexedIndirect-VkPipelineViewportCreateInfo-04142
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT} dynamic state enabled and an instance of \texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV} chained from \texttt{VkPipelineViewportCreateInfo}, then the bound graphics pipeline must have been created with \texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCountEXT}

- VUID-vkCmdDrawIndexedIndirect-primitiveTopology-03420
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT} dynamic state enabled then \texttt{vkCmdSetPrimitiveTopologyEXT} must have been called in the current command buffer prior to this draw command, and the \texttt{primitiveTopology} parameter of \texttt{vkCmdSetPrimitiveTopologyEXT} must be of the same topology class as the pipeline \texttt{VkPipelineInputAssemblyStateCreateInfo::topology} state

- VUID-vkCmdDrawIndexedIndirect-None-04875
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT} dynamic state enabled then \texttt{vkCmdSetPatchControlPointsEXT} must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndexedIndirect-None-04876
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT dynamic state enabled then
vkCmdSetRasterizerDiscardEnableEXT must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndexedIndirect-None-04877
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT dynamic state enabled then
  vkCmdSetDepthBiasEnableEXT must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndexedIndirect-logicOp-04878
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then
  vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this draw command and the logicOp must be a valid VkLogicOp value

- VUID-vkCmdDrawIndexedIndirect-None-04879
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT dynamic state enabled then
  vkCmdSetPrimitiveRestartEnableEXT must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndexedIndirect-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the
  VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then
  vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must be 1

- VUID-vkCmdDrawIndexedIndirect-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain
  VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

- VUID-vkCmdDrawIndexedIndirect-rasterizationSamples-04740
  If rasterization is not disabled in the bound graphics pipeline, and neither the
  VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are enabled, then
  VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdDrawIndexedIndirect-pStrides-04884
  If the bound graphics pipeline was created with the
  VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, then
  vkCmdBindVertexBuffer2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffer2EXT must not be NULL

- VUID-vkCmdDrawIndexedIndirect-None-04007
  All vertex input bindings accessed via vertex input variables declared in the vertex...
shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound

- VUID-vkCmdDrawIndexedIndirect-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be VK_NULL_HANDLE

- VUID-vkCmdDrawIndexedIndirect-None-02721
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- VUID-vkCmdDrawIndexedIndirect-buffer-02708
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDrawIndexedIndirect-offset-02710
  offset must be a multiple of 4

- VUID-vkCmdDrawIndexedIndirect-drawCount-00528
  If drawCount is greater than 1, stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndexedIndirectCommand)

- VUID-vkCmdDrawIndexedIndirect-firstInstance-00530
  If the drawIndirectFirstInstance feature is not enabled, all the firstInstance members of the VkDrawIndexedIndirectCommand structures accessed by this command must be 0

- VUID-vkCmdDrawIndexedIndirect-drawCount-00539
  If drawCount is equal to 1, (offset + sizeof(VkDrawIndexedIndirectCommand)) must be less than or equal to the size of buffer

- VUID-vkCmdDrawIndexedIndirect-drawCount-00540
  If drawCount is greater than 1, (stride × (drawCount - 1) + offset + sizeof(VkDrawIndexedIndirectCommand)) must be less than or equal to the size of buffer
Valid Usage (Implicit)

- VUID-vkCmdDrawIndexedIndirect-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDrawIndexedIndirect-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-vkCmdDrawIndexedIndirect-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDrawIndexedIndirect-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdDrawIndexedIndirect-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawIndexedIndirect-commonparent
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

The VkDrawIndexedIndirectCommand structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndexedIndirectCommand {
    uint32_t    indexCount;
    uint32_t    instanceCount;
    uint32_t    firstIndex;
    int32_t     vertexOffset;
    uint32_t    firstInstance;
} VkDrawIndexedIndirectCommand;
```
indexCount is the number of vertices to draw.

instanceCount is the number of instances to draw.

firstIndex is the base index within the index buffer.

vertexOffset is the value added to the vertex index before indexing into the vertex buffer.

firstInstance is the instance ID of the first instance to draw.

The members of VkDrawIndexedIndirectCommand have the same meaning as the similarly named parameters of vkCmdDrawIndexed.

Valid Usage

- VUID-VkDrawIndexedIndirectCommand-None-00552
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- VUID-VkDrawIndexedIndirectCommand-indexSize-00553
  \[(\text{indexSize} \times (\text{firstIndex} + \text{indexCount}) + \text{offset})\] must be less than or equal to the size of the bound index buffer, with indexSize being based on the type specified by indexType, where the index buffer, indexType, and offset are specified via vkCmdBindIndexBuffer

- VUID-VkDrawIndexedIndirectCommand-firstInstance-00554
  If the drawIndirectFirstInstance feature is not enabled, firstInstance must be 0

To record an indexed draw call with a draw call count sourced from a buffer, call:

```c
// Provided by VK_KHR_draw_indirect_count
void vkCmdDrawIndexedIndirectCountKHR(
  VkCommandBuffer                             commandBuffer,
  VkBuffer                                    buffer,
  VkDeviceSize                                offset,
  VkBuffer                                    countBuffer,
  VkDeviceSize                                countBufferOffset,
  uint32_t                                    maxDrawCount,
  uint32_t                                    stride);
```

or the equivalent command

```c
// Provided by VK_AMD_draw_indirect_count
void vkCmdDrawIndexedIndirectCountAMD(
  VkCommandBuffer                             commandBuffer,
  VkBuffer                                    buffer,
  VkDeviceSize                                offset,
  VkBuffer                                    countBuffer,
  VkDeviceSize                                countBufferOffset,
  uint32_t                                    maxDrawCount,
  uint32_t                                    stride);
```
• `commandBuffer` is the command buffer into which the command is recorded.
• `buffer` is the buffer containing draw parameters.
• `offset` is the byte offset into `buffer` where parameters begin.
• `countBuffer` is the buffer containing the draw count.
• `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
• `maxDrawCount` specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.
• `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndexedIndirectCount` behaves similarly to `vkCmdDrawIndexedIndirect` except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.
Valid Usage

- **VUID-vkCmdDrawIndexedIndirectCount-magFilter-04553**
  
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndexedIndirectCount-mipmapMode-04770**
  
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndexedIndirectCount-None-02691**
  
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDrawIndexedIndirectCount-None-02692**
  
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdDrawIndexedIndirectCount-filterCubic-02694**
  
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndexedIndirectCount-filterCubicMinmax-02695**
  
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndexedIndirectCount-flags-02696**
  
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdDrawIndexedIndirectCount-None-02697**
  
  For each set $n$ that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set $n$, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDrawIndexedIndirectCount-None-02698**
  
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.
Compatibility

- VUID-vkCmdDrawIndexedIndirectCount-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawIndexedIndirectCount-None-02700
  A valid pipeline **must** be bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdDrawIndexedIndirectCount-None-02859
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDrawIndexedIndirectCount-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- VUID-vkCmdDrawIndexedIndirectCount-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- VUID-vkCmdDrawIndexedIndirectCount-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDrawIndexedIndirectCount-None-02705
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawIndexedIndirectCount-None-02706
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawIndexedIndirectCount-None-04115
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the...
Type of the Texel operand of that instruction must have at least as many components as the image view's format.

- VUID-vkCmdDrawIndexedIndirectCount-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format.

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04471
  If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04473
  If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawIndexedIndirectCount-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawIndexedIndirectCount-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawIndexedIndirectCount-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndexedIndirectCount-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndexedIndirectCount-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set

- VUID-vkCmdDrawIndexedIndirectCount-None-04584
  Image subresources used as attachments in the current render pass must not be accessed in any way other than as an attachment by this command, except for cases involving
read-only access to depth/stencil attachments as described in the Render Pass chapter

• VUID-vkCmdDrawIndexedIndirectCount-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

• VUID-vkCmdDrawIndexedIndirectCount-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

• VUID-vkCmdDrawIndexedIndirectCount-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

• VUID-vkCmdDrawIndexedIndirectCount-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

• VUID-vkCmdDrawIndexedIndirectCount-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the scissorCount parameter of vkCmdSetScissorWithCountEXT

• VUID-vkCmdDrawIndexedIndirectCount-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

• VUID-vkCmdDrawIndexedIndirectCount-viewportCount-04138
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to...
vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndexedIndirectCount-viewportCount-04139
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndexedIndirectCount-viewportCount-04140
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndexedIndirectCount-VkPipelineViewportCreateInfo-04141
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled and an instance of VkPipelineViewportSwizzleStateCreateInfoNV chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndexedIndirectCount-VkPipelineViewportCreateInfo-04142
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled and an instance of VkPipelineViewportExclusiveScissorStateCreateInfoNV chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawIndexedIndirectCount-primitiveTopology-03420
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT dynamic state enabled then vkCmdSetPrimitiveTopologyEXT must have been called in the current command buffer prior to this draw command, and the primitiveTopology parameter of vkCmdSetPrimitiveTopologyEXT must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state

- VUID-vkCmdDrawIndexedIndirectCount-None-04875
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndexedIndirectCount-None-04876
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT  dynamic state enabled then
vkCmdSetRasterizerDiscardEnableEXT must have been called in the current command
buffer prior to this draw command

• VUID-vkCmdDrawIndexedIndirectCount-None-04877
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT  dynamic state enabled then
vkCmdSetDepthBiasEnableEXT must have been called in the current command buffer prior to this draw command

• VUID-vkCmdDrawIndexedIndirectCount-logicOp-04878
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT
dynamic state enabled then vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this draw command and the logicOp must be a valid VkLogicOp value

• VUID-vkCmdDrawIndexedIndirectCount-None-04879
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT
dynamic state enabled then vkCmdSetPrimitiveRestartEnableEXT must have been called in the current command buffer prior to this draw command

• VUID-vkCmdDrawIndexedIndirectCount-primitiveFragmentShadingRateWithMultipleViewports-04552
If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT
dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must be 1

• VUID-vkCmdDrawIndexedIndirectCount-blendEnable-04727
If rasterization is not disabled in the bound graphics pipeline, then for each color
attachment in the subpass, if the corresponding image view’s format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

• VUID-vkCmdDrawIndexedIndirectCount-rasterizationSamples-04740
If rasterization is not disabled in the bound graphics pipeline, and neither the VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are enabled, then VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the current subpass color and/or depth/stencil attachments

• VUID-vkCmdDrawIndexedIndirectCount-pStrides-04884
If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, then vkCmdBindVertexBuffers2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL

• VUID-vkCmdDrawIndexedIndirectCount-None-04007
All vertex input bindings accessed via vertex input variables declared in the vertex...
shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound

• VUID-vkCmdDrawIndexedIndirectCount-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be VK_NULL_HANDLE

• VUID-vkCmdDrawIndexedIndirectCount-None-02721
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

• VUID-vkCmdDrawIndexedIndirectCount-buffer-02708
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdDrawIndexedIndirectCount-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdDrawIndexedIndirectCount-offset-02710
  offset must be a multiple of 4

• VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02714
  If countBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02715
  countBuffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdDrawIndexedIndirectCount-countBufferOffset-02716
  countBufferOffset must be a multiple of 4

• VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02717
  The count stored in countBuffer must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

• VUID-vkCmdDrawIndexedIndirectCount-countBufferOffset-04129
  (countBufferOffset + sizeof(uint32_t)) must be less than or equal to the size of countBuffer

• VUID-vkCmdDrawIndexedIndirectCount-stride-03142
  stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndexedIndirectCommand)

• VUID-vkCmdDrawIndexedIndirectCount-maxDrawCount-03143
  If maxDrawCount is greater than or equal to 1, (stride × (maxDrawCount - 1) + offset + sizeof(VkDrawIndexedIndirectCommand)) must be less than or equal to the size of buffer

• VUID-vkCmdDrawIndexedIndirectCount-countBuffer-03153
  If count stored in countBuffer is equal to 1, (offset + sizeof(VkDrawIndexedIndirectCommand)) must be less than or equal to the size of buffer

• VUID-vkCmdDrawIndexedIndirectCount-countBuffer-03154
  If count stored in countBuffer is greater than 1, (stride × (drawCount - 1) + offset + sizeof(VkDrawIndexedIndirectCommand)) must be less than or equal to the size of buffer
Valid Usage (Implicit)

- **VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdDrawIndexedIndirectCount-buffer-parameter**
  - `buffer` must be a valid `VkBuffer` handle

- **VUID-vkCmdDrawIndexedIndirectCount-countBuffer-parameter**
  - `countBuffer` must be a valid `VkBuffer` handle

- **VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdDrawIndexedIndirectCount-renderpass**
  - This command must only be called inside of a render pass instance

- **VUID-vkCmdDrawIndexedIndirectCount-commonparent**
  - Each of `buffer`, `commandBuffer`, and `countBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

21.3.1. Drawing Transform Feedback

It is possible to draw vertex data that was previously captured during active transform feedback by binding one or more of the transform feedback buffers as vertex buffers. A pipeline barrier is required between using the buffers as transform feedback buffers and vertex buffers to ensure all writes to the transform feedback buffers are visible when the data is read as vertex attributes. The source access is `VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT` and the destination access is `VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT` for the pipeline stages `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` and `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT`
respectively. The value written to the counter buffer by `vkCmdEndTransformFeedbackEXT` can be used to determine the vertex count for the draw. A pipeline barrier is required between using the counter buffer for `vkCmdEndTransformFeedbackEXT` and `vkCmdDrawIndirectByteCountEXT` where the source access is `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT` and the destination access is `VK_ACCESS_INDIRECT_COMMAND_READ_BIT` for the pipeline stages `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` and `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT` respectively.

To record a non-indexed draw call, where the vertex count is based on a byte count read from a buffer and the passed in vertex stride parameter, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdDrawIndirectByteCountEXT(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    instanceCount,
    uint32_t                                    firstInstance,
    VkBuffer                                    counterBuffer,
    VkDeviceSize                                counterBufferOffset,
    uint32_t                                    counterOffset,
    uint32_t                                    vertexStride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `instanceCount` is the number of instances to draw.
- `firstInstance` is the instance ID of the first instance to draw.
- `counterBuffer` is the buffer handle from where the byte count is read.
- `counterBufferOffset` is the offset into the buffer used to read the byte count, which is used to calculate the vertex count for this draw call.
- `counterOffset` is subtracted from the byte count read from the `counterBuffer` at the `counterBufferOffset`.
- `vertexStride` is the stride in bytes between each element of the vertex data that is used to calculate the vertex count from the counter value. This value is typically the same value that was used in the graphics pipeline state when the transform feedback was captured as the XfbStride.

When the command is executed, primitives are assembled in the same way as done with `vkCmdDraw` except the `vertexCount` is calculated based on the byte count read from `counterBuffer` at offset `counterBufferOffset`. The assembled primitives execute the bound graphics pipeline.

The effective `vertexCount` is calculated as follows:

```c
const uint32_t * counterBufferPtr = (const uint8_t *)counterBuffer.address + counterBufferOffset;
vertexCount = floor(max(0, (*counterBufferPtr - counterOffset)) / vertexStride);
```

The effective `firstVertex` is zero.
Valid Usage

• VUID-vkCmdDrawIndirectByteCountEXT-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDrawIndirectByteCountEXT-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDrawIndirectByteCountEXT-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

• VUID-vkCmdDrawIndirectByteCountEXT-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

• VUID-vkCmdDrawIndirectByteCountEXT-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawIndirectByteCountEXT-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawIndirectByteCountEXT-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdDrawIndirectByteCountEXT-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDrawIndirectByteCountEXT-None-02698
  For each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility
Compatibility

- VUID-vkCmdDrawIndirectByteCountEXT-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-02700
  A valid pipeline **must** be bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdDrawIndirectByteCountEXT-None-02859
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDrawIndirectByteCountEXT-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- VUID-vkCmdDrawIndirectByteCountEXT-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- VUID-vkCmdDrawIndirectByteCountEXT-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDrawIndirectByteCountEXT-None-02705
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawIndirectByteCountEXT-None-02706
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawIndirectByteCountEXT-None-04115
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the...
Type of the Texel operand of that instruction must have at least as many components as the image view's format.

- VUID-vkCmdDrawIndirectByteCountEXT-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format.

- VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04471
  If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04473
  If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawIndirectByteCountEXT-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawIndirectByteCountEXT-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawIndirectByteCountEXT-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdDrawIndirectByteCountEXT-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdDrawIndirectByteCountEXT-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

- VUID-vkCmdDrawIndirectByteCountEXT-None-04584
  Image subresources used as attachments in the current render pass must not be accessed in any way other than as an attachment by this command, except for cases involving
read-only access to depth/stencil attachments as described in the Render Pass chapter

- **VUID-vkCmdDrawIndirectByteCountEXT-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- **VUID-vkCmdDrawIndirectByteCountEXT-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- **VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-03417**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT **must** have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT **must** match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- **VUID-vkCmdDrawIndirectByteCountEXT-scissorCount-03418**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT **must** have been called in the current command buffer prior to this draw command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT **must** match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- **VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-03419**
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT **must** have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT **must** match the viewportCount of the pipeline

- **VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-04137**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline **must** have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- **VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-04138**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportWScalingNV must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndirectByteCountEXT-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportSwizzleStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndirectByteCountEXT-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

- **VUID-vkCmdDrawIndirectByteCountEXT-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this draw command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-04876**
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT  dynamic state enabled then
\texttt{vkCmdSetRasterizerDiscardEnableEXT} must have been called in the current command
buffer prior to this draw command

- \texttt{VUID-vkCmdDrawIndirectByteCountEXT-None-04877}
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT  dynamic state enabled then
  \texttt{vkCmdSetDepthBiasEnableEXT} must have been called in the current command buffer
  prior to this draw command

- \texttt{VUID-vkCmdDrawIndirectByteCountEXT-logicOp-04878}
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT
dynamic state enabled then \texttt{vkCmdSetLogicOpEXT} must have been called in the current
  command buffer prior to this draw command and the \texttt{logicOp} must be a valid \texttt{VkLogicOp}
  value

- \texttt{VUID-vkCmdDrawIndirectByteCountEXT-None-04879}
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT  dynamic state enabled then
  \texttt{vkCmdSetPrimitiveRestartEnableEXT} must have been called in the current command
  buffer prior to this draw command

- \texttt{VUID-vkCmdDrawIndirectByteCountEXT-primitiveFragmentShadingRateWithMultipleViewports-04552}
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the
  bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT
  dynamic state enabled, and any of the shader stages of the bound graphics pipeline write
to the PrimitiveShadingRateKHR built-in, then \texttt{vkCmdSetViewportWithCountEXT} must have
  been called in the current command buffer prior to this draw command, and the
  \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCountEXT} must be 1

- \texttt{VUID-vkCmdDrawIndirectByteCountEXT-blendEnable-04727}
  If rasterization is not disabled in the bound graphics pipeline, then for each color
  attachment in the subpass, if the corresponding image view’s format features do not
  contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of
  the corresponding element of the \texttt{pAttachments} member of \texttt{pColorBlendState} must
  be VK_FALSE

- \texttt{VUID-vkCmdDrawIndirectByteCountEXT-rasterizationSamples-04740}
  If rasterization is not disabled in the bound graphics pipeline, and neither the
  VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are
  enabled, then \texttt{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} must be
  the same as the current subpass color and/or depth/stencil attachments

- \texttt{VUID-vkCmdDrawIndirectByteCountEXT-pStrides-04884}
  If the bound graphics pipeline was created with the
  VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT  dynamic state enabled, then
  \texttt{vkCmdBindVertexBuffers2EXT} must have been called in the current command buffer
  prior to this draw command, and the \texttt{pStrides} parameter of \texttt{vkCmdBindVertexBuffers2EXT} must not be \texttt{NULL}

- \texttt{VUID-vkCmdDrawIndirectByteCountEXT-None-04007}
  All vertex input bindings accessed via vertex input variables declared in the vertex
shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound

- VUID-vkCmdDrawIndirectByteCountEXT-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be VK_NULL_HANDLE

- VUID-vkCmdDrawIndirectByteCountEXT-None-02721
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- VUID-vkCmdDrawIndirectByteCountEXT-transformFeedback-02287
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback must be enabled

- VUID-vkCmdDrawIndirectByteCountEXT-transformFeedbackDraw-02288
  The implementation must support VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackDraw

- VUID-vkCmdDrawIndirectByteCountEXT-vertexStride-02289
  vertexStride must be greater than 0 and less than or equal to VkPhysicalDeviceLimits::maxTransformFeedbackBufferDataStride

- VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-04567
  If counterBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-02290
  counterBuffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDrawIndirectByteCountEXT-counterBufferOffset-04568
  counterBufferOffset must be a multiple of 4
Valid Usage (Implicit)

- **VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-parameter**
  commandBuffer must be a valid VkCommandBuffer handle

- **VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-parameter**
  counterBuffer must be a valid VkBuffer handle

- **VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-recording**
  commandBuffer must be in the recording state

- **VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-cmpool**
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- **VUID-vkCmdDrawIndirectByteCountEXT-renderpass**
  This command must only be called inside of a render pass instance

- **VUID-vkCmdDrawIndirectByteCountEXT-commonparent**
  Both of commandBuffer, and counterBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

21.4. Conditional Rendering

Certain rendering commands can be executed conditionally based on a value in buffer memory. These rendering commands are limited to drawing commands, dispatching commands, and clearing attachments with vkCmdClearAttachments within a conditional rendering block which is defined by commands vkCmdBeginConditionalRenderingEXT and vkCmdEndConditionalRenderingEXT. Other rendering commands remain unaffected by conditional rendering.

After beginning conditional rendering, it is considered active within the command buffer it was called until it is ended with vkCmdEndConditionalRenderingEXT.
Conditional rendering must begin and end in the same command buffer. When conditional rendering is active, a primary command buffer can execute secondary command buffers if the inherited conditional rendering feature is enabled. For a secondary command buffer to be executed while conditional rendering is active in the primary command buffer, it must set the conditionalRenderingEnable flag of VkCommandBufferInheritanceConditionalRenderingInfoEXT, as described in the Command Buffer Recording section.

Conditional rendering must also either begin and end inside the same subpass of a render pass instance, or must both begin and end outside of a render pass instance (i.e. contain entire render pass instances).

To begin conditional rendering, call:

```c
// Provided by VK_EXT_conditional_rendering
void vkCmdBeginConditionalRenderingEXT(
    VkCommandBuffer                             commandBuffer,
    const VkConditionalRenderingBeginInfoEXT*   pConditionalRenderingBegin);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `pConditionalRenderingBegin` is a pointer to a VkConditionalRenderingBeginInfoEXT structure specifying parameters of conditional rendering.

**Valid Usage**

- VUID-vkCmdBeginConditionalRenderingEXT-None-01980
  Conditional rendering must not already be active

**Valid Usage (Implicit)**

- VUID-vkCmdBeginConditionalRenderingEXT-commandBuffer-parameter
  `commandBuffer` must be a valid VkCommandBuffer handle
- VUID-vkCmdBeginConditionalRenderingEXT-pConditionalRenderingBegin-parameter
  `pConditionalRenderingBegin` must be a valid pointer to a valid VkConditionalRenderingBeginInfoEXT structure
- VUID-vkCmdBeginConditionalRenderingEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdBeginConditionalRenderingEXT-commandBuffer-cmdpool
  The VkCommandPool that `commandBuffer` was allocated from must support graphics, or compute operations
Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td>Both</td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

The `VkConditionalRenderingBeginInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_conditional_rendering
typedef struct VkConditionalRenderingBeginInfoEXT {
    VkStructureType                   sType;
    const void*                       pNext;
    VkBuffer                          buffer;
    VkDeviceSize                      offset;
    VkConditionalRenderingFlagsEXT    flags;
} VkConditionalRenderingBeginInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is a buffer containing the predicate for conditional rendering.
- `offset` is the byte offset into `buffer` where the predicate is located.
- `flags` is a bitmask of `VkConditionalRenderingFlagsEXT` specifying the behavior of conditional rendering.

If the 32-bit value at `offset` in `buffer` memory is zero, then the rendering commands are discarded, otherwise they are executed as normal. If the value of the predicate in `buffer` memory changes while conditional rendering is active, the rendering commands **may** be discarded in an implementation-dependent way. Some implementations may latch the value of the predicate upon beginning conditional rendering while others may read it before every rendering command.
Valid Usage

- VUID-VkConditionalRenderingBeginInfoEXT-buffer-01981
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkConditionalRenderingBeginInfoEXT-buffer-01982
  buffer must have been created with the VK_BUFFER_USAGE_CONDITIONAL_RENDERING_BIT_EXT bit set

- VUID-VkConditionalRenderingBeginInfoEXT-offset-01983
  offset must be less than the size of buffer by at least 32 bits

- VUID-VkConditionalRenderingBeginInfoEXT-offset-01984
  offset must be a multiple of 4

Valid Usage (Implicit)

- VUID-VkConditionalRenderingBeginInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_CONDITIONAL_RENDERING_BEGIN_INFO_EXT

- VUID-VkConditionalRenderingBeginInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkConditionalRenderingBeginInfoEXT-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-VkConditionalRenderingBeginInfoEXT-flags-parameter
  flags must be a valid combination of VkConditionalRenderingFlagBitsEXT values

Bits which can be set in VkCmdBeginConditionalRenderingEXT::flags specifying the behavior of conditional rendering are:

// Provided by VK_EXT_conditional_rendering
typedef enum VkConditionalRenderingFlagBitsEXT {
    VK_CONDITIONAL_RENDERING_INVERTED_BIT_EXT = 0x00000001,
} VkConditionalRenderingFlagBitsEXT;

- VK_CONDITIONAL_RENDERING_INVERTED_BIT_EXT specifies the condition used to determine whether to discard rendering commands or not. That is, if the 32-bit predicate read from buffer memory at offset is zero, the rendering commands are not discarded, and if non zero, then they are discarded.

// Provided by VK_EXT_conditional_rendering
typedef VkFlags VkConditionalRenderingFlagsEXT;

VkConditionalRenderingFlagsEXT is a bitmask type for setting a mask of zero or more VkConditionalRenderingFlagBitsEXT.
To end conditional rendering, call:

```c
// Provided by VK_EXT_conditional_rendering
extvoid vkCmdEndConditionalRenderingEXT(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer into which this command will be recorded.

Once ended, conditional rendering becomes inactive.

### Valid Usage

- **VUID-vkCmdEndConditionalRenderingEXT-None-01985**
  Conditional rendering must be active

- **VUID-vkCmdEndConditionalRenderingEXT-None-01986**
  If conditional rendering was made active outside of a render pass instance, it must not be ended inside a render pass instance

- **VUID-vkCmdEndConditionalRenderingEXT-None-01987**
  If conditional rendering was made active within a subpass it must be ended in the same subpass

### Valid Usage (Implicit)

- **VUID-vkCmdEndConditionalRenderingEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdEndConditionalRenderingEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdEndConditionalRenderingEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
21.5. Programmable Mesh Shading

In this drawing approach, primitives are assembled by the mesh shader stage. Mesh shading operates similarly to dispatching compute as the shaders make use of workgroups.

To record a draw that uses the mesh pipeline, call:

```c
// Provided by VK_NV_mesh_shader
void vkCmdDrawMeshTasksNV(
    VkCommandBuffer commandBuffer,
    uint32_t taskCount,
    uint32_t firstTask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `taskCount` is the number of local workgroups to dispatch in the X dimension. Y and Z dimension are implicitly set to one.
- `firstTask` is the X component of the first workgroup ID.

When the command is executed, a global workgroup consisting of `taskCount` local workgroups is assembled.
Valid Usage

- VUID-vkCmdDrawMeshTasksNV-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawMeshTasksNV-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawMeshTasksNV-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdDrawMeshTasksNV-flags-02696
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- VUID-vkCmdDrawMeshTasksNV-None-02697
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawMeshTasksNV-None-02698
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout
Compatibility

- VUID-vkCmdDrawMeshTasksNV-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMeshTasksNV-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMeshTasksNV-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- VUID-vkCmdDrawMeshTasksNV-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawMeshTasksNV-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

- VUID-vkCmdDrawMeshTasksNV-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- VUID-vkCmdDrawMeshTasksNV-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdDrawMeshTasksNV-None-02705
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksNV-None-02706
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksNV-None-04115
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the...
Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- **VUID-vkCmdDrawMeshTasksNV-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- **VUID-vkCmdDrawMeshTasksNV-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- **VUID-vkCmdDrawMeshTasksNV-SampledType-04471**
  If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- **VUID-vkCmdDrawMeshTasksNV-SampledType-04472**
  If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- **VUID-vkCmdDrawMeshTasksNV-SampledType-04473**
  If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- **VUID-vkCmdDrawMeshTasksNV-sparseImageInt64Atomics-04474**
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- **VUID-vkCmdDrawMeshTasksNV-sparseImageInt64Atomics-04475**
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- **VUID-vkCmdDrawMeshTasksNV-renderPass-02684**
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- **VUID-vkCmdDrawMeshTasksNV-subpass-02685**
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- **VUID-vkCmdDrawMeshTasksNV-None-02686**
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

- **VUID-vkCmdDrawMeshTasksNV-None-04584**
  Image subresources used as attachments in the current render pass must not be accessed in any way other than as an attachment by this command, except for cases involving...
read-only access to depth/stencil attachments as described in the Render Pass chapter

- **VUID-vkCmdDrawMeshTasksNV-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- **VUID-vkCmdDrawMeshTasksNV-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- **VUID-vkCmdDrawMeshTasksNV-viewportCount-03417**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- **VUID-vkCmdDrawMeshTasksNV-scissorCount-03418**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- **VUID-vkCmdDrawMeshTasksNV-viewportCount-03419**
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the scissorCount parameter of vkCmdSetScissorWithCountEXT

- **VUID-vkCmdDrawMeshTasksNV-viewportCount-04137**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- **VUID-vkCmdDrawMeshTasksNV-viewportCount-04138**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- **VUID-vkCmdDrawMeshTasksNV-viewportCount-04139**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- **VUID-vkCmdDrawMeshTasksNV-viewportCount-04140**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- **VUID-vkCmdDrawMeshTasksNV-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled and an instance of VkPipelineViewportSwizzleStateCreateInfoNV chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- **VUID-vkCmdDrawMeshTasksNV-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled and an instance of VkPipelineViewportExclusiveScissorStateCreateInfoNV chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- **VUID-vkCmdDrawMeshTasksNV-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT dynamic state enabled then vkCmdSetPrimitiveTopologyEXT must have been called in the current command buffer prior to this draw command, and the primitiveTopology parameter of vkCmdSetPrimitiveTopologyEXT must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state

- **VUID-vkCmdDrawMeshTasksNV-None-04875**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawMeshTasksNV-None-04876**
  If the bound graphics pipeline state was created with the
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawMeshTasksNV-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this draw command and the `logicOp` must be a valid `VkLogicOp` value.

- **VUID-vkCmdDrawMeshTasksNV-None-04879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawMeshTasksNV-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled then `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawMeshTasksNV-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this draw command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1.

- **VUID-vkCmdDrawMeshTasksNV-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

- **VUID-vkCmdDrawMeshTasksNV-rasterizationSamples-04740**
  If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDrawMeshTasksNV-pStrides-04884**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, then `vkCmdBindVertexBuffer2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffer2EXT` must not be NULL.

- **VUID-vkCmdDrawMeshTasksNV-taskCount-02119**
  `taskCount` must be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesNV::maxDrawMeshTasksCount`.

1364 | Chapter 21. Drawing Commands
Valid Usage (Implicit)

- VUID-vkCmdDrawMeshTasksNV-commandBuffer-parameter
  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdDrawMeshTasksNV-commandBuffer-recording
  
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdDrawMeshTasksNV-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdDrawMeshTasksNV-renderpass
  
  This command **must** only be called inside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>

</tbody>
</table>

To record an indirect mesh tasks draw, call:

```c
// Provided by VK_NV_mesh_shader
void vkCmdDrawMeshTasksIndirectNV(
    VkCommandBuffer commandBuffer,    
    VkBuffer buffer,                  
    VkDeviceSize offset,              
    uint32_t drawCount,               
    uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and **can** be zero.
- `stride` is the byte stride between successive sets of draw parameters.
vkCmdDrawMeshTasksIndirectNV behaves similarly to vkCmdDrawMeshTasksNV except that the parameters are read by the device from a buffer during execution. drawCount draws are executed by the command, with parameters taken from buffer starting at offset and increasing by stride bytes for each successive draw. The parameters of each draw are encoded in an array of VkDrawMeshTasksIndirectCommandNV structures. If drawCount is less than or equal to one, stride is ignored.
Valid Usage

- **VUID-vkCmdDrawMeshTasksIndirectNV-magFilter-04553**
  
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-mipmapMode-04770**
  
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02691**
  
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02692**
  
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-filterCubic-02694**
  
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDrawMeshTasksIndirectNV-filterCubicMinmax-02695**
  
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDrawMeshTasksIndirectNV-flags-02696**
  
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02697**
  
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02698**
  
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility
Compatibility

- VUID-vkCmdDrawMeshTasksIndirectNV-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawMeshTasksIndirectNV-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdDrawMeshTasksIndirectNV-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDrawMeshTasksIndirectNV-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` in any shader stage.

- VUID-vkCmdDrawMeshTasksIndirectNV-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- VUID-vkCmdDrawMeshTasksIndirectNV-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImage SparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDrawMeshTasksIndirectNV-None-02705
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawMeshTasksIndirectNV-None-02706
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawMeshTasksIndirectNV-None-04115
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the
Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- **VUID-vkCmdDrawMeshTasksIndirectNV-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- **VUID-vkCmdDrawMeshTasksIndirectNV-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- **VUID-vkCmdDrawMeshTasksIndirectNV-SampledType-04471**
  If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- **VUID-vkCmdDrawMeshTasksIndirectNV-SampledType-04472**
  If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- **VUID-vkCmdDrawMeshTasksIndirectNV-SampledType-04473**
  If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- **VUID-vkCmdDrawMeshTasksIndirectNV-sparseImageInt64Atomics-04474**
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- **VUID-vkCmdDrawMeshTasksIndirectNV-sparseImageInt64Atomics-04475**
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- **VUID-vkCmdDrawMeshTasksIndirectNV-renderPass-02684**
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- **VUID-vkCmdDrawMeshTasksIndirectNV-subpass-02685**
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02686**
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-04584**
  Image subresources used as attachments in the current render pass must not be accessed in any way other than as an attachment by this command, except for cases involving
read-only access to depth/stencil attachments as described in the Render Pass chapter

• VUID-vkCmdDrawMeshTasksIndirectNV-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

• VUID-vkCmdDrawMeshTasksIndirectNV-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

• VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

• VUID-vkCmdDrawMeshTasksIndirectNV-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

• VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the scissorCount parameter of vkCmdSetScissorWithCountEXT

• VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV ::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

• VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-04138
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to

1370 | Chapter 21. Drawing Commands
vkCmdSetViewportWScalingNV must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportSwizzleStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this draw command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-04876**
  If the bound graphics pipeline state was created with the
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this draw command and the `logicOp` must be a valid `VkLogicOp` value.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitive RestartEnableEXT` must have been called in the current command buffer prior to this draw command.

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this draw command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1.

If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be NULL.

If `buffer` is non-sparse then it must be bound completely and contiguously to a single
VkDeviceMemory object

- VUID-vkCmdDrawMeshTasksIndirectNV-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set
- VUID-vkCmdDrawMeshTasksIndirectNV-offset-02710
  offset must be a multiple of 4

- VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02718
  If the multi-draw indirect feature is not enabled, drawCount must be 0 or 1
- VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02719
  drawCount must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount
- VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02146
  If drawCount is greater than 1, stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawMeshTasksIndirectCommandNV)
- VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02156
  If drawCount is equal to 1, (offset + sizeof(VkDrawMeshTasksIndirectCommandNV)) must be less than or equal to the size of buffer
- VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02157
  If drawCount is greater than 1, (stride \times (drawCount - 1) + offset + sizeof(VkDrawMeshTasksIndirectCommandNV)) must be less than or equal to the size of buffer

Valid Usage (Implicit)

- VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdDrawMeshTasksIndirectNV-buffer-parameter
  buffer must be a valid VkBuffer handle
- VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdDrawMeshTasksIndirectNV-renderpass
  This command must only be called inside of a render pass instance
- VUID-vkCmdDrawMeshTasksIndirectNV-commonparent
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Graphics</td>
<td>Graphics</td>

<td>Inside</td>
<td>Graphics</td>
<td>Graphics</td>
</tr>
</tbody>
</table>

The `VkDrawMeshTasksIndirectCommandNV` structure is defined as:

```c
// Provided by VK_NV_mesh_shader
typedef struct VkDrawMeshTasksIndirectCommandNV {
    uint32_t    taskCount;
    uint32_t    firstTask;
} VkDrawMeshTasksIndirectCommandNV;
```

- `taskCount` is the number of local workgroups to dispatch in the X dimension. Y and Z dimension are implicitly set to one.
- `firstTask` is the X component of the first workgroup ID.

The members of `VkDrawMeshTasksIndirectCommandNV` have the same meaning as the similarly named parameters of `vkCmdDrawMeshTasksNV`.

Valid Usage

- `VUID-VkDrawMeshTasksIndirectCommandNV-taskCount-02175` taskCount must be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesNV::maxDrawMeshTasksCount`

To record an indirect mesh tasks draw with the draw count sourced from a buffer, call:
// Provided by VK_NV_mesh_shader

void vkCmdDrawMeshTasksIndirectCountNV(
    VkCommandBuffer                             commandBuffer,
    VkBuffer                                    buffer,
    VkDeviceSize                                offset,
    VkBuffer                                    countBuffer,
    VkDeviceSize                                countBufferOffset,
    uint32_t                                    maxDrawCount,
    uint32_t                                    stride);

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `countBuffer` is the buffer containing the draw count.
- `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
- `maxDrawCount` specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawMeshTasksIndirectCountNV` behaves similarly to `vkCmdDrawMeshTasksIndirectNV` except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.
Valid Usage

• VUID-vkCmdDrawMeshTasksIndirectCountNV-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDrawMeshTasksIndirectCountNV-mipmapMode-04770
  If a VkSampler created with.mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

• VUID-vkCmdDrawMeshTasksIndirectCountNV-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawMeshTasksIndirectCountNV-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawMeshTasksIndirectCountNV-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02698
  For each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout
**Compatibility**

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02699**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02700**
  A valid pipeline must be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02859**
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02702**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02703**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02704**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02705**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02706**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04115**
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the
Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-SampledType-04471
  If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-SampledType-04473
  If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04584
  Image subresources used as attachments in the current render pass must not be accessed in any way other than as an attachment by this command, except for cases involving
read-only access to depth/stencil attachments as described in the Render Pass chapter

- VUID-vkCmdDrawMeshTasksIndirectCountNV-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- VUID-vkCmdDrawMeshTasksIndirectCountNV-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountNV-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, then vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount parameter of the pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the scissorCount parameter of vkCmdSetScissorWithCountEXT

- VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCountEXT

- VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04138
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportWScalingNV must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04139
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04140
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-VkPipelineViewportCreateInfo-04141
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportSwizzleStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-VkPipelineViewportCreateInfo-04142
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled and an instance of `VkPipelineViewportExclusiveScissorStateCreateInfoNV` chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-primitiveTopology-03420
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this draw command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04875
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this draw command.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04876
If the bound graphics pipeline state was created with the
If the bound graphics pipeline state was created with the
\texttt{VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT} dynamic state enabled then
\texttt{vkCmdSetDepthBiasEnableEXT} \textbf{must} have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the
\texttt{VK_DYNAMIC_STATE_LOGIC_OP_EXT} dynamic state enabled then
\texttt{vkCmdSetLogicOpEXT} \textbf{must} have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the
\texttt{VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT} dynamic state enabled then
\texttt{vkCmdSetPrimitiveRestartEnableEXT} \textbf{must} have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the
\texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT} dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the \texttt{PrimitiveShadingRateKHR} built-in, then \texttt{vkCmdSetViewportWithCountEXT} \textbf{must} have been called in the current command buffer prior to this draw command, and the \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCountEXT} \textbf{must} be \texttt{1}.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's \texttt{format features} do not contain \texttt{VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT}, then the \texttt{blendEnable} member of the corresponding element of the \texttt{pAttachments} member of \texttt{pColorBlendState} \textbf{must} be \texttt{VK_FALSE}.

If rasterization is not disabled in the bound graphics pipeline, and neither the \texttt{VK_AMD_mixed_attachment_samples} nor the \texttt{VK_NV_framebuffer_mixed_samples} extensions are enabled, then \texttt{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} \textbf{must} be the same as the current subpass color and/or depth/stencil attachments.

If the bound graphics pipeline was created with the
\texttt{VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT} dynamic state enabled, then
\texttt{vkCmdBindVertexBuffers2EXT} \textbf{must} have been called in the current command buffer prior to this draw command, and the \texttt{pStrides} parameter of \texttt{vkCmdBindVertexBuffers2EXT} \textbf{must} not be \texttt{NULL}.

If \texttt{buffer} is non-sparse then it \textbf{must} be bound completely and contiguously to a single...
VkDeviceMemory object

- VUID-vkCmdDrawMeshTasksIndirectCountNV-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDrawMeshTasksIndirectCountNV-offset-02710
  offset must be a multiple of 4

- VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-02714
  If countBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-02715
  countBuffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDrawMeshTasksIndirectCountNV-countBufferOffset-02716
  countBufferOffset must be a multiple of 4

- VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-02717
  The count stored in countBuffer must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

- VUID-vkCmdDrawMeshTasksIndirectCountNV-countBufferOffset-04129
  (countBufferOffset + sizeof(uint32_t)) must be less than or equal to the size of countBuffer

- VUID-vkCmdDrawMeshTasksIndirectCountNV-stride-02182
  stride must be a multiple of 4 and must be greater than or equal to sizeof (VkDrawMeshTasksIndirectCommandNV)

- VUID-vkCmdDrawMeshTasksIndirectCountNV-maxDrawCount-02183
  If maxDrawCount is greater than or equal to 1, (stride × (maxDrawCount - 1) + offset + sizeof(VkDrawMeshTasksIndirectCommandNV)) must be less than or equal to the size of buffer

- VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-02191
  If the count stored in countBuffer is equal to 1, (offset + sizeof(VkDrawMeshTasksIndirectCommandNV)) must be less than or equal to the size of buffer

- VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-02192
  If the count stored in countBuffer is greater than 1, (stride × (drawCount - 1) + offset + sizeof(VkDrawMeshTasksIndirectCommandNV)) must be less than or equal to the size of buffer
Valid Usage (Implicit)

- VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdDrawMeshTasksIndirectCountNV-buffer-parameter
  `buffer` must be a valid `VkBuffer` handle

- VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-parameter
  `countBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdDrawMeshTasksIndirectCountNV-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawMeshTasksIndirectCountNV-commonparent
  Each of `buffer`, `commandBuffer`, and `countBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Chapter 22. Fixed-Function Vertex Processing

Vertex fetching is controlled via configurable state, as a logically distinct graphics pipeline stage.

22.1. Vertex Attributes

Vertex shaders can define input variables, which receive vertex attribute data transferred from one or more VkBuffer(s) by drawing commands. Vertex shader input variables are bound to buffers via an indirect binding where the vertex shader associates a vertex input attribute number with each variable, vertex input attributes are associated to vertex input bindings on a per-pipeline basis, and vertex input bindings are associated with specific buffers on a per-draw basis via the vkCmdBindVertexBuffers command. Vertex input attribute and vertex input binding descriptions also contain format information controlling how data is extracted from buffer memory and converted to the format expected by the vertex shader.

There are VkPhysicalDeviceLimits::maxVertexInputAttributes number of vertex input attributes and VkPhysicalDeviceLimits::maxVertexInputBindings number of vertex input bindings (each referred to by zero-based indices), where there are at least as many vertex input attributes as there are vertex input bindings. Applications can store multiple vertex input attributes interleaved in a single buffer, and use a single vertex input binding to access those attributes.

In GLSL, vertex shaders associate input variables with a vertex input attribute number using the location layout qualifier. The component layout qualifier associates components of a vertex shader input variable with components of a vertex input attribute.

**GLSL example**

```glsl
// Assign location M to variableName
layout (location=M, component=2) in vec2 variableName;

// Assign locations [N,N+L) to the array elements of variableNameArray
layout (location=N) in vec4 variableNameArray[L];
```

In SPIR-V, vertex shaders associate input variables with a vertex input attribute number using the Location decoration. The Component decoration associates components of a vertex shader input variable with components of a vertex input attribute. The Location and Component decorations are specified via the OpDecorate instruction.
22.1.1. Attribute Location and Component Assignment

Vertex shaders allow Location and Component decorations on input variable declarations. The Location decoration specifies which vertex input attribute is used to read and interpret the data that a variable will consume. The Component decoration allows the location to be more finely specified for scalars and vectors, down to the individual components within a location that are consumed. The components within a location are 0, 1, 2, and 3. A variable starting at component N will consume components N, N+1, N+2, ... up through its size. For single precision types, it is invalid if the sequence of components gets larger than 3.

When a vertex shader input variable declared using a scalar or vector 32-bit data type is assigned a location, its value(s) are taken from the components of the input attribute specified with the corresponding VkVertexInputAttributeDescription::location. The components used depend on the type of variable and the Component decoration specified in the variable declaration, as identified in Input attribute components accessed by 32-bit input variables. Any 32-bit scalar or vector input will consume a single location. For 32-bit data types, missing components are filled in with default values as described below.

Table 31. Input attribute components accessed by 32-bit input variables
Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a 32-bit floating point matrix type is assigned a location $i$, its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. Such matrices are treated as an array of column vectors with values taken from the input attributes identified in `Input attributes accessed by 32-bit input matrix variables`. The `VkVertexInputAttributeDescription::format` must be specified with a `VkFormat` that corresponds to the appropriate type of column vector. The `Component` decoration must not be used with matrix types.

<td>(x, y, o, o), (x, y, o, o), (x, y, o, o), (x, y, o, o)</td>
</tr>
</tbody>
</table>
Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input (if present), or the default value.

When a vertex shader input variable declared using a scalar or vector 64-bit data type is assigned a location $i$, its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. The locations and components used depend on the type of variable and the `Component` decoration specified in the variable declaration, as identified in Table 33. Input attribute locations and components accessed by 64-bit input variables. For 64-bit data types, no default attribute values are provided. Input variables must not use more components than provided by the attribute. Input attributes which have one- or two-component 64-bit formats will consume a single location. Input attributes which have three- or four-component 64-bit formats will consume two consecutive locations. A 64-bit scalar data type will consume two components, and a 64-bit two-component vector data type will consume all four components available within a location. A three- or four-component 64-bit data type must not specify a component. A three-component 64-bit data type will consume all four components of the first location and components 0 and 1 of the second location. This leaves components 2 and 3 available for other component-qualified declarations. A four-component 64-bit data type will consume all four components of the first location and all four components of the second location. It is invalid for a scalar or two-component 64-bit data type to specify a component of 1 or 3.

</table>

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute. Components indicated by “-” are not available for input variables as there are no default values provided for 64-bit data types, and there is no data provided by the input format.

When a vertex shader input variable declared using a 64-bit floating-point matrix type is assigned a location $i$, its values are taken from consecutive input attribute locations. Such matrices are treated as an array of column vectors with values taken from the input attributes as shown in Input attribute locations and components accessed by 64-bit input variables. Each column vector starts at the location immediately following the last location of the previous column vector. The number of attributes and components assigned to each matrix is determined by the matrix dimensions and ranges from two to eight locations.
When a vertex shader input variable declared using an array type is assigned a location, its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. The number of attributes and components assigned to each element are determined according to the data type of the array elements and Component decoration (if any) specified in the declaration of the array, as described above. Each element of the array, in order, is assigned to consecutive locations, but all at the same specified component within each location.

Only input variables declared with the data types and component decorations as specified above are supported. Location aliasing is causing two variables to have the same location number. Component aliasing is assigning the same (or overlapping) component number for two location aliases. Location aliasing is allowed only if it does not cause component aliasing. Further, when location aliasing, the aliases sharing the location must all have the same SPIR-V floating-point component type or all have the same width integer-type components.

### 22.2. Vertex Input Description

Applications specify vertex input attribute and vertex input binding descriptions as part of graphics pipeline creation. `VkGraphicsPipelineCreateInfo::pVertexInputState` is a pointer to a `VkPipelineVertexInputStateCreateInfo` value.

The `VkPipelineVertexInputStateCreateInfo` structure is defined as:

```c
typedef struct VkPipelineVertexInputStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineVertexInputStateCreateFlags flags;
    uint32_t vertexBindingDescriptionCount;
    const VkVertexInputBindingDescription* pVertexBindingDescriptions;
    uint32_t vertexAttributeDescriptionCount;
    const VkVertexInputAttributeDescription* pVertexAttributeDescriptions;
} VkPipelineVertexInputStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `vertexBindingDescriptionCount` is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.
- `pVertexBindingDescriptions` is a pointer to an array of `VkVertexInputBindingDescription` structures.
- `vertexAttributeDescriptionCount` is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.
- `pVertexAttributeDescriptions` is a pointer to an array of `VkVertexInputAttributeDescription` structures.
Valid Usage

- VUID-VkPipelineVertexInputStateCreateInfo-vertexBindingDescriptionCount-00613
  
  `vertexBindingDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkPipelineVertexInputStateCreateInfo-vertexAttributeDescriptionCount-00614
  
  `vertexAttributeDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- VUID-VkPipelineVertexInputStateCreateInfo-binding-00615
  
  For every binding specified by each element of `pVertexAttributeDescriptions`, a `VkVertexInputBindingDescription` **must** exist in `pVertexBindingDescriptions` with the same value of binding

- VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-00616
  
  All elements of `pVertexBindingDescriptions` **must** describe distinct binding numbers

- VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-00617
  
  All elements of `pVertexAttributeDescriptions` **must** describe distinct attribute locations

Valid Usage (Implicit)

- VUID-VkPipelineVertexInputStateCreateInfo-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO`

- VUID-VkPipelineVertexInputStateCreateInfo-pNext-pNext
  
  `pNext` **must** be `NULL` or a pointer to a valid instance of `VkPipelineVertexInputDivisorStateCreateInfoEXT`

- VUID-VkPipelineVertexInputStateCreateInfo-sType-unique
  
  The `sType` value of each struct in the `pNext` chain **must** be unique

- VUID-VkPipelineVertexInputStateCreateInfo-stateCreateInfo-flags-zero bitmask
  
  `flags` **must** be `0`

- VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-parameter
  
  If `vertexBindingDescriptionCount` is not `0`, `pVertexBindingDescriptions` **must** be a valid pointer to an array of `vertexBindingDescriptionCount` valid `VkVertexInputBindingDescription` structures

- VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-parameter
  
  If `vertexAttributeDescriptionCount` is not `0`, `pVertexAttributeDescriptions` **must** be a valid pointer to an array of `vertexAttributeDescriptionCount` valid `VkVertexInputAttributeDescription` structures

// Provided by VK_VERSION_1_0

typedef VkFlags VkPipelineVertexInputStateCreateFlags;

VkPipelineVertexInputStateCreateFlags is a bitmask type for setting a mask, but is currently
reserved for future use.

Each vertex input binding is specified by the `VkVertexInputBindingDescription` structure, defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputBindingDescription {
    uint32_t binding;
    uint32_t stride;
    VkVertexInputRate inputRate;
} VkVertexInputBindingDescription;
```

- `binding` is the binding number that this structure describes.
- `stride` is the distance in bytes between two consecutive elements within the buffer.
- `inputRate` is a `VkVertexInputRate` value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.

### Valid Usage

- [VUID-VkVertexInputBindingDescription-binding-00618](#) `binding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`
- [VUID-VkVertexInputBindingDescription-stride-00619](#) `stride` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`
- [VUID-VkVertexInputBindingDescription-stride-04456](#) If the VK_KHR_portability_subset extension is enabled, `stride` must be a multiple of, and at least as large as, `VkPhysicalDevicePortabilitySubsetPropertiesKHR::minVertexInputBindingStrideAlignment`.

### Valid Usage (Implicit)

- [VUID-VkVertexInputBindingDescription-inputRate-parameter](#) `inputRate` must be a valid `VkVertexInputRate` value

Possible values of `VkVertexInputBindingDescription::inputRate`, specifying the rate at which vertex attributes are pulled from buffers, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkVertexInputRate {
    VK_VERTEX_INPUT_RATE_VERTEX = 0,
    VK_VERTEX_INPUT_RATE_INSTANCE = 1,
} VkVertexInputRate;
```

- `VK_VERTEX_INPUT_RATE_VERTEX` specifies that vertex attribute addressing is a function of the vertex index.
• **VK_VERTEX_INPUT_RATE_INSTANCE** specifies that vertex attribute addressing is a function of the instance index.

Each vertex input attribute is specified by the `VkVertexInputAttributeDescription` structure, defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputAttributeDescription {
    uint32_t    location;
    uint32_t    binding;
    VkFormat    format;
    uint32_t    offset;
} VkVertexInputAttributeDescription;
```

- **location** is the shader input location number for this attribute.
- **binding** is the binding number which this attribute takes its data from.
- **format** is the size and type of the vertex attribute data.
- **offset** is a byte offset of this attribute relative to the start of an element in the vertex input binding.

### Valid Usage

- **VUID-VkVertexInputAttributeDescription-location-00620**
  
  location must be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- **VUID-VkVertexInputAttributeDescription-binding-00621**
  
  binding must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-VkVertexInputAttributeDescription-offset-00622**
  
  offset must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributeOffset`

- **VUID-VkVertexInputAttributeDescription-format-00623**
  
  format must be allowed as a vertex buffer format, as specified by the `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT` flag in `VkFormatProperties::bufferFeatures` returned by `vkGetPhysicalDeviceFormatProperties`

- **VUID-VkVertexInputAttributeDescription-vertexAttributeAccessBeyondStride-04457**
  
  If the **VK_KHR_portability_subset** extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride` is **VK_FALSE**, the sum of offset plus the size of the vertex attribute data described by format must not be greater than stride in the `VkVertexInputBindingDescription` referenced in binding.
Valid Usage (Implicit)

- VUID-VkVertexInputAttributeDescription-format-parameter
  
  **format** must be a valid **VkFormat** value

An alternative to specifying the vertex input attribute and vertex input binding descriptions as part of graphics pipeline creation, the pipeline can be created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, and for that state to be set dynamically with:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
void vkCmdSetVertexInputEXT(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    vertexBindingDescriptionCount,
    const VkVertexInputBindingDescription2EXT*  pVertexBindingDescriptions,
    uint32_t                                    vertexAttributeDescriptionCount,
    const VkVertexInputAttributeDescription2EXT* pVertexAttributeDescriptions);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **vertexBindingDescriptionCount** is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.
- **pVertexBindingDescriptions** is a pointer to an array of `VkVertexInputBindingDescription2EXT` structures.
- **vertexAttributeDescriptionCount** is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.
- **pVertexAttributeDescriptions** is a pointer to an array of `VkVertexInputAttributeDescription2EXT` structures.

This command sets the vertex input attribute and vertex input binding descriptions state for subsequent draw commands.
Valid Usage

- **VUID-vkCmdSetVertexInputEXT-None-04790**
  
  The vertexInputDynamicState feature must be enabled

- **VUID-vkCmdSetVertexInputEXT-vertexBindingDescriptionCount-04791**
  
  vertexBindingDescriptionCount must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputBindings

- **VUID-vkCmdSetVertexInputEXT-vertexAttributeDescriptionCount-04792**
  
  vertexAttributeDescriptionCount must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputAttributes

- **VUID-vkCmdSetVertexInputEXT-binding-04793**
  
  For every binding specified by each element of pVertexAttributeDescriptions, a VkVertexInputBindingDescription2EXT must exist in pVertexBindingDescriptions with the same value of binding

- **VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-04794**
  
  All elements of pVertexBindingDescriptions must describe distinct binding numbers

- **VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-04795**
  
  All elements of pVertexAttributeDescriptions must describe distinct attribute locations

Valid Usage (Implicit)

- **VUID-vkCmdSetVertexInputEXT-commandBuffer-parameter**
  
  commandBuffer must be a valid VkCommandBuffer handle

- **VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-parameter**
  
  If vertexBindingDescriptionCount is not 0, pVertexBindingDescriptions must be a valid pointer to an array of vertexBindingDescriptionCount valid VkVertexInputBindingDescription2EXT structures

- **VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-parameter**
  
  If vertexAttributeDescriptionCount is not 0, pVertexAttributeDescriptions must be a valid pointer to an array of vertexAttributeDescriptionCount valid VkVertexInputAttributeDescription2EXT structures

- **VUID-vkCmdSetVertexInputEXT-commandBuffer-recording**
  
  commandBuffer must be in the recording state

- **VUID-vkCmdSetVertexInputEXT-commandBuffer-cmdpool**
  
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>

<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkVertexInputBindingDescription2EXT` structure is defined as:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputBindingDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t binding;
    uint32_t stride;
    VkVertexInputRate inputRate;
    uint32_t divisor;
} VkVertexInputBindingDescription2EXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `binding` is the binding number that this structure describes.
- `stride` is the distance in bytes between two consecutive elements within the buffer.
- `inputRate` is a `VkVertexInputRate` value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.
- `divisor` is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. This member can be set to a value other than 1 if the `vertexAttributeInstanceRateDivisor` feature is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of divisor is implementation dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`. A value of 0 can be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.
Valid Usage

- **VUID-VkVertexInputBindingDescription2EXT-binding-04796**
  binding must be less than \( \text{VkPhysicalDeviceLimits}::\text{maxVertexInputBindings} \)

- **VUID-VkVertexInputBindingDescription2EXT-stride-04797**
  stride must be less than or equal to \( \text{VkPhysicalDeviceLimits}::\text{maxVertexInputBindingStride} \)

- **VUID-VkVertexInputBindingDescription2EXT-divisor-04798**
  If the \text{vertexAttributeInstanceRateZeroDivisor} feature is not enabled, divisor must not be 0

- **VUID-VkVertexInputBindingDescription2EXT-divisor-04799**
  If the \text{vertexAttributeInstanceRateDivisor} feature is not enabled, divisor must be 1

- **VUID-VkVertexInputBindingDescription2EXT-divisor-04800**
  divisor must be a value between 0 and \( \text{VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT}::\text{maxVertexAttribDivisor} \), inclusive

- **VUID-VkVertexInputBindingDescription2EXT-divisor-04801**
  If divisor is not 1 then inputRate must be of type \text{VK_VERTEX_INPUT_RATE_INSTANCE}

Valid Usage (Implicit)

- **VUID-VkVertexInputBindingDescription2EXT-sType-sType**
  sType must be \text{VK_STRUCTURE_TYPE_VERTEX_INPUT_BINDING_DESCRIPTION_2_EXT}

- **VUID-VkVertexInputBindingDescription2EXT-inputRate-parameter**
  inputRate must be a valid \text{VkVertexInputRate} value

The \text{VkVertexInputAttributeDescription2EXT} structure is defined as:

```c
typedef struct VkVertexInputAttributeDescription2EXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           location;
    uint32_t           binding;
    VkFormat           format;
    uint32_t           offset;
} VkVertexInputAttributeDescription2EXT;
```

- **sType** is the type of this structure.
- **pNext** is \text{NULL} or a pointer to a structure extending this structure.
- **location** is the shader input location number for this attribute.
- **binding** is the binding number which this attribute takes its data from.
- **format** is the size and type of the vertex attribute data.
• **offset** is a byte offset of this attribute relative to the start of an element in the vertex input binding.

### Valid Usage

- **VUID-VkVertexInputAttributeDescription2EXT-location-04802**
  
  `location` must be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- **VUID-VkVertexInputAttributeDescription2EXT-binding-04803**
  
  `binding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-VkVertexInputAttributeDescription2EXT-offset-04804**
  
  `offset` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributeOffset`

- **VUID-VkVertexInputAttributeDescription2EXT-format-04805**
  
  `format` must be allowed as a vertex buffer format, as specified by the `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT` flag in `VkFormatProperties::bufferFeatures` returned by `vkGetPhysicalDeviceFormatProperties`

- **VUID-VkVertexInputAttributeDescription2EXT-vertexAttributeAccessBeyondStride-04806**
  
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride` is `VK_FALSE`, the sum of `offset` plus the size of the vertex attribute data described by `format` must not be greater than `stride` in the `VkVertexInputBindingDescription2EXT` referenced in `binding`.

### Valid Usage (Implicit)

- **VUID-VkVertexInputAttributeDescription2EXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_VERTEX_INPUT_ATTRIBUTE_DESCRIPTION_2_EXT`

- **VUID-VkVertexInputAttributeDescription2EXT-format-parameter**
  
  `format` must be a valid `VkFormat` value

To bind vertex buffers to a command buffer for use in subsequent draw commands, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindVertexBuffer(  
    VkCommandBuffer                             commandBuffer,  
    uint32_t                                    firstBinding,  
    uint32_t                                    bindingCount,  
    const VkBuffer*                             pBuffers,  
    const VkDeviceSize*                         pOffsets);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **firstBinding** is the index of the first vertex input binding whose state is updated by the command.
• `bindingCount` is the number of vertex input bindings whose state is updated by the command.
• `pBuffers` is a pointer to an array of buffer handles.
• `pOffsets` is a pointer to an array of buffer offsets.

The values taken from elements `i` of `pBuffers` and `pOffsets` replace the current state for the vertex input binding `firstBinding + i`, for `i` in `[0, bindingCount)`. The vertex input binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent draw commands. If the `nullDescriptor` feature is enabled, elements of `pBuffers` can be `VK_NULL_HANDLE`, and can be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is `VK_NULL_HANDLE`, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with `(0,0,1)`.

### Valid Usage

- **VUID-vkCmdBindVertexBuffers-firstBinding-00624**
  `firstBinding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-vkCmdBindVertexBuffers-firstBinding-00625**
  The sum of `firstBinding` and `bindingCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-vkCmdBindVertexBuffers-pOffsets-00626**
  All elements of `pOffsets` must be less than the size of the corresponding element in `pBuffers`

- **VUID-vkCmdBindVertexBuffers-pBuffers-00627**
  All elements of `pBuffers` must have been created with the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` flag

- **VUID-vkCmdBindVertexBuffers-pBuffers-00628**
  Each element of `pBuffers` that is non-sparse must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBindVertexBuffers-pBuffers-04001**
  If the `nullDescriptor` feature is not enabled, all elements of `pBuffers` must not be `VK_NULL_HANDLE`

- **VUID-vkCmdBindVertexBuffers-pBuffers-04002**
  If an element of `pBuffers` is `VK_NULL_HANDLE`, then the corresponding element of `pOffsets` must be zero
Valid Usage (Implicit)

- VUID-vkCmdBindVertexBuffers-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBindVertexBuffers-pBuffers-parameter
  pBuffers must be a valid pointer to an array of bindingCount valid or VK_NULL_HANDLE VkBuffer handles

- VUID-vkCmdBindVertexBuffers-pOffsets-parameter
  pOffsets must be a valid pointer to an array of bindingCount VkDeviceSize values

- VUID-vkCmdBindVertexBuffers-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBindVertexBuffers-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBindVertexBuffers-bindingCount-arraylength
  bindingCount must be greater than 0

- VUID-vkCmdBindVertexBuffers-commonparent
  Both of commandBuffer, and the elements of pBuffers that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Alternatively, to bind vertex buffers, along with their sizes and strides, to a command buffer for use in subsequent draw commands, call:
void vkCmdBindVertexBuffer2EXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes,
    const VkDeviceSize* pStrides);

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first vertex input binding whose state is updated by the command.
- `bindingCount` is the number of vertex input bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is `NULL` or a pointer to an array of the size in bytes of vertex data bound from `pBuffers`.
- `pStrides` is `NULL` or a pointer to an array of buffer strides.

The values taken from elements i of `pBuffers` and `pOffsets` replace the current state for the vertex input binding `firstBinding` + i, for i in [0, `bindingCount`). The vertex input binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. If `pSizes` is not `NULL` then `pSizes[i]` specifies the bound size of the vertex buffer starting from the corresponding elements of `pBuffers[i]` plus `pOffsets[i]`. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent draw commands.

If the bound pipeline state object was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled then `pStrides[i]` specifies the distance in bytes between two consecutive elements within the corresponding buffer. In this case the `VkVertexInputBindingDescription::stride` state from the pipeline state object is ignored.
Valid Usage

- VUID-vkCmdBindVertexBuffers2EXT-firstBinding-03355
  \texttt{firstBinding} must be less than \texttt{VkPhysicalDeviceLimits::maxVertexInputBindings}

- VUID-vkCmdBindVertexBuffers2EXT-firstBinding-03356
  The sum of \texttt{firstBinding} and \texttt{bindingCount} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxVertexInputBindings}

- VUID-vkCmdBindVertexBuffers2EXT-pOffsets-03357
  All elements of \texttt{pOffsets} must be less than the size of the corresponding element in \texttt{pBuffers}

- VUID-vkCmdBindVertexBuffers2EXT-pSizes-03358
  If \texttt{pSizes} is not \texttt{NULL}, all elements of \texttt{pOffsets} plus \texttt{pSizes} must be less than or equal to the size of the corresponding element in \texttt{pBuffers}

- VUID-vkCmdBindVertexBuffers2EXT-pBuffers-03359
  All elements of \texttt{pBuffers} must have been created with the \texttt{VK_BUFFER_USAGE_VERTEX_BUFFER_BIT} flag

- VUID-vkCmdBindVertexBuffers2EXT-pBuffers-03360
  Each element of \texttt{pBuffers} that is non-sparse must be bound completely and contiguously to a single \texttt{VkDeviceMemory} object

- VUID-vkCmdBindVertexBuffers2EXT-pBuffers-04111
  If the \texttt{nullDescriptor} feature is not enabled, all elements of \texttt{pBuffers} must not be \texttt{VK_NULL_HANDLE}

- VUID-vkCmdBindVertexBuffers2EXT-pBuffers-04112
  If an element of \texttt{pBuffers} is \texttt{VK_NULL_HANDLE}, then the corresponding element of \texttt{pOffsets} must be zero

- VUID-vkCmdBindVertexBuffers2EXT-pStrides-03362
  If \texttt{pStrides} is not \texttt{NULL} each element of \texttt{pStrides} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxVertexInputBindingStride}

- VUID-vkCmdBindVertexBuffers2EXT-pStrides-03363
  If \texttt{pStrides} is not \texttt{NULL} each element of \texttt{pStrides} must be greater than or equal to the maximum extent of all vertex input attributes fetched from the corresponding binding, where the extent is calculated as the \texttt{VkVertexInputAttributeDescription::offset} plus \texttt{VkVertexInputAttributeDescription::format} size

Chapter 22. Fixed-Function Vertex Processing | 1401
**Valid Usage (Implicit)**

- VUID-vkCmdBindVertexBuffers2EXT-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdBindVertexBuffers2EXT-pBuffers-parameter
  
  `pBuffers` must be a valid pointer to an array of `bindingCount` valid `VkBuffer` handles.

- VUID-vkCmdBindVertexBuffers2EXT-pOffsets-parameter
  
  `pOffsets` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values.

- VUID-vkCmdBindVertexBuffers2EXT-pSizes-parameter
  
  If `pSizes` is not NULL, `pSizes` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values.

- VUID-vkCmdBindVertexBuffers2EXT-pStrides-parameter
  
  If `pStrides` is not NULL, `pStrides` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values.

- VUID-vkCmdBindVertexBuffers2EXT-commandBuffer-recording
  
  `commandBuffer` must be in the recording state.

- VUID-vkCmdBindVertexBuffers2EXT-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdBindVertexBuffers2EXT-bindingCount-arraylength
  
  If any of `pSizes`, or `pStrides` are not NULL, `bindingCount` must be greater than 0.

- VUID-vkCmdBindVertexBuffers2EXT-commonparent
  
  Both of `commandBuffer`, and the elements of `pBuffers` must have been created, allocated, or retrieved from the same `VkDevice`.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

22.3. Vertex Attribute Divisor in Instanced Rendering

If `vertexAttributeInstanceRateDivisor` feature is enabled and the `pNext` chain of `VkPipelineVertexInputStateCreateInfo` includes a `VkPipelineVertexInputDivisorStateCreateInfoEXT` structure, then that structure controls how vertex attributes are assigned to an instance when instanced rendering is enabled.

The `VkPipelineVertexInputDivisorStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkPipelineVertexInputDivisorStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t vertexBindingDivisorCount;
    const VkVertexInputBindingDivisorDescriptionEXT* pVertexBindingDivisors;
} VkPipelineVertexInputDivisorStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexBindingDivisorCount` is the number of elements in the `pVertexBindingDivisors` array.
- `pVertexBindingDivisors` is a pointer to an array of `VkVertexInputBindingDivisorDescriptionEXT` structures, which specifies the divisor value for each binding.

Valid Usage (Implicit)

- `VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-sType-sType` **sType** must be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_EXT`
- `VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-pVertexBindingDivisors-parameter` **pVertexBindingDivisors** must be a valid pointer to an array of `vertexBindingDivisorCount` `VkVertexInputBindingDivisorDescriptionEXT` structures
- `VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-vertexBindingDivisorCount-arraylength` **vertexBindingDivisorCount** must be greater than 0

The individual divisor values per binding are specified using the `VkVertexInputBindingDivisorDescriptionEXT` structure which is defined as:

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkVertexInputBindingDivisorDescriptionEXT {
    uint32_t binding;
    uint32_t divisor;
} VkVertexInputBindingDivisorDescriptionEXT;
```

- `binding` is the binding number for which the divisor is specified.
• **divisor** is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of divisor is implementation dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`. A value of 0 can be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.

If this structure is not used to define a divisor value for an attribute then the divisor has a logical default value of 1.

### Valid Usage

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-binding-01869**
  
  binding must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-vertexAttributeInstanceRateZeroDivisor-02228**
  
  If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, divisor must not be 0

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-vertexAttributeInstanceRateDivisor-02229**
  
  If the `vertexAttributeInstanceRateDivisor` feature is not enabled, divisor must be 1

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-divisor-01870**
  
  divisor must be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`, inclusive

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-inputRate-01871**
  
  `VkVertexInputBindingDescription::inputRate` must be of type `VK_VERTEX_INPUT_RATE_INSTANCE` for this binding

The address of each attribute for each `vertexIndex` and `instanceIndex` is calculated as follows:

- Let `attribDesc` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexAttributeDescriptions` with `VkVertexInputAttributeDescription::location` equal to the vertex input attribute number.

- Let `bindingDesc` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexBindingDescriptions` with `VkVertexInputAttributeDescription::binding` equal to `attribDesc.binding`.

- Let `vertexIndex` be the index of the vertex within the draw (a value between `firstVertex` and `firstVertex+vertexCount` for `vkCmdDraw`, or a value taken from the index buffer for `vkCmdDrawIndexed`), and let `instanceIndex` be the instance number of the draw (a value between `firstInstance` and `firstInstance+instanceCount`).

- Let `divisor` be the member of `VkPipelineVertexInputDivisorStateCreateInfoEXT::pVertexBindingDivisors` with `VkVertexInputBindingDivisorDescriptionEXT::binding` equal to `attribDesc.binding`.
bufferBindingAddress = buffer[binding].baseAddress + offset[binding];

if (bindingDesc.inputRate == VK_VERTEX_INPUT_RATE_VERTEX)
    vertexOffset = vertexIndex * bindingDesc.stride;
else
    if (divisor == 0)
        vertexOffset = firstInstance * bindingDesc.stride;
    else
        vertexOffset = (firstInstance + ((instanceIndex - firstInstance) / divisor)) * bindingDesc.stride;

attribAddress = bufferBindingAddress + vertexOffset + attribDesc.offset;

For each attribute, raw data is extracted starting at `attribAddress` and is converted from the `VkVertexInputAttributeDescription`'s `format` to either floating-point, unsigned integer, or signed integer based on the base type of the format; the base type of the format **must** match the base type of the input variable in the shader. If `format` is a packed format, `attribAddress` **must** be a multiple of the size in bytes of the whole attribute data type as described in Packed Formats. Otherwise, `attribAddress` **must** be a multiple of the size in bytes of the component type indicated by `format` (see Formats). If the format does not include G, B, or A components, then those are filled with (0,0,1) as needed (using either 1.0f or integer 1 based on the format) for attributes that are not 64-bit data types. The number of components in the vertex shader input variable need not exactly match the number of components in the format. If the vertex shader has fewer components, the extra components are discarded.
Chapter 23. Tessellation

Tessellation involves three pipeline stages. First, a tessellation control shader transforms control points of a patch and can produce per-patch data. Second, a fixed-function tessellator generates multiple primitives corresponding to a tessellation of the patch in (u,v) or (u,v,w) parameter space. Third, a tessellation evaluation shader transforms the vertices of the tessellated patch, for example to compute their positions and attributes as part of the tessellated surface. The tessellator is enabled when the pipeline contains both a tessellation control shader and a tessellation evaluation shader.

23.1. Tessellator

If a pipeline includes both tessellation shaders (control and evaluation), the tessellator consumes each input patch (after vertex shading) and produces a new set of independent primitives (points, lines, or triangles). These primitives are logically produced by subdividing a geometric primitive (rectangle or triangle) according to the per-patch outer and inner tessellation levels written by the tessellation control shader. These levels are specified using the built-in variables `TessLevelOuter` and `TessLevelInner`, respectively. This subdivision is performed in an implementation-dependent manner. If no tessellation shaders are present in the pipeline, the tessellator is disabled and incoming primitives are passed through without modification.

The type of subdivision performed by the tessellator is specified by an `OpExecutionMode` instruction in the tessellation evaluation or tessellation control shader using one of execution modes `Triangles`, `Quads`, and `IsoLines`. Other tessellation-related execution modes can also be specified in either the tessellation control or tessellation evaluation shaders, and if they are specified in both then the modes must be the same.

Tessellation execution modes include:

- `Triangles`, `Quads`, and `IsoLines`. These control the type of subdivision and topology of the output primitives. One mode must be set in at least one of the tessellation shader stages. If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines` is `VK_FALSE`, then isoline tessellation is not supported by the implementation, and `IsoLines` must not be used in either tessellation shader stage.

- `VertexOrderCw` and `VertexOrderCcw`. These control the orientation of triangles generated by the tessellator. One mode must be set in at least one of the tessellation shader stages.

- `PointMode`. Controls generation of points rather than triangles or lines. This functionality defaults to disabled, and is enabled if either shader stage includes the execution mode. If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode` is `VK_FALSE`, then point mode tessellation is not supported by the implementation, and `PointMode` must not be used in either tessellation shader stage.

- `SpacingEqual`, `SpacingFractionalEven`, and `SpacingFractionalOdd`. Controls the spacing of segments on the edges of tessellated primitives. One mode must be set in at least one of the tessellation shader stages.
• **OutputVertices.** Controls the size of the output patch of the tessellation control shader. One value **must** be set in at least one of the tessellation shader stages.

For triangles, the tessellator subdivides a triangle primitive into smaller triangles. For quads, the tessellator subdivides a rectangle primitive into smaller triangles. For isolines, the tessellator subdivides a rectangle primitive into a collection of line segments arranged in strips stretching across the rectangle in the u dimension (i.e. the coordinates in `TessCoord` are of the form (0,x) through (1,x) for all tessellation evaluation shader invocations that share a line).

Each vertex produced by the tessellator has an associated (u,v,w) or (u,v) position in a normalized parameter space, with parameter values in the range [0,1], as illustrated in figures [Domain parameterization for tessellation primitive modes (upper-left origin)] and [Domain parameterization for tessellation primitive modes (lower-left origin)]. The domain space **can** have either an upper-left or lower-left origin, selected by the `domainOrigin` member of `VkPipelineTessellationDomainOriginStateCreateInfo`.

![Domain parameterization for tessellation primitive modes](image)

*Figure 12. Domain parameterization for tessellation primitive modes (upper-left origin)*
In the domain parameterization diagrams, the coordinates illustrate the value of \text{TessCoord} at the corners of the domain. The labels on the edges indicate the inner (IL0 and IL1) and outer (OL0 through OL3) tessellation level values used to control the number of subdivisions along each edge of the domain.

For triangles, the vertex’s position is a barycentric coordinate \((u,v,w)\), where \(u + v + w = 1.0\), and indicates the relative influence of the three vertices of the triangle on the position of the vertex. For quads and isolines, the position is a \((u,v)\) coordinate indicating the relative horizontal and vertical position of the vertex relative to the subdivided rectangle. The subdivision process is explained in more detail in subsequent sections.

### 23.2. Tessellator Patch Discard

A patch is discarded by the tessellator if any relevant outer tessellation level is less than or equal to zero.

Patches will also be discarded if any relevant outer tessellation level corresponds to a floating-point NaN (not a number) in implementations supporting NaN.

No new primitives are generated and the tessellation evaluation shader is not executed for patches that are discarded. For \texttt{Quads}, all four outer levels are relevant. For \texttt{Triangles} and \texttt{Isolines}, only the first three or two outer levels, respectively, are relevant. Negative inner levels will not cause a patch to be discarded; they will be clamped as described below.
23.3. Tessellator Spacing

Each of the tessellation levels is used to determine the number and spacing of segments used to subdivide a corresponding edge. The method used to derive the number and spacing of segments is specified by an `OpExecutionMode` in the tessellation control or tessellation evaluation shader using one of the identifiers `SpacingEqual`, `SpacingFractionalEven`, or `SpacingFractionalOdd`.

If `SpacingEqual` is used, the floating-point tessellation level is first clamped to $[1, \text{maxLevel}]$, where `maxLevel` is the implementation-dependent maximum tessellation level (`VkPhysicalDeviceLimits::maxTessellationGenerationLevel`). The result is rounded up to the nearest integer n, and the corresponding edge is divided into n segments of equal length in (u,v) space.

If `SpacingFractionalEven` is used, the tessellation level is first clamped to $[2, \text{maxLevel}]$ and then rounded up to the nearest even integer n. If `SpacingFractionalOdd` is used, the tessellation level is clamped to $[1, \text{maxLevel} - 1]$ and then rounded up to the nearest odd integer n. If n is one, the edge will not be subdivided. Otherwise, the corresponding edge will be divided into n - 2 segments of equal length, and two additional segments of equal length that are typically shorter than the other segments. The length of the two additional segments relative to the others will decrease monotonically with $n - f$, where $f$ is the clamped floating-point tessellation level. When $n - f$ is zero, the additional segments will have equal length to the other segments. As $n - f$ approaches 2.0, the relative length of the additional segments approaches zero. The two additional segments must be placed symmetrically on opposite sides of the subdivided edge. The relative location of these two segments is implementation-dependent, but must be identical for any pair of subdivided edges with identical values of f.

When tessellating triangles or quads using point mode with fractional odd spacing, the tessellator may produce interior vertices that are positioned on the edge of the patch if an inner tessellation level is less than or equal to one. Such vertices are considered distinct from vertices produced by subdividing the outer edge of the patch, even if there are pairs of vertices with identical coordinates.

23.4. Tessellation Primitive Ordering

Few guarantees are provided for the relative ordering of primitives produced by tessellation, as they pertain to primitive order.

- The output primitives generated from each input primitive are passed to subsequent pipeline stages in an implementation-dependent order.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.

23.5. Tessellator Vertex Winding Order

When the tessellator produces triangles (in the `Triangles` or `Quads` modes), the orientation of all triangles is specified with an `OpExecutionMode` of `VertexOrderCw` or `VertexOrderCcw` in the tessellation control or tessellation evaluation shaders. If the order is `VertexOrderCw`, the vertices of all generated triangles will have clockwise ordering in (u,v) or (u,v,w) space. If the order is `VertexOrderCcw`, the
vertices will have counter-clockwise ordering in that space.

If the tessellation domain has an upper-left origin, the vertices of a triangle have counter-clockwise ordering if

\[ a = u_0 v_1 - u_1 v_0 + u_1 v_2 - u_2 v_1 + u_2 v_0 - u_0 v_2 \]

is negative, and clockwise ordering if \( a \) is positive. \( u_i \) and \( v_i \) are the \( u \) and \( v \) coordinates in normalized parameter space of the \( i \)th vertex of the triangle. If the tessellation domain has a lower-left origin, the vertices of a triangle have counter-clockwise ordering if \( a \) is positive, and clockwise ordering if \( a \) is negative.

**Note**

The value \( a \) is proportional (with a positive factor) to the signed area of the triangle.

In **Triangles** mode, even though the vertex coordinates have a \( w \) value, it does not participate directly in the computation of \( a \), being an affine combination of \( u \) and \( v \).

### 23.6. Triangle Tessellation

If the tessellation primitive mode is **Triangles**, an equilateral triangle is subdivided into a collection of triangles covering the area of the original triangle. First, the original triangle is subdivided into a collection of concentric equilateral triangles. The edges of each of these triangles are subdivided, and the area between each triangle pair is filled by triangles produced by joining the vertices on the subdivided edges. The number of concentric triangles and the number of subdivisions along each triangle except the outermost is derived from the first inner tessellation level. The edges of the outermost triangle are subdivided independently, using the first, second, and third outer tessellation levels to control the number of subdivisions of the \( u = 0 \) (left), \( v = 0 \) (bottom), and \( w = 0 \) (right) edges, respectively. The second inner tessellation level and the fourth outer tessellation level have no effect in this mode.

If the first inner tessellation level and all three outer tessellation levels are exactly one after clamping and rounding, only a single triangle with \((u,v,w)\) coordinates of \((0,0,1)\), \((1,0,0)\), and \((0,1,0)\) is generated. If the inner tessellation level is one and any of the outer tessellation levels is greater than one, the inner tessellation level is treated as though it were originally specified as \(1 + \varepsilon\) and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the triangle.

If any tessellation level is greater than one, tessellation begins by producing a set of concentric inner triangles and subdividing their edges. First, the three outer edges are temporarily subdivided using the clamped and rounded first inner tessellation level and the specified tessellation spacing, generating \( n \) segments. For the outermost inner triangle, the inner triangle is degenerate — a single point at the center of the triangle — if \( n \) is two. Otherwise, for each corner of the outer triangle, an inner triangle corner is produced at the intersection of two lines extended perpendicular to the
corner's two adjacent edges running through the vertex of the subdivided outer edge nearest that corner. If \( n \) is three, the edges of the inner triangle are not subdivided and it is the final triangle in the set of concentric triangles. Otherwise, each edge of the inner triangle is divided into \( n - 2 \) segments, with the \( n - 1 \) vertices of this subdivision produced by intersecting the inner edge with lines perpendicular to the edge running through the \( n - 1 \) innermost vertices of the subdivision of the outer edge. Once the outermost inner triangle is subdivided, the previous subdivision process repeats itself, using the generated triangle as an outer triangle. This subdivision process is illustrated in Inner Triangle Tessellation.

![Inner Triangle Tessellation](image)

**Caption**

In the Inner Triangle Tessellation diagram, inner tessellation levels of (a) five and (b) four are shown (not to scale). Solid black circles depict vertices along the edges of the concentric triangles. The edges of inner triangles are subdivided by intersecting the edge with segments perpendicular to the edge passing through each inner vertex of the subdivided outer edge. Dotted lines depict edges connecting corresponding vertices on the inner and outer triangle edges.

Once all the concentric triangles are produced and their edges are subdivided, the area between each pair of adjacent inner triangles is filled completely with a set of non-overlapping triangles. In this subdivision, two of the three vertices of each triangle are taken from adjacent vertices on a subdivided edge of one triangle; the third is one of the vertices on the corresponding edge of the other triangle. If the innermost triangle is degenerate (i.e., a point), the triangle containing it is subdivided into six triangles by connecting each of the six vertices on that triangle with the center point. If the innermost triangle is not degenerate, that triangle is added to the set of generated triangles as-is.

After the area corresponding to any inner triangles is filled, the tessellator generates triangles to cover the area between the outermost triangle and the outermost inner triangle. To do this, the temporary subdivision of the outer triangle edge above is discarded. Instead, the \( u = 0 \), \( v = 0 \), and \( w = 0 \) edges are subdivided according to the first, second, and third outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the first inner triangle is retained. The area between the outer and first inner triangles is completely filled by non-overlapping triangles as described above. If the first (and only) inner triangle is degenerate, a set of triangles is produced by connecting each vertex on the outer triangle edges with the center point.
After all triangles are generated, each vertex in the subdivided triangle is assigned a barycentric \((u,v,w)\) coordinate based on its location relative to the three vertices of the outer triangle.

The algorithm used to subdivide the triangular domain in \((u,v,w)\) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is consistent across the domain as described in Tessellator Vertex Winding Order.

### 23.7. Quad Tessellation

If the tessellation primitive mode is Quads, a rectangle is subdivided into a collection of triangles covering the area of the original rectangle. First, the original rectangle is subdivided into a regular mesh of rectangles, where the number of rectangles along the \(u = 0\) and \(u = 1\) (vertical) and \(v = 0\) and \(v = 1\) (horizontal) edges are derived from the first and second inner tessellation levels, respectively. All rectangles, except those adjacent to one of the outer rectangle edges, are decomposed into triangle pairs. The outermost rectangle edges are subdivided independently, using the first, second, third, and fourth outer tessellation levels to control the number of subdivisions of the \(u = 0\) (left), \(v = 0\) (bottom), \(u = 1\) (right), and \(v = 1\) (top) edges, respectively. The area between the inner rectangles of the mesh and the outer rectangle edges are filled by triangles produced by joining the vertices on the subdivided outer edges to the vertices on the edge of the inner rectangle mesh.

If both clamped inner tessellation levels and all four clamped outer tessellation levels are exactly one, only a single triangle pair covering the outer rectangle is generated. Otherwise, if either clamped inner tessellation level is one, that tessellation level is treated as though it was originally specified as \(1 + \varepsilon\) and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the rectangle.

If any tessellation level is greater than one, tessellation begins by subdividing the \(u = 0\) and \(u = 1\) edges of the outer rectangle into \(m\) segments using the clamped and rounded first inner tessellation level and the tessellation spacing. The \(v = 0\) and \(v = 1\) edges are subdivided into \(n\) segments using the second inner tessellation level. Each vertex on the \(u = 0\) and \(v = 0\) edges are joined with the corresponding vertex on the \(u = 1\) and \(v = 1\) edges to produce a set of vertical and horizontal lines that divide the rectangle into a grid of smaller rectangles. The primitive generator emits a pair of non-overlapping triangles covering each such rectangle not adjacent to an edge of the outer rectangle. The boundary of the region covered by these triangles forms an inner rectangle, the edges of which are subdivided by the grid vertices that lie on the edge. If either \(m\) or \(n\) is two, the inner rectangle is degenerate, and one or both of the rectangle’s edges consist of a single point. This subdivision is illustrated in Figure Inner Quad Tessellation.
Figure 15. Inner Quad Tessellation

**Caption**

In the Inner Quad Tessellation diagram, inner quad tessellation levels of (a) (4,2) and (b) (7,4) are shown. The regions highlighted in red in figure (b) depict the 10 inner rectangles, each of which will be subdivided into two triangles. Solid black circles depict vertices on the boundary of the outer and inner rectangles, where the inner rectangle of figure (a) is degenerate (a single line segment). Dotted lines depict the horizontal and vertical edges connecting corresponding vertices on the inner and outer rectangle edges.

After the area corresponding to the inner rectangle is filled, the tessellator **must** produce triangles to cover the area between the inner and outer rectangles. To do this, the subdivision of the outer rectangle edge above is discarded. Instead, the \( u = 0, v = 0, u = 1, \) and \( v = 1 \) edges are subdivided according to the first, second, third, and fourth outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the inner rectangle is retained. The area between the outer and inner rectangles is completely filled by non-overlapping triangles. Two of the three vertices of each triangle are adjacent vertices on a subdivided edge of one rectangle; the third is one of the vertices on the corresponding edge of the other rectangle. If either edge of the innermost rectangle is degenerate, the area near the corresponding outer edges is filled by connecting each vertex on the outer edge with the single vertex making up the **inner edge**.

The algorithm used to subdivide the rectangular domain in \((u,v)\) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to **triangle lists**, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is consistent across the domain as described in **Tessellator Vertex Winding Order**.

### 23.8. Isoline Tessellation

If the tessellation primitive mode is **IsoLines**, a set of independent horizontal line segments is drawn. The segments are arranged into connected strips called **isolines**, where the vertices of each isoleine have a constant \( v \) coordinate and \( u \) coordinates covering the full range \([0,1]\). The number of
isolines generated is derived from the first outer tessellation level; the number of segments in each isoline is derived from the second outer tessellation level. Both inner tessellation levels and the third and fourth outer tessellation levels have no effect in this mode.

As with quad tessellation above, isoline tessellation begins with a rectangle. The \( u = 0 \) and \( u = 1 \) edges of the rectangle are subdivided according to the first outer tessellation level. For the purposes of this subdivision, the tessellation spacing mode is ignored and treated as equal_spacing. An isoline is drawn connecting each vertex on the \( u = 0 \) rectangle edge to the corresponding vertex on the \( u = 1 \) rectangle edge, except that no line is drawn between (0,1) and (1,1). If the number of isolines on the subdivided \( u = 0 \) and \( u = 1 \) edges is \( n \), this process will result in \( n \) equally spaced lines with constant \( v \) coordinates of 0, \( \frac{1}{n} \), \( \frac{2}{n} \), ..., \( \frac{n-1}{n} \).

Each of the \( n \) isolines is then subdivided according to the second outer tessellation level and the tessellation spacing, resulting in \( m \) line segments. Each segment of each line is emitted by the tessellator. These line segments are generated with a topology similar to line lists, except that the order in which each line is generated, and the order in which the vertices are generated for each line segment, are implementation-dependent.

**Note**

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines` is `VK_FALSE`, then isoline tessellation is not supported by the implementation.

### 23.9. Tessellation Point Mode

For all primitive modes, the tessellator is capable of generating points instead of lines or triangles. If the tessellation control or tessellation evaluation shader specifies the `OpExecutionMode PointMode`, the primitive generator will generate one point for each distinct vertex produced by tessellation, rather than emitting triangles or lines. Otherwise, the tessellator will produce a collection of line segments or triangles according to the primitive mode. These points are generated with a topology similar to point lists, except the order in which the points are generated for each input primitive is undefined.

**Note**

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode` is `VK_FALSE`, then tessellation point mode is not supported by the implementation.

### 23.10. Tessellation Pipeline State

The `pTessellationState` member of `VkGraphicsPipelineCreateInfo` is a pointer to a `VkPipelineTessellationStateCreateInfo` structure.

The `VkPipelineTessellationStateCreateInfo` structure is defined as:
// Provided by VK_VERSION_1_0
typedef struct VkPipelineTessellationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineTessellationStateCreateFlags flags;
    uint32_t patchControlPoints;
} VkPipelineTessellationStateCreateInfo;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is reserved for future use.
• **patchControlPoints** is the number of control points per patch.

### Valid Usage

• VUID-VkPipelineTessellationStateCreateInfo-patchControlPoints-01214
  
  **patchControlPoints** must be greater than zero and less than or equal to
  
  `VkPhysicalDeviceLimits::maxTessellationPatchSize`

### Valid Usage (Implicit)

• VUID-VkPipelineTessellationStateCreateInfo-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO`

• VUID-VkPipelineTessellationStateCreateInfo-pNext-pNext
  
  **pNext** must be NULL or a pointer to a valid instance of
  
  `VkPipelineTessellationDomainOriginStateCreateInfo`

• VUID-VkPipelineTessellationStateCreateInfo-sType-unique
  
  The **sType** value of each struct in the **pNext** chain must be unique

• VUID-VkPipelineTessellationStateCreateInfo-flags-zerobitmask
  
  **flags** must be 0

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineTessellationStateCreateFlags;

**VkPipelineTessellationStateCreateFlags** is a bitmask type for setting a mask, but is currently reserved for future use.

The **VkPipelineTessellationDomainOriginStateCreateInfo** structure is defined as:
typedef struct VkPipelineTessellationDomainOriginStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkTessellationDomainOrigin domainOrigin;
} VkPipelineTessellationDomainOriginStateCreateInfo;

or the equivalent

// Provided by VK_KHR_maintenance2
typedef VkPipelineTessellationDomainOriginStateCreateInfo
VkPipelineTessellationDomainOriginStateCreateInfoKHR;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• domainOrigin is a VkTessellationDomainOrigin value controlling the origin of the tessellation domain space.

If the VkPipelineTessellationDomainOriginStateCreateInfo structure is included in the pNext chain of VkPipelineTessellationStateCreateInfo, it controls the origin of the tessellation domain. If this structure is not present, it is as if domainOrigin was VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT.

Valid Usage (Implicit)

• VUID-VkPipelineTessellationDomainOriginStateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_DOMAIN_ORIGIN_STATE_CREATE_INFO
• VUID-VkPipelineTessellationDomainOriginStateCreateInfo-domainOrigin-parameter
  domainOrigin must be a valid VkTessellationDomainOrigin value

The possible tessellation domain origins are specified by the VkTessellationDomainOrigin enumeration:

typedef enum VkTessellationDomainOrigin {
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT = 0,
    VK_TESSELLATION DOMAIN ORIGIN LOWER LEFT = 1,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN UPPER LEFT_KHR =
    VK_TESSELLATION_DOMAIN ORIGIN UPPER LEFT,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN ORIGIN LOWER LEFT_KHR =
    VK_TESSELLATION_DOMAIN ORIGIN LOWER LEFT,
} VkTessellationDomainOrigin;

or the equivalent
typedef VkTessellationDomainOrigin VkTessellationDomainOriginKHR;

- **VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT** specifies that the origin of the domain space is in the upper left corner, as shown in figure Domain parameterization for tessellation primitive modes (upper-left origin).

- **VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT** specifies that the origin of the domain space is in the lower left corner, as shown in figure Domain parameterization for tessellation primitive modes (lower-left origin).

This enum affects how the `VertexOrderCw` and `VertexOrderCcw` tessellation execution modes are interpreted, since the winding is defined relative to the orientation of the domain.
Chapter 24. Geometry Shading

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive. Geometry shading is enabled when a geometry shader is included in the pipeline.

24.1. Geometry Shader Input Primitives

Each geometry shader invocation has access to all vertices in the primitive (and their associated data), which are presented to the shader as an array of inputs.

The input primitive type expected by the geometry shader is specified with an `OpExecutionMode` instruction in the geometry shader, and must match the incoming primitive type specified by either the pipeline’s primitive topology if tessellation is inactive, or the tessellation mode if tessellation is active, as follows:

- An input primitive type of `InputPoints` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, or with a tessellation shader that specifies `PointMode`. The input arrays always contain one element, as described by the point list topology or tessellation in point mode.

- An input primitive type of `InputLines` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, or with a tessellation shader specifying `IsoLines` that does not specify `PointMode`. The input arrays always contain two elements, as described by the line list topology or line strip topology, or by isoline tessellation.

- An input primitive type of `InputLinesAdjacency` must only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`. The input arrays always contain four elements, as described by the line list with adjacency topology or line strip with adjacency topology.

- An input primitive type of `Triangles` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`; or with a tessellation shader specifying `Quads` or `Triangles` that does not specify `PointMode`. The input arrays always contain three elements, as described by the triangle list topology, triangle strip topology, or triangle fan topology, or by triangle or quad tessellation. Vertices may be in a different absolute order to that specified by the topology, but must adhere to the specified winding order.

- An input primitive type of `InputTrianglesAdjacency` must only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`. The input arrays always contain six elements, as described by the triangle list with adjacency topology or triangle strip with adjacency topology. Vertices may be in a different absolute order to that specified by the topology, but must adhere to the specified winding order, and the vertices making up the main primitive must still occur at the first, third, and fifth index.
24.2. Geometry Shader Output Primitives

A geometry shader generates primitives in one of three output modes: points, line strips, or triangle strips. The primitive mode is specified in the shader using an OpExecutionMode instruction with the OutputPoints, OutputLineStrip or OutputTriangleStrip modes, respectively. Each geometry shader must include exactly one output primitive mode.

The vertices output by the geometry shader are assembled into points, lines, or triangles based on the output primitive type and the resulting primitives are then further processed as described in Rasterization. If the number of vertices emitted by the geometry shader is not sufficient to produce a single primitive, vertices corresponding to incomplete primitives are not processed by subsequent pipeline stages. The number of vertices output by the geometry shader is limited to a maximum count specified in the shader.

The maximum output vertex count is specified in the shader using an OpExecutionMode instruction with the mode set to OutputVertices and the maximum number of vertices that will be produced by the geometry shader specified as a literal. Each geometry shader must specify a maximum output vertex count.

24.3. Multiple Invocations of Geometry Shaders

Geometry shaders can be invoked more than one time for each input primitive. This is known as geometry shader instancing and is requested by including an OpExecutionMode instruction with mode specified as Invocations and the number of invocations specified as an integer literal.

In this mode, the geometry shader will execute at least n times for each input primitive, where n is the number of invocations specified in the OpExecutionMode instruction. The instance number is available to each invocation as a built-in input using InvocationId.

24.4. Geometry Shader Primitive Ordering

Limited guarantees are provided for the relative ordering of primitives produced by a geometry shader, as they pertain to primitive order.

- For instanced geometry shaders, the output primitives generated from each input primitive are passed to subsequent pipeline stages using the invocation number to order the primitives, from least to greatest.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.

24.5. Geometry Shader Passthrough

A geometry shader that uses the PassthroughNV decoration on a variable in its input interface is considered a passthrough geometry shader. Output primitives in a passthrough geometry shader must have the same topology as the input primitive and are not produced by emitting vertices. The vertices of the output primitive have two different types of attributes, per-vertex and per-primitive. Geometry shader input variables with PassthroughNV decoration are considered to produce per-
vertex outputs, where values for each output vertex are copied from the corresponding input vertex. Any built-in or user-defined geometry shader outputs are considered per-primitive in a passthrough geometry shader, where a single output value is copied to all output vertices.

The remainder of this section details the usage of the `PassthroughNV` decoration and modifications to the interface matching rules when using passthrough geometry shaders.

### 24.5.1. PassthroughNV Decoration

Decorating a geometry shader input variable with the `PassthroughNV` decoration indicates that values of this input are copied through to the corresponding vertex of the output primitive. Input variables and block members which do not have the `PassthroughNV` decoration are consumed by the geometry shader without being passed through to subsequent stages.

The `PassthroughNV` decoration **must** only be used within a geometry shader.

Any variable decorated with `PassthroughNV` **must** be declared using the `Input` storage class.

The `PassthroughNV` decoration **must** not be used with any of:

- an input primitive type other than `InputPoints`, `InputLines`, or `Triangles`, as specified by the mode for `OpExecutionMode`.
- an invocation count other than one, as specified by the `Invocations` mode for `OpExecutionMode`.
- an `OpEntryPoint` which statically uses the `OpEmitVertex` or `OpEndPrimitive` instructions.
- a variable decorated with the `InvocationId` built-in decoration.
- a variable decorated with the `PrimitiveId` built-in decoration that is declared using the `Input` storage class.

### 24.5.2. Passthrough Interface Matching

When a passthrough geometry shader is in use, the Interface Matching rules involving the geometry shader input and output interfaces operate as described in this section.

For the purposes of matching passthrough geometry shader inputs with outputs of the previous pipeline stages, the `PassthroughNV` decoration is ignored.

For the purposes of matching the outputs of the geometry shader with subsequent pipeline stages, each input variable with the `PassthroughNV` decoration is considered to add an equivalent output variable with the same type, decoration (other than `PassthroughNV`), number, and declaration order on the output interface. The output variable declaration corresponding to an input variable decorated with `PassthroughNV` will be identical to the input declaration, except that the outermost array dimension of such variables is removed. The output block declaration corresponding to an input block decorated with `PassthroughNV` or having members decorated with `PassthroughNV` will be identical to the input declaration, except that the outermost array dimension of such declaration is removed.

If an input block is decorated with `PassthroughNV`, the equivalent output block contains all the members of the input block. Otherwise, the equivalent output block contains only those input block
members decorated with `PassthroughNV`. All members of the corresponding output block are assigned `Location` and `Component` decorations identical to those assigned to the corresponding input block members.

Output variables and blocks generated from inputs decorated with `PassthroughNV` will only exist for the purposes of interface matching; these declarations are not available to geometry shader code or listed in the module interface.

For the purposes of component counting, passthrough geometry shaders count all statically used input variable components declared with the `PassthroughNV` decoration as output components as well, since their values will be copied to the output primitive produced by the geometry shader.
Chapter 25. Mesh Shading

Task and mesh shaders operate in workgroups to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline.

Work on the mesh pipeline is initiated by the application drawing a set of mesh tasks organized in global workgroups. If the optional task shader is active, each workgroup triggers the execution of task shader invocations that will create a new set of mesh workgroups upon completion. Each of these created workgroups, or each of the original workgroups if no task shader is present, triggers the execution of mesh shader invocations.

Each mesh shader workgroup emits zero or more output primitives along with the group of vertices and their associated data required for each output primitive.

25.1. Task Shader Input

For every workgroup issued via the drawing commands a group of task shader invocations is executed. There are no inputs other than the builtin workgroup identifiers.

25.2. Task Shader Output

The task shader can emit zero or more mesh workgroups to be generated using the built-in variable TaskCountNV. This value must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV::maxTaskOutputCount.

It can also output user-defined data that is passed as input to all mesh shader invocations that the task creates. These outputs are decorated as PerTaskNV.

25.3. Mesh Generation

If a task shader exists, the mesh assembler creates a variable amount of mesh workgroups depending on each task's output. If there is no task shader, the drawing commands emit the mesh shader invocations directly.

25.4. Mesh Shader Input

The only inputs available to the mesh shader are variables identifying the specific workgroup and invocation and, if applicable, any outputs written as PerTaskNV by the task shader that spawned the mesh shader's workgroup. The mesh shader can operate without a task shader as well.

25.5. Mesh Shader Output Primitives

A mesh shader generates primitives in one of three output modes: points, lines, or triangles. The primitive mode is specified in the shader using an OpExecutionMode instruction with the OutputPoints, OutputLinesNV, or OutputTrianglesNV modes, respectively. Each mesh shader must include exactly one output primitive mode.
The maximum output vertex count is specified as a literal in the shader using an `OpExecutionMode` instruction with the mode set to `OutputVertices` and must be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputVertices`.

The maximum output primitive count is specified as a literal in the shader using an `OpExecutionMode` instruction with the mode set to `OutputPrimitivesNV` and must be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputPrimitives`.

The number of primitives output by the mesh shader is provided via writing to the built-in variable `PrimitiveCountNV` and must be less than or equal to the maximum output primitive count specified in the shader. A variable decorated with `PrimitiveIndicesNV` is an output array of local index values into the vertex output arrays from which primitives are assembled according to the output primitive type. These resulting primitives are then further processed as described in Rasterization.

### 25.6. Mesh Shader Per-View Outputs

The mesh shader outputs decorated with the `PositionPerViewNV`, `ClipDistancePerViewNV`, `CullDistancePerViewNV`, `LayerPerViewNV`, and `ViewportMaskPerViewNV` built-in decorations are the per-view versions of the single-view variables with equivalent names (that is `Position`, `ClipDistance`, `CullDistance`, `Layer`, and `ViewportMaskNV`, respectively). If a shader statically assigns a value to any element of a per-view array it must not statically assign a value to the equivalent single-view variable.

Each of these outputs is considered arrayed, with separate values for each view. The view number is used to index the first dimension of these arrays.

The second dimension of the `ClipDistancePerViewNV`, and `CullDistancePerViewNV` arrays have the same requirements as the `ClipDistance`, and `CullDistance` arrays.

If a mesh shader output is *per-view*, the corresponding fragment shader input is taken from the element of the per-view output array that corresponds to the view that is currently being processed by the fragment shader.

### 25.7. Mesh Shader Primitive Ordering

Following guarantees are provided for the relative ordering of primitives produced by a mesh shader, as they pertain to primitive order:

- When a task shader is used, mesh workgroups spawned from lower tasks will be ordered prior those workgroups from subsequent tasks.

- All output primitives generated from a given mesh workgroup are passed to subsequent pipeline stages before any output primitives generated from subsequent input workgroups.

- All output primitives within a mesh workgroup, will be generated in the ordering provided by the builtin primitive indexbuffer (from low address to high address).
Chapter 26. Fixed-Function Vertex Post-Processing

After programmable vertex processing, the following fixed-function operations are applied to vertices of the resulting primitives:

- Transform feedback (see Transform Feedback)
- Viewport swizzle (see Viewport Swizzle)
- Flat shading (see Flat Shading).
- Primitive clipping, including client-defined half-spaces (see Primitive Clipping).
- Shader output attribute clipping (see Clipping Shader Outputs).
- Clip space W scaling (see Controlling Viewport W Scaling).
- Perspective division on clip coordinates (see Coordinate Transformations).
- Viewport mapping, including depth range scaling (see Controlling the Viewport).
- Front face determination for polygon primitives (see Basic Polygon Rasterization).

Next, rasterization is performed on primitives as described in chapter Rasterization.

26.1. Transform Feedback

Before any other fixed-function vertex post-processing, vertex outputs from the last shader in the vertex processing stage can be written out to one or more transform feedback buffers bound to the command buffer. To capture vertex outputs the last vertex processing stage shader must be declared with the Xfb execution mode. Outputs decorated with XfbBuffer will be written out to the corresponding transform feedback buffers bound to the command buffer when transform feedback is active. Transform feedback buffers are bound to the command buffer by using vkCmdBindTransformFeedbackBuffersEXT. Transform feedback is made active by calling vkCmdBeginTransformFeedbackEXT and made inactive by calling vkCmdEndTransformFeedbackEXT. After vertex data is written it is possible to use vkCmdDrawIndirectByteCountEXT to start a new draw where the vertexCount is derived from the number of bytes written by a previous transform feedback.

When an individual point, line, or triangle primitive reaches the transform feedback stage while transform feedback is active, the values of the specified output variables are assembled into primitives and appended to the bound transform feedback buffers. After activating transform feedback, the values of the first assembled primitive are written at the starting offsets of the bound transform feedback buffers, and subsequent primitives are appended to the buffer. If the optional pCounterBuffers and pCounterBufferOffsets parameters are specified, the starting points within the transform feedback buffers are adjusted so data is appended to the previously written values indicated by the value stored by the implementation in the counter buffer.

For multi-vertex primitives, all values for a given vertex are written before writing values for any other vertex. When transformFeedbackPreservesProvokingVertex is not enabled, implementations may write out any vertex within the primitive first, but all subsequent vertices for that primitive
must be written out in a consistent winding order defined as follows:

- If neither geometry or tessellation shading is active, vertices within a primitive are appended according to the winding order described by the primitive topology defined by the `VkPipelineInputAssemblyStateCreateInfo::topology` used to execute the drawing command.

- If geometry shading is active, vertices within a primitive are appended according to the winding order described by the primitive topology defined by the `OutputPoints`, `OutputLineStrips`, or `OutputTriangleStrips` execution mode.

- If tessellation shading is active but geometry shading is not, vertices within a primitive are appended according to the winding order defined by triangle tessellation, quad tessellation, and isoline tessellation.

When `transformFeedbackPreservesProvokingVertex` is enabled, then in addition to writing vertices with a consistent winding order, the vertex order must preserve the provoking vertex of each primitive:

- When the pipeline's provoking vertex mode is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the primitive's provoking vertex must be the first vertex written.

- When the pipeline's provoking vertex mode is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the primitive's provoking vertex must be the last vertex written.

If `transformFeedbackPreservesTriangleFanProvokingVertex` is `VK_FALSE`, neither geometry nor tessellation shading is active, and the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`, then the first vertex written from each primitive is implementation-defined even when `transformFeedbackPreservesProvokingVertex` is enabled.

When capturing vertices, the stride associated with each transform feedback buffer, as indicated by the `XfbStride` decoration, indicates the number of bytes of storage reserved for each vertex in the transform feedback buffer. For every vertex captured, each output attribute with a `Offset` decoration will be written to the storage reserved for the vertex at the associated transform feedback buffer. When writing output variables that are arrays or structures, individual array elements or structure members are written tightly packed in order. For vector types, individual components are written in order. For matrix types, outputs are written as an array of column vectors.

If any component of an output with an assigned transform feedback offset was not written to by its shader, the value recorded for that component is undefined. All components of an output variable must be written at an offset aligned to the size of the component. The size of each component of an output variable must be at least 32-bits. When capturing a vertex, any portion of the reserved storage not associated with an output variable with an assigned transform feedback offset will be unmodified.

When transform feedback is inactive, no vertices are recorded. If there is a valid counter buffer handle and counter buffer offset in the `pCounterBuffers` and `pCounterBufferOffsets` arrays, writes to the corresponding transform feedback buffer will start at the byte offset represented by the value stored in the counter buffer location.

Individual lines or triangles of a strip or fan primitive will be extracted and recorded separately.
Incomplete primitives are not recorded.

When using a geometry shader that emits vertices to multiple vertex streams, a primitive will be assembled and output for each stream when there are enough vertices emitted for the output primitive type. All outputs assigned to a given transform feedback buffer are required to come from a single vertex stream.

The sizes of the transform feedback buffers are defined by the `vkCmdBindTransformFeedbackBuffersEXT` `pSizes` parameter for each of the bound buffers, or the size of the bound buffer, whichever is the lesser. If there is less space remaining in any of the transform feedback buffers than the size of the all the vertex data for that primitive based on the `XfbStride` for that `XfbBuffer` then no vertex data of that primitive is recorded in any transform feedback buffer, and the value for the number of primitives written in the corresponding `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` query for all transform feedback buffers is no longer incremented.

Any outputs made to a `XfbBuffer` that is not bound to a transform feedback buffer is ignored.

To bind transform feedback buffers to a command buffer for use in subsequent draw commands, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBindTransformFeedbackBuffersEXT(
    VkCommandBuffer                             commandBuffer,  // Provided by VK_EXT_transform_feedback
    uint32_t                                    firstBinding,     // Provided by VK_EXT_transform_feedback
    uint32_t                                    bindingCount,    // Provided by VK_EXT_transform_feedback
    const VkBuffer*                             pBuffers,         // Provided by VK_EXT_transform_feedback
    const VkDeviceSize*                         pOffsets,         // Provided by VK_EXT_transform_feedback
    const VkDeviceSize*                         pSizes           // Provided by VK_EXT_transform_feedback);  // Provided by VK_EXT_transform_feedback
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first transform feedback binding whose state is updated by the command.
- `bindingCount` is the number of transform feedback bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is `NULL` or a pointer to an array of `VkDeviceSize` buffer sizes, specifying the maximum number of bytes to capture to the corresponding transform feedback buffer. If `pSizes` is `NULL`, or the value of the `pSizes` array element is `VK_WHOLE_SIZE`, then the maximum number of bytes captured will be the size of the corresponding buffer minus the buffer offset.

The values taken from elements i of `pBuffers`, `pOffsets` and `pSizes` replace the current state for the transform feedback binding `firstBinding + i`, for i in `[0, bindingCount)`. The transform feedback binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. 
Valid Usage

- VUID-vkCmdBindTransformFeedbackBuffersEXT-transformFeedback-02355
  
  \textit{VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback} must be enabled

- VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02356
  
  \textit{firstBinding} must be less than \textit{VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers}

- VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02357
  
  The sum of \textit{firstBinding} and \textit{bindingCount} must be less than or equal to \textit{VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers}

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02358
  
  All elements of \textit{pOffsets} must be less than the size of the corresponding element in \textit{pBuffers}

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02359
  
  All elements of \textit{pOffsets} must be a multiple of 4

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02360
  
  All elements of \textit{pBuffers} must have been created with the \textit{VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT} flag

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pSize-02361
  
  If the optional \textit{pSize} array is specified, each element of \textit{pSizes} must either be \textit{VK_WHOLE_SIZE}, or be less than or equal to \textit{VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferSize}

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pSizes-02362
  
  All elements of \textit{pSizes} must be either \textit{VK_WHOLE_SIZE}, or less than or equal to the size of the corresponding buffer in \textit{pBuffers}

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02363
  
  All elements of \textit{pOffsets} plus \textit{pSizes}, where the \textit{pSizes}, element is not \textit{VK_WHOLE_SIZE}, must be less than or equal to the size of the corresponding buffer in \textit{pBuffers}

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02364
  
  Each element of \textit{pBuffers} that is non-sparse must be bound completely and contiguously to a single \textit{VkDeviceMemory} object

- VUID-vkCmdBindTransformFeedbackBuffersEXT-None-02365
  
  Transform feedback \textbf{must} not be active when the \textit{vkCmdBindTransformFeedbackBuffersEXT} command is recorded
Valid Usage (Implicit)

- VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-parameter
  `pBuffers` must be a valid pointer to an array of `bindingCount` valid `VkBuffer` handles

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-parameter
  `pOffsets` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values

- VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdBindTransformFeedbackBuffersEXT-bindingCount-arraylength
  `bindingCount` must be greater than 0

- VUID-vkCmdBindTransformFeedbackBuffersEXT-commonparent
  Both of `commandBuffer`, and the elements of `pBuffers` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>

Transform feedback for specific transform feedback buffers is made active by calling:
// Provided by VK_EXT_transform_feedback

void vkCmdBeginTransformFeedbackEXT(
    VkCommandBuffer commandBuffer,  
    uint32_t firstCounterBuffer,    
    uint32_t counterBufferCount,    
    const VkBuffer* pCounterBuffers,  
    const VkDeviceSize* pCounterBufferOffsets);

• `commandBuffer` is the command buffer into which the command is recorded.

• `firstCounterBuffer` is the index of the first transform feedback buffer corresponding to `pCounterBuffers[0]` and `pCounterBufferOffsets[0]`.

• `counterBufferCount` is the size of the `pCounterBuffers` and `pCounterBufferOffsets` arrays.

• `pCounterBuffers` is NULL or a pointer to an array of `VkBuffer` handles to counter buffers. Each buffer contains a 4 byte integer value representing the byte offset from the start of the corresponding transform feedback buffer from where to start capturing vertex data. If the byte offset stored to the counter buffer location was done using `vkCmdEndTransformFeedbackEXT` it can be used to resume transform feedback from the previous location. If `pCounterBuffers` is NULL, then transform feedback will start capturing vertex data to byte offset zero in all bound transform feedback buffers. For each element of `pCounterBuffers` that is `VK_NULL_HANDLE`, transform feedback will start capturing vertex data to byte zero in the corresponding bound transform feedback buffer.

• `pCounterBufferOffsets` is NULL or a pointer to an array of `VkDeviceSize` values specifying offsets within each of the `pCounterBuffers` where the counter values were previously written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. This data is the number of bytes captured by the previous transform feedback to this buffer. If `pCounterBufferOffsets` is NULL, then it is assumed the offsets are zero.

The active transform feedback buffers will capture primitives emitted from the corresponding `XfbBuffer` in the bound graphics pipeline. Any `XfbBuffer` emitted that does not output to an active transform feedback buffer will not be captured.
### Valid Usage

- VUID-vkCmdBeginTransformFeedbackEXT-transformFeedback-02366
  
  `VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` must be enabled

- VUID-vkCmdBeginTransformFeedbackEXT-None-02367
  
  Transform feedback must not be active

- VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02368
  
  `firstCounterBuffer` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`

- VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02369
  
  The sum of `firstCounterBuffer` and `counterBufferCount` must be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`

- VUID-vkCmdBeginTransformFeedbackEXT-counterBufferCount-02607
  
  If `counterBufferCount` is not 0, and `pCounterBuffers` is not NULL, `pCounterBuffers` must be a valid pointer to an array of `counterBufferCount` `VkBuffer` handles that are either valid or `VK_NULL_HANDLE`

- VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-02370
  
  For each buffer handle in the array, if it is not `VK_NULL_HANDLE` it must reference a buffer large enough to hold 4 bytes at the corresponding offset from the `pCounterBufferOffsets` array

- VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffer-02371
  
  If `pCounterBuffer` is NULL, then `pCounterBufferOffsets` must also be NULL

- VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffers-02372
  
  For each buffer handle in the `pCounterBuffers` array that is not `VK_NULL_HANDLE` it must have been created with a usage value containing `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT`

- VUID-vkCmdBeginTransformFeedbackEXT-None-04128
  
  The last vertex processing stage of the bound graphics pipeline must have been declared with the `Xfb` execution mode

- VUID-vkCmdBeginTransformFeedbackEXT-None-02373
  
  Transform feedback must not be made active in a render pass instance with multiview enabled
### Valid Usage (Implicit)

- **VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-parameter**
  
  ```
  commandBuffer must be a valid VkCommandBuffer handle
  ```

- **VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-parameter**
  
  If `counterBufferCount` is not 0, and `pCounterBufferOffsets` is not NULL, `pCounterBufferOffsets` must be a valid pointer to an array of `counterBufferCount` `VkDeviceSize` values

- **VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-recording**
  
  ```
  commandBuffer must be in the recording state
  ```

- **VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdBeginTransformFeedbackEXT-renderpass**
  
  This command must only be called inside of a render pass instance

- **VUID-vkCmdBeginTransformFeedbackEXT-commonparent**
  
  Both of `commandBuffer`, and the elements of `pCounterBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<td></td>
</tr>
</tbody>
</table>

Transform feedback for specific transform feedback buffers is made inactive by calling:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdEndTransformFeedbackEXT(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    firstCounterBuffer,
    uint32_t                                    counterBufferCount,
    const VkBuffer*                             pCounterBuffers,
    const VkDeviceSize*                         pCounterBufferOffsets);
```
• `commandBuffer` is the command buffer into which the command is recorded.

• `firstCounterBuffer` is the index of the first transform feedback buffer corresponding to `pCounterBuffers[0]` and `pCounterBufferOffsets[0]`.

• `counterBufferCount` is the size of the `pCounterBuffers` and `pCounterBufferOffsets` arrays.

• `pCounterBuffers` is `NULL` or a pointer to an array of `VkBuffer` handles to counter buffers. The counter buffers are used to record the current byte positions of each transform feedback buffer where the next vertex output data would be captured. This can be used by a subsequent `vkCmdBeginTransformFeedbackEXT` call to resume transform feedback capture from this position. It can also be used by `vkCmdDrawIndirectByteCountEXT` to determine the vertex count of the draw call.

• `pCounterBufferOffsets` is `NULL` or a pointer to an array of `VkDeviceSize` values specifying offsets within each of the `pCounterBuffers` where the counter values can be written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. The data stored at this location is the byte offset from the start of the transform feedback buffer binding where the next vertex data would be written. If `pCounterBufferOffsets` is `NULL`, then it is assumed the offsets are zero.

### Valid Usage

- VUID-vkCmdEndTransformFeedbackEXT-transformFeedback-02374
  
  `VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` must be enabled

- VUID-vkCmdEndTransformFeedbackEXT-None-02375
  
  Transform feedback must be active

- VUID-vkCmdEndTransformFeedbackEXT-firstCounterBuffer-02376
  
  `firstCounterBuffer` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`

- VUID-vkCmdEndTransformFeedbackEXT-firstCounterBuffer-02377
  
  The sum of `firstCounterBuffer` and `counterBufferCount` must be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`

- VUID-vkCmdEndTransformFeedbackEXT-counterBufferCount-02608
  
  If `counterBufferCount` is not 0, and `pCounterBuffers` is not `NULL`, `pCounterBuffers` must be a valid pointer to an array of `counterBufferCount` `VkBuffer` handles that are either valid or `VK_NULL_HANDLE`

- VUID-vkCmdEndTransformFeedbackEXT-pCounterBufferOffsets-02378
  
  For each buffer handle in the array, if it is not `VK_NULL_HANDLE` it must reference a buffer large enough to hold 4 bytes at the corresponding offset from the `pCounterBufferOffsets` array

- VUID-vkCmdEndTransformFeedbackEXT-pCounterBuffer-02379
  
  If `pCounterBuffer` is `NULL`, then `pCounterBufferOffsets` must also be `NULL`

- VUID-vkCmdEndTransformFeedbackEXT-pCounterBuffers-02380
  
  For each buffer handle in the `pCounterBuffers` array that is not `VK_NULL_HANDLE` it must have been created with a usage value containing `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT`
Valid Usage (Implicit)

- VUID-vkCmdEndTransformFeedbackEXT-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdEndTransformFeedbackEXT-pCounterBufferOffsets-parameter
  
  If `counterBufferCount` is not 0, and `pCounterBufferOffsets` is not NULL, `pCounterBufferOffsets` must be a valid pointer to an array of `counterBufferCount` `VkDeviceSize` values.

- VUID-vkCmdEndTransformFeedbackEXT-commandBuffer-recording
  
  `commandBuffer` must be in the recording state.

- VUID-vkCmdEndTransformFeedbackEXT-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdEndTransformFeedbackEXT-renderpass
  
  This command must only be called inside of a render pass instance.

- VUID-vkCmdEndTransformFeedbackEXT-commonparent
  
  Both of `commandBuffer`, and the elements of `pCounterBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

26.2. Viewport Swizzle

Each primitive sent to a given viewport has a swizzle and optional negation applied to its clip coordinates. The swizzle that is applied depends on the viewport index, and is controlled by the `VkPipelineViewportSwizzleStateCreateInfoNV` pipeline state:
typedef struct VkPipelineViewportSwizzleStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportSwizzleStateCreateFlagsNV flags;
    uint32_t viewportCount;
    const VkViewportSwizzleNV* pViewportSwizzles;
} VkPipelineViewportSwizzleStateCreateInfoNV;

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **viewportCount** is the number of viewport swizzles used by the pipeline.
- **pViewportSwizzles** is a pointer to an array of `VkViewportSwizzleNV` structures, defining the viewport swizzles.

### Valid Usage

- **VUID-VkPipelineViewportSwizzleStateCreateInfoNV-viewportCount-01215**
  
  `viewportCount` **must** be greater than or equal to the `viewportCount` set in `VkPipelineViewportStateCreateInfo`

### Valid Usage (Implicit)

- **VUID-VkPipelineViewportSwizzleStateCreateInfoNV-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_SIZZLE_STATE_CREATE_INFO_NV`

- **VUID-VkPipelineViewportSwizzleStateCreateInfoNV-flags-zerobitmask**
  
  `flags` **must** be `0`

- **VUID-VkPipelineViewportSwizzleStateCreateInfoNV-pViewportSwizzles-parameter**
  
  `pViewportSwizzles` **must** be a valid pointer to an array of `viewportCount` valid `VkViewportSwizzleNV` structures

- **VUID-VkPipelineViewportSwizzleStateCreateInfoNV-viewportCount-arraylength**
  
  `viewportCount` **must** be greater than `0`

// Provided by VK_NV_viewport_swizzle
typedef VkFlags VkPipelineViewportSwizzleStateCreateFlagsNV;

`VkPipelineViewportSwizzleStateCreateFlagsNV` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkPipelineViewportSwizzleStateCreateInfoNV` state is set by adding this structure to the `pNext` chain of a `VkPipelineViewportStateCreateInfo` structure and setting the graphics pipeline state with
Each viewport specified from 0 to `viewportCount - 1` has its x, y, z, w swizzle state set to the corresponding `x`, `y`, `z` and `w` in the `VkViewportSwizzleNV` structure. Each component is of type `VkViewportCoordinateSwizzleNV`, which determines the type of swizzle for that component. The value of `x` computes the new x component of the position as:

```c
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV) x' = x;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_X_NV) x' = -x;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV) x' = y;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Y_NV) x' = -y;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV) x' = z;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Z_NV) x' = -z;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV) x' = w;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_W_NV) x' = -w;
```

Similar selections are performed for the `y`, `z`, and `w` coordinates. This swizzling is applied before clipping and perspective divide. If the swizzle for an active viewport index is not specified, the swizzle for `x` is `VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV`, `y` is `VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV`, `z` is `VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV` and `w` is `VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV`.

Viewport swizzle parameters are specified by setting the `pNext` pointer of `VkGraphicsPipelineCreateInfo` to point to a `VkPipelineViewportSwizzleStateCreateInfoNV` structure. `VkPipelineViewportSwizzleStateCreateInfoNV` uses `VkViewportSwizzleNV` to set the viewport swizzle parameters.

The `VkViewportSwizzleNV` structure is defined as:

```c
// Provided by VK_NV_viewport_swizzle
typedef struct VkViewportSwizzleNV {
    VkViewportCoordinateSwizzleNV x;
    VkViewportCoordinateSwizzleNV y;
    VkViewportCoordinateSwizzleNV z;
    VkViewportCoordinateSwizzleNV w;
} VkViewportSwizzleNV;
```

- `x` is a `VkViewportCoordinateSwizzleNV` value specifying the swizzle operation to apply to the x component of the primitive
- `y` is a `VkViewportCoordinateSwizzleNV` value specifying the swizzle operation to apply to the y component of the primitive
- `z` is a `VkViewportCoordinateSwizzleNV` value specifying the swizzle operation to apply to the z component of the primitive
- `w` is a `VkViewportCoordinateSwizzleNV` value specifying the swizzle operation to apply to the w component of the primitive
Valid Usage (Implicit)

- VUID-VkViewportSwizzleNV-x-parameter
  x must be a valid VkViewportCoordinateSwizzleNV value

- VUID-VkViewportSwizzleNV-y-parameter
  y must be a valid VkViewportCoordinateSwizzleNV value

- VUID-VkViewportSwizzleNV-z-parameter
  z must be a valid VkViewportCoordinateSwizzleNV value

- VUID-VkViewportSwizzleNV-w-parameter
  w must be a valid VkViewportCoordinateSwizzleNV value

Possible values of the VkViewportSwizzleNV::x, y, z, and w members, specifying swizzling of the corresponding components of primitives, are:

```cpp
// Provided by VK_NV_viewport_swizzle
typedef enum VkViewportCoordinateSwizzleNV {
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV = 0,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_X_NV = 1,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV = 2,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Y_NV = 3,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV = 4,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Z_NV = 5,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV = 6,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_W_NV = 7,
} VkViewportCoordinateSwizzleNV;
```

These values are described in detail in Viewport Swizzle.

26.3. Flat Shading

*Flat shading* a vertex output attribute means to assign all vertices of the primitive the same value for that output. The output values assigned are those of the *provoking vertex* of the primitive. Flat shading is applied to those vertex attributes that match fragment input attributes which are decorated as *Flat*.

If neither *geometry* nor *tessellation shading* is active, the provoking vertex is determined by the *primitive topology* defined by VkPipelineInputAssemblyStateCreateInfo:topology used to execute the drawing command.

If *geometry shading* is active, the provoking vertex is determined by the *primitive topology* defined by the OutputPoints, OutputLineStrips, or OutputTriangleStrips execution mode.

If *tessellation shading* is active but *geometry shading* is not, the provoking vertex *may* be any of the vertices in each primitive.

For a given primitive topology, the pipeline’s provoking vertex mode determines which vertex is
the provoking vertex. To specify the provoking vertex mode, attach an instance of
\texttt{VkPipelineRasterizationProvokingVertexStateCreateInfoEXT} to
\texttt{VkPipelineRasterizationStateCreateInfo::pNext} when creating the pipeline.

The \texttt{VkPipelineRasterizationProvokingVertexStateCreateInfoEXT} structure is defined as:

```c
// Provided by VK_EXT_provoking_vertex
typedef struct VkPipelineRasterizationProvokingVertexStateCreateInfoEXT {
    VkStructureType             sType;
    const void*                 pNext;
    VkProvokingVertexModeEXT    provokingVertexMode;
} VkPipelineRasterizationProvokingVertexStateCreateInfoEXT;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to an extension-specific structure.
- \texttt{provokingVertexMode} is a \texttt{VkProvokingVertexModeEXT} value selecting the provoking vertex mode.

If this struct is not provided when creating the pipeline, the pipeline will use the
\texttt{VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT} mode.

If the \texttt{provokingVertexModePerPipeline} limit is \texttt{VK_FALSE}, then the all pipelines bound within a
renderpass instance \textbf{must} have the same \texttt{provokingVertexMode}.

### Valid Usage

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-04883
  If \texttt{provokingVertexMode} is \texttt{VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT}, then the
  \texttt{provokingVertexLast} feature \textbf{must} be enabled

### Valid Usage (Implicit)

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-sType-sType
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_PROVOKING_VERTEX_STATE_CREATE_INFO_EXT}

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-parameter
  \texttt{provokingVertexMode} \textbf{must} be a valid \texttt{VkProvokingVertexModeEXT} value

Possible values of \texttt{VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode}
are:
typedef enum VkProvokingVertexModeEXT {
    VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT = 0,
    VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT = 1,
} VkProvokingVertexModeEXT;

- VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT specifies that the provoking vertex is the first non-adjacency vertex in the list of vertices used by a primitive.
- VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT specifies that the provoking vertex is the last non-adjacency vertex in the list of vertices used by a primitive.

These modes are described more precisely in Primitive Topologies.

### 26.4. Primitive Clipping

Primitives are culled against the *cull volume* and then clipped to the *clip volume*. In clip coordinates, the *view volume* is defined by:

\[
\begin{align*}
-W_c & \leq x_c \leq W_c \\
-W_c & \leq y_c \leq W_c \\
0 & \leq z_c \leq W_c
\end{align*}
\]

This view volume can be further restricted by as many as `VkPhysicalDeviceLimits::maxClipDistances` client-defined half-spaces.

The cull volume is the intersection of up to `VkPhysicalDeviceLimits::maxCullDistances` client-defined half-spaces (if no client-defined cull half-spaces are enabled, culling against the cull volume is skipped).

A shader must write a single cull distance for each enabled cull half-space to elements of the `CullDistance` array. If the cull distance for any enabled cull half-space is negative for all of the vertices of the primitive under consideration, the primitive is discarded. Otherwise the primitive is clipped against the clip volume as defined below.

The clip volume is the intersection of up to `VkPhysicalDeviceLimits::maxClipDistances` client-defined half-spaces with the view volume (if no client-defined clip half-spaces are enabled, the clip volume is the view volume).

A shader must write a single clip distance for each enabled clip half-space to elements of the `ClipDistance` array. Clip half-space i is then given by the set of points satisfying the inequality

\[ c_i(P) \geq 0 \]

where \( c_i(P) \) is the clip distance i at point \( P \). For point primitives, \( c_i(P) \) is simply the clip distance for the vertex in question. For line and triangle primitives, per-vertex clip distances are interpolated using a weighted mean, with weights derived according to the algorithms described in sections Basic Line Segment Rasterization and Basic Polygon Rasterization, using the perspective interpolation equations.
The number of client-defined clip and cull half-spaces that are enabled is determined by the explicit size of the built-in arrays `ClipDistance` and `CullDistance`, respectively, declared as an output in the interface of the entry point of the final shader stage before clipping.

If `VkPipelineRasterizationDepthClipStateCreateInfoEXT` is present in the graphics pipeline state then depth clipping is disabled if `VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable` is `VK_FALSE`. Otherwise, if `VkPipelineRasterizationDepthClipStateCreateInfoEXT` is not present, depth clipping is disabled when `VkPipelineRasterizationStateCreateInfo::depthClampEnable` is `VK_TRUE`. When depth clipping is disabled, the plane equation

\[0 \leq z_c \leq w_c\]

(see the clip volume definition above) is ignored by view volume clipping (effectively, there is no near or far plane clipping).

If the primitive under consideration is a point or line segment, then clipping passes it unchanged if its vertices lie entirely within the clip volume.

Possible values of `VkPhysicalDevicePointClippingProperties::pointClippingBehavior`, specifying clipping behavior of a point primitive whose vertex lies outside the clip volume, are:

```c
typedef enum VkPointClippingBehavior {
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES = 0,
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY = 1,
    // Provided by VK_KHR_maintenance2
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES_KHR = VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES,
    // Provided by VK_KHR_maintenance2
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY_KHR = VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY,
} VkPointClippingBehavior;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkPointClippingBehavior VkPointClippingBehaviorKHR;
```

- `VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES` specifies that the primitive is discarded if the vertex lies outside any clip plane, including the planes bounding the view volume.
- `VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY` specifies that the primitive is discarded only if the vertex lies outside any user clip plane.

If either of a line segment's vertices lie outside of the clip volume, the line segment may be clipped, with new vertex coordinates computed for each vertex that lies outside the clip volume. A clipped line segment endpoint lies on both the original line segment and the boundary of the clip volume.

This clipping produces a value, \(0 \leq t \leq 1\), for each clipped vertex. If the coordinates of a clipped
vertex are \( P \) and the unclipped line segment’s vertex coordinates are \( P_1 \) and \( P_2 \), then \( t \) satisfies the following equation

\[
P = t \, P_1 + (1-t) \, P_2.
\]

\( t \) is used to clip vertex output attributes as described in *Clipping Shader Outputs*.

If the primitive is a polygon, it passes unchanged if every one of its edges lies entirely inside the clip volume, and is either clipped or discarded otherwise. If the edges of the polygon intersect the boundary of the clip volume, the intersecting edges are reconnected by new edges that lie along the boundary of the clip volume - in some cases requiring the introduction of new vertices into a polygon.

If a polygon intersects an edge of the clip volume’s boundary, the clipped polygon **must** include a point on this boundary edge.

Primitives rendered with user-defined half-spaces **must** satisfy a complementarity criterion. Suppose a series of primitives is drawn where each vertex \( i \) has a single specified clip distance \( d_i \) (or a number of similarly specified clip distances, if multiple half-spaces are enabled). Next, suppose that the same series of primitives are drawn again with each such clip distance replaced by \(-d_i\) (and the graphics pipeline is otherwise the same). In this case, primitives **must** not be missing any pixels, and pixels **must** not be drawn twice in regions where those primitives are cut by the clip planes.

### 26.5. Clipping Shader Outputs

Next, vertex output attributes are clipped. The output values associated with a vertex that lies within the clip volume are unaffected by clipping. If a primitive is clipped, however, the output values assigned to vertices produced by clipping are clipped.

Let the output values assigned to the two vertices \( P_1 \) and \( P_2 \) of an unclipped edge be \( c_1 \) and \( c_2 \). The value of \( t \) (see *Primitive Clipping*) for a clipped point \( P \) is used to obtain the output value associated with \( P \) as

\[
c = t \, c_1 + (1-t) \, c_2.
\]

(Multiplying an output value by a scalar means multiplying each of \( x, y, z \), and \( w \) by the scalar.)

Since this computation is performed in clip space before division by \( w \), clipped output values are perspective-correct.

Polygon clipping creates a clipped vertex along an edge of the clip volume’s boundary. This situation is handled by noting that polygon clipping proceeds by clipping against one half-space at a time. Output value clipping is done in the same way, so that clipped points always occur at the intersection of polygon edges (possibly already clipped) with the clip volume’s boundary.

For vertex output attributes whose matching fragment input attributes are decorated with \texttt{NoPerspective}, the value of \( t \) used to obtain the output value associated with \( P \) will be adjusted to produce results that vary linearly in framebuffer space.
Output attributes of integer or unsigned integer type must always be flat shaded. Flat shaded attributes are constant over the primitive being rasterized (see Basic Line Segment Rasterization and Basic Polygon Rasterization), and no interpolation is performed. The output value \( c \) is taken from either \( c_1 \) or \( c_2 \), since flat shading has already occurred and the two values are identical.

### 26.6. Controlling Viewport W Scaling

If viewport W scaling is enabled, the W component of the clip coordinate is modified by the provided coefficients from the corresponding viewport as follows.

\[
W'_c = x_{\text{coeff}} x_c + y_{\text{coeff}} y_c + W_c
\]

The `VkPipelineViewportWScalingStateCreateInfoNV` structure is defined as:

```c
typedef struct VkPipelineViewportWScalingStateCreateInfoNV {
    VkStructureType                sType;
    const void*                    pNext;
    VkBool32                       viewportWScalingEnable;
    uint32_t                       viewportCount;
    const VkViewportWScalingNV*    pViewportWScalings;
} VkPipelineViewportWScalingStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `viewportWScalingEnable` controls whether viewport W scaling is enabled.
- `viewportCount` is the number of viewports used by W scaling, and must match the number of viewports in the pipeline if viewport W scaling is enabled.
- `pViewportWScalings` is a pointer to an array of `VkViewportWScalingNV` structures defining the W scaling parameters for the corresponding viewports. If the viewport W scaling state is dynamic, this member is ignored.

#### Valid Usage (Implicit)

- `VUID-VkPipelineViewportWScalingStateCreateInfoNV-sType-sType` if `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_W_SCALING_STATE_CREATE_INFO_NV`

If the bound pipeline state object was not created with the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV`.
dynamic state enabled, viewport W scaling parameters are specified using the pViewportWScalings member of VkPipelineViewportWScalingStateCreateInfoNV in the pipeline state object. If the pipeline state object was created with the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, the viewport transformation parameters are dynamically set and changed with the command:

```c
// Provided by VK_NV_clip_space_w_scaling
void vkCmdSetViewportWScalingNV(
    VkCommandBuffer                             commandBuffer,  // Provided by VK_NV_clip_space_w_scaling
    uint32_t                                    firstViewport,  // Provided by VK_NV_clip_space_w_scaling
    uint32_t                                    viewportCount,  // Provided by VK_NV_clip_space_w_scaling
    const VkViewportWScalingNV*                 pViewportWScalings);  // Provided by VK_NV_clip_space_w_scaling
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstViewport` is the index of the first viewport whose parameters are updated by the command.
- `viewportCount` is the number of viewports whose parameters are updated by the command.
- `pViewportWScalings` is a pointer to an array of VkViewportWScalingNV structures specifying viewport parameters.

The viewport parameters taken from element i of pViewportWScalings replace the current state for the viewport index firstViewport + i, for i in [0, viewportCount).

### Valid Usage
- VUID-vkCmdSetViewportWScalingNV-firstViewport-01324
  The sum of `firstViewport` and `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewport`, inclusive.

### Valid Usage (Implicit)
- VUID-vkCmdSetViewportWScalingNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetViewportWScalingNV-pViewportWScalings-parameter
  `pViewportWScalings` must be a valid pointer to an array of `viewportCount` `VkViewportWScalingNV` structures
- VUID-vkCmdSetViewportWScalingNV-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetViewportWScalingNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetViewportWScalingNV-viewportCount-arraylength
  `viewportCount` must be greater than 0
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Both `VkPipelineViewportWScalingStateCreateInfoNV` and `vkCmdSetViewportWScalingNV` use `VkViewportWScalingNV` to set the viewport transformation parameters.

The `VkViewportWScalingNV` structure is defined as:

```c
// Provided by VK_NV_clip_space_w_scaling
typedef struct VkViewportWScalingNV {
  float  xcoeff;
  float  ycoeff;
} VkViewportWScalingNV;
```

- `xcoeff` and `ycoeff` are the viewport’s W scaling factor for x and y respectively.

26.7. Coordinate Transformations

*Clip coordinates* for a vertex result from shader execution, which yields a vertex coordinate *Position*.

Perspective division on clip coordinates yields *normalized device coordinates*, followed by a *viewport* transformation (see *Controlling the Viewport*) to convert these coordinates into *framebuffer coordinates*.

If a vertex in clip coordinates has a position given by

\[
\begin{pmatrix}
  x_c \\
  y_c \\
  z_c \\
  w_c
\end{pmatrix}
\]

then the vertex’s normalized device coordinates are
26.8. Render Pass Transform

A render pass transform can be enabled for render pass instances. The clip coordinates \((x_c, y_c)\) that result from vertex shader execution are transformed by a rotation of 0, 90, 180, or 270 degrees in the XY plane, centered at the origin.

When render pass transform is enabled, the transform applies to all primitives for all subpasses of the render pass. The transformed vertex in clip coordinates has a position given by

\[
\begin{pmatrix}
  x_{c_{\text{trans}}} \\ y_{c_{\text{trans}}} \\ z_{c_{\text{trans}}}
\end{pmatrix} = \begin{pmatrix}
  x_c \\ y_c \\ z_c
\end{pmatrix}
\begin{pmatrix}
  \cos \theta & -\sin \theta & 0 \\ \sin \theta & \cos \theta & 0 \\ 0 & 0 & 1
\end{pmatrix}
\]

where

- \(\theta\) is 0 degrees for \text{VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR}
- \(\theta\) is 90 degrees for \text{VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR}
- \(\theta\) is 180 degrees for \text{VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR}
- \(\theta\) is 270 degrees for \text{VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR}

The transformed vertex’s normalized device coordinates are

\[
\begin{pmatrix}
  x_d \\ y_d \\ z_d
\end{pmatrix} = \begin{pmatrix}
  x_{c_{\text{trans}}} \\ y_{c_{\text{trans}}} \\ z_{c_{\text{trans}}}
\end{pmatrix}
\begin{pmatrix}
  \frac{w_c}{w_d} \\ \frac{w_c}{w_d} \\ \frac{w_c}{w_d}
\end{pmatrix}
\]

When render pass transform is enabled for a render pass instance, the following additional features are enabled:

- Each \text{VkViewport} specified by either \text{VkPipelineViewportStateCreateInfo}::pViewports or \text{vkCmdSetViewport} will have its width/height \((p_x, p_y)\) and its center \((o_x, o_y)\) similarly transformed by the implementation.

- Each scissor specified by \text{VkPipelineViewportStateCreateInfo}::pScissors or \text{vkCmdSetScissor} will have its \((\text{offset}_x, \text{offset}_y)\) and \((\text{extent}_x, \text{extent}_y)\) similarly transformed by the implementation.

- The \text{renderArea} specified in \text{VkCommandBufferInheritanceRenderPassTransformInfoQCOM} and \text{VkRenderPassBeginInfo} will be similarly transformed by the implementation.

- The \((x, y)\) components of shader variables with built-in decorations \text{FragCoord}, \text{SamplePosition}, or \text{PointCoord} will be similarly transformed by the implementation.

- The \((x, y)\) components of the \text{offset} operand of the \text{InterpolateAtOffset} extended instruction will be similarly transformed by the implementation.
The values returned by SPIR-V derivative instructions \texttt{OpDPdx}, \texttt{OpDPdy}, \texttt{OpDPdxCourse}, \texttt{OpDPdyCourse}, \texttt{OpDPdxFine}, \texttt{OpDPdyFine} will be similarly transformed by the implementation.

The net result of the above, is that applications can act as if rendering to a framebuffer oriented with the \texttt{VkSurfaceCapabilitiesKHR::currentTransform}. In other words, applications can act as if the presentation engine will be performing the transformation of the swapchain image after rendering and prior to presentation to the user. In fact, the transformation of the various items cited above are being handled by the implementation as the rendering takes place.

### 26.9. Controlling the Viewport

The viewport transformation is determined by the selected viewport’s width and height in pixels, \(p_x\) and \(p_y\), respectively, and its center \((o_x, o_y)\) (also in pixels), as well as its depth range min and max determining a depth range scale value \(p_z\) and a depth range bias value \(o_z\) (defined below). The vertex’s framebuffer coordinates \((x_f, y_f, z_f)\) are given by

\[
x_f = \left(\frac{p_x}{2}\right) x_d + o_x
\]

\[
y_f = \left(\frac{p_y}{2}\right) y_d + o_y
\]

\[
z_f = p_z \times z_d + o_z
\]

Multiple viewports are available, numbered zero up to \texttt{VkPhysicalDeviceLimits::maxViewports} minus one. The number of viewports used by a pipeline is controlled by the \texttt{viewportCount} member of the \texttt{VkPipelineViewportStateCreateInfo} structure used in pipeline creation.

The \texttt{VkPipelineViewportStateCreateInfo} structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineViewportStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportStateCreateFlags flags;
    uint32_t viewportCount;
    const VkViewport* pViewports;
    uint32_t scissorCount;
    const VkRect2D* pScissors;
} VkPipelineViewportStateCreateInfo;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{flags} is reserved for future use.
- \texttt{viewportCount} is the number of viewports used by the pipeline.
• `pViewports` is a pointer to an array of `VkViewport` structures, defining the viewport transforms. If the viewport state is dynamic, this member is ignored.

• `scissorCount` is the number of scissors and must match the number of viewports.

• `pScissors` is a pointer to an array of `VkRect2D` structures defining the rectangular bounds of the scissors for the corresponding viewport. If the scissor state is dynamic, this member is ignored.

Valid Usage

• VUID-VkPipelineViewportStateCreateInfo-viewportCount-01216
  If the multiple viewports feature is not enabled, `viewportCount` must not be greater than 1

• VUID-VkPipelineViewportStateCreateInfo-scissorCount-01217
  If the multiple viewports feature is not enabled, `scissorCount` must not be greater than 1

• VUID-VkPipelineViewportStateCreateInfo-viewportCount-01218
  `viewportCount` must be less than or equal to `VkPhysicalDeviceLimits::maxViewports`

• VUID-VkPipelineViewportStateCreateInfo-scissorCount-01219
  `scissorCount` must be less than or equal to `VkPhysicalDeviceLimits::maxViewports`

• VUID-VkPipelineViewportStateCreateInfo-x-02821
  The x and y members of `offset` member of any element of `pScissors` must be greater than or equal to 0

• VUID-VkPipelineViewportStateCreateInfo-offset-02822
  Evaluation of `(offset.x + extent.width)` must not cause a signed integer addition overflow for any element of `pScissors`

• VUID-VkPipelineViewportStateCreateInfo-offset-02823
  Evaluation of `(offset.y + extent.height)` must not cause a signed integer addition overflow for any element of `pScissors`

• VUID-VkPipelineViewportStateCreateInfo-scissorCount-04134
  If the graphics pipeline is being created without `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` set then `scissorCount` and `viewportCount` must be identical

• VUID-VkPipelineViewportStateCreateInfo-viewportCount-04135
  If the graphics pipeline is being created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` set then `viewportCount` must be 0, otherwise it must be greater than 0

• VUID-VkPipelineViewportStateCreateInfo-scissorCount-04136
  If the graphics pipeline is being created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` set then `scissorCount` must be 0, otherwise it must be greater than 0

• VUID-VkPipelineViewportStateCreateInfo-viewportWScalingEnable-01726
  If the `viewportWScalingEnable` member of a `VkPipelineViewportWScalingStateCreateInfoNV` structure included in the `pNext` chain is `VK_TRUE`, the `viewportCount` member of the `VkPipelineViewportWScalingStateCreateInfoNV` structure must be greater than or equal to `VkPipelineViewportStateCreateInfo::viewportCount`
Valid Usage (Implicit)

- **VUID-VkPipelineViewportStateCreateInfo-sType-sType**
  
  
  *sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO*

- **VUID-VkPipelineViewportStateCreateInfo-pNext-pNext**

  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineViewportCoarseSampleOrderStateCreateInfoNV`, `VkPipelineViewportExclusiveScissorStateCreateInfoNV`, `VkPipelineViewportShadingRateImageStateCreateInfoNV`, `VkPipelineViewportSwizzleStateCreateInfoNV`, or `VkPipelineViewportWScalingStateCreateInfoNV`

- **VUID-VkPipelineViewportStateCreateInfo-sType-unique**

  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkPipelineViewportStateCreateInfo-flags-zerobitmask**

  `flags` must be 0

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled then the viewport count and viewport transformation parameters are set dynamically by calling:

```c
// Provided by VK_EXT_extended_dynamic_state

void vkCmdSetViewportWithCountEXT(
    VkCommandBuffer commandBuffer,                     
    uint32_t viewportCount,                             
    const VkViewport* pViewports);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `viewportCount` specifies the viewport count.
- `pViewports` specifies the viewports to use for drawing.

Valid Usage

- **VUID-vkCmdSetViewportWithCountEXT-None-03393**

  The `extendedDynamicState` feature must be enabled

- **VUID-vkCmdSetViewportWithCountEXT-viewportCount-03394**

  `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- **VUID-vkCmdSetViewportWithCountEXT-viewportCount-03395**

  If the `multiple Viewports` feature is not enabled, `viewportCount` must be 1

- **VUID-vkCmdSetViewportWithCountEXT-commandBuffer-04819**

  `commandBuffer` must not have `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled.
Valid Usage (Implicit)

- VUID-vkCmdSetViewportWithCountEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetViewportWithCountEXT-pViewports-parameter
  `pViewports` must be a valid pointer to an array of `viewportCount` valid `VkViewport` structures

- VUID-vkCmdSetViewportWithCountEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetViewportWithCountEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetViewportWithCountEXT-viewportCount-arraylength
  `viewportCount` must be greater than 0

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` dynamic state enabled then the scissor count and scissor rectangular bounds are set dynamically by calling:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetScissorWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `scissorCount` specifies the scissor count.
• `pScissors` specifies the scissors to use for drawing.

## Valid Usage

- **VUID-vkCmdSetScissorWithCountEXT-None-03396**
  The `extendedDynamicState` feature **must** be enabled

- **VUID-vkCmdSetScissorWithCountEXT-scissorCount-03397**
  `scissorCount` **must** be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- **VUID-vkCmdSetScissorWithCountEXT-scissorCount-03398**
  If the `multiple viewports` feature is not enabled, `scissorCount` **must** be 1

- **VUID-vkCmdSetScissorWithCountEXT-offset-03399**
  The `x` and `y` members of `offset` member of any element of `pScissors` **must** be greater than or equal to 0

- **VUID-vkCmdSetScissorWithCountEXT-offset-03400**
  Evaluation of `(offset.x + extent.width)` **must** not cause a signed integer addition overflow for any element of `pScissors`

- **VUID-vkCmdSetScissorWithCountEXT-offset-03401**
  Evaluation of `(offset.y + extent.height)` **must** not cause a signed integer addition overflow for any element of `pScissors`

- **VUID-vkCmdSetScissorWithCountEXT-commandBuffer-04820**
  `commandBuffer` **must** not have `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled.

## Valid Usage (Implicit)

- **VUID-vkCmdSetScissorWithCountEXT-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetScissorWithCountEXT-pScissors-parameter**
  `pScissors` **must** be a valid pointer to an array of `scissorCount` `VkRect2D` structures

- **VUID-vkCmdSetScissorWithCountEXT-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdSetScissorWithCountEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdSetScissorWithCountEXT-scissorCount-arraylength**
  `scissorCount` **must** be greater than 0
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineViewportStateCreateFlags;
```

`VkPipelineViewportStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

A vertex processing stage can direct each primitive to zero or more viewports. The destination viewports for a primitive are selected by the last active vertex processing stage that has an output variable decorated with `ViewportIndex` (selecting a single viewport) or `ViewportMaskNV` (selecting multiple viewports). The viewport transform uses the viewport corresponding to either the value assigned to `ViewportIndex` or one of the bits set in `ViewportMaskNV`, and taken from an implementation-dependent vertex of each primitive. If `ViewportIndex` or any of the bits in `ViewportMaskNV` are outside the range zero to `viewportCount` minus one for a primitive, or if the last active vertex processing stage did not assign a value to either `ViewportIndex` or `ViewportMaskNV` for all vertices of a primitive due to flow control, the values resulting from the viewport transformation of the vertices of such primitives are undefined. If the last vertex processing stage does not have an output decorated with `ViewportIndex` or `ViewportMaskNV`, the viewport numbered zero is used by the viewport transformation.

A single vertex can be used in more than one individual primitive, in primitives such as `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`. In this case, the viewport transformation is applied separately for each primitive.

If the bound pipeline state object was not created with the `VK_DYNAMIC_STATE_VIEWPORT` dynamic state enabled, viewport transformation parameters are specified using the `pViewports` member of `VkPipelineViewportStateCreateInfo` in the pipeline state object. If the pipeline state object was created with the `VK_DYNAMIC_STATE_VIEWPORT` dynamic state enabled, the viewport transformation parameters are dynamically set and changed with the command:
// Provided by VK_VERSION_1_0

void vkCmdSetViewport(
    VkCommandBuffer commandBuffer,
    uint32_t firstViewport,
    uint32_t viewportCount,
    const VkViewport* pViewports);

• commandBuffer is the command buffer into which the command will be recorded.
• firstViewport is the index of the first viewport whose parameters are updated by the command.
• viewportCount is the number of viewports whose parameters are updated by the command.
• pViewports is a pointer to an array of VkViewport structures specifying viewport parameters.

The viewport parameters taken from element i of pViewports replace the current state for the viewport index firstViewport + i, for i in [0, viewportCount).

Valid Usage

• VUID-vkCmdSetViewport-firstViewport-01223
  The sum of firstViewport and viewportCount must be between 1 and VkPhysicalDeviceLimits::maxViewports, inclusive

• VUID-vkCmdSetViewport-firstViewport-01224
  If the multiple viewports feature is not enabled, firstViewport must be 0

• VUID-vkCmdSetViewport-viewportCount-01225
  If the multiple viewports feature is not enabled, viewportCount must be 1

• VUID-vkCmdSetViewport-commandBuffer-04821
  commandBuffer must not have VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D enabled.
Valid Usage (Implicit)

• VUID-vkCmdSetViewport-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetViewport-pViewports-parameter
  pViewports must be a valid pointer to an array of viewportCount valid VkViewport structures

• VUID-vkCmdSetViewport-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetViewport-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetViewport-viewportCount-arraylength
  viewportCount must be greater than 0

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>

<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Both VkPipelineViewportStateCreateInfo and vkCmdSetViewport use VkViewport to set the viewport transformation parameters.

The VkViewport structure is defined as:
typedef struct VkViewport {
    float x;
    float y;
    float width;
    float height;
    float minDepth;
    float maxDepth;
} VkViewport;

• x and y are the viewport's upper left corner (x,y).
• width and height are the viewport's width and height, respectively.
• minDepth and maxDepth are the depth range for the viewport.

Note
Despite their names, minDepth can be less than, equal to, or greater than maxDepth.

The framebuffer depth coordinate $z_f$ may be represented using either a fixed-point or floating-point representation. However, a floating-point representation must be used if the depth/stencil attachment has a floating-point depth component. If an m-bit fixed-point representation is used, we assume that it represents each value $\frac{k}{2^m-1}$, where $k \in \{0, 1, ..., 2^m-1\}$, as k (e.g. 1.0 is represented in binary as a string of all ones).

The viewport parameters shown in the above equations are found from these values as

\[
o_x = x + \frac{\text{width}}{2}
\]

\[
o_y = y + \frac{\text{height}}{2}
\]

\[
o_z = \text{minDepth}
\]

\[
\text{px} = \text{width}
\]

\[
\text{py} = \text{height}
\]

\[
\text{pz} = \text{maxDepth} - \text{minDepth}.
\]

If a render pass transform is enabled, the values (px,py) and (ox, oz) defining the viewport are transformed as described in render pass transform before participating in the viewport transform.

The application can specify a negative term for height, which has the effect of negating the y
coordinate in clip space before performing the transform. When using a negative `height`, the application should also adjust the `y` value to point to the lower left corner of the viewport instead of the upper left corner. Using the negative `height` allows the application to avoid having to negate the `y` component of the `Position` output from the last vertex processing stage in shaders that also target other graphics APIs.

The width and height of the implementation-dependent maximum viewport dimensions must be greater than or equal to the width and height of the largest image which can be created and attached to a framebuffer.

The floating-point viewport bounds are represented with an implementation-dependent precision.

### Valid Usage

- **VUID-VkViewport-width-01770**  
  width must be greater than 0.0

- **VUID-VkViewport-width-01771**  
  width must be less than or equal to `VkPhysicalDeviceLimits::maxViewportDimensions[0]`

- **VUID-VkViewport-height-01773**  
  The absolute value of `height` must be less than or equal to `VkPhysicalDeviceLimits::maxViewportDimensions[1]`

- **VUID-VkViewport-x-01774**  
  `x` must be greater than or equal to `viewportBoundsRange[0]`

- **VUID-VkViewport-x-01232**  
  `(x + width)` must be less than or equal to `viewportBoundsRange[1]`

- **VUID-VkViewport-y-01775**  
  y must be greater than or equal to `viewportBoundsRange[0]`

- **VUID-VkViewport-y-01776**  
  y must be less than or equal to `viewportBoundsRange[1]`

- **VUID-VkViewport-y-01777**  
  `(y + height)` must be greater than or equal to `viewportBoundsRange[0]`

- **VUID-VkViewport-y-01233**  
  `(y + height)` must be less than or equal to `viewportBoundsRange[1]`

- **VUID-VkViewport-minDepth-01234**  
  Unless `VK_EXT_depth_range_unrestricted` extension is enabled, `minDepth` must be between 0.0 and 1.0, inclusive

- **VUID-VkViewport-maxDepth-01235**  
  Unless `VK_EXT_depth_range_unrestricted` extension is enabled, `maxDepth` must be between 0.0 and 1.0, inclusive
Chapter 27. Rasterization

Rasterization is the process by which a primitive is converted to a two-dimensional image. Each discrete location of this image contains associated data such as depth, color, or other attributes.

Rasterizing a primitive begins by determining which squares of an integer grid in framebuffer coordinates are occupied by the primitive, and assigning one or more depth values to each such square. This process is described below for points, lines, and polygons.

A grid square, including its \((x,y)\) framebuffer coordinates, \(z\) (depth), and associated data added by fragment shaders, is called a fragment. A fragment is located by its upper left corner, which lies on integer grid coordinates.

Rasterization operations also refer to a fragment’s sample locations, which are offset by fractional values from its upper left corner. The rasterization rules for points, lines, and triangles involve testing whether each sample location is inside the primitive. Fragments need not actually be square, and rasterization rules are not affected by the aspect ratio of fragments. Display of non-square grids, however, will cause rasterized points and line segments to appear fatter in one direction than the other.

We assume that fragments are square, since it simplifies antialiasing and texturing. After rasterization, fragments are processed by fragment operations.

Several factors affect rasterization, including the members of \(\text{VkPipelineRasterizationStateCreateInfo}\) and \(\text{VkPipelineMultisampleStateCreateInfo}\).

The \(\text{VkPipelineRasterizationStateCreateInfo}\) structure is defined as:

```c
typedef struct VkPipelineRasterizationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateCreateFlags flags;
    VkBool32 depthClampEnable;
    VkBool32 rasterizerDiscardEnable;
    VkPolygonMode polygonMode;
    VkCullModeFlags cullMode;
    VkFrontFace frontFace;
    float lineWidth;
    float depthBiasConstantFactor;
    float depthBiasClamp;
    float depthBiasSlopeFactor;
} VkPipelineRasterizationStateCreateInfo;
```

- \(\text{sType}\) is the type of this structure.
- \(\text{pNext}\) is \(\text{NULL}\) or a pointer to a structure extending this structure.
- \(\text{flags}\) is reserved for future use.
• **depthClampEnable** controls whether to clamp the fragment’s depth values as described in *Depth Test*. If the pipeline is not created with *VkPipelineRasterizationDepthClipStateCreateInfoEXT* present then enabling depth clamp will also disable clipping primitives to the z planes of the frustrum as described in *Primitive Clipping*. Otherwise depth clipping is controlled by the state set in *VkPipelineRasterizationDepthClipStateCreateInfoEXT*.

• **rasterizerDiscardEnable** controls whether primitives are discarded immediately before the rasterization stage.

• **polygonMode** is the triangle rendering mode. See *VkPolygonMode*.

• **cullMode** is the triangle facing direction used for primitive culling. See *VkCullModeFlagBits*.

• **frontFace** is a *VkFrontFace* value specifying the front-facing triangle orientation to be used for culling.

• **depthBiasEnable** controls whether to bias fragment depth values.

• **depthBiasConstantFactor** is a scalar factor controlling the constant depth value added to each fragment.

• **depthBiasClamp** is the maximum (or minimum) depth bias of a fragment.

• **depthBiasSlopeFactor** is a scalar factor applied to a fragment's slope in depth bias calculations.

• **lineWidth** is the width of rasterized line segments.

The application **can** also add a *VkPipelineRasterizationStateRasterizationOrderAMD* structure to the *pNext* chain of a *VkPipelineRasterizationStateCreateInfo* structure. This structure enables selecting the rasterization order to use when rendering with the corresponding graphics pipeline as described in *Rasterization Order*.

---

**Valid Usage**

- **VUID-VkPipelineRasterizationStateCreateInfo-depthClampEnable-00782**
  
  If the *depth clamping* feature is not enabled, **depthClampEnable must be VK_FALSE**

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01507**
  
  If the *non-solid fill modes* feature is not enabled, **polygonMode must be VK_POLYGON_MODE_FILL or VK_POLYGON_MODE_FILL_RECTANGLE_NV**

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01414**
  
  If the *VK_NV_fill_rectangle* extension is not enabled, **polygonMode must not be VK_POLYGON_MODE_FILL_RECTANGLE_NV**

- **VUID-VkPipelineRasterizationStateCreateInfo-pointPolygons-04458**
  
  If the *VK_KHR_portability_subset* extension is enabled, and *VkPhysicalDevicePortabilitySubsetFeaturesKHR::pointPolygons* is **VK_FALSE**, and **rasterizerDiscardEnable must not be VK_POLYGON_MODE_POINT**.
Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationStateCreateInfo-sType-sType**
  The *sType* must be **VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO**

- **VUID-VkPipelineRasterizationStateCreateInfo-pNext-pNext**
  Each *pNext* member of any structure (including this one) in the *pNext* chain must be either NULL or a pointer to a valid instance of
  - **VkPipelineRasterizationConservativeStateCreateInfoEXT**
  - **VkPipelineRasterizationDepthClipStateCreateInfoEXT**
  - **VkPipelineRasterizationLineStateCreateInfoEXT**
  - **VkPipelineRasterizationProvokingVertexStateCreateInfoEXT**
  - **VkPipelineRasterizationStateRasterizationOrderAMD**
  - **VkPipelineRasterizationStateStreamCreateInfoEXT**

- **VUID-VkPipelineRasterizationStateCreateInfo-sType-unique**
  The *sType* value of each struct in the *pNext* chain must be unique

- **VUID-VkPipelineRasterizationStateCreateInfo-flags-zerobitmask**
  The *flags* must be 0

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-parameter**
  The *polygonMode* must be a valid **VkPolygonMode** value

- **VUID-VkPipelineRasterizationStateCreateInfo-cullMode-parameter**
  The *cullMode* must be a valid combination of **VkCullModeFlagBits** values

- **VUID-VkPipelineRasterizationStateCreateInfo-frontFace-parameter**
  The *frontFace* must be a valid **VkFrontFace** value

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineRasterizationStateCreateFlags;
```

**VkPipelineRasterizationStateCreateFlags** is a bitmask type for setting a mask, but is currently reserved for future use.

If the *pNext* chain of **VkPipelineRasterizationStateCreateInfo** includes a **VkPipelineRasterizationDepthClipStateCreateInfoEXT** structure, then that structure controls whether depth clipping is enabled or disabled.

The **VkPipelineRasterizationDepthClipStateCreateInfoEXT** structure is defined as:

```c
// Provided by VK_EXT_depth_clip_enable
typedef struct VkPipelineRasterizationDepthClipStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationDepthClipStateCreateFlagsEXT flags;
    VkBool32 depthClipEnable;
} VkPipelineRasterizationDepthClipStateCreateInfoEXT;
```
• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **flags** is reserved for future use.
• **depthClipEnable** controls whether depth clipping is enabled as described in *Primitive Clipping*.

### Valid Usage (Implicit)

- VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-sType-sType
  
  sType must be
  
  VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_DEPTH_CLIP_STATE_CREATE_INFO_EXT

- VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-flags-zerobitmask
  
  flags must be 0

---

```c
// Provided by VK_EXT_depth_clip_enable
typedef VkFlags VkPipelineRasterizationDepthClipStateCreateFlagsEXT;
```

**VkPipelineRasterizationDepthClipStateCreateFlagsEXT** is a bitmask type for setting a mask, but is currently reserved for future use.

The **VkPipelineMultisampleStateCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineMultisampleStateCreateInfo {
  VkStructureType                          sType;
  const void*                              pNext;
  VkPipelineMultisampleStateCreateFlags    flags;
  VkSampleCountFlagBits                    rasterizationSamples;
  VkBool32                                 sampleShadingEnable;
  float                                    minSampleShading;
  const VkSampleMask*                      pSampleMask;
  VkBool32                                 alphaToCoverageEnable;
  VkBool32                                 alphaToOneEnable;
} VkPipelineMultisampleStateCreateInfo;
```

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **flags** is reserved for future use.
• **rasterizationSamples** is a **VkSampleCountFlagBits** value specifying the number of samples used in rasterization.
• **sampleShadingEnable** can be used to enable **Sample Shading**.
• **minSampleShading** specifies a minimum fraction of sample shading if **sampleShadingEnable** is set to **VK_TRUE**.
• **pSampleMask** is an array of **VkSampleMask** values used in the sample mask test.

• **alphaToCoverageEnable** controls whether a temporary coverage value is generated based on the alpha component of the fragment’s first color output as specified in the Multisample Coverage section.

• **alphaToOneEnable** controls whether the alpha component of the fragment’s first color output is replaced with one as described in Multisample Coverage.

Each bit in the sample mask is associated with a unique sample index as defined for the coverage mask. Each bit b for mask word w in the sample mask corresponds to sample index i, where i = 32 × w + b. **pSampleMask** has a length equal to ⌈rasterizationSamples / 32⌉ words.

If **pSampleMask** is NULL, it is treated as if the mask has all bits set to 1.

### Valid Usage

- **VUID-VkPipelineMultisampleStateCreateInfo-sampleShadingEnable-00784**
  If the sample rate shading feature is not enabled, **sampleShadingEnable** must be **VK_FALSE**

- **VUID-VkPipelineMultisampleStateCreateInfo-alphaToOneEnable-00785**
  If the alpha to one feature is not enabled, **alphaToOneEnable** must be **VK_FALSE**

- **VUID-VkPipelineMultisampleStateCreateInfo-minSampleShading-00786**
  **minSampleShading** must be in the range [0,1]

- **VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-01415**
  If the **VK_NV_framebuffer_mixed_samples** extension is enabled, and if the subpass has any color attachments and **rasterizationSamples** is greater than the number of color samples, then **sampleShadingEnable** must be **VK_FALSE**
Valid Usage (Implicit)

- VUID-VkPipelineMultisampleStateCreateInfo-sType-sType
  *sType must be VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO*

- VUID-VkPipelineMultisampleStateCreateInfo-pNext-pNext
  Each *pNext* member of any structure (including this one) in the *pNext* chain *must* be either NULL or a pointer to a valid instance of VkPipelineCoverageModulationStateCreateInfoNV, VkPipelineCoverageReductionStateCreateInfoNV, VkPipelineCoverageToColorStateCreateInfoNV, or VkPipelineSampleLocationsStateCreateInfoEXT

- VUID-VkPipelineMultisampleStateCreateInfo-sType-unique
  The *sType* value of each struct in the *pNext* chain *must* be unique

- VUID-VkPipelineMultisampleStateCreateInfo-flags-zerobitmask
  *flags must be 0*

- VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-parameter
  *rasterizationSamples must be a valid VkSampleCountFlagBits value*

- VUID-VkPipelineMultisampleStateCreateInfo-pSampleMask-parameter
  If *pSampleMask* is not NULL, *pSampleMask must be a valid pointer to an array of \[
  \left[ \frac{\text{rasterizationSamples}}{32} \right] \text{VkSampleMask values}
  \]

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineMultisampleStateCreateFlags;

**VkPipelineMultisampleStateCreateFlags** is a bitmask type for setting a mask, but is currently reserved for future use.

The elements of the sample mask array are of type **VkSampleMask**, each representing 32 bits of coverage information:

// Provided by VK_VERSION_1_0
typedef uint32_t VkSampleMask;

Rasterization only generates fragments which cover one or more pixels inside the framebuffer. Pixels outside the framebuffer are never considered covered in the fragment. Fragments which would be produced by application of any of the primitive rasterization rules described below but which lie outside the framebuffer are not produced, nor are they processed by any later stage of the pipeline, including any of the fragment operations.

Surviving fragments are processed by fragment shaders. Fragment shaders determine associated data for fragments, and can also modify or replace their assigned depth values.

When the **VK_AMD_mixed_attachment_samples** and **VK_NV_framebuffer_mixed_samples** extensions are not enabled, if the subpass for which this pipeline is being created uses color and/or depth/stencil...
attachments, then `rasterizationSamples` must be the same as the sample count for those subpass attachments.

When the `VK_AMD_mixed_attachment_samples` extension is enabled, if the subpass for which this pipeline is being created uses color and/or depth/stencil attachments, then `rasterizationSamples` must be the same as the maximum of the sample counts of those subpass attachments.

When the `VK_NV_framebuffer_mixed_samples` extension is enabled, `rasterizationSamples` must match the sample count of the depth/stencil attachment if present, otherwise must be greater than or equal to the sample count of the color attachments, if present.

If the `VK_NV_coverage_reduction_mode` extension is enabled, the coverage reduction mode specified by `VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode`, the `rasterizationSamples` member of `pMultisampleState` and the sample counts for the color and depth/stencil attachments (if present) must be a valid combination returned by `vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV`.

If the subpass for which this pipeline is being created does not use color or depth/stencil attachments, `rasterizationSamples` must follow the rules for a zero-attachment subpass.

### 27.1. Discarding Primitives Before Rasterization

Primitives are discarded before rasterization if the `rasterizerDiscardEnable` member of `VkPipelineRasterizationStateCreateInfo` is enabled. When enabled, primitives are discarded after they are processed by the last active shader stage in the pipeline before rasterization.

To dynamically control whether primitives are discarded before the rasterization stage:

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetRasterizerDiscardEnableEXT(VkCommandBuffer commandBuffer, VkBool32 rasterizerDiscardEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizerDiscardEnable` controls whether primitives are discarded immediately before the rasterization stage.

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

### Valid Usage

- `VUID-vkCmdSetRasterizerDiscardEnableEXT-None-04871` The `extendedDynamicState2` feature must be enabled
### Valid Usage (Implicit)

- VUID-vkCmdSetRasterizerDiscardEnableEXT-commandBuffer-parameter
  - `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetRasterizerDiscardEnableEXT-commandBuffer-recording
  - `commandBuffer` must be in the recording state
- VUID-vkCmdSetRasterizerDiscardEnableEXT-commandBuffer-cmdpool
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### 27.2. Controlling the Vertex Stream Used for Rasterization

By default vertex data output from the last vertex processing stage are directed to vertex stream zero. Geometry shaders can emit primitives to multiple independent vertex streams. Each vertex emitted by the geometry shader is directed at one of the vertex streams. As vertices are received on each vertex stream, they are arranged into primitives of the type specified by the geometry shader output primitive type. The shading language instructions `OpEndPrimitive` and `OpEndStreamPrimitive` can be used to end the primitive being assembled on a given vertex stream and start a new empty primitive of the same type. An implementation supports up to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams` streams, which is at least 1. The individual streams are numbered 0 through `maxTransformFeedbackStreams` minus 1. There is no requirement on the order of the streams to which vertices are emitted, and the number of vertices emitted to each vertex stream can be completely independent, subject only to the `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreamDataSize` and `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferSizeDataSize` limits. The primitives output from all vertex streams are passed to the transform feedback stage to be captured to transform feedback buffers in the manner specified by the last vertex processing stage shader’s
XfbBuffer, XfbStride, and Offsets decorations on the output interface variables in the graphics pipeline. To use a vertex stream other than zero, or to use multiple streams, the GeometryStreams capability must be specified.

By default, the primitives output from vertex stream zero are rasterized. If the implementation supports the VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect property it is possible to rasterize a vertex stream other than zero.

By default, geometry shaders that emit vertices to multiple vertex streams are limited to using only the OutputPoints output primitive type. If the implementation supports the VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackStreamsLinesTriangles property it is possible to emit OutputLineStrip or OutputTriangleStrip in addition to OutputPoints.

The vertex stream used for rasterization is specified by adding a VkPipelineRasterizationStateStreamCreateInfoEXT structure to the pNext chain of a VkPipelineRasterizationStateCreateInfo structure.

The VkPipelineRasterizationStateStreamCreateInfoEXT structure is defined as:

```c
typedef struct VkPipelineRasterizationStateStreamCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateStreamCreateFlagsEXT flags;
    uint32_t rasterizationStream;
} VkPipelineRasterizationStateStreamCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **rasterizationStream** is the vertex stream selected for rasterization.

If this structure is not present, **rasterizationStream** is assumed to be zero.

### Valid Usage

- **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-geometryStreams-02324**  
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams must be enabled

- **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02325**  
  rasterizationStream must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams

- **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02326**  
  rasterizationStream must be zero if VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect is VK_FALSE
Valid Usage (Implicit)

- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_STREAM_CREATE_INFO_EXT`

- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-flags-zerobitmask
  
  `flags` **must** be `0`

// Provided by VK_EXT_transform_feedback
typedef VkFlags VkPipelineRasterizationStateStreamCreateFlagsEXT;

`VkPipelineRasterizationStateStreamCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

### 27.3. Rasterization Order

Within a subpass of a *render pass instance*, for a given `(x,y,layer,sample)` sample location, the following operations are guaranteed to execute in *rasterization order*, for each separate primitive that includes that sample location:

1. **Fragment operations**, in the order defined
2. **Blending**, **logic operations**, and color writes

Each operation is atomically executed for each primitive and sample location.

Execution of these operations for each primitive in a subpass occurs in an order determined by the application.

The rasterization order to use for a graphics pipeline is specified by adding a `VkPipelineRasterizationStateRasterizationOrderAMD` structure to the `pNext` chain of a `VkPipelineRasterizationStateCreateInfo` structure.

The `VkPipelineRasterizationStateRasterizationOrderAMD` structure is defined as:

```c
// Provided by VK_AMD_rasterization_order
typedef struct VkPipelineRasterizationStateRasterizationOrderAMD {
    VkStructureType            sType;
    const void*                pNext;
    VkRasterizationOrderAMD    rasterizationOrder;
} VkPipelineRasterizationStateRasterizationOrderAMD;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `rasterizationOrder` is a `VkRasterizationOrderAMD` value specifying the primitive rasterization order to use.
Valid Usage (Implicit)

- `VUID-VkPipelineRasterizationStateRasterizationOrderAMD-sType-sType`
  - `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_RASTERIZATION_ORDER_AMD`
- `VUID-VkPipelineRasterizationStateRasterizationOrderAMD-rasterizationOrder-parameter`
  - `rasterizationOrder` must be a valid `VkRasterizationOrderAMD` value

If the `VK_AMD_rasterization_order` device extension is not enabled or the application does not request a particular rasterization order through specifying a `VkPipelineRasterizationStateRasterizationOrderAMD` structure then the rasterization order used by the graphics pipeline defaults to `VK_RASTERIZATION_ORDER_STRICT_AMD`.

Possible values of `VkPipelineRasterizationStateRasterizationOrderAMD::rasterizationOrder`, specifying the primitive rasterization order, are:

```c
// Provided by VK_AMD_rasterization_order
typedef enum VkRasterizationOrderAMD {
    VK_RASTERIZATION_ORDER_STRICT_AMD = 0,
    VK_RASTERIZATION_ORDER_RELAXED_AMD = 1,
} VkRasterizationOrderAMD;
```

- `VK_RASTERIZATION_ORDER_STRICT_AMD` specifies that operations for each primitive in a subpass must occur in primitive order.
- `VK_RASTERIZATION_ORDER_RELAXED_AMD` specifies that operations for each primitive in a subpass may not occur in primitive order.

### 27.4. Multisampling

Multisampling is a mechanism to antialias all Vulkan primitives: points, lines, and polygons. The technique is to sample all primitives multiple times at each pixel. Each sample in each framebuffer attachment has storage for a color, depth, and/or stencil value, such that per-fragment operations apply to each sample independently. The color sample values can be later resolved to a single color (see Resolving Multisample Images and the Render Pass chapter for more details on how to resolve multisample images to non-multisample images).

Vulkan defines rasterization rules for single-sample modes in a way that is equivalent to a multisample mode with a single sample in the center of each fragment.

Each fragment includes a coverage mask with a single bit for each sample in the fragment, and a number of depth values and associated data for each sample. An implementation may choose to assign the same associated data to more than one sample. The location for evaluating such associated data may be anywhere within the fragment area including the fragment's center location \((x_f, y_f)\) or any of the sample locations. When `rasterizationSamples` is `VK_SAMPLE_COUNT_1_BIT`, the fragment's center location must be used. The different associated data values need not all be evaluated at the same location.
It is understood that each pixel has `rasterizationSamples` locations associated with it. These locations are exact positions, rather than regions or areas, and each is referred to as a sample point. The sample points associated with a pixel **must** be located inside or on the boundary of the unit square that is considered to bound the pixel. Furthermore, the relative locations of sample points **may** be identical for each pixel in the framebuffer, or they **may** differ.

If the render pass has a fragment density map attachment, each fragment only has `rasterizationSamples` locations associated with it regardless of how many pixels are covered in the fragment area. Fragment sample locations are defined as if the fragment had an area of (1,1) and its sample points **must** be located within these bounds. Their actual location in the framebuffer is calculated by scaling the sample location by the fragment area. Attachments with storage for multiple samples per pixel are located at the pixel sample locations. Otherwise, the fragment’s sample locations are generally used for evaluation of associated data and fragment operations.

If the current pipeline includes a fragment shader with one or more variables in its interface decorated with `Sample` and `Input`, the data associated with those variables will be assigned independently for each sample. The values for each sample **must** be evaluated at the location of the sample. The data associated with any other variables not decorated with `Sample` and `Input` need not be evaluated independently for each sample.

A *coverage mask* is generated for each fragment, based on which samples within that fragment are determined to be within the area of the primitive that generated the fragment.

Single pixel fragments and multi-pixel fragments defined by a fragment density map have one set of samples. Multi-pixel fragments defined by a shading rate image have one set of samples per pixel. Multi-pixel fragments defined by setting the fragment shading rate have one set of samples per pixel. Each set of samples has a number of samples determined by `VkPipelineMultisampleStateCreateInfo::rasterizationSamples`. Each sample in a set is assigned a unique sample index `i` in the range `[0, rasterizationSamples)`. Each sample in a fragment is also assigned a unique coverage index `j` in the range `[0, n × rasterizationSamples)`, where `n` is the number of sets in the fragment. If the fragment contains a single set of samples, the coverage index is always equal to the sample index. If a shading rate image is used and a fragment covers multiple pixels, the coverage index is determined as defined by `VkPipelineViewportCoarseSampleOrderStateCreateInfoNV` or `vkCmdSetCoarseSampleOrderNV`.

If the fragment shading rate is set, the coverage index `j` is determined as a function of the pixel index `p`, the sample index `i`, and the number of rasterization samples `r` as:

\[ j = i + r \times ((f_w \times f_h) - 1 - p) \]

where the pixel index `p` is determined as a function of the pixel's framebuffer location `(x,y)` and the fragment size `(f_w,f_h)`:  

\[ p_x = x \% f_w \]
\[ p_y = y \% f_h \]

\[ p = p_x + (p_y \times f_w) \]

The table below illustrates the pixel index for multi-pixel fragments:

**Table 34. Pixel indices - 1 wide**

<table>
<thead>
<tr>
<th>1x1</th>
<th>1x2</th>
<th>1x4</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Diagram 1x1]</td>
<td>![Diagram 1x2]</td>
<td>![Diagram 1x4]</td>
</tr>
</tbody>
</table>

**Table 35. Pixel indices - 2 wide**

<table>
<thead>
<tr>
<th>2x1</th>
<th>2x2</th>
<th>2x4</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Diagram 2x1]</td>
<td>![Diagram 2x2]</td>
<td>![Diagram 2x4]</td>
</tr>
</tbody>
</table>

**Table 36. Pixel indices - 4 wide**

| ![Diagram 4x1] | ![Diagram 4x2] | ![Diagram 4x4] |
The coverage mask includes $B$ bits packed into $W$ words, defined as:

\[
B = n \times \text{rasterizationSamples}
\]

\[
W = \lceil B/32 \rceil
\]

Bit $b$ in coverage mask word $w$ is 1 if the sample with coverage index $j = 32w + b$ is covered, and 0 otherwise.

If the `standardSampleLocations` member of `VkPhysicalDeviceLimits` is `VK_TRUE`, then the sample counts `VK_SAMPLE_COUNT_1_BIT`, `VK_SAMPLE_COUNT_2_BIT`, `VK_SAMPLE_COUNT_4_BIT`, `VK_SAMPLE_COUNT_8_BIT`, and `VK_SAMPLE_COUNT_16_BIT` have sample locations as listed in the following table, with the $i$th entry in the table corresponding to sample index $i$. `VK_SAMPLE_COUNT_32_BIT` and `VK_SAMPLE_COUNT_64_BIT` do not have standard sample locations. Locations are defined relative to an origin in the upper left corner of the fragment.
### Table 37. Standard sample locations

</tr>
</tbody>
</table>

Color images created with multiple samples per pixel use a compression technique where there are
two arrays of data associated with each pixel. The first array contains one element per sample where each element stores an index to the second array defining the fragment mask of the pixel. The second array contains one element per color fragment and each element stores a unique color value in the format of the image. With this compression technique it is not always necessary to actually use unique storage locations for each color sample: when multiple samples share the same color value the fragment mask may have two samples referring to the same color fragment. The number of color fragments is determined by the samples member of the VkImageCreateInfo structure used to create the image. The VK_AMD_shader_fragment_mask device extension provides shader instructions enabling the application to get direct access to the fragment mask and the individual color fragment values.

![Fragment Mask](image)

**Figure 16. Fragment Mask**

### 27.5. Custom Sample Locations

Applications can also control the sample locations used for rasterization. If the pNext chain of the VkPipelineMultisampleStateCreateInfo structure specified at pipeline creation time includes a VkPipelineSampleLocationsStateCreateInfoEXT structure, then that structure controls the sample locations used when rasterizing primitives with the pipeline.

The VkPipelineSampleLocationsStateCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkPipelineSampleLocationsStateCreateInfoEXT {
    VkStructureType             sType;
    const void*                 pNext;
    VkBool32                    sampleLocationsEnable;
    VkSampleLocationsInfoEXT    sampleLocationsInfo;
} VkPipelineSampleLocationsStateCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **sampleLocationsEnable** controls whether custom sample locations are used. If sampleLocationsEnable is VK_FALSE, the default sample locations are used and the values specified in sampleLocationsInfo are ignored.
- **sampleLocationsInfo** is the sample locations to use during rasterization if sampleLocationsEnable is VK_TRUE and the graphics pipeline is not created with VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT.
Valid Usage (Implicit)

- **VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_SAMPLE_LOCATIONS_STATE_CREATE_INFO_EXT`

- **VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sampleLocationsInfo-parameter**
  - `sampleLocationsInfo` must be a valid `VkSampleLocationsInfoEXT` structure

The `VkSampleLocationsInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationsInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSampleCountFlagBits sampleLocationsPerPixel;
    VkExtent2D sampleLocationGridSize;
    uint32_t sampleLocationsCount;
    const VkSampleLocationEXT* pSampleLocations;
} VkSampleLocationsInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **sampleLocationsPerPixel** is a `VkSampleCountFlagBits` value specifying the number of sample locations per pixel.
- **sampleLocationGridSize** is the size of the sample location grid to select custom sample locations for.
- **sampleLocationsCount** is the number of sample locations in `pSampleLocations`.
- **pSampleLocations** is a pointer to an array of `sampleLocationsCount` `VkSampleLocationEXT` structures.

This structure can be used either to specify the sample locations to be used for rendering or to specify the set of sample locations an image subresource has been last rendered with for the purposes of layout transitions of depth/stencil images created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT`.

The sample locations in `pSampleLocations` specify `sampleLocationsPerPixel` number of sample locations for each pixel in the grid of the size specified in `sampleLocationGridSize`. The sample location for sample `i` at the pixel grid location `(x,y)` is taken from `pSampleLocations[(x + y × sampleLocationGridSize.width) × sampleLocationsPerPixel + i]`.

If the render pass has a fragment density map, the implementation will choose the sample locations for the fragment and the contents of `pSampleLocations` may be ignored.
Valid Usage

- VUID-VkSampleLocationsInfoEXT-sampleLocationsPerPixel-01526
  sampleLocationsPerPixel must be a bit value that is set in VkPhysicalDeviceSampleLocationsPropertiesEXT::sampleLocationSampleCounts

- VUID-VkSampleLocationsInfoEXT-sampleLocationsCount-01527
  sampleLocationsCount must equal sampleLocationsPerPixel \times sampleLocationGridSize.width \times sampleLocationGridSize.height

Valid Usage (Implicit)

- VUID-VkSampleLocationsInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLE_LOCATIONS_INFO_EXT

- VUID-VkSampleLocationsInfoEXT-pSampleLocations-parameter
  If sampleLocationsCount is not 0, pSampleLocations must be a valid pointer to an array of sampleLocationsCount VkSampleLocationEXT structures

The VkSampleLocationEXT structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationEXT {
  float x;
  float y;
} VkSampleLocationEXT;
```

- x is the horizontal coordinate of the sample’s location.
- y is the vertical coordinate of the sample’s location.

The domain space of the sample location coordinates has an upper-left origin within the pixel in framebuffer space.

The values specified in a VkSampleLocationEXT structure are always clamped to the implementation-dependent sample location coordinate range [sampleLocationCoordinateRange[0],sampleLocationCoordinateRange[1]] that can be queried using VkPhysicalDeviceSampleLocationsPropertiesEXT.

The custom sample locations used for rasterization when VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable is VK_TRUE are specified by the VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsInfo property of the bound graphics pipeline, if the pipeline was not created with VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT enabled.

Otherwise, the sample locations used for rasterization are set by calling vkCmdSetSampleLocationsEXT:
// Provided by VK_EXT_sample_locations

```c
void vkCmdSetSampleLocationsEXT(
    VkCommandBuffer                             commandBuffer,
    const VkSampleLocationsInfoEXT*             pSampleLocationsInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pSampleLocationsInfo` is the sample locations state to set.

### Valid Usage

- **VUID-vkCmdSetSampleLocationsEXT-sampleLocationsPerPixel-01529**
  The `sampleLocationsPerPixel` member of `pSampleLocationsInfo` must equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with.

- **VUID-vkCmdSetSampleLocationsEXT-variableSampleLocations-01530**
  If `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE` then the current render pass must have been begun by specifying a `VkRenderPassSampleLocationsBeginInfoEXT` structure whose `pPostSubpassSampleLocations` member contains an element with a `subpassIndex` matching the current subpass index and the `sampleLocationsInfo` member of that element must match the sample locations state pointed to by `pSampleLocationsInfo`.

### Valid Usage (Implicit)

- **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetSampleLocationsEXT-pSampleLocationsInfo-parameter**
  `pSampleLocationsInfo` must be a valid pointer to a valid `VkSampleLocationsInfoEXT` structure.

- **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.
27.6. Fragment Shading Rates

The features advertised by `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` allow an application to control the shading rate of a given fragment shader invocation.

The fragment shading rate strongly interacts with `Multisampling`, and the set of available rates for an implementation may be restricted by sample rate.

To query available shading rates, call:

```c
// Provided by VK_KHR_fragment_shading_rate
VkResult vkGetPhysicalDeviceFragmentShadingRatesKHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pFragmentShadingRateCount,
    VkPhysicalDeviceFragmentShadingRateKHR*     pFragmentShadingRates);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pFragmentShadingRateCount` is a pointer to an integer related to the number of fragment shading rates available or queried, as described below.
- `pFragmentShadingRates` is either `NULL` or a pointer to an array of `VkPhysicalDeviceFragmentShadingRateKHR` structures.

If `pFragmentShadingRates` is `NULL`, then the number of fragment shading rates available is returned in `pFragmentShadingRateCount`. Otherwise, `pFragmentShadingRateCount` must point to a variable set by the user to the number of elements in the `pFragmentShadingRates` array, and on return the variable is overwritten with the number of structures actually written to `pFragmentShadingRates`. If `pFragmentShadingRateCount` is less than the number of fragment shading rates available, at most `pFragmentShadingRateCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available fragment shading rates were returned.

The returned array of fragment shading rates must be ordered from largest `fragmentSize.width` value to smallest, and each set of fragment shading rates with the same `fragmentSize.width` value must be ordered from largest `fragmentSize.height` to smallest. Any two entries in the array must not have the same `fragmentSize` values.

For any entry in the array, the following rules also apply:

- The value of `fragmentSize.width` must be less than or equal to `maxFragmentSize.width`.
• The value of `fragmentSize.width` **must** be greater than or equal to 1.
• The value of `fragmentSize.width` **must** be a power-of-two.
• The value of `fragmentSize.height` **must** be less than or equal to `maxFragmentSize.height`.
• The value of `fragmentSize.height` **must** be greater than or equal to 1.
• The value of `fragmentSize.height` **must** be a power-of-two.
• The highest sample count in `sampleCounts` **must** be less than or equal to `maxFragmentShadingRateRasterizationSamples`.
• The product of `fragmentSize.width`, `fragmentSize.height`, and the highest sample count in `sampleCounts` **must** be less than or equal to `maxFragmentShadingRateCoverageSamples`.

Implementations **must** support at least the following shading rates:

<table>
<thead>
<tr>
<th>sampleCounts</th>
<th>fragmentSize</th>
</tr>
</thead>
<tbody>
<tr>
<td>`VK_SAMPLE_COUNT_1_BIT</td>
<td>VK_SAMPLE_COUNT_4_BIT`</td>
</tr>
<tr>
<td>`VK_SAMPLE_COUNT_1_BIT</td>
<td>VK_SAMPLE_COUNT_4_BIT`</td>
</tr>
<tr>
<td>~0</td>
<td>{1,1}</td>
</tr>
</tbody>
</table>

If `framebufferColorSampleCounts` includes `VK_SAMPLE_COUNT_2_BIT`, the required rates **must** also include `VK_SAMPLE_COUNT_2_BIT`.

**Note**
Including the {1,1} fragment size is done for completeness; it has no actual effect on the support of rendering without setting the fragment size. All sample counts and render pass transforms are supported for this rate.

The returned set of fragment shading rates **must** be returned in the native (rotated) coordinate system. For rasterization using render pass transform not equal to `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, the application **must** transform the returned fragment shading rates into the current (unrotated) coordinate system to get the supported rates for that transform.

**Note**
For example, consider an implementation returning support for 4x2, but not 2x4 in the set of supported fragment shading rates. This means that for transforms `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR` and `VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR`, 2x4 is a supported rate, but 4x2 is an unsupported rate.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-physicalDevice-parameter  
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRateCount-parameter  
  pFragmentShadingRateCount must be a valid pointer to a uint32_t value

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRates-parameter  
  If the value referenced by pFragmentShadingRateCount is not 0, and pFragmentShadingRates is not NULL, pFragmentShadingRates must be a valid pointer to an array of pFragmentShadingRateCount VkPhysicalDeviceFragmentShadingRateKHR structures

Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkPhysicalDeviceFragmentShadingRateKHR structure is defined as

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateKHR {
    VkStructureType       sType;
    void*                 pNext;
    VkSampleCountFlags    sampleCounts;
    VkExtent2D            fragmentSize;
} VkPhysicalDeviceFragmentShadingRateKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **sampleCounts** is a bitmask of sample counts for which the shading rate described by **fragmentSize** is supported.
- **fragmentSize** is a VkExtent2D describing the width and height of a supported shading rate.
Fragment shading rates can be set at three points, with the three rates combined to determine the final shading rate.

27.6.1. Pipeline Fragment Shading Rate

The pipeline fragment shading rate can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via `vkCmdSetFragmentShadingRateKHR`.

The `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPipelineFragmentShadingRateStateCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExtent2D fragmentSize;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateStateCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `fragmentSize` specifies a `VkExtent2D` structure containing the fragment size used to define the pipeline fragment shading rate for draw commands using this pipeline.
- `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` value determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure, then that structure includes parameters that control the pipeline fragment shading rate.

If this structure is not present, `fragmentSize` is considered to be equal to (1,1), and both elements of `combinerOps` are considered to be equal to `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`. 
Valid Usage (Implicit)

- **VUID-VkPipelineFragmentShadingRateStateCreateInfoKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_STATE_CREATE_INFO_KHR`.

- **VUID-VkPipelineFragmentShadingRateStateCreateInfoKHR-combinerOps-parameter**
  - Any given element of `combinerOps` must be a valid `VkFragmentShadingRateCombinerOpKHR` value.

If a pipeline state object is created with `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` enabled, the pipeline fragment shading rate and combiner operation is set by the command:

```c
// Provided by VK_KHR_fragment_shading_rate
void vkCmdSetFragmentShadingRateKHR(
    VkCommandBuffer                             commandBuffer,
    const VkExtent2D*                           pFragmentSize,
    const VkFragmentShadingRateCombinerOpKHR    combinerOps[2]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pFragmentSize` specifies the pipeline fragment shading rate for subsequent draw commands.
- `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by subsequent drawing commands.
Valid Usage

- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04507
  If `pipelineFragmentShadingRate` is not enabled, `pFragmentSize->width` must be 1

- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04508
  If `pipelineFragmentShadingRate` is not enabled, `pFragmentSize->height` must be 1

- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04509
  One of `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or
  `attachmentFragmentShadingRate` must be enabled

- VUID-vkCmdSetFragmentShadingRateKHR-primitiveFragmentShadingRate-04510
  If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0]` must be
  `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- VUID-vkCmdSetFragmentShadingRateKHR-attachmentFragmentShadingRate-04511
  If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1]` must be
  `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- VUID-vkCmdSetFragmentShadingRateKHR-fragmentSizeNonTrivialCombinerOps-04512
  If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps`
  must be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or
  `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04513
  `pFragmentSize->width` must be greater than or equal to 1

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04514
  `pFragmentSize->height` must be greater than or equal to 1

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04515
  `pFragmentSize->width` must be a power-of-two value

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04516
  `pFragmentSize->height` must be a power-of-two value

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04517
  `pFragmentSize->width` must be less than or equal to 4

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04518
  `pFragmentSize->height` must be less than or equal to 4
27.6.2. Primitive Fragment Shading Rate

The *primitive fragment shading rate* can be set via the `PrimitiveShadingRateKHR` built-in in the last active vertex processing shader stage. The rate associated with a given primitive is sourced from the value written to `PrimitiveShadingRateKHR` by that primitive's **provoking vertex**.

27.6.3. Attachment Fragment Shading Rate

The *attachment shading rate* can be set by including `VkFragmentShadingRateAttachmentInfoKHR` in a subpass to define a **fragment shading rate attachment**. Each pixel in the framebuffer is assigned an attachment fragment shading rate by the corresponding texel in the fragment shading rate attachment, according to:
\[ x' = \text{floor}(x / \text{region}_x) \]

\[ y' = \text{floor}(y / \text{region}_y) \]

where \( x' \) and \( y' \) are the coordinates of a texel in the fragment shading rate attachment, \( x \) and \( y \) are the coordinates of the pixel in the framebuffer, and \( \text{region}_x \) and \( \text{region}_y \) are the size of the region each texel corresponds to, as defined by the shadingRateAttachmentTexelSize member of VkFragmentShadingRateAttachmentInfoKHR.

If multiview is enabled and the shading rate attachment has multiple layers, the shading rate attachment texel is selected from the layer determined by the ViewIndex built-in. If multiview is disabled, and both the shading rate attachment and the framebuffer have multiple layers, the shading rate attachment texel is selected from the layer determined by the Layer built-in. Otherwise, the texel is unconditionally selected from the first layer of the attachment.

The fragment size is encoded into the first component of the identified texel as follows:

\[ \text{size}_w = 2^{\text{texel} \mod 4 \mod 3} \]

\[ \text{size}_h = 2^{\text{texel} \mod 3} \]

where \( \text{texel} \) is the value in the first component of the identified texel, and \( \text{size}_w \) and \( \text{size}_h \) are the width and height of the fragment size, decoded from the texel.

If no fragment shading rate attachment is specified, this size is calculated as \( \text{size}_w = \text{size}_h = 1 \). Applications must not specify a width or height greater than 4 by this method.

The Fragment Shading Rate enumeration in SPIR-V adheres to the above encoding.

### 27.6.4. Combining the Fragment Shading Rates

The final rate \( (C_{xy})' \) used for fragment shading must be one of the rates returned by vkGetPhysicalDeviceFragmentShadingRatesKHR for the sample count and render pass transform used by rasterization.

If any of the following conditions are met, \( C_{xy}' \) must be set to \{1,1\}:

- If Sample Shading is enabled.
- The fragmentShadingRateWithSampleMask limit is not supported, and VkPipelineMultisampleStateCreateInfo::pSampleMask contains a zero value in any bit used by fragment operations.
- The fragmentShadingRateWithShaderSampleMask is not supported, and the fragment shader has SampleMask in the input or output interface.
- The fragmentShadingRateWithShaderDepthStencilWrites limit is not supported, and the fragment
shader declares the `FragDepth` or `FragStencilRefEXT` built-in.

- The `fragmentShadingRateWithConservativeRasterization` limit is not supported, and `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode` is not `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`.

- The `fragmentShadingRateWithFragmentShaderInterlock` limit is not supported, and the fragment shader declares any of the fragment shader interlock execution modes.

- The `fragmentShadingRateWithCustomSampleLocations` limit is not supported, and `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` is `VK_TRUE`.

Otherwise, each of the specified shading rates are combined and then used to derive the value of \( C_{xy} \)'. As there are three ways to specify shading rates, two combiner operations are specified - between the pipeline and primitive shading rates, and between the result of that and the attachment shading rate.

The equation used for each combiner operation is defined by `VkFragmentShadingRateCombinerOpKHR`:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef enum VkFragmentShadingRateCombinerOpKHR {
   VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR = 0,
   VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR = 1,
   VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR = 2,
   VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR = 3,
   VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR = 4,
} VkFragmentShadingRateCombinerOpKHR;
```

- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = A_{xy} \).
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR` specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = B_{xy} \).
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR` specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = \min(A_{xy}, B_{xy}) \).
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR` specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = \max(A_{xy}, B_{xy}) \).
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR` specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = A_{xy} * B_{xy} \).

where `\text{combine}(A_{xy}, B_{xy})` is the combine operation, and `A_{xy}` and `B_{xy}` are the inputs to the operation.

If `fragmentShadingRateStrictMultiplyCombiner` is `VK_FALSE`, using `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR` with values of 1 for both `A` and `B` in the same dimension results in the value 2 being produced for that dimension. See the definition of `fragmentShadingRateStrictMultiplyCombiner` for more information.

These operations are performed in a component-wise fashion.

This is used to generate a combined fragment area using the equation:
\[ C_{xy} = \text{combine}(A_{xy}, B_{xy}) \]

where \( C_{xy} \) is the combined fragment area result, and \( A_{xy} \) and \( B_{xy} \) are the fragment areas of the fragment shading rates being combined.

Two combine operations are performed, first with \( A_{xy} \) equal to the pipeline fragment shading rate and \( B_{xy} \) equal to the primitive fragment shading rate, with the combine() operation selected by combinerOps[0]. A second combination is then performed, with \( A_{xy} \) equal to the result of the first combination and \( B_{xy} \) equal to the attachment fragment shading rate, with the combine() operation selected by combinerOps[1]. The result of the second combination is used as the final fragment shading rate, reported via the `ShadingRateKHR` built-in.

Implementations may clamp the \( C_{xy} \) result of each combiner operation separately, or only after the second combiner operation.

If the final combined rate is one of the rates returned by `vkGetPhysicalDeviceFragmentShadingRatesKHR` for the sample count and render pass transform used by rasterization, \( C_{xy}' = C_{xy} \). Otherwise, \( C_{xy}' \) is selected from the rates returned by `vkGetPhysicalDeviceFragmentShadingRatesKHR` for the sample count and render pass transform used by rasterization. From this list of supported rates, the following steps are applied in order, to select a single value:

1. Keep only rates where \( C_x' \leq C_x \) and \( C_y' \leq C_y \).
   ◦ Implementations may also keep rates where \( C_x' \leq C_y \) and \( C_y' \leq C_x \).
2. Keep only rates with the highest area \( (C_x' \times C_y') \).
3. Keep only rates with the lowest aspect ratio \( (C_x' + C_y') \).
4. In cases where a wide (e.g. 4x1) and tall (e.g. 1x4) rate remain, the implementation may choose either rate. However, it must choose this rate consistently for the same shading rates, render pass transform, and combiner operations for the lifetime of the `VkDevice`.

### 27.6.5. Extended Fragment Shading Rates

The features advertised by `VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV` provide support for additional fragment shading rates beyond those specifying one fragment shader invocation covering all pixels in a fragment whose size is indicated by the fragment shading rate.

If the `fragmentShadingRateEnums` feature is enabled, fragment shading rates may be specified using the `VkFragmentShadingRateNV` enumerated type defined as:
Provided by VK_NV_fragment_shading_rateEnums

typedef enum VkFragmentShadingRateNV {
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV = 0,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_1X2_PIXELS_NV = 1,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X1_PIXELS_NV = 4,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X2_PIXELS_NV = 5,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X4_PIXELS_NV = 6,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X2_PIXELS_NV = 9,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X4_PIXELS_NV = 10,
    VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV = 11,
    VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV = 12,
    VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV = 13,
    VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV = 14,
    VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV = 15,
} VkFragmentShadingRateNV;

• VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV specifies a fragment size of 1x1 pixels.
• VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_1X2_PIXELS_NV specifies a fragment size of 1x2 pixels.
• VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X1_PIXELS_NV specifies a fragment size of 2x1 pixels.
• VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X2_PIXELS_NV specifies a fragment size of 2x2 pixels.
• VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X4_PIXELS_NV specifies a fragment size of 2x4 pixels.
• VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X2_PIXELS_NV specifies a fragment size of 4x2 pixels.
• VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X4_PIXELS_NV specifies a fragment size of 4x4 pixels.
• VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV specifies a fragment size of 1x1 pixels, with two fragment shader invocations per fragment.
• VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV specifies a fragment size of 1x1 pixels, with four fragment shader invocations per fragment.
• VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV specifies a fragment size of 1x1 pixels, with eight fragment shader invocations per fragment.
• VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV specifies a fragment size of 1x1 pixels, with sixteen fragment shader invocations per fragment.
• VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV specifies that any portions of a primitive that use that shading rate should be discarded without invoking any fragment shader.

To use the shading rates VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV, VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV, VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV, and
VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV as a pipeline, primitive, or attachment shading rate, the supersampleFragmentShadingRates feature must be enabled. To use the shading rate VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV as a pipeline, primitive, or attachment shading rate, the noInvocationFragmentShadingRates feature must be enabled.

When using fragment shading rate enums, the pipeline fragment shading rate can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via vkCmdSetFragmentShadingRateEnumNV.

The VkPipelineFragmentShadingRateEnumStateCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_fragment_shading_rate_enums
typedef struct VkPipelineFragmentShadingRateEnumStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkFragmentShadingRateTypeNV shadingRateType;
    VkFragmentShadingRateNV shadingRate;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateEnumStateCreateInfoNV;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shadingRateType** specifies a VkFragmentShadingRateTypeNV value indicating whether fragment shading rates are specified using fragment sizes or VkFragmentShadingRateNV enums.
- **shadingRate** specifies a VkFragmentShadingRateNV value indicating the pipeline fragment shading rate.
- **combinerOps** specifies VkFragmentShadingRateCombinerOpKHR values determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the pNext chain of VkGraphicsPipelineCreateInfo includes a VkPipelineFragmentShadingRateEnumStateCreateInfoNV structure, then that structure includes parameters that control the pipeline fragment shading rate.

If this structure is not present, shadingRateType is considered to be equal to VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV, shadingRate is considered to be equal to VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV, and both elements of combinerOps are considered to be equal to VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR.
Valid Usage (Implicit)

- **VUID-VkPipelineFragmentShadingRateEnumStateCreateInfoNV-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_ENUM_STATE_CREATE_INFO_NV`.

- **VUID-VkPipelineFragmentShadingRateEnumStateCreateInfoNV-shadingRateType-parameter**
  - `shadingRateType` must be a valid `VkFragmentShadingRateTypeNV` value.

- **VUID-VkPipelineFragmentShadingRateEnumStateCreateInfoNV-shadingRate-parameter**
  - `shadingRate` must be a valid `VkFragmentShadingRateNV` value.

- **VUID-VkPipelineFragmentShadingRateEnumStateCreateInfoNV-combinerOps-parameter**
  - Any given element of `combinerOps` must be a valid `VkFragmentShadingRateCombinerOpKHR` value.

The `VkFragmentShadingRateTypeNV` enumerated type specifies whether a graphics pipeline gets its pipeline fragment shading rates and combiners from the `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` structure or the `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure.

```c
// Provided by VK_NV_fragment_shading_rateEnums
typedef enum VkFragmentShadingRateTypeNV {
    VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV = 0,
    VK_FRAGMENT_SHADING_RATE_TYPE_ENUMS_NV = 1,
} VkFragmentShadingRateTypeNV;
```

- **VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV** specifies that a graphics pipeline should obtain its pipeline fragment shading rate and combiner state from the `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure and that any state specified by the `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` structure should be ignored.

- **VK_FRAGMENT_SHADING_RATE_TYPE_ENUMS_NV** specifies that a graphics pipeline should obtain its pipeline fragment shading rate and combiner state from the `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` structure and that any state specified by the `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure should be ignored.

If a pipeline state object is created with `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` enabled, the pipeline fragment shading rate and combiner operation may be set by the command:

```c
// Provided by VK_NV_fragment_shading_rateEnums
void vkCmdSetFragmentShadingRateEnumNV(
    VkCommandBuffer                             commandBuffer,
    VkFragmentShadingRateNV                     shadingRate,
    const VkFragmentShadingRateCombinerOpKHR    combinerOps[2]);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **shadingRate** specifies a `VkFragmentShadingRateNV` enum indicating the pipeline fragment
shading rate for subsequent draw commands.

- `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by subsequent drawing commands.

**Valid Usage**

- VUID-vkCmdSetFragmentShadingRateEnumNV-pipelineFragmentShadingRate-04576
  If `pipelineFragmentShadingRate` is not enabled, `shadingRate` must be `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV`

- VUID-vkCmdSetFragmentShadingRateEnumNV-supersampleFragmentShadingRates-04577
  If `supersampleFragmentShadingRates` is not enabled, `shadingRate` must not be `VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV`, `VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV`, `VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV`, or `VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV`

- VUID-vkCmdSetFragmentShadingRateEnumNV-noInvocationFragmentShadingRates-04578
  If `noInvocationFragmentShadingRates` is not enabled, `shadingRate` must not be `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`

- VUID-vkCmdSetFragmentShadingRateEnumNV-fragmentShadingRateEnums-04579
  `fragmentShadingRateEnums` must be enabled

- VUID-vkCmdSetFragmentShadingRateEnumNV-pipelineFragmentShadingRate-04580
  One of `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or `attachmentFragmentShadingRate` must be enabled

- VUID-vkCmdSetFragmentShadingRateEnumNV-primitiveFragmentShadingRate-04581
  If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- VUID-vkCmdSetFragmentShadingRateEnumNV-attachmentFragmentShadingRate-04582
  If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- VUID-vkCmdSetFragmentShadingRateEnumNV-fragmentSizeNonTrivialCombinerOps-04583
  If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps` must be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`
Valid Usage (Implicit)

- VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdSetFragmentShadingRateEnumNV-shadingRate-parameter
  
  `shadingRate` must be a valid `VkFragmentShadingRateNV` value.

- VUID-vkCmdSetFragmentShadingRateEnumNV-combinerOps-parameter
  
  Any given element of `combinerOps` must be a valid `VkFragmentShadingRateCombinerOpKHR` value.

- VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-recording
  
  `commandBuffer` must be in the recording state.

- VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

When the `supersampleFragmentShadingRates` or `noInvocationFragmentShadingRates` features are enabled, the behavior of the shading rate combiner operations is extended to support the shading rates enabled by those features. Primitive and attachment shading rate values are interpreted as `VkFragmentShadingRateNV` values and the behavior of the combiners is modified as follows:

- For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR`, `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR`, and `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR`, if either `A_xy` or `B_xy` is `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`, combine(`A_xy`, `B_xy`) produces a shading rate of `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`, regardless of the other input shading rate.

- For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR`, combine(`A_xy`, `B_xy`) produces a shading rate whose fragment size is the smaller of the fragment sizes of `A_xy` and `B_xy` and whose invocation count is the larger of the invocation counts of `A_xy` and `B_xy`.
• For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR`, combine($A_{xy}, B_{xy}$) produces a shading rate whose fragment size is the larger of the fragment sizes of $A_{xy}$ and $B_{xy}$ and whose invocation count is the smaller of the invocation counts of $A_{xy}$ and $B_{xy}$.

• For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR`, combine($A_{xy}, B_{xy}$) produces a shading rate whose fragment size and invocation count is the product of the fragment sizes and invocation counts, respectively, of $A_{xy}$ and $B_{xy}$. If the resulting shading rate has both multiple pixels and multiple invocations per fragment, an implementation may adjust the shading rate by reducing both the pixel and invocation counts.

If the final shading rate from the combiners is `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`, no fragments will be generated for any portion of a primitive using that shading rate.

If the final shading rate from the combiners specifies multiple fragment shader invocations per fragment, the fragment will be processed with multiple unique samples as in sample shading, where the total number the total number of invocations is taken from the shading rate and then clamped to the value of `totalSamples` used by sample shading and to the value of `maxFragmentShadingRateInvocationCount`.

### 27.7. Shading Rate Image

The shading rate image feature allows pipelines to use a shading rate image to control the fragment area and the minimum number of fragment shader invocations launched for each fragment. When the shading rate image is enabled, the rasterizer determines a base shading rate for each region of the framebuffer covered by a primitive by fetching a value from the shading rate image and translating it to a shading rate using a per-viewport shading rate palette. This base shading rate is then adjusted to derive a final shading rate. The final shading rate specifies the fragment area and fragment shader invocation count to use for fragments generated in the region.

If the `pNext` chain of `VkPipelineViewportStateCreateInfo` includes a `VkPipelineViewportShadingRateImageStateCreateInfoNV` structure, then that structure includes parameters that control the shading rate.

The `VkPipelineViewportShadingRateImageStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkPipelineViewportShadingRateImageStateCreateInfoNV {
    VkStructureType         sType;
    const void*             pNext;
    VkBool32                 shadingRateImageEnable;
    uint32_t                 viewportCount;
    const VkShadingRatePaletteNV* pShadingRatePalettes;
} VkPipelineViewportShadingRateImageStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shadingRateImageEnable` specifies whether shading rate image and palettes are used during rasterization.
• **viewportCount** specifies the number of per-viewport palettes used to translate values stored in shading rate images.

• **pShadingRatePalettes** is a pointer to an array of *VkShadingRatePaletteNV* structures defining the palette for each viewport. If the shading rate palette state is dynamic, this member is ignored.

If this structure is not present, **shadingRateImageEnable** is considered to be **VK_FALSE**, and the shading rate image and palettes are not used.

### Valid Usage

- **VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-viewportCount-02054**
  
  If the **multiple viewports** feature is not enabled, **viewportCount** **must** be **0** or **1**

- **VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-viewportCount-02055**
  
  **viewportCount** **must** be less than or equal to **VkPhysicalDeviceLimits::maxViewports**

- **VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-shadingRateImageEnable-02056**
  
  If **shadingRateImageEnable** is **VK_TRUE**, **viewportCount** **must** be greater or equal to the **viewportCount** member of **VkPipelineViewportStateCreateInfo**

### Valid Usage (Implicit)

- **VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-sType-sType**
  
  **sType** **must** be **VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_SHADING_RATE_IMAGE_STATE_CREATE_INFO_NV**

When shading rate image usage is enabled in the bound pipeline, the pipeline uses a shading rate image specified by the command:

```c
// Provided by VK_NV_shading_rate_image
void vkCmdBindShadingRateImageNV(
    VkCommandBuffer                             commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    VkImageView                                 imageView,       // imageView is an image view handle specifying the shading rate image. imageView may be set to VK_NULL_HANDLE, which is equivalent to specifying a view of an image filled with zero values.
    VkImageLayout                               imageLayout);   // imageLayout is the layout that the image subresources accessible from imageView will be in when the shading rate image is accessed.
```
Valid Usage

- VUID-vkCmdBindShadingRateImageNV-None-02058
  The shading rate image feature must be enabled

- VUID-vkCmdBindShadingRateImageNV-imageView-02059
  If imageView is not VK_NULL_HANDLE, it must be a valid VkImageView handle of type VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

- VUID-vkCmdBindShadingRateImageNV-imageView-02060
  If imageView is not VK_NULL_HANDLE, it must have a format of VK_FORMAT_R8_UINT

- VUID-vkCmdBindShadingRateImageNV-imageView-02061
  If imageView is not VK_NULL_HANDLE, it must have been created with a usage value including VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV

- VUID-vkCmdBindShadingRateImageNV-imageView-02062
  If imageView is not VK_NULL_HANDLE, imageLayout must match the actual VkImageLayout of each subresource accessible from imageView at the time the subresource is accessed

- VUID-vkCmdBindShadingRateImageNV-imageLayout-02063
  If imageView is not VK_NULL_HANDLE, imageLayout must be VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV or VK_IMAGE_LAYOUT_GENERAL

Valid Usage (Implicit)

- VUID-vkCmdBindShadingRateImageNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBindShadingRateImageNV-imageView-parameter
  If imageView is not VK_NULL_HANDLE, imageView must be a valid VkImageView handle

- VUID-vkCmdBindShadingRateImageNV-imageLayout-parameter
  imageLayout must be a valid VkImageLayout value

- VUID-vkCmdBindShadingRateImageNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBindShadingRateImageNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBindShadingRateImageNV-commonparent
  Both of commandBuffer, and imageView that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

When the shading rate image is enabled in the current pipeline, rasterizing a primitive covering the pixel with coordinates \((x,y)\) will fetch a shading rate index value from the shading rate image bound by `vkCmdBindShadingRateImageNV`. If the shading rate image view has a type of `VK_IMAGE_VIEW_TYPE_2D`, the lookup will use texel coordinates \((u,v)\) where \(u = \frac{x}{tw\text{idth}}\), \(v = \frac{y}{the\text{ight}}\), and `width` and `height` are the width and height of the implementation-dependent shading rate texel size. If the shading rate image view has a type of `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, the lookup will use texel coordinates \((u,v)\) to extract a texel from the layer \(l\), where \(l\) is the layer of the framebuffer being rendered to. If \(l\) is greater than or equal to the number of layers in the image view, layer zero will be used.

If the bound shading rate image view is not `VK_NULL_HANDLE` and contains a texel with coordinates \((u,v)\) in layer \(l\) (if applicable), the single unsigned integer component for that texel will be used as the shading rate index. If the \((u,v)\) coordinate is outside the extents of the subresource used by the shading rate image view, or if the image view is `VK_NULL_HANDLE`, the shading rate index is zero. If the shading rate image view has multiple mipmap levels, the base level identified by `VkImageSubresourceRange::baseMipLevel` will be used.

A shading rate index is mapped to a base shading rate using a lookup table called the shading rate image palette. There is a separate palette for each viewport. The number of entries in each palette is given by the implementation-dependent shading rate image palette size.

If a pipeline state object is created with `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` enabled, the per-viewport shading rate image palettes are set by the command:

```c
// Provided by VK_NV_shading_rate_image
void vkCmdSetViewportShadingRatePaletteNV(
    VkCommandBuffer commandBuffer,
    uint32_t firstViewport,
    uint32_t viewportCount,
    const VkShadingRatePaletteNV* pShadingRatePalettes);
```
• `commandBuffer` is the command buffer into which the command will be recorded.
• `firstViewport` is the index of the first viewport whose shading rate palette is updated by the command.
• `viewportCount` is the number of viewports whose shading rate palettes are updated by the command.
• `pShadingRatePalettes` is a pointer to an array of `VkShadingRatePaletteNV` structures defining the palette for each viewport.

## Valid Usage

• VUID-vkCmdSetViewportShadingRatePaletteNV-None-02064
  - The shading rate image feature must be enabled

• VUID-vkCmdSetViewportShadingRatePaletteNV-firstViewport-02067
  - The sum of `firstViewport` and `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

• VUID-vkCmdSetViewportShadingRatePaletteNV-firstViewport-02068
  - If the multiple viewports feature is not enabled, `firstViewport` must be 0

• VUID-vkCmdSetViewportShadingRatePaletteNV-viewportCount-02069
  - If the multiple viewports feature is not enabled, `viewportCount` must be 1

## Valid Usage (Implicit)

• VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-parameter
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

• VUID-vkCmdSetViewportShadingRatePaletteNV-pShadingRatePalettes-parameter
  - `pShadingRatePalettes` must be a valid pointer to an array of `viewportCount` valid `VkShadingRatePaletteNV` structures

• VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-recording
  - `commandBuffer` must be in the recording state

• VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-cmdpool
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

• VUID-vkCmdSetViewportShadingRatePaletteNV-viewportCount-arraylength
  - `viewportCount` must be greater than 0

## Host Synchronization

• Host access to `commandBuffer` must be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
The `VkShadingRatePaletteNV` structure specifies the contents of a single shading rate image palette and is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkShadingRatePaletteNV {
    uint32_t shadingRatePaletteEntryCount;
    const VkShadingRatePaletteEntryNV* pShadingRatePaletteEntries;
} VkShadingRatePaletteNV;
```

- `shadingRatePaletteEntryCount` specifies the number of entries in the shading rate image palette.
- `pShadingRatePaletteEntries` is a pointer to an array of `VkShadingRatePaletteEntryNV` enums defining the shading rate for each palette entry.

### Valid Usage

- `VUID-VkShadingRatePaletteNV-shadingRatePaletteEntryCount-02071`
  
  `shadingRatePaletteEntryCount` must be between `1` and `VkPhysicalDeviceShadingRateImagePropertiesNV::shadingRatePaletteSize`, inclusive.

### Valid Usage (Implicit)

- `VUID-VkShadingRatePaletteNV-pShadingRatePaletteEntries-parameter`
  
  `pShadingRatePaletteEntries` must be a valid pointer to an array of `shadingRatePaletteEntryCount` valid `VkShadingRatePaletteEntryNV` values.

- `VUID-VkShadingRatePaletteNV-shadingRatePaletteEntryCount-arraylength`
  
  `shadingRatePaletteEntryCount` must be greater than `0`.

To determine the base shading rate image, a shading rate index `i` is mapped to array element `i` in the array `pShadingRatePaletteEntries` for the palette corresponding to the viewport used for the fragment. If `i` is greater than or equal to the palette size `shadingRatePaletteEntryCount`, the base shading rate is undefined.

The supported shading rate image palette entries are defined by `VkShadingRatePaletteEntryNV`: 

---

1494 | Chapter 27. Rasterization
The following table indicates the width and height (in pixels) of each fragment generated using the indicated shading rate, as well as the maximum number of fragment shader invocations launched for each fragment. When processing regions of a primitive that have a shading rate of `VK_SHADING_RATE_PALETTE_ENTRY_NO_INVOCATIONS_NV`, no fragments will be generated in that region.

Chapter 27. Rasterization | 1495
When the shading rate image is disabled, a shading rate of `VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_PIXEL_NV` will be used as the base shading rate.

Once a base shading rate has been established, it is adjusted to produce a final shading rate. First, if the base shading rate uses multiple pixels for each fragment, the implementation may reduce the fragment area to ensure that the total number of coverage samples for all pixels in a fragment does not exceed an implementation-dependent maximum.

If sample shading is active in the current pipeline and would result in processing $n$ ($n > 1$) unique samples per fragment when the shading rate image is disabled, the shading rate is adjusted in an implementation-dependent manner to increase the number of fragment shader invocations spawned by the primitive. If the shading rate indicates $fs$ pixels per fragment and $fs$ is greater than $n$, the fragment area is adjusted so each fragment has approximately $\frac{fs}{n}$ pixels. Otherwise, if the shading rate indicates $ipf$ invocations per fragment, the fragment area will be adjusted to a single pixel with approximately $ipf \times \frac{1}{fs}$ invocations per fragment.

If sample shading occurs due to the use of a fragment shader input variable decorated with `SampleId` or `SamplePosition`, the shading rate is ignored. Each fragment will have a single pixel and will spawn up to `totalSamples` fragment shader invocations, as when using sample shading without a shading rate image.

Finally, if the shading rate specifies multiple fragment shader invocations per fragment, the total number of invocations in the shading rate is clamped to be no larger than the value of `totalSamples` used for sample shading.

When the final shading rate for a primitive covering pixel $(x,y)$ has a fragment area of $fw \times fh$, the fragment for that pixel will cover all pixels with coordinates $(x',y')$ that satisfy the equations:

$$\frac{x}{fw} = \frac{x'}{fw}$$

$$\frac{y}{fh} = \frac{y'}{fh}$$

This combined fragment is considered to have multiple coverage samples; the total number of samples in this fragment is given by $samples = fw \times fh \times rs$ where $rs$ indicates the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` specified at pipeline creation time. The set of coverage samples in the fragment is the union of the per-pixel coverage samples in each of the fragment's pixels. The location and order of coverage samples within each pixel in the combined

1496 | Chapter 27. Rasterization
fragment are assigned as described in Multisampling and Custom Sample Locations. Each coverage sample in the set of pixels belonging to the combined fragment is assigned a unique coverage index in the range \([0, \text{samples}-1]\). If the shadingRateCoarseSampleOrder feature is supported, the order of coverage samples can be specified for each combination of fragment area and coverage sample count. If this feature is not supported, the sample order is implementation-dependent.

If the pNext chain of VkPipelineViewportStateCreateInfo includes a VkPipelineViewportCoarseSampleOrderStateCreateInfoNV structure, then that structure includes parameters that control the order of coverage samples in fragments larger than one pixel.

The VkPipelineViewportCoarseSampleOrderStateCreateInfoNV structure is defined as:

```c
typedef struct VkPipelineViewportCoarseSampleOrderStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkCoarseSampleOrderTypeNV sampleOrderType;
    uint32_t customSampleOrderCount;
    const VkCoarseSampleOrderCustomNV* pCustomSampleOrders;
} VkPipelineViewportCoarseSampleOrderStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `sampleOrderType` specifies the mechanism used to order coverage samples in fragments larger than one pixel.
- `customSampleOrderCount` specifies the number of custom sample orderings to use when ordering coverage samples.
- `pCustomSampleOrders` is a pointer to an array of `customSampleOrderCount` VkCoarseSampleOrderCustomNV structures, each of which specifies the coverage sample order for a single combination of fragment area and coverage sample count.

If this structure is not present, `sampleOrderType` is considered to be VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV.

If `sampleOrderType` is VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV, the coverage sample order used for any combination of fragment area and coverage sample count not enumerated in `pCustomSampleOrders` will be identical to that used for VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV.

If the pipeline was created with VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV, the contents of this structure (if present) are ignored, and the coverage sample order is instead specified by vkCmdSetCoarseSampleOrderNV.
The type `VkCoarseSampleOrderTypeNV` specifies the technique used to order coverage samples in fragments larger than one pixel, and is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef enum VkCoarseSampleOrderTypeNV {
    VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV = 0,
    VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV = 1,
    VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV = 2,
    VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV = 3,
} VkCoarseSampleOrderTypeNV;
```

- `VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV` specifies that coverage samples will be ordered in an implementation-dependent manner.
- `VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV` specifies that coverage samples will be ordered according to the array of custom orderings provided in either the `pCustomSampleOrders` member of `VkPipelineViewportCoarseSampleOrderStateCreateInfoNV` or the `pCustomSampleOrders` member of `vkCmdSetCoarseSampleOrderNV`.
- `VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV` specifies that coverage samples will be ordered sequentially, sorted first by pixel coordinate (in row-major order) and then by sample index.
- `VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV` specifies that coverage samples will be ordered sequentially, sorted first by sample index and then by pixel coordinate (in row-major order).

When using a coarse sample order of `VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV` for a fragment...
with an upper-left corner of \((f_x, f_y)\) with a width of \(f_w \times f_h\) and \(f_{sc}\) samples per pixel, coverage index \(cs\) of the fragment will be assigned to sample index \(fs\) of pixel \((px, py)\) as follows:

\[
px = f_x + \left\lfloor \frac{cs}{f_{sc}} \right\rfloor f_w \\
py = f_y + \left\lfloor \frac{cs}{f_{sc} \times f_w} \right\rfloor \\
fs = cs \% f_{sc}
\]

When using a coarse sample order of \texttt{VK\_COARSE\_SAMPLE\_ORDER\_TYPE\_SAMPLE\_MAJOR\_NV}, coverage index \(cs\) will be assigned as follows:

\[
px = f_x + cs \% f_w \\
py = (f_y + \left\lfloor \frac{cs}{f_{w}} \right\rfloor f_h) \\
fs = \left\lfloor \frac{cs}{f_{w} \times f_h} \right\rfloor
\]

The \texttt{VkCoarseSampleOrderCustomNV} structure is used with a coverage sample ordering type of \texttt{VK\_COARSE\_SAMPLE\_ORDER\_TYPE\_CUSTOM\_NV} to specify the order of coverage samples for one combination of fragment width, fragment height, and coverage sample count. The structure is defined as:

```c
// Provided by VK\_NV\_shading\_rate\_image
typedef struct VkCoarseSampleOrderCustomNV {
    VkShadingRatePaletteEntryNV shadingRate;
    uint32_t sampleCount;
    uint32_t sampleLocationCount;
    const VkCoarseSampleLocationNV* pSampleLocations;
} VkCoarseSampleOrderCustomNV;
```

- \texttt{shadingRate} is a shading rate palette entry that identifies the fragment width and height for the combination of fragment area and per-pixel coverage sample count to control.
- \texttt{sampleCount} identifies the per-pixel coverage sample count for the combination of fragment area and coverage sample count to control.
- \texttt{sampleLocationCount} specifies the number of sample locations in the custom ordering.
- \texttt{pSampleLocations} is a pointer to an array of \texttt{VkCoarseSampleLocationNV} structures specifying the location of each sample in the custom ordering.

When using a custom sample ordering, element \(j\) in \texttt{pSampleLocations} specifies a specific pixel location and sample index that corresponds to coverage index \(j\) in the multi-pixel fragment.
Valid Usage

- VUID-VkCoarseSampleOrderCustomNV-shadingRate-02073
  shadingRate must be a shading rate that generates fragments with more than one pixel

- VUID-VkCoarseSampleOrderCustomNV-sampleCount-02074
  sampleCount must correspond to a sample count enumerated in VkSampleCountFlags
  whose corresponding bit is set in VkPhysicalDeviceLimits::framebufferNoAttachmentsSampleCounts

- VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-02075
  sampleLocationCount must be equal to the product of sampleCount, the fragment width for
  shadingRate, and the fragment height for shadingRate

- VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-02076
  sampleLocationCount must be less than or equal to the value of
  VkPhysicalDeviceShadingRateImagePropertiesNV::shadingRateMaxCoarseSamples

- VUID-VkCoarseSampleOrderCustomNV-pSampleLocations-02077
  The array pSampleLocations must contain exactly one entry for every combination of valid
  values for pixelX, pixelY, and sample in the structure VkCoarseSampleOrderCustomNV

Valid Usage (Implicit)

- VUID-VkCoarseSampleOrderCustomNV-shadingRate-parameter
  shadingRate must be a valid VkShadingRatePaletteEntryNV value

- VUID-VkCoarseSampleOrderCustomNV-pSampleLocations-parameter
  pSampleLocations must be a valid pointer to an array of sampleLocationCount
  VkCoarseSampleLocationNV structures

- VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-arraylength
  sampleLocationCount must be greater than 0

The VkCoarseSampleLocationNV structure identifies a specific pixel and sample index for one of the
coverage samples in a fragment that is larger than one pixel. This structure is defined as:

```
// Provided by VK_NV_shading_rate_image
typedef struct VkCoarseSampleLocationNV {
    uint32_t    pixelX;
    uint32_t    pixelY;
    uint32_t    sample;
} VkCoarseSampleLocationNV;
```

- pixelX is added to the x coordinate of the upper-leftmost pixel of each fragment to identify the
  pixel containing the coverage sample.

- pixelY is added to the y coordinate of the upper-leftmost pixel of each fragment to identify the
  pixel containing the coverage sample.
sample is the number of the coverage sample in the pixel identified by pixelX and pixelY.

**Valid Usage**

- VUID-VkCoarseSampleLocationNV-pixelX-02078
  pixelX must be less than the width (in pixels) of the fragment

- VUID-VkCoarseSampleLocationNV-pixelY-02079
  pixelY must be less than the height (in pixels) of the fragment

- VUID-VkCoarseSampleLocationNV-sample-02080
  sample must be less than the number of coverage samples in each pixel belonging to the fragment

If a pipeline state object is created with VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV enabled, the order of coverage samples in fragments larger than one pixel is set by the command:

```c
// Provided by VK_NV_shading_rate_image
void vkCmdSetCoarseSampleOrderNV(
    VkCommandBuffer                             commandBuffer,  
    VkCoarseSampleOrderTypeNV                   sampleOrderType, 
    uint32_t                                    customSampleOrderCount, 
    const VkCoarseSampleOrderCustomNV*          pCustomSampleOrders);
```

- commandBuffer is the command buffer into which the command will be recorded.
- sampleOrderType specifies the mechanism used to order coverage samples in fragments larger than one pixel.
- customSampleOrderCount specifies the number of custom sample orderings to use when ordering coverage samples.
- pCustomSampleOrders is a pointer to an array of VkCoarseSampleOrderCustomNV structures, each of which specifies the coverage sample order for a single combination of fragment area and coverage sample count.

If sampleOrderType is VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV, the coverage sample order used for any combination of fragment area and coverage sample count not enumerated in pCustomSampleOrders will be identical to that used for VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV.

**Valid Usage**

- VUID-vkCmdSetCoarseSampleOrderNV-sampleOrderType-02081
  If sampleOrderType is not VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV, customSamplerOrderCount must be 0

- VUID-vkCmdSetCoarseSampleOrderNV-pCustomSampleOrders-02235
  The array pCustomSampleOrders must not contain two structures with matching values for both the shadingRate and sampleCount members
Valid Usage (Implicit)

- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetCoarseSampleOrderNV-sampleOrderType-parameter
  sampleOrderType must be a valid VkCoarseSampleOrderTypeNV value

- VUID-vkCmdSetCoarseSampleOrderNV-pCustomSampleOrders-parameter
  If customSampleOrderCount is not 0, pCustomSampleOrders must be a valid pointer to an array of customSampleOrderCount valid VkCoarseSampleOrderCustomNV structures

- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

If the final shading rate for a primitive covering pixel \((x,y)\) results in \(n\) invocations per pixel \((n > 1)\), \(n\) separate fragment shader invocations will be generated for the fragment. Each coverage sample in the fragment will be assigned to one of the \(n\) fragment shader invocations in an implementation-dependent manner. The outputs from the fragment output interface of each shader invocation will be broadcast to all of the framebuffer samples associated with the invocation. If none of the coverage samples associated with a fragment shader invocation is covered by a primitive, the implementation may discard the fragment shader invocation for those samples.

If the final shading rate for a primitive covering pixel \((x,y)\) results in a fragment containing multiple pixels, a single set of fragment shader invocations will be generated for all pixels in the combined fragment. Outputs from the fragment output interface will be broadcast to all covered framebuffer samples belonging to the fragment. If the fragment shader executes code discarding the fragment, none of the samples of the fragment will be updated.
27.8. Sample Shading

Sample shading can be used to specify a minimum number of unique samples to process for each fragment. If sample shading is enabled an implementation must provide a minimum of \( \text{max}(\lceil \text{minSampleShadingFactor} \times \text{totalSamples} \rceil, 1) \) unique associated data for each fragment, where \( \text{minSampleShadingFactor} \) is the minimum fraction of sample shading. If the \text{VK_AMD_mixed_attachment_samples} extension is enabled and the subpass uses color attachments, \( \text{totalSamples} \) is the number of samples of the color attachments. Otherwise, \( \text{totalSamples} \) is the value of \text{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} specified at pipeline creation time. These are associated with the samples in an implementation-dependent manner. When \( \text{minSampleShadingFactor} \) is 1.0, a separate set of associated data are evaluated for each sample, and each set of values is evaluated at the sample location.

Sample shading is enabled for a graphics pipeline:

- If the interface of the fragment shader entry point of the graphics pipeline includes an input variable decorated with \text{SampleId} or \text{SamplePosition}. In this case \( \text{minSampleShadingFactor} \) takes the value 1.0.
- Else if the \text{sampleShadingEnable} member of the \text{VkPipelineMultisampleStateCreateInfo} structure specified when creating the graphics pipeline is set to \text{VK_TRUE}. In this case \( \text{minSampleShadingFactor} \) takes the value of \text{VkPipelineMultisampleStateCreateInfo::minSampleShading}.

Otherwise, sample shading is considered disabled.

27.9. Barycentric Interpolation

When the \text{fragmentShaderBarycentric} feature is enabled, the \text{PerVertexNV} interpolation decoration can be used with fragment shader inputs to indicate that the decorated inputs do not have associated data in the fragment. Such inputs can only be accessed in a fragment shader using an array index whose value (0, 1, or 2) identifies one of the vertices of the primitive that produced the fragment.

When tessellation, geometry shading, and mesh shading are not active, fragment shader inputs decorated with \text{PerVertexNV} will take values from one of the vertices of the primitive that produced the fragment, identified by the extra index provided in SPIR-V code accessing the input. If the \( n \) vertices passed to a draw call are numbered 0 through \( n-1 \), and the point, line, and triangle primitives produced by the draw call are numbered with consecutive integers beginning with zero, the following table indicates the original vertex numbers used when the provoking vertex mode is \text{VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT} for index values of 0, 1, and 2. If an input decorated with \text{PerVertexNV} is accessed with any other vertex index value, an undefined value is returned.

When geometry or mesh shading is active, primitives processed by fragment shaders are assembled from the vertices emitted by the geometry or mesh shader. In this case, the vertices used for fragment shader inputs decorated with `PerVertexNV` are derived by treating the primitives produced by the shader as though they were specified by a draw call and consulting the table above.

When using tessellation without geometry shading, the tessellator produces primitives in an implementation-dependent manner. While there is no defined vertex ordering for inputs decorated with `PerVertexNV`, the vertex ordering used in this case will be consistent with the ordering used to
derive the values of inputs decorated with \textit{BaryCoordNV} or \textit{BaryCoordNoPerspNV}.

Fragment shader inputs decorated with \textit{BaryCoordNV} or \textit{BaryCoordNoPerspNV} hold three-component vectors with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive. For point primitives, such variables are always assigned the value (1,0,0). For \textit{line} primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0 and 1 are (1,0,0) and (0,1,0), respectively. For \textit{polygon} primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0, 1, and 2 are (1,0,0), (0,1,0), and (0,0,1), respectively. For \textit{BaryCoordNV}, the values are obtained using perspective interpolation. For \textit{BaryCoordNoPerspNV}, the values are obtained using linear interpolation.

\section*{27.10. Points}

A point is drawn by generating a set of fragments in the shape of a square centered around the vertex of the point. Each vertex has an associated point size that controls the width/height of that square. The point size is taken from the (potentially clipped) shader built-in \textit{PointSize} written by:

\begin{itemize}
  \item the geometry shader, if active;
  \item the tessellation evaluation shader, if active and no geometry shader is active;
  \item the vertex shader, otherwise
\end{itemize}

and clamped to the implementation-dependent point size range \([\text{pointSizeRange}[0], \text{pointSizeRange}[1]]\). The value written to \textit{PointSize} \textbf{must} be greater than zero.

Not all point sizes need be supported, but the size 1.0 \textbf{must} be supported. The range of supported sizes and the size of evenly-spaced gradations within that range are implementation-dependent. The range and gradations are obtained from the \textit{pointSizeRange} and \textit{pointSizeGranularity} members of \texttt{VkPhysicalDeviceLimits}. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional point sizes \textit{may} also be supported. There is no requirement that these sizes be equally spaced. If an unsupported size is requested, the nearest supported size is used instead.

Further, if the render pass has a fragment density map attachment, point size \textit{may} be rounded by the implementation to a multiple of the fragment’s width or height.

\subsection*{27.10.1. Basic Point Rasterization}

Point rasterization produces a fragment for each fragment area group of framebuffer pixels with one or more sample points that intersect a region centered at the point’s \((x_f, y_f)\). This region is a square with side equal to the current point size. Coverage bits that correspond to sample points that intersect the region are 1, other coverage bits are 0. All fragments produced in rasterizing a point are assigned the same associated data, which are those of the vertex corresponding to the point. However, the fragment shader built-in \textit{PointCoord} contains point sprite texture coordinates. The \(s\) and \(t\) point sprite texture coordinates vary from zero to one across the point horizontally left-to-right and vertically top-to-bottom, respectively. The following formulas are used to evaluate \(s\) and \(t\):

\[
 s = \frac{1}{2} + \frac{(x_P - x_f)}{\text{size}}
\]
where size is the point’s size; \((x_p, y_p)\) is the location at which the point sprite coordinates are evaluated - this may be the framebuffer coordinates of the fragment center, or the location of a sample; and \((x_v, y_v)\) is the exact, unrounded framebuffer coordinate of the vertex for the point.

### 27.11. Line Segments

Line segment rasterization options are controlled by the `VkPipelineRasterizationLineStateCreateInfoEXT` structure.

The `VkPipelineRasterizationLineStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_line_rasterization
typedef struct VkPipelineRasterizationLineStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkLineRasterizationModeEXT lineRasterizationMode;
    VkBool32 stippledLineEnable;
    uint32_t lineStippleFactor;
    uint16_t lineStipplePattern;
} VkPipelineRasterizationLineStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `lineRasterizationMode` is a `VkLineRasterizationModeEXT` value selecting the style of line rasterization.
- `stippledLineEnable` enables stippled line rasterization.
- `lineStippleFactor` is the repeat factor used in stippled line rasterization.
- `lineStipplePattern` is the bit pattern used in stippled line rasterization.
Valid Usage

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02768
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT`, then the `rectangularLines` feature must be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02769
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`, then the `bresenhamLines` feature must be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02770
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then the `smoothLines` feature must be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02771
  If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT`, then the `stippledRectangularLines` feature must be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02772
  If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`, then the `stippledBresenhamLines` feature must be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02773
  If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then the `stippledSmoothLines` feature must be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02774
  If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT`, then the `stippledRectangularLines` feature must be enabled and `VkPhysicalDeviceLimits::strictLines` must be `VK_TRUE`

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_EXT`

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-parameter
  `lineRasterizationMode` must be a valid `VkLineRasterizationModeEXT` value

Possible values of `VkPipelineRasterizationLineStateCreateInfoEXT::lineRasterizationMode` are:
typedef enum VkLineRasterizationModeEXT {
    VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT = 0,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT = 1,
    VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT = 2,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT = 3,
} VkLineRasterizationModeEXT;

• VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT is equivalent to
  VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT if VkPhysicalDeviceLimits::strictLines is VK_TRUE,
  otherwise lines are drawn as non-strictLines parallelograms. Both of these modes are defined
  in Basic Line Segment Rasterization.

• VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT specifies lines drawn as if they were rectangles
  extruded from the line

• VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT specifies lines drawn by determining which pixel
  diamonds the line intersects and exits, as defined in Bresenham Line Segment Rasterization.

• VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT specifies lines drawn if they were
  rectangles extruded from the line, with alpha falloff, as defined in Smooth Lines.

Each line segment has an associated width. The line width is specified by the
VkPipelineRasterizationStateCreateInfo::lineWidth property of the currently active pipeline, if the
pipeline was not created with VK_DYNAMIC_STATE_LINE_WIDTH enabled.

Otherwise, the line width is set by calling vkCmdSetLineWidth:

// Provided by VK_VERSION_1_0
void vkCmdSetLineWidth(
    VkCommandBuffer                             commandBuffer,
    float                                       lineWidth);

• commandBuffer is the command buffer into which the command will be recorded.

• lineWidth is the width of rasterized line segments.

Valid Usage

• VUID-vkCmdSetLineWidth-lineWidth-00788
  If the wide lines feature is not enabled, lineWidth must be 1.0
Valid Usage (Implicit)

- VUID-vkCmdSetLineWidth-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetLineWidth-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetLineWidth-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Not all line widths need be supported for line segment rasterization, but width 1.0 antialiased segments must be provided. The range and gradations are obtained from the lineWidthRange and lineWidthGranularity members of VkPhysicalDeviceLimits. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional line widths may also be supported. There is no requirement that these widths be equally spaced. If an unsupported width is requested, the nearest supported width is used instead.

Further, if the render pass has a fragment density map attachment, line width may be rounded by the implementation to a multiple of the fragment’s width or height.

27.11.1. Basic Line Segment Rasterization

If the lineRasterizationMode member of VkPipelineRasterizationLineStateCreateInfoEXT is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT, rasterized line segments produce fragments which intersect a rectangle centered on the line segment. Two of the edges are parallel to the specified line segment; each is at a distance of one-half the current width from that segment in directions perpendicular to the direction of the line. The other two edges pass through the line endpoints and are perpendicular to the direction of the specified line segment. Coverage bits that correspond to sample points that intersect the rectangle are 1, other coverage bits are 0.
Next we specify how the data associated with each rasterized fragment are obtained. Let \( p_r = (x_d, y_d) \) be the framebuffer coordinates at which associated data are evaluated. This may be the center of a fragment or the location of a sample within the fragment. When \( \text{rasterizationSamples} \) is \( \text{VK\_SAMPLE\_COUNT\_1\_BIT} \), the fragment center must be used. Let \( p_a = (x_a, y_a) \) and \( p_b = (x_b, y_b) \) be initial and final endpoints of the line segment, respectively.

Set

\[
 t = \frac{(p_r - p_d) \cdot (p_b - p_d)}{||p_b - p_a||^2}
\]

(Note that \( t = 0 \) at \( p_a \) and \( t = 1 \) at \( p_b \). Also note that this calculation projects the vector from \( p_a \) to \( p_r \) onto the line, and thus computes the normalized distance of the fragment along the line.)

The value of an associated datum \( f \) for the fragment, whether it be a shader output or the clip \( w \) coordinate, must be determined using perspective interpolation:

\[
 f = \frac{(1-t)f_a/w_a + tf_b/w_b}{(1-t)/w_a + t/w_b}
\]

where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively; \( w_a \) and \( w_b \) are the clip \( w \) coordinates of the starting and ending endpoints of the segment, respectively.

Depth values for lines must be determined using linear interpolation:

\[
 z = (1 - t) z_a + t z_b
\]

where \( z_a \) and \( z_b \) are the depth values of the starting and ending endpoints of the segment, respectively.

The \text{NoPerspective} and \text{Flat} interpolation decorations can be used with fragment shader inputs to declare how they are interpolated. When neither decoration is applied, perspective interpolation is performed as described above. When the \text{NoPerspective} decoration is used, linear interpolation is performed in the same fashion as for depth values, as described above. When the \text{Flat} decoration is used, no interpolation is performed, and outputs are taken from the corresponding input value of the \text{providing vertex} corresponding to that primitive.

When the \text{fragmentShaderBarycentric} feature is enabled, the \text{PerVertexNV} interpolation decoration can also be used with fragment shader inputs which indicate that the decorated inputs are not interpolated and can only be accessed using an extra array dimension, where the extra index identifies one of the vertices of the primitive that produced the fragment.

The above description documents the preferred method of line rasterization, and must be used when the implementation advertises the \text{strictLines} limit in \text{VkPhysicalDeviceLimits} as \text{VK\_TRUE}.

When \text{strictLines} is \text{VK\_FALSE}, the edges of the lines are generated as a parallelogram surrounding the original line. The major axis is chosen by noting the axis in which there is the greatest distance between the line start and end points. If the difference is equal in both directions then the X axis is chosen as the major axis. Edges 2 and 3 are aligned to the minor axis and are centered on the endpoints of the line as in \text{Non strict lines}, and each is \text{lineWidth} long. Edges 0 and 1 are parallel to the line and connect the endpoints of edges 2 and 3. Coverage bits that correspond to sample points
that intersect the parallelogram are 1, other coverage bits are 0.

Samples that fall exactly on the edge of the parallelogram follow the polygon rasterization rules.

Interpolation occurs as if the parallelogram was decomposed into two triangles where each pair of vertices at each end of the line has identical attributes.

![Figure 17. Non strict lines](image)

Only when strictLines is VK_FALSE implementations may deviate from the non-strict line algorithm described above in the following ways:

- Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization using the original line segment endpoints.
- Rasterization of non-antialiased non-strict line segments may be performed using the rules defined in Bresenham Line Segment Rasterization.

### 27.11.2. Bresenham Line Segment Rasterization

If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT, then the following rules replace the line rasterization rules defined in Basic Line Segment Rasterization.

Non-strict lines may also follow these rasterization rules for non-antialiased lines.

Line segment rasterization begins by characterizing the segment as either x-major or y-major. x-major line segments have slope in the closed interval [-1,1]; all other line segments are y-major (slope is determined by the segment's endpoints). We specify rasterization only for x-major segments except in cases where the modifications for y-major segments are not self-evident.

Ideally, Vulkan uses a diamond-exit rule to determine those fragments that are produced by rasterizing a line segment. For each fragment f with center at framebuffer coordinates $x_f$ and $y_f$, define a diamond-shaped region that is the intersection of four half planes:

$$R_f = \{(x, y) \mid |x - x_f| + |y - y_f| < \frac{1}{2}\}$$

Essentially, a line segment starting at $p_a$ and ending at $p_b$ produces those fragments $f$ for which the segment intersects $R_c$, except if $p_b$ is contained in $R_c$. 
To avoid difficulties when an endpoint lies on a boundary of $R$, we (in principle) perturb the supplied endpoints by a tiny amount. Let $p_a$ and $p_b$ have framebuffer coordinates $(x_a, y_a)$ and $(x_b, y_b)$, respectively. Obtain the perturbed endpoints $p_a'$ given by $(x_a, y_a) - (\varepsilon, \varepsilon^2)$ and $p_b'$ given by $(x_b, y_b) - (\varepsilon, \varepsilon^2)$. Rasterizing the line segment starting at $p_a$ and ending at $p_b$ produces those fragments $f$ for which the segment starting at $p_a'$ and ending on $p_b'$ intersects $R$, except if $p_b'$ is contained in $R$. $\varepsilon$ is chosen to be so small that rasterizing the line segment produces the same fragments when $\delta$ is substituted for $\varepsilon$ for any $0 < \delta \leq \varepsilon$.

When $p_a$ and $p_b$ lie on fragment centers, this characterization of fragments reduces to Bresenham’s algorithm with one modification: lines produced in this description are “half-open,” meaning that the final fragment (corresponding to $p_b$) is not drawn. This means that when rasterizing a series of connected line segments, shared endpoints will be produced only once rather than twice (as would occur with Bresenham’s algorithm).

Implementations may use other line segment rasterization algorithms, subject to the following rules:

- The coordinates of a fragment produced by the algorithm must not deviate by more than one unit in either $x$ or $y$ framebuffer coordinates from a corresponding fragment produced by the diamond-exit rule.
- The total number of fragments produced by the algorithm must not differ from that produced by the diamond-exit rule by no more than one.
- For an $x$-major line, two fragments that lie in the same framebuffer-coordinate column must not be produced (for a $y$-major line, two fragments that lie in the same framebuffer-coordinate row must not be produced).
- If two line segments share a common endpoint, and both segments are either $x$-major (both left-to-right or both right-to-left) or $y$-major (both bottom-to-top or both top-to-bottom), then rasterizing both segments must not produce duplicate fragments. Fragments also must not be omitted so as to interrupt continuity of the connected segments.
The actual width \( w \) of Bresenham lines is determined by rounding the line width to the nearest integer, clamping it to the implementation-dependent \( \text{lineWidthRange} \) (with both values rounded to the nearest integer), then clamping it to be no less than 1.

Bresenham line segments of width other than one are rasterized by offsetting them in the minor direction (for an \( x \)-major line, the minor direction is \( y \), and for a \( y \)-major line, the minor direction is \( x \)) and producing a row or column of fragments in the minor direction. If the line segment has endpoints given by \( (x_0, y_0) \) and \( (x_1, y_1) \) in framebuffer coordinates, the segment with endpoints \( (x_0, y_0 - \frac{w-1}{2}) \) and \( (x_1, y_1 - \frac{w-1}{2}) \) is rasterized, but instead of a single fragment, a column of fragments of height \( w \) (a row of fragments of length \( w \) for a \( y \)-major segment) is produced at each \( x \) (\( y \) for \( y \)-major) location. The lowest fragment of this column is the fragment that would be produced by rasterizing the segment of width 1 with the modified coordinates.

The preferred method of attribute interpolation for a wide line is to generate the same attribute values for all fragments in the row or column described above, as if the adjusted line was used for interpolation and those values replicated to the other fragments, except for \( \text{FragCoord} \) which is interpolated as usual. Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization, using the original line segment endpoints.

When Bresenham lines are being rasterized, sample locations may all be treated as being at the pixel center (this may affect attribute and depth interpolation).

**Note**

The sample locations described above are not used for determining coverage, they are only used for things like attribute interpolation. The rasterization rules that determine coverage are defined in terms of whether the line intersects pixels, as opposed to the point sampling rules used for other primitive types. So these rules are independent of the sample locations. One consequence of this is that Bresenham lines cover the same pixels regardless of the number of rasterization samples, and cover all samples in those pixels (unless masked out or killed).

### 27.11.3. Line Stipple

If the \( \text{stippledLineEnable} \) member of \( \text{VkPipelineRasterizationLineStateCreateInfoEXT} \) is \( \text{VK_TRUE} \), then lines are rasterized with a line stipple determined by \( \text{lineStippleFactor} \) and \( \text{lineStipplePattern} \). \( \text{lineStipplePattern} \) is an unsigned 16-bit integer that determines which fragments are to be drawn or discarded when the line is rasterized. \( \text{lineStippleFactor} \) is a count that is used to modify the effective line stipple by causing each bit in \( \text{lineStipplePattern} \) to be used \( \text{lineStippleFactor} \) times.

Line stippling discards certain fragments that are produced by rasterization. The masking is achieved using three parameters: the 16-bit line stipple pattern \( p \), the line stipple factor \( r \), and an integer stipple counter \( s \). Let

\[
  b = \left\lfloor \frac{s}{r} \right\rfloor \mod 16
\]

Then a fragment is produced if the b'th bit of \( p \) is 1, and discarded otherwise. The bits of \( p \) are numbered with 0 being the least significant and 15 being the most significant.
The initial value of s is zero. For `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT` lines, s is incremented after production of each fragment of a line segment (fragments are produced in order, beginning at the starting point and working towards the ending point). For `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT` and `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT` lines, the rectangular region is subdivided into adjacent unit-length rectangles, and s is incremented once for each rectangle. Rectangles with a value of s such that the b'th bit of p is zero are discarded. If the last rectangle in a line segment is shorter than unit-length, then the remainder may carry over to the next line segment in the line strip using the same value of s (this is the preferred behavior, for the stipple pattern to appear more consistent through the strip).

s is reset to 0 at the start of each strip (for line strips), and before every line segment in a group of independent segments.

If the line segment has been clipped, then the value of s at the beginning of the line segment is implementation-dependent.

The line stipple factor and pattern are specified by the `VkPipelineRasterizationLineStateCreateInfoEXT::lineStippleFactor` and `VkPipelineRasterizationLineStateCreateInfoEXT::lineStipplePattern` members of the currently active pipeline, if the pipeline was not created with `VK_DYNAMIC_STATE_LINE_STIPPLE_EXT` enabled.

Otherwise, the line stipple factor and pattern are set by calling `vkCmdSetLineStippleEXT`:

```c
// Provided by VK_EXT_line_rasterization
define void vkCmdSetLineStippleEXT(
    VkCommandBuffer commandBuffer,
    uint32_t lineStippleFactor,
    uint16_t lineStipplePattern);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `lineStippleFactor` is the repeat factor used in stippled line rasterization.
- `lineStipplePattern` is the bit pattern used in stippled line rasterization.

**Valid Usage**

- `VUID-vkCmdSetLineStippleEXT-lineStippleFactor-02776` `lineStippleFactor` must be in the range \([1, 256]\)
Valid Usage (Implicit)

- VUID-vkCmdSetLineStippleEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetLineStippleEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetLineStippleEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

27.11.4. Smooth Lines

If the lineRasterizationMode member of VkPipelineRasterizationLineStateCreateInfoEXT is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT, then lines are considered to be rectangles using the same geometry as for VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT lines. The rules for determining which pixels are covered are implementation-dependent, and may include nearby pixels where no sample locations are covered or where the rectangle does not intersect the pixel at all. For each pixel that is considered covered, the fragment computes a coverage value that approximates the area of the intersection of the rectangle with the pixel square, and this coverage value is multiplied into the color location 0’s alpha value after fragment shading, as described in Multisample Coverage.

Note

The details of the rasterization rules and area calculation are left intentionally vague, to allow implementations to generate coverage and values that are aesthetically pleasing.
27.12. Polygons

A polygon results from the decomposition of a triangle strip, triangle fan or a series of independent triangles. Like points and line segments, polygon rasterization is controlled by several variables in the VkPipelineRasterizationStateCreateInfo structure.

27.12.1. Basic Polygon Rasterization

The first step of polygon rasterization is to determine whether the triangle is back-facing or front-facing. This determination is made based on the sign of the (clipped or unclipped) polygon’s area computed in framebuffer coordinates. One way to compute this area is:

\[ a = -\frac{1}{2} \sum_{i=0}^{n-1} x_i y_{i+1} - x_{i+1} y_i \]

where \( x_i \) and \( y_i \) are the x and y framebuffer coordinates of the ith vertex of the n-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and \( i \oplus 1 \) is \((i + 1) \mod n\).

The interpretation of the sign of \( a \) is determined by the VkPipelineRasterizationStateCreateInfo ::frontFace property of the currently active pipeline. Possible values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkFrontFace {
    VK_FRONT_FACE_COUNTER_CLOCKWISE = 0,
    VK_FRONT_FACE_CLOCKWISE = 1,
} VkFrontFace;
```

- **VK_FRONT_FACE_COUNTER_CLOCKWISE** specifies that a triangle with positive area is considered front-facing.
- **VK_FRONT_FACE_CLOCKWISE** specifies that a triangle with negative area is considered front-facing.

Any triangle which is not front-facing is back-facing, including zero-area triangles.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_FRONT_FACE_EXT dynamic state enabled then the front face property is set dynamically by calling:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetFrontFaceEXT(
    VkCommandBuffer                             commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    VkFrontFace                                 frontFace);      // frontFace specifies the front face property to use for drawing.
```
Valid Usage

• VUID-vkCmdSetFrontFaceEXT-None-03383
  The extendedDynamicState feature must be enabled

Valid Usage (Implicit)

• VUID-vkCmdSetFrontFaceEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetFrontFaceEXT-frontFace-parameter
  frontFace must be a valid VkFrontFace value

• VUID-vkCmdSetFrontFaceEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetFrontFaceEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Once the orientation of triangles is determined, they are culled according to the VkPipelineRasterizationStateCreateInfo::cullMode property of the currently active pipeline. Possible values are:
 typedef enum VkCullModeFlagBits {
    VK_CULL_MODE_NONE = 0,
    VK_CULL_MODE_FRONT_BIT = 0x00000001,
    VK_CULL_MODE_BACK_BIT = 0x00000002,
    VK_CULL_MODE_FRONT_AND_BACK = 0x00000003,
} VkCullModeFlagBits;

• **VK_CULL_MODE_NONE** specifies that no triangles are discarded
• **VK_CULL_MODE_FRONT_BIT** specifies that front-facing triangles are discarded
• **VK_CULL_MODE_BACK_BIT** specifies that back-facing triangles are discarded
• **VK_CULL_MODE_FRONT_AND_BACK** specifies that all triangles are discarded.

Following culling, fragments are produced for any triangles which have not been discarded.

 typedef VkFlags VkCullModeFlags;

**VkCullModeFlags** is a bitmask type for setting a mask of zero or more **VkCullModeFlagBits**.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_CULL_MODE_EXT** dynamic state enabled then the cull mode is set dynamically by calling:

 void vkCmdSetCullModeEXT(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);

• **commandBuffer** is the command buffer into which the command will be recorded.
• **cullMode** specifies the cull mode property to use for drawing.

**Valid Usage**

• VUID-vkCmdSetCullModeEXT-None-03384

  The **extendedDynamicState** feature **must** be enabled
**Valid Usage (Implicit)**

- VUID-vkCmdSetCullModeEXT-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetCullModeEXT-cullMode-parameter
  
  `cullMode` must be a valid combination of `VkCullModeFlagBits` values

- VUID-vkCmdSetCullModeEXT-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetCullModeEXT-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

<table>

The rule for determining which fragments are produced by polygon rasterization is called *point sampling*. The two-dimensional projection obtained by taking the x and y framebuffer coordinates of the polygon’s vertices is formed. Fragments are produced for any fragment area groups of pixels for which any sample points lie inside of this polygon. Coverage bits that correspond to sample points that satisfy the point sampling criteria are 1, other coverage bits are 0. Special treatment is given to a sample whose sample location lies on a polygon edge. In such a case, if two polygons lie on either side of a common edge (with identical endpoints) on which a sample point lies, then exactly one of the polygons must result in a covered sample for that fragment during rasterization. As for the data associated with each fragment produced by rasterizing a polygon, we begin by specifying how these values are produced for fragments in a triangle.

*Barycentric coordinates* are a set of three numbers, a, b, and c, each in the range [0,1], with \(a + b + c = 1\). These coordinates uniquely specify any point \(p\) within the triangle or on the triangle’s boundary as

\[ p = a \ p_a + b \ p_b + c \ p_c \]
where \( p_a, p_b, \) and \( p_c \) are the vertices of the triangle. \( a, b, \) and \( c \) are determined by:

\[
a = \frac{A(p_a p_b p_c)}{A(p_a p_b p_c)}, \quad b = \frac{A(p_a p_b p_c)}{A(p_a p_b p_c)}, \quad c = \frac{A(p_a p_b p_c)}{A(p_a p_b p_c)},
\]

where \( A(lmn) \) denotes the area in framebuffer coordinates of the triangle with vertices \( l, m, \) and \( n \).

Denote an associated datum at \( p_a, p_b, \) or \( p_c \) as \( f_a, f_b, \) or \( f_c \), respectively.

The value of an associated datum \( f \) for a fragment produced by rasterizing a triangle, whether it be a shader output or the clip \( w \) coordinate, must be determined using perspective interpolation:

\[
f = \frac{a f_a / w_a + b f_b / w_b + c f_c / w_c}{a / w_a + b / w_b + c / w_c}
\]

where \( w_a, w_b, \) and \( w_c \) are the clip \( w \) coordinates of \( p_a, p_b, \) and \( p_c \), respectively. \( a, b, \) and \( c \) are the barycentric coordinates of the location at which the data are produced - this must be the location of the fragment center or the location of a sample. When \( \text{rasterizationSamples} \) is \( \text{VK_SAMPLE_COUNT_1_BIT} \), the fragment center must be used.

Depth values for triangles must be determined using linear interpolation:

\[
z = a z_a + b z_b + c z_c
\]

where \( z_a, z_b, \) and \( z_c \) are the depth values of \( p_a, p_b, \) and \( p_c \), respectively.

The \text{NoPerspective} and \text{Flat} interpolation decorations can be used with fragment shader inputs to declare how they are interpolated. When neither decoration is applied, perspective interpolation is performed as described above. When the \text{NoPerspective} decoration is used, linear interpolation is performed in the same fashion as for depth values, as described above. When the \text{Flat} decoration is used, no interpolation is performed, and outputs are taken from the corresponding input value of the \text{provoking vertex} corresponding to that primitive.

When the \text{VK_AMD_shader_explicit_vertex_parameter} device extension is enabled the \text{CustomInterpAMD} interpolation decoration can also be used with fragment shader inputs which indicate that the decorated inputs can only be accessed by the extended instruction \text{InterpolateAtVertexAMD} and allows accessing the value of the inputs for individual vertices of the primitive.

When the \text{fragmentShaderBarycentric} feature is enabled, the \text{PerVertexNV} interpolation decoration can also be used with fragment shader inputs which indicate that the decorated inputs can only be accessed using an extra array dimension, where the extra index identifies one of the vertices of the primitive that produced the fragment.

For a polygon with more than three edges, such as are produced by clipping a triangle, a convex combination of the values of the datum at the polygon’s vertices must be used to obtain the value assigned to each fragment produced by the rasterization algorithm. That is, it must be the case that at every fragment

\[
f = \sum_{i=1}^{n} a_i f_i
\]
where \( n \) is the number of vertices in the polygon and \( f_i \) is the value of \( f \) at vertex \( i \). For each \( i \), \( 0 \leq a_i \leq 1 \) and \( \sum_{i=1}^{n} a_i = 1 \). The values of \( a_i \) may differ from fragment to fragment, but at vertex \( i \), \( a_i = 1 \) and \( a_j = 0 \) for \( j \neq i \).

**Note**

One algorithm that achieves the required behavior is to triangulate a polygon (without adding any vertices) and then treat each triangle individually as already discussed. A scan-line rasterizer that linearly interpolates data along each edge and then linearly interpolates data across each horizontal span from edge to edge also satisfies the restrictions (in this case the numerator and denominator of perspective interpolation are iterated independently, and a division is performed for each fragment).

### 27.12.2. Polygon Mode

Possible values of the `VkPipelineRasterizationStateCreateInfo::polygonMode` property of the currently active pipeline, specifying the method of rasterization for polygons, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPolygonMode {
    VK_POLYGON_MODE_FILL = 0,
    VK_POLYGON_MODE_LINE = 1,
    VK_POLYGON_MODE_POINT = 2,
    // Provided by VK_NV_fill_rectangle
    VK_POLYGON_MODE_FILL_RECTANGLE_NV = 1000153000,
} VkPolygonMode;
```

- **VK_POLYGON_MODE_POINT** specifies that polygon vertices are drawn as points.
- **VK_POLYGON_MODE_LINE** specifies that polygon edges are drawn as line segments.
- **VK_POLYGON_MODE_FILL** specifies that polygons are rendered using the polygon rasterization rules in this section.
- **VK_POLYGON_MODE_FILL_RECTANGLE_NV** specifies that polygons are rendered using polygon rasterization rules, modified to consider a sample within the primitive if the sample location is inside the axis-aligned bounding box of the triangle after projection. Note that the barycentric weights used in attribute interpolation can extend outside the range [0,1] when these primitives are shaded. Special treatment is given to a sample position on the boundary edge of the bounding box. In such a case, if two rectangles lie on either side of a common edge (with identical endpoints) on which a sample position lies, then exactly one of the triangles must produce a fragment that covers that sample during rasterization.

Polygons rendered in **VK_POLYGON_MODE_FILL_RECTANGLE_NV** mode may be clipped by the frustum or by user clip planes. If clipping is applied, the triangle is culled rather than clipped.

Area calculation and facingness are determined for **VK_POLYGON_MODE_FILL_RECTANGLE_NV** mode using the triangle’s vertices.
These modes affect only the final rasterization of polygons: in particular, a polygon’s vertices are shaded and the polygon is clipped and possibly culled before these modes are applied.

### 27.12.3. Depth Bias

The depth values of all fragments generated by the rasterization of a polygon can be offset by a single value that is computed for that polygon. This behavior is controlled by the `depthBiasEnable`, `depthBiasConstantFactor`, `depthBiasClamp`, and `depthBiasSlopeFactor` members of `VkPipelineRasterizationStateCreateInfo`, or by the corresponding parameters to the `vkCmdSetDepthBias` and `vkCmdSetDepthBiasEnableEXT` command if depth bias state is dynamic.

```c
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBias(
    VkCommandBuffer                             commandBuffer,
    float                                      depthBiasConstantFactor,
    float                                      depthBiasClamp,
    float                                      depthBiasSlopeFactor);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasConstantFactor` is a scalar factor controlling the constant depth value added to each fragment.
- `depthBiasClamp` is the maximum (or minimum) depth bias of a fragment.
- `depthBiasSlopeFactor` is a scalar factor applied to a fragment’s slope in depth bias calculations.

If `depthBiasEnable` is `VK_FALSE` at draw time, no depth bias is applied and the fragment’s depth values are unchanged.

`depthBiasSlopeFactor` scales the maximum depth slope of the polygon, and `depthBiasConstantFactor` scales the minimum resolvable difference of the depth buffer. The resulting values are summed to produce the depth bias value which is then clamped to a minimum or maximum value specified by `depthBiasClamp`. `depthBiasSlopeFactor`, `depthBiasConstantFactor`, and `depthBiasClamp` can each be positive, negative, or zero.

The maximum depth slope \( m \) of a triangle is

\[
m = \sqrt{\left(\frac{\partial z_f}{\partial x_f}\right)^2 + \left(\frac{\partial z_f}{\partial y_f}\right)^2}
\]

where \((x_f, y_f, z_f)\) is a point on the triangle. \( m \) may be approximated as

\[
m = \max\left(\frac{\partial z_f}{\partial x_f}, \frac{\partial z_f}{\partial y_f}\right)
\]

The minimum resolvable difference \( r \) is a parameter that depends on the depth buffer representation. It is the smallest difference in framebuffer coordinate z values that is guaranteed to remain distinct throughout polygon rasterization and in the depth buffer. All pairs of fragments generated by the rasterization of two polygons with otherwise identical vertices, but \( z_f \) values that differ by \( r \), will have distinct depth values.

1522 | Chapter 27. Rasterization
For fixed-point depth buffer representations, \( r \) is constant throughout the range of the entire depth buffer. Its value is implementation dependent but **must** be at most

\[
r = 2 \times 2^n
\]

for an \( n \)-bit buffer. For floating-point depth buffers, there is no single minimum resolvable difference. In this case, the minimum resolvable difference for a given polygon is dependent on the maximum exponent, \( e \), in the range of \( z \) values spanned by the primitive. If \( n \) is the number of bits in the floating-point mantissa, the minimum resolvable difference, \( r \), for the given primitive is defined as

\[
r = 2^e
\]

If a triangle is rasterized using the `VK_POLYGON_MODE_FILL_RECTANGLE_NV` polygon mode, then this minimum resolvable difference **may** not be resolvable for samples outside of the triangle, where the depth is extrapolated.

If no depth buffer is present, \( r \) is undefined.

The bias value \( o \) for a polygon is

\[
o = \text{dbclamp}(m \times \text{depthBiasSlopeFactor} + r \times \text{depthBiasConstantFactor})
\]

where

\[
\text{dbclamp}(x) = \begin{cases} 
  x & \text{depthBiasClamp = 0 or NaN} \\
  \min(x, \text{depthBiasClamp}) & \text{depthBiasClamp} > 0 \\
  \max(x, \text{depthBiasClamp}) & \text{depthBiasClamp} < 0
\end{cases}
\]

\( m \) is computed as described above. If the depth buffer uses a fixed-point representation, \( m \) is a function of depth values in the range \([0,1]\), and \( o \) is applied to depth values in the same range.

For fixed-point depth buffers, fragment depth values are always limited to the range \([0,1]\) by clamping after depth bias addition is performed. Unless the `VK_EXT_depth_range_unrestricted` extension is enabled, fragment depth values are clamped even when the depth buffer uses a floating-point representation.

---

**Valid Usage**

- **VUID-vkCmdSetDepthBias-depthBiasClamp-00790**

  If the **depth bias clamping** feature is not enabled, `depthBiasClamp` **must** be 0.0
Valid Usage (Implicit)

- VUID-vkCmdSetDepthBias-enable-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBias-enable-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthBias-enable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically control whether to bias fragment depth values:

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetDepthBiasEnableEXT(
    VkCommandBuffer                             commandBuffer,
    VkBool32                                    depthBiasEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasEnable` controls whether to bias fragment depth values.

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

Valid Usage

- VUID-vkCmdSetDepthBias-enable-None-04872
  The `extendedDynamicState2` feature must be enabled
Valid Usage (Implicit)

- VUID-vkCmdSetDepthBiasEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetDepthBiasEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetDepthBiasEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

27.12.4. Conservative Rasterization

Polygon rasterization can be made conservative by setting conservativeRasterizationMode to
VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT or
VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT in
VkPipelineRasterizationConservativeStateCreateInfoEXT. The state is set by adding this structure to the
pNext chain of a VkPipelineRasterizationStateCreateInfo structure when creating the graphics pipeline. Enabling these modes also affects line and point rasterization if the implementation sets
VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization to VK_TRUE.

VkPipelineRasterizationConservativeStateCreateInfoEXT is defined as:
// Provided by VK_EXT_conservative_rasterization
typedef struct VkPipelineRasterizationConservativeStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationConservativeStateCreateFlagsEXT flags;
    VkConservativeRasterizationModeEXT conservativeRasterizationMode;
    float extraPrimitiveOverestimationSize;
} VkPipelineRasterizationConservativeStateCreateInfoEXT;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• conservativeRasterizationMode is the conservative rasterization mode to use.
• extraPrimitiveOverestimationSize is the extra size in pixels to increase the generating primitive during conservative rasterization at each of its edges in X and Y equally in screen space beyond the base overestimation specified in VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize.

Valid Usage

• VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-extraPrimitiveOverestimationSize-01769 extraPrimitiveOverestimationSize must be in the range of 0.0 to VkPhysicalDeviceConservativeRasterizationPropertiesEXT::maxExtraPrimitiveOverestimationSize inclusive

Valid Usage (Implicit)

• VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-sType-sType sType must be VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_CONSERVATIVE_STATE_CREATE_INFO_EXT
• VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-flags-zerobitmask flags must be 0
• VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-conservativeRasterizationMode-parameter conservativeRasterizationMode must be a valid VkConservativeRasterizationModeEXT value

// Provided by VK_EXT_conservative_rasterization
typedef VkFlags VkPipelineRasterizationConservativeStateCreateFlagsEXT;

VkPipelineRasterizationConservativeStateCreateFlagsEXT is a bitmask type for setting a mask, but is
Possible values of `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode`, specifying the conservative rasterization mode are:

```c
typedef enum VkConservativeRasterizationModeEXT {
    VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT = 0,
    VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT = 1,
    VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT = 2
} VkConservativeRasterizationModeEXT;
```

- `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT` specifies that conservative rasterization is disabled and rasterization proceeds as normal.
- `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` specifies that conservative rasterization is enabled in overestimation mode.
- `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` specifies that conservative rasterization is enabled in underestimation mode.

When overestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made of whether any portion of the pixel (including its edges and corners) is covered by the primitive. If any portion of the pixel is covered, then all bits of the coverage mask for the fragment corresponding to that pixel are enabled. If the render pass has a fragment density map attachment and any bit of the coverage mask for the fragment is enabled, then all bits of the coverage mask for the fragment are enabled.

If the implementation supports `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativeRasterizationPostDepthCoverage` and the PostDepthCoverage execution mode is specified the SampleMask built-in input variable will reflect the coverage after the early per-fragment depth and stencil tests are applied.

For the purposes of evaluating which pixels are covered by the primitive, implementations can increase the size of the primitive by up to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize` pixels at each of the primitive edges. This may increase the number of fragments generated by this primitive and represents an overestimation of the pixel coverage.

This overestimation size can be increased further by setting the `extraPrimitiveOverestimationSize` value above 0.0 in steps of `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSizeGranularity` up to and including `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSize`. This will further increase the number of fragments generated by this primitive.

The actual precision of the overestimation size used for conservative rasterization may vary between implementations and produce results that only approximate the `primitiveOverestimationSize` and `extraPrimitiveOverestimationSizeGranularity` properties. Implementations may especially vary these approximations when the render pass has a fragment density map and the fragment area covers multiple pixels.
For triangles if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, fragments will be generated if the primitive area covers any portion of any pixel inside the fragment area, including their edges or corners. The tie-breaking rule described in Basic Polygon Rasterization does not apply during conservative rasterization and coverage is set for all fragments generated from shared edges of polygons. Degenerate triangles that evaluate to zero area after rasterization, even for pixels containing a vertex or edge of the zero-area polygon, will be culled if `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateTrianglesRasterized` is `VK_FALSE` or will generate fragments if `degenerateTrianglesRasterized` is `VK_TRUE`. The fragment input values for these degenerate triangles take their attribute and depth values from the provoking vertex. Degenerate triangles are considered backfacing and the application can enable backface culling if desired. Triangles that are zero area before rasterization may be culled regardless.

For lines if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, and the implementation sets `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization` to `VK_TRUE`, fragments will be generated if the line covers any portion of any pixel inside the fragment area, including their edges or corners. Degenerate lines that evaluate to zero length after rasterization will be culled if `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateLinesRasterized` is `VK_FALSE` or will generate fragments if `degenerateLinesRasterized` is `VK_TRUE`. The fragments input values for these degenerate lines take their attribute and depth values from the provoking vertex. Lines that are zero length before rasterization may be culled regardless.

For points if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, and the implementation sets `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization` to `VK_TRUE`, fragments will be generated if the point square covers any portion of any pixel inside the fragment area, including their edges or corners.

When underestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made of whether all of the pixel (including its edges and corners) is covered by the primitive. If the entire pixel is covered, then a fragment is generated with all bits of its coverage mask corresponding to the pixel enabled, otherwise the pixel is not considered covered even if some portion of the pixel is covered. The fragment is discarded if no pixels inside the fragment area are considered covered. If the render pass has a fragment density map attachment and any pixel inside the fragment area is not considered covered, then the fragment is discarded even if some pixels are considered covered.

If the implementation supports `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativeRasterizationPostDepthCoverage` and the PostDepthCoverage execution mode is specified the SampleMask built-in input variable will reflect the coverage after the early per-fragment depth and stencil tests are applied.

For triangles, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if any pixel inside the fragment area is fully covered by the generating primitive, including its edges and corners.

For lines, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will be generated if any pixel inside the fragment area, including its edges and corners, are entirely covered by the line.
For points, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if the point square covers the entirety of any pixel square inside the fragment area, including its edges or corners.

If the render pass has a fragment density map and `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if the entirety of all pixels inside the fragment area are covered by the generating primitive, line, or point.

For both overestimate and underestimate conservative rasterization modes a fragment has all of its pixel squares fully covered by the generating primitive must set `FullyCoveredEXT` to `VK_TRUE` if the implementation enables the `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::fullyCoveredFragmentShaderInputVariable` feature.

When the use of a shading rate image or setting the fragment shading rate results in fragments covering multiple pixels, coverage for conservative rasterization is still evaluated on a per-pixel basis and may result in fragments with partial coverage. For fragment shader inputs decorated with `FullyCoveredEXT`, a fragment is considered fully covered if and only if all pixels in the fragment are fully covered by the generating primitive.
Chapter 28. Fragment Operations

Fragments produced by rasterization go through a number of operations to determine whether or how values produced by fragment shading are written to the framebuffer.

The following fragment operations adhere to rasterization order, and are typically performed in this order:

1. Discard rectangles test
2. Scissor test
3. Exclusive scissor test
4. Sample mask test
5. Fragment shading
6. Multisample coverage
7. Depth bounds test
8. Stencil test
9. Depth test
10. Representative fragment test
11. Sample counting
12. Coverage to color
13. Coverage reduction
14. Coverage modulation

The coverage mask generated by rasterization describes the initial coverage of each sample covered by the fragment. Fragment operations will update the coverage mask to add or subtract coverage where appropriate. If a fragment operation results in all bits of the coverage mask being 0, the fragment is discarded, and no further operations are performed. Fragments can also be programmatically discarded in a fragment shader by executing one of

- OpTerminateInvocation
- OpDemoteToHelperInvocationEXT
- OpKill.

When one of the fragment operations in this chapter is described as “replacing” a fragment shader output, that output is replaced unconditionally, even if no fragment shader previously wrote to that output.

If post-depth coverage is enabled, the sample mask test is instead performed after the depth test.

If early per-fragment operations are enabled, fragment shading and multisample coverage operations are instead performed after sample counting.

Once all fragment operations have completed, fragment shader outputs for covered color
attachment samples pass through framebuffer operations.

## 28.1. Discard Rectangles Test

The discard rectangle test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a set of discard rectangles.

Each discard rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineDiscardRectangleStateCreateInfoEXT` structure during pipeline creation, or dynamically by the `vkCmdSetDiscardRectangleEXT` command.

A given sample is considered inside a discard rectangle if the \(x_f\) is in the range \([\text{VkRect2D}::\text{offset} . x, \text{VkRect2D}::\text{offset} . x + \text{VkRect2D}::\text{extent} . x)\), and \(y_f\) is in the range \([\text{VkRect2D}::\text{offset} . y, \text{VkRect2D}::\text{offset} . y + \text{VkRect2D}::\text{extent} . y)\). If the test is set to be inclusive, samples that are not inside any of the discard rectangles will have their coverage set to 0. If the test is set to be exclusive, samples that are inside any of the discard rectangles will have their coverage set to 0.

If no discard rectangles are specified, the coverage mask is unmodified by this operation.

The `VkPipelineDiscardRectangleStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_discard_rectangles
typedef struct VkPipelineDiscardRectangleStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDiscardRectangleStateCreateFlagsEXT flags;
    VkDiscardRectangleModeEXT discardRectangleMode;
    uint32_t discardRectangleCount;
    const VkRect2D* pDiscardRectangles;
} VkPipelineDiscardRectangleStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `discardRectangleMode` is a `VkDiscardRectangleModeEXT` value determining whether the discard rectangle test is inclusive or exclusive.
- `discardRectangleCount` is the number of discard rectangles to use.
- `pDiscardRectangles` is a pointer to an array of `VkRect2D` structures defining discard rectangles.

If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is enabled for a pipeline, the `pDiscardRectangles` member is ignored.

When this structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it defines parameters of the discard rectangle test. If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with a `discardRectangleCount` of 0.
Valid Usage

- `discardRectangleCount` must be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_DISCARD_RECTANGLE_STATE_CREATE_INFO_EXT`
- `flags` must be `0`
- `discardRectangleMode` must be a valid `VkDiscardRectangleModeEXT` value

// Provided by VK_EXT_discard_rectangles
typedef VkFlags VkPipelineDiscardRectangleStateCreateFlagsEXT;

`VkPipelineDiscardRectangleStateCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

`VkDiscardRectangleModeEXT` values are:

- `VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT` specifies that the discard rectangle test is inclusive.
- `VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT` specifies that the discard rectangle test is exclusive.

The discard rectangles can be set dynamically with the command:

// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstDiscardRectangle,
    uint32_t discardRectangleCount,
    const VkRect2D* pDiscardRectangles);

- `commandBuffer` is the command buffer into which the command will be recorded.
• **firstDiscardRectangle** is the index of the first discard rectangle whose state is updated by the command.

• **discardRectangleCount** is the number of discard rectangles whose state are updated by the command.

• **pDiscardRectangles** is a pointer to an array of **VkRect2D** structures specifying discard rectangles.

The discard rectangle taken from element i of **pDiscardRectangles** replace the current state for the discard rectangle at index **firstDiscardRectangle + i**, for i in [0, **discardRectangleCount**).

This command sets the state for a given draw when the graphics pipeline is created with **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**.

---

### Valid Usage

- **VUID-vkCmdSetDiscardRectangleEXT-firstDiscardRectangle-00585**
  The sum of **firstDiscardRectangle** and **discardRectangleCount** must be less than or equal to **VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles**

- **VUID-vkCmdSetDiscardRectangleEXT-x-00587**
  The x and y member of **offset** in each **VkRect2D** element of **pDiscardRectangles** must be greater than or equal to 0

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00588**
  Evaluation of (offset.x + extent.width) in each **VkRect2D** element of **pDiscardRectangles** must not cause a signed integer addition overflow

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00589**
  Evaluation of (offset.y + extent.height) in each **VkRect2D** element of **pDiscardRectangles** must not cause a signed integer addition overflow

- **VUID-vkCmdSetDiscardRectangleEXT-viewportScissor2D-04788**
  If this command is recorded in a secondary command buffer with **VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D** enabled, then this function must not be called.
Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetDiscardRectangleEXT-pDiscardRectangles-parameter
  pDiscardRectangles must be a valid pointer to an array of discardRectangleCount VkRect2D structures

- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetDiscardRectangleEXT-discardRectangleCount-arraylength
  discardRectangleCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

</tbody>
</table>

28.2. Scissor Test

The scissor test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a scissor rectangle at the index equal to the fragment’s ViewportIndex.

Each scissor rectangle is defined by a VkRect2D. These values are either set by the VkPipelineViewportStateCreateInfo structure during pipeline creation, or dynamically by the vkCmdSetScissor command.

A given sample is considered inside a scissor rectangle if \(x_f\) is in the range \([\text{VkRect2D::offset.x}, \text{VkRect2D::offset.x} + \text{VkRect2D::extent.x})\), and \(y_f\) is in the range \([\text{VkRect2D::offset.y}, \text{VkRect2D::offset.y} + \text{VkRect2D::extent.y})\). Samples with coordinates outside the scissor rectangle at the corresponding ViewportIndex will have their coverage set to 0.
If a render pass transform is enabled, the \((\text{offset.x} \text{ and } \text{offset.y})\) and \((\text{extent.width} \text{ and } \text{extent.height})\) values are transformed as described in \text{render pass transform} before participating in the scissor test.

The scissor rectangles \textbf{can} be set dynamically with the command:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetScissor(
    VkCommandBuffer commandBuffer,
    uint32_t firstScissor,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- \text{commandBuffer} is the command buffer into which the command will be recorded.
- \text{firstScissor} is the index of the first scissor whose state is updated by the command.
- \text{scissorCount} is the number of scissors whose rectangles are updated by the command.
- \text{pScissors} is a pointer to an array of \text{VkRect2D} structures defining scissor rectangles.

The scissor rectangles taken from element \(i\) of \text{pScissors} replace the current state for the scissor index \(\text{firstScissor} + i\), for \(i\) in \([0, \text{scissorCount})\).

This command sets the state for a given draw when the graphics pipeline is created with \text{VK_DYNAMIC_STATE_SCISSOR} set in \text{VkPipelineDynamicStateCreateInfo::pDynamicStates}.
Valid Usage

- VUID-vkCmdSetScissor-firstScissor-00592
  The sum of firstScissor and scissorCount must be between 1 and VkPhysicalDeviceLimits::maxViewports, inclusive

- VUID-vkCmdSetScissor-firstScissor-00593
  If the multiple viewports feature is not enabled, firstScissor must be 0

- VUID-vkCmdSetScissor-scissorCount-00594
  If the multiple viewports feature is not enabled, scissorCount must be 1

- VUID-vkCmdSetScissor-x-00595
  The x and y members of offset member of any element of pScissors must be greater than or equal to 0

- VUID-vkCmdSetScissor-offset-00596
  Evaluation of (offset.x + extent.width) must not cause a signed integer addition overflow for any element of pScissors

- VUID-vkCmdSetScissor-offset-00597
  Evaluation of (offset.y + extent.height) must not cause a signed integer addition overflow for any element of pScissors

- VUID-vkCmdSetScissor-viewportScissor2D-04789
  If this command is recorded in a secondary command buffer with VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D enabled, then this function must not be called.

Valid Usage (Implicit)

- VUID-vkCmdSetScissor-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetScissor-pScissors-parameter
  pScissors must be a valid pointer to an array of scissorCount VkRect2D structures

- VUID-vkCmdSetScissor-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetScissor-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetScissor-scissorCount-arraylength
  scissorCount must be greater than 0
Host Synchronization

- Host access to commandBuffer must be externally synchronized.
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

28.3. Exclusive Scissor Test

The exclusive scissor test compares the framebuffer coordinates \((x, y)\) of each sample covered by a fragment against an exclusive scissor rectangle at the index equal to the fragment's ViewportIndex.

Each exclusive scissor rectangle is defined by a VkRect2D. These values are either set by the VkPipelineViewportExclusiveScissorStateCreateInfoNV structure during pipeline creation, or dynamically by the vkCmdSetExclusiveScissorNV command.

A given sample is considered inside an exclusive scissor rectangle if \(x_i\) is in the range \([\text{VkRect2D}::\text{offset}.x, \text{VkRect2D}::\text{offset}.x + \text{VkRect2D}::\text{extent}.x)\), and \(y_i\) is in the range \([\text{VkRect2D}::\text{offset}.y, \text{VkRect2D}::\text{offset}.y + \text{VkRect2D}::\text{extent}.y)\). Samples with coordinates inside the exclusive scissor rectangle at the corresponding ViewportIndex will have their coverage set to 0.

If no exclusive scissor rectangles are specified, the coverage mask is unmodified by this operation.

The VkPipelineViewportExclusiveScissorStateCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_scissor_exclusive
typedef struct VkPipelineViewportExclusiveScissorStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t exclusiveScissorCount;
    const VkRect2D* pExclusiveScissors;
} VkPipelineViewportExclusiveScissorStateCreateInfoNV;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- exclusiveScissorCount is the number of exclusive scissor rectangles.
- pExclusiveScissors is a pointer to an array of VkRect2D structures defining exclusive scissor...
rectangles.

If the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` dynamic state is enabled for a pipeline, the `pExclusiveScissors` member is ignored.

When this structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it defines parameters of the exclusive scissor test. If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with a `exclusiveScissorCount` of 0.

### Valid Usage

- **VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02027**
  - If the **multiple viewports** feature is not enabled, `exclusiveScissorCount` **must be 0 or 1**

- **VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02028**
  - `exclusiveScissorCount` **must be less than or equal to** `VkPhysicalDeviceLimits::maxViewports`

- **VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02029**
  - `exclusiveScissorCount` **must be 0 or greater than or equal to the `viewportCount` member of** `VkPipelineViewportStateCreateInfo`

### Valid Usage (Implicit)

- **VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-sType-sType**
  - `sType` **must be** `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_EXCLUSIVE_SCISSOR_STATE_CREATE_INFO_NV`

The exclusive scissor rectangles **can be set dynamically with the command:**

```c
// Provided by VK_NV_scissor_exclusive
void vkCmdSetExclusiveScissorNV(
    VkCommandBuffer commandBuffer,
    uint32_t firstExclusiveScissor,
    uint32_t exclusiveScissorCount,
    const VkRect2D* pExclusiveScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstExclusiveScissor` is the index of the first exclusive scissor rectangle whose state is updated by the command.
- `exclusiveScissorCount` is the number of exclusive scissor rectangles updated by the command.
- `pExclusiveScissors` is a pointer to an array of `VkRect2D` structures defining exclusive scissor rectangles.

The scissor rectangles taken from element i of `pExclusiveScissors` replace the current state for the scissor index `firstExclusiveScissor + i`, for i in [0, `exclusiveScissorCount`).
This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

### Valid Usage

- **VUID-vkCmdSetExclusiveScissorNV-None-02031**
  The exclusive scissor feature must be enabled

- **VUID-vkCmdSetExclusiveScissorNV-firstExclusiveScissor-02034**
  The sum of `firstExclusiveScissor` and `exclusiveScissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- **VUID-vkCmdSetExclusiveScissorNV-firstExclusiveScissor-02035**
  If the multiple viewports feature is not enabled, `firstExclusiveScissor` must be 0

- **VUID-vkCmdSetExclusiveScissorNV-exclusiveScissorCount-02036**
  If the multiple viewports feature is not enabled, `exclusiveScissorCount` must be 1

- **VUID-vkCmdSetExclusiveScissorNV-x-02037**
  The `x` and `y` members of `offset` in each member of `pExclusiveScissors` must be greater than or equal to 0

- **VUID-vkCmdSetExclusiveScissorNV-offset-02038**
  Evaluation of `(offset.x + extent.width)` for each member of `pExclusiveScissors` must not cause a signed integer addition overflow

- **VUID-vkCmdSetExclusiveScissorNV-offset-02039**
  Evaluation of `(offset.y + extent.height)` for each member of `pExclusiveScissors` must not cause a signed integer addition overflow

### Valid Usage (Implicit)

- **VUID-vkCmdSetExclusiveScissorNV-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetExclusiveScissorNV-pExclusiveScissors-parameter**
  `pExclusiveScissors` must be a valid pointer to an array of `exclusiveScissorCount` `VkRect2D` structures

- **VUID-vkCmdSetExclusiveScissorNV-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetExclusiveScissorNV-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetExclusiveScissorNV-exclusiveScissorCount-arraylength**
  `exclusiveScissorCount` must be greater than 0
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

28.4. Sample Mask Test

The sample mask test compares the coverage mask for a fragment with the sample mask defined by `VkPipelineMultisampleStateCreateInfo::pSampleMask`.

Each bit of the coverage mask is associated with a sample index as described in the rasterization chapter. If the bit in `VkPipelineMultisampleStateCreateInfo::pSampleMask` which is associated with that same sample index is set to 0, the coverage mask bit is set to 0.

28.5. Multisample Coverage

If a fragment shader is active and its entry point’s interface includes a built-in output variable decorated with `SampleMask`, but not `OverrideCoverageNV`, the coverage mask is ANDed with the bits of the `SampleMask` built-in to generate a new coverage mask. If the `SampleMask` built-in is also decorated with `OverrideCoverageNV`, the coverage mask is replaced with the mask bits set in the shader. If sample shading is enabled, bits written to `SampleMask` corresponding to samples that are not being shaded by the fragment shader invocation are ignored. If no fragment shader is active, or if the active fragment shader does not include `SampleMask` in its interface, the coverage mask is not modified.

Next, the fragment alpha value and coverage mask are modified based on the line coverage factor if the `lineRasterizationMode` member of the `VkPipelineRasterizationStateCreateInfo` structure is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, and the `alphaToCoverageEnable` and `alphaToOneEnable` members of the `VkPipelineMultisampleStateCreateInfo` structure.

All alpha values in this section refer only to the alpha component of the fragment shader output that has a `Location` and `Index` decoration of zero (see the Fragment Output Interface section). If that shader output has an integer or unsigned integer type, then these operations are skipped.

If the `lineRasterizationMode` member of the `VkPipelineRasterizationStateCreateInfo` structure is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT` and the fragment came from a line segment,
then the alpha value is replaced by multiplying it by the coverage factor for the fragment computed
during smooth line rasterization.

If alphaToCoverageEnable is enabled, a temporary coverage mask is generated where each bit is
determined by the fragment's alpha value, which is ANDed with the fragment coverage mask.

No specific algorithm is specified for converting the alpha value to a temporary coverage mask. It is
intended that the number of 1's in this value be proportional to the alpha value (clamped to [0,1]),
with all 1's corresponding to a value of 1.0 and all 0's corresponding to 0.0. The algorithm may be
different at different framebuffer coordinates.

Note
Using different algorithms at different framebuffer coordinates may help to avoid
artifacts caused by regular coverage sample locations.

Finally, if alphaToOneEnable is enabled, each alpha value is replaced by the maximum representable
alpha value for fixed-point color buffers, or by 1.0 for floating-point buffers. Otherwise, the alpha
values are not changed.

28.6. Depth and Stencil Operations

Pipeline state controlling the depth bounds tests, stencil test, and depth test is specified through the
members of the VkPipelineDepthStencilStateCreateInfo structure.

The VkPipelineDepthStencilStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDepthStencilStateCreateInfo {
    VkStructureType                          sType;
    const void*                               pNext;
    VkPipelineDepthStencilStateCreateFlags    flags;
    VkBool32                                  depthTestEnable;
    VkBool32                                  depthWriteEnable;
    VkCompareOp                               depthCompareOp;
    VkBool32                                  depthBoundsTestEnable;
    VkBool32                                  stencilTestEnable;
    VkStencilOpState                          front;
    VkStencilOpState                          back;
    float                                      minDepthBounds;
    float                                      maxDepthBounds;
} VkPipelineDepthStencilStateCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **depthTestEnable** controls whether depth testing is enabled.
• `depthWriteEnable` controls whether depth writes are enabled when `depthTestEnable` is `VK_TRUE`. Depth writes are always disabled when `depthTestEnable` is `VK_FALSE`.

• `depthCompareOp` is the comparison operator used in the depth test.

• `depthBoundsTestEnable` controls whether depth bounds testing is enabled.

• `stencilTestEnable` controls whether stencil testing is enabled.

• `front` and `back` control the parameters of the stencil test.

• `minDepthBounds` is the minimum depth bound used in the depth bounds test.

• `maxDepthBounds` is the maximum depth bound used in the depth bounds test.

---

**Valid Usage**

• VUID-VkPipelineDepthStencilStateCreateInfo-depthBoundsTestEnable-00598
  If the depth bounds testing feature is not enabled, `depthBoundsTestEnable` must be `VK_FALSE`

• VUID-VkPipelineDepthStencilStateCreateInfo-separateStencilMaskRef-04453
  If the VK_KHR_portability_subset extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::separateStencilMaskRef` is `VK_FALSE`, and the value of `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable` is `VK_TRUE`, and the value of `VkPipelineRasterizationStateCreateInfo::cullMode` is `VK_CULL_MODE_NONE`, the value of `reference` in each of the `VkStencilOpState` structs in `front` and `back` must be the same.

---

**Valid Usage (Implicit)**

• VUID-VkPipelineDepthStencilStateCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO`

• VUID-VkPipelineDepthStencilStateCreateInfo-pNext-pNext
  `pNext` must be `NULL`

• VUID-VkPipelineDepthStencilStateCreateInfo-flags-zerobitmask
  `flags` must be `0`

• VUID-VkPipelineDepthStencilStateCreateInfo-depthCompareOp-parameter
  `depthCompareOp` must be a valid `VkCompareOp` value

• VUID-VkPipelineDepthStencilStateCreateInfo-front-parameter
  `front` must be a valid `VkStencilOpState` structure

• VUID-VkPipelineDepthStencilStateCreateInfo-back-parameter
  `back` must be a valid `VkStencilOpState` structure

---

<pre>// Provided by VK_VERSION_1_0
<code>typedef VkFlags VkPipelineDepthStencilStateCreateFlags;</code>
</pre>

`VkPipelineDepthStencilStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.
28.7. Depth Bounds Test

The depth bounds test compares the depth value $z_i$ in the depth/stencil attachment at each sample’s framebuffer coordinates $(x_f, y_f)$ and sample index $i$ against a set of depth bounds.

The depth bounds are determined by two floating point values defining a minimum ($\text{minDepthBounds}$) and maximum ($\text{maxDepthBounds}$) depth value. These values are either set by the $\text{VkPipelineDepthStencilStateCreateInfo}$ structure during pipeline creation, or dynamically by $\text{vkCmdSetDepthBoundsTestEnableEXT}$ and $\text{vkCmdSetDepthBounds}$.

A given sample is considered within the depth bounds if $z_i$ is in the range $[\text{minDepthBounds}, \text{maxDepthBounds}]$. Samples with depth attachment values outside of the depth bounds will have their coverage set to 0.

If the depth bounds test is disabled, or if there is no depth attachment, the coverage mask is unmodified by this operation.

To dynamically enable or disable the depth bounds test:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthBoundsTestEnableEXT(
    VkCommandBuffer                             commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    VkBool32                                    depthBoundsTestEnable);  // depthBoundsTestEnable specifies if the depth bounds test is enabled.
```

This command sets the state for a given draw when the graphics pipeline is created with $\text{VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE_EXT}$ set in $\text{VkPipelineDynamicStateCreateInfo} :: \text{pDynamicStates}$.

---

**Valid Usage**

- VUID-vkCmdSetDepthBoundsTestEnableEXT-None-03349
  The extendedDynamicState feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetDepthBoundsTestEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetDepthBoundsTestEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetDepthBoundsTestEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the depth bounds range values call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBounds(
    VkCommandBuffer                             commandBuffer,
    float minDepthBounds,
    float maxDepthBounds);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `minDepthBounds` is the minimum depth bound.
- `maxDepthBounds` is the maximum depth bound.

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BOUNDS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

Valid Usage

- `VUID-vkCmdSetDepthBounds-minDepthBounds-00600`
  Unless the `VK_EXT_depth_range_unrestricted` extension is enabled, `minDepthBounds` must be between 0.0 and 1.0, inclusive

- `VUID-vkCmdSetDepthBounds-maxDepthBounds-00601`
  Unless the `VK_EXT_depth_range_unrestricted` extension is enabled, `maxDepthBounds` must be between 0.0 and 1.0, inclusive
28.8. Stencil Test

The stencil test compares the stencil attachment value \( s_a \) in the depth/stencil attachment at each sample’s framebuffer coordinates \((x_f, y_f)\) and sample index \( i \) against a stencil reference value.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of coverage samples to stencil attachment samples within the fragment. However, if all samples in the fragment are covered, and the stencil attachment value is updated as a result of this test, all stencil attachment samples will be updated.

If the stencil test is not enabled, as specified by `vkCmdSetStencilTestEnableEXT` or `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable`, or if there is no stencil attachment, the coverage mask is unmodified by this operation.

The stencil test is controlled by one of two sets of stencil-related state, the front stencil state and the back stencil state. Stencil tests and writes use the back stencil state when processing fragments generated by back-facing polygons, and the front stencil state when processing fragments generated by front-facing polygons or any other primitives.

The comparison performed is based on the `VkCompareOp`, compare mask \( s_c \), and stencil reference...
value \( s_r \) of the relevant state set. The compare mask and stencil reference value are set by either the `VkPipelineDepthStencilStateCreateInfo` structure during pipeline creation, or by the `vkCmdSetStencilCompareMask` and `vkCmdSetStencilReference` commands respectively. The compare operation is set by `VkStencilOpState::compareOp` during pipeline creation.

The stencil reference and attachment values \( s_r \) and \( s_a \) are each independently combined with the compare mask \( s_c \) using a logical AND operation to create masked reference and attachment values \( s'_r \) and \( s'_a \). \( s'_r \) and \( s'_a \) are used as A and B, respectively, in the operation specified by `VkCompareOp`.

If the comparison evaluates to false, the coverage for the sample is set to 0.

A new stencil value \( s_g \) is generated according to a stencil operation defined by `VkStencilOp` parameters set by `vkCmdSetStencilOpEXT` or `VkPipelineDepthStencilStateCreateInfo`. If the stencil test fails, `failOp` defines the stencil operation used. If the stencil test passes however, the stencil op used is based on the depth test - if it passes, `VkPipelineDepthStencilStateCreateInfo::passOp` is used, otherwise `VkPipelineDepthStencilStateCreateInfo::depthFailOp` is used.

The stencil attachment value \( s_a \) is then updated with the generated stencil value \( s_g \) according to the write mask \( s_w \) defined by `VkPipelineDepthStencilStateCreateInfo::writeMask` as:

\[
s_a = (s_a \land \neg s_w) \lor (s_g \land s_w)
\]

To dynamically enable or disable the stencil test, call:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetStencilTestEnableEXT(
    VkCommandBuffer                             commandBuffer,
    VkBool32                                    stencilTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stencilTestEnable` specifies if the stencil test is enabled.

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

**Valid Usage**

- VUID-vkCmdSetStencilTestEnableEXT-None-03350

  The `extendedDynamicState` feature **must** be enabled
Valid Usage (Implicit)

- VUID-vkCmdSetStencilTestEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetStencilTestEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetStencilTestEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the stencil operations, call:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetStencilOpEXT(
  VkCommandBuffer commandBuffer,
  VkStencilFaceFlags faceMask,
  VkStencilOp failOp,
  VkStencilOp passOp,
  VkStencilOp depthFailOp,
  VkCompareOp compareOp);
```

- commandBuffer is the command buffer into which the command will be recorded.

- faceMask is a bitmask of VkStencilFaceFlagBits specifying the set of stencil state for which to update the stencil operation.

- failOp is a VkStencilOp value specifying the action performed on samples that fail the stencil test.

- passOp is a VkStencilOp value specifying the action performed on samples that pass both the depth and stencil tests.
• **depthFailOp** is a **VkStencilOp** value specifying the action performed on samples that pass the stencil test and fail the depth test.

• **compareOp** is a **VkCompareOp** value specifying the comparison operator used in the stencil test.

This command sets the state for a given draw when the graphics pipeline is created with **VK_DYNAMIC_STATE_STENCIL_OP_EXT** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**.

### Valid Usage

- **VUID-vkCmdSetStencilOpEXT-None-03351**
  The **extendedDynamicState** feature must be enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetStencilOpEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid **VkCommandBuffer** handle

- **VUID-vkCmdSetStencilOpEXT-faceMask-parameter**
  `faceMask` must be a valid combination of **VkStencilFaceFlagBits** values

- **VUID-vkCmdSetStencilOpEXT-faceMask-requiredbitmask**
  `faceMask` must not be 0

- **VUID-vkCmdSetStencilOpEXT-failOp-parameter**
  `failOp` must be a valid **VkStencilOp** value

- **VUID-vkCmdSetStencilOpEXT-passOp-parameter**
  `passOp` must be a valid **VkStencilOp** value

- **VUID-vkCmdSetStencilOpEXT-depthFailOp-parameter**
  `depthFailOp` must be a valid **VkStencilOp** value

- **VUID-vkCmdSetStencilOpEXT-compareOp-parameter**
  `compareOp` must be a valid **VkCompareOp** value

- **VUID-vkCmdSetStencilOpEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetStencilOpEXT-commandBuffer-cmdpool**
  The **VkCommandPool** that `commandBuffer` was allocated from must support graphics operations

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the **VkCommandPool** that `commandBuffer` was allocated from must be externally synchronized
### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkStencilOpState` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkStencilOpState {
    VkStencilOp     failOp;
    VkStencilOp     passOp;
    VkStencilOp     depthFailOp;
    VkCompareOp     compareOp;
    uint32_t        compareMask;
    uint32_t        writeMask;
    uint32_t        reference;
} VkStencilOpState;
```

- **failOp** is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- **passOp** is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
- **depthFailOp** is a `VkStencilOp` value specifying the action performed on samples that pass the stencil test and fail the depth test.
- **compareOp** is a `VkCompareOp` value specifying the comparison operator used in the stencil test.
- **compareMask** selects the bits of the unsigned integer stencil values participating in the stencil test.
- **writeMask** selects the bits of the unsigned integer stencil values updated by the stencil test in the stencil framebuffer attachment.
- **reference** is an integer reference value that is used in the unsigned stencil comparison.
Valid Usage (Implicit)

- VUID-VkStencilOpState-failOp-parameter
  
  **failOp** must be a valid **VkStencilOp** value

- VUID-VkStencilOpState-passOp-parameter
  
  **passOp** must be a valid **VkStencilOp** value

- VUID-VkStencilOpState-depthFailOp-parameter
  
  **depthFailOp** must be a valid **VkStencilOp** value

- VUID-VkStencilOpState-compareOp-parameter
  
  **compareOp** must be a valid **VkCompareOp** value

To dynamically set the stencil compare mask call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilCompareMask(
    VkCommandBuffer commandBuffer,  
    VkStencilFaceFlags faceMask, 
    uint32_t compareMask);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **faceMask** is a bitmask of **VkStencilFaceFlagBits** specifying the set of stencil state for which to update the compare mask.
- **compareMask** is the new value to use as the stencil compare mask.

This command sets the state for a given draw when the graphics pipeline is created with **VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**.

Valid Usage (Implicit)

- VUID-vkCmdSetStencilCompareMask-commandBuffer-parameter
  
  **commandBuffer** must be a valid **VkCommandBuffer** handle

- VUID-vkCmdSetStencilCompareMask-faceMask-parameter
  
  **faceMask** must be a valid combination of **VkStencilFaceFlagBits** values

- VUID-vkCmdSetStencilCompareMask-faceMask-requiredbitmap
  
  **faceMask** must not be 0

- VUID-vkCmdSetStencilCompareMask-commandBuffer-recording
  
  **commandBuffer** must be in the recording state

- VUID-vkCmdSetStencilCompareMask-commandBuffer-cmdpool
  
  The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

`VkStencilFaceFlagBits` values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilFaceFlagBits {
    VK_STENCIL_FACE_FRONT_BIT = 0x00000001,
    VK_STENCIL_FACE_BACK_BIT = 0x00000002,
    VK_STENCIL_FACE_FRONT_AND_BACK = 0x00000003,
    VK_STENCIL_FRONT_AND_BACK = VK_STENCIL_FACE_FRONT_AND_BACK,
} VkStencilFaceFlagBits;
```

- `VK_STENCIL_FACE_FRONT_BIT` specifies that only the front set of stencil state is updated.
- `VK_STENCIL_FACE_BACK_BIT` specifies that only the back set of stencil state is updated.
- `VK_STENCIL_FACE_FRONT_AND_BACK` is the combination of `VK_STENCIL_FACE_FRONT_BIT` and `VK_STENCIL_FACE_BACK_BIT`, and specifies that both sets of stencil state are updated.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkStencilFaceFlags;
```

`VkStencilFaceFlags` is a bitmask type for setting a mask of zero or more `VkStencilFaceFlagBits`.

To dynamically set the stencil write mask call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilWriteMask(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t writeMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
• **faceMask** is a bitmask of **VkStencilFaceFlagBits** specifying the set of stencil state for which to update the write mask, as described above for **vkCmdSetStencilCompareMask**.

• **writeMask** is the new value to use as the stencil write mask.

This command sets the state for a given draw when the graphics pipeline is created with **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**.

### Valid Usage (Implicit)

- VUID-vkCmdSetStencilWriteMask-faceMask-parameter
  - **faceMask must be a valid combination of **VkStencilFaceFlagBits** values**

- VUID-vkCmdSetStencilWriteMask-faceMask-required bitmask
  - **faceMask must not be 0**

- VUID-vkCmdSetStencilWriteMask-commandBuffer-recording
  - **commandBuffer must be in the recording state**

- VUID-vkCmdSetStencilWriteMask-commandBuffer-cmdpool
  - The **VkCommandPool** that **commandBuffer** was allocated from **must** support graphics operations

### Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized

- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the stencil reference value call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilReference(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t reference);
```
• **commandBuffer** is the command buffer into which the command will be recorded.

• **faceMask** is a bitmask of **VkStencilFaceFlagBits** specifying the set of stencil state for which to update the reference value, as described above for **vkCmdSetStencilCompareMask**.

• **reference** is the new value to use as the stencil reference value.

This command sets the state for a given draw when the graphics pipeline is created with **VK_DYNAMIC_STATE_STENCIL_REFERENCE** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**.

**Valid Usage (Implicit)**

- VUID-vkCmdSetStencilReference-commandBuffer-parameter
  
  **commandBuffer** must be a valid **VkCommandBuffer** handle

- VUID-vkCmdSetStencilReference-faceMask-parameter
  
  **faceMask** must be a valid combination of **VkStencilFaceFlagBits** values

- VUID-vkCmdSetStencilReference-faceMask-required bitmask
  
  **faceMask** must not be 0

- VUID-vkCmdSetStencilReference-commandBuffer-recording
  
  **commandBuffer** must be in the recording state

- VUID-vkCmdSetStencilReference-commandBuffer-cmdpool
  
  The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations

**Host Synchronization**

• Host access to **commandBuffer** must be externally synchronized

• Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Possible values of **VkStencilOpState::compareOp**, specifying the stencil comparison function, are:
// Provided by VK_VERSION_1_0

typedef enum VkCompareOp {
    VK_COMPARE_OP_NEVER = 0,
    VK_COMPARE_OP_LESS = 1,
    VK_COMPARE_OP_EQUAL = 2,
    VK_COMPARE_OP_LESS_OR_EQUAL = 3,
    VK_COMPARE_OP_GREATER = 4,
    VK_COMPARE_OP_NOT_EQUAL = 5,
    VK_COMPARE_OP_GREATER_OR_EQUAL = 6,
    VK_COMPARE_OP_ALWAYS = 7,
} VkCompareOp;

- **VK_COMPARE_OP_NEVER** specifies that the test evaluates to false.
- **VK_COMPARE_OP_LESS** specifies that the test evaluates \( A < B \).
- **VK_COMPARE_OP_EQUAL** specifies that the test evaluates \( A = B \).
- **VK_COMPARE_OP_LESS_OR_EQUAL** specifies that the test evaluates \( A \leq B \).
- **VK_COMPARE_OP_GREATER** specifies that the test evaluates \( A > B \).
- **VK_COMPARE_OP_NOT_EQUAL** specifies that the test evaluates \( A \neq B \).
- **VK_COMPARE_OP_GREATER_OR_EQUAL** specifies that the test evaluates \( A \geq B \).
- **VK_COMPARE_OP_ALWAYS** specifies that the test evaluates to true.

Possible values of the `failOp`, `passOp`, and `depthFailOp` members of `VkStencilOpState`, specifying what happens to the stored stencil value if this or certain subsequent tests fail or pass, are:

// Provided by VK_VERSION_1_0

typedef enum VkStencilOp {
    VK_STENCIL_OP_KEEP = 0,
    VK_STENCIL_OP_ZERO = 1,
    VK_STENCIL_OP_REPLACE = 2,
    VK_STENCIL_OP_INCREMENT_AND_CLAMP = 3,
    VK_STENCIL_OP_DECREMENT_AND_CLAMP = 4,
    VK_STENCIL_OP_INVERT = 5,
    VK_STENCIL_OP_INCREMENT_AND_WRAP = 6,
    VK_STENCIL_OP_DECREMENT_AND_WRAP = 7,
} VkStencilOp;

- **VK_STENCIL_OP_KEEP** keeps the current value.
- **VK_STENCIL_OP_ZERO** sets the value to 0.
- **VK_STENCIL_OP_REPLACE** sets the value to `reference`.
- **VK_STENCIL_OP_INCREMENT_AND_CLAMP** increments the current value and clamps to the maximum representable unsigned value.
- **VK_STENCIL_OP_DECREMENT_AND_CLAMP** decrements the current value and clamps to 0.
- **VK_STENCIL_OP_INVERT** bitwise-inverts the current value.
• **VK_STENCIL_OP_INCREMENT_AND_WRAP** increments the current value and wraps to 0 when the maximum value would have been exceeded.

• **VK_STENCIL_OP_DECREMENT_AND_WRAP** decrements the current value and wraps to the maximum possible value when the value would go below 0.

For purposes of increment and decrement, the stencil bits are considered as an unsigned integer.

### 28.9. Depth Test

The depth test compares the depth value \( z_a \) in the depth/stencil attachment at each sample's framebuffer coordinates \((x_f, y_f)\) and sample index \( i \) against the sample's depth value \( z_f \).

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of rasterization samples to depth attachment samples within the fragment. However, if all samples in the fragment are covered, and the depth attachment value is updated as a result of this test, all depth attachment samples will be updated.

If the depth test is not enabled, as specified by `vkCmdSetDepthTestEnableEXT` or `VkPipelineDepthStencilStateCreateInfo::depthTestEnable`, or if there is no depth attachment, the coverage mask is unmodified by this operation.

The comparison performed is based on the `VkCompareOp`, set by `vkCmdSetDepthCompareOpEXT` or `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` during pipeline creation. \( z_f \) and \( z_a \) are used as A and B, respectively, in the operation specified by the `VkCompareOp`.

If `VkPipelineRasterizationStateCreateInfo::depthClampEnable` is enabled, before the sample's \( z_f \) is compared to \( z_a \), \( z_f \) is clamped to \([\text{min}(n,f), \text{max}(n,f)]\), where \( n \) and \( f \) are the `minDepth` and `maxDepth` depth range values of the viewport used by this fragment, respectively.

If the comparison evaluates to false, the coverage for the sample is set to 0.

If depth writes are enabled, as specified by `vkCmdSetDepthWriteEnableEXT` or `VkPipelineDepthStencilStateCreateInfo::depthWriteEnable`, and the comparison evaluated to true, the depth attachment value \( z_a \) is set to the sample's depth value \( z_f \).

If the depth attachment has a fixed-point format and \( z_f \) is outside of the range \([0.0,1.0]\), it is clamped to that range before writing.

To dynamically enable or disable the depth test, call:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthTestEnableEXT(
    VkCommandBuffer commandBuffer, 
    VkBool32 depthTestEnable);
```

• **commandBuffer** is the command buffer into which the command will be recorded.

• **depthTestEnable** specifies if the depth test is enabled.
This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

### Valid Usage

- VUID-vkCmdSetDepthTestEnableEXT-None-03352
  
  The `extendedDynamicState` feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthTestEnableEXT-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDepthTestEnableEXT-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetDepthTestEnableEXT-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

To dynamically set the depth compare operations, call:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthCompareOpEXT(
    VkCommandBuffer commandBuffer,
    VkCompareOp     depthCompareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthCompareOp` specifies the depth comparison operator.
This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

**Valid Usage**

- VUID-vkCmdSetDepthCompareOpEXT-None-03353
  The `extendedDynamicState` feature **must** be enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetDepthCompareOpEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthCompareOpEXT-depthCompareOp-parameter
  `depthCompareOp` **must** be a valid `VkCompareOp` value
- VUID-vkCmdSetDepthCompareOpEXT-commandBuffer-recording
  `commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetDepthCompareOpEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>

</tbody>
</table>

To dynamically enable or disable depth writes, call:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthWriteEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthWriteEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
• **depthWriteEnable** specifies if depth writes are enabled.

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

### Valid Usage

- **VUID-vkCmdSetDepthWriteEnableEXT-None-03354**
  
  The **extendedDynamicState** feature **must** be enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthWriteEnableEXT-commandBuffer-parameter**
  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetDepthWriteEnableEXT-commandBuffer-recording**
  
  `commandBuffer` **must** be in the **recording state**

- **VUID-vkCmdSetDepthWriteEnableEXT-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

### 28.10. Representative Fragment Test

The representative fragment test allows implementations to reduce the amount of rasterization and fragment processing work performed for each point, line, or triangle primitive. For any primitive that produces one or more fragments that pass all prior early fragment tests, the implementation **may** choose one or more “representative” fragments for processing and discard all other fragments. For draw calls rendering multiple points, lines, or triangles arranged in lists, strips, or fans, the representative fragment test is performed independently for each of those primitives. The
set of fragments discarded by the representative fragment test is implementation-dependent. In some cases, the representative fragment test may not discard any fragments for a given primitive.

If the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineRepresentativeFragmentTestStateCreateInfoNV` structure, then that structure includes parameters that control the representative fragment test.

The `VkPipelineRepresentativeFragmentTestStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_representative_fragment_test
typedef struct VkPipelineRepresentativeFragmentTestStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32           representativeFragmentTestEnable;
} VkPipelineRepresentativeFragmentTestStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `representativeFragmentTestEnable` controls whether the representative fragment test is enabled.

If this structure is not present, `representativeFragmentTestEnable` is considered to be `VK_FALSE`, and the representative fragment test is disabled.

If early fragment tests are not enabled in the active fragment shader, the representative fragment shader test has no effect, even if enabled.

### Valid Usage (Implicit)

- `VUID-VkPipelineRepresentativeFragmentTestStateCreateInfoNV-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_REPRESENTATIVE_FRAGMENT_TEST_STATE_CREATE_INFO_NV`.

# 28.11. Sample Counting

Occlusion queries use query pool entries to track the number of samples that pass all the per-fragment tests. The mechanism of collecting an occlusion query value is described in Occlusion Queries.

The occlusion query sample counter increments by one for each sample with a coverage value of 1 in each fragment that survives all the per-fragment tests, including scissor, exclusive scissor, sample mask, alpha to coverage, stencil, and depth tests.

# 28.12. Fragment Coverage To Color

The `VkPipelineCoverageToColorStateCreateInfoNV` structure is defined as:
// Provided by VK_NV_fragment_coverage_to_color

typedef struct VkPipelineCoverageToColorStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageToColorStateCreateFlagsNV flags;
    VkBool32 coverageToColorEnable;
    uint32_t coverageToColorLocation;
} VkPipelineCoverageToColorStateCreateInfoNV;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **coverageToColorEnable** controls whether the fragment coverage value replaces a fragment color output.
- **coverageToColorLocation** controls which fragment shader color output value is replaced.

If the **pNext** chain of **VkPipelineMultisampleStateCreateInfo** includes a **VkPipelineCoverageToColorStateCreateInfoNV** structure, then that structure controls whether the fragment coverage is substituted for a fragment color output and, if so, which output is replaced.

If **coverageToColorEnable** is **VK_TRUE**, the coverage mask replaces the first component of the color value corresponding to the fragment shader output location with **Location** equal to **coverageToColorLocation** and **Index** equal to zero. If the color attachment format has fewer bits than the coverage mask, the low bits of the sample coverage mask are taken without any clamping. If the color attachment format has more bits than the coverage mask, the high bits of the sample coverage mask are filled with zeros.

If **coverageToColorEnable** is **VK_FALSE**, these operations are skipped. If this structure is not present, it is as if **coverageToColorEnable** is **VK_FALSE**.

### Valid Usage

- **VUID-VkPipelineCoverageToColorStateCreateInfoNV-coverageToColorEnable-01404**

  If **coverageToColorEnable** is **VK_TRUE**, then the render pass subpass indicated by **VkGraphicsPipelineCreateInfo::renderPass** and **VkGraphicsPipelineCreateInfo::subpass** **must** have a color attachment at the location selected by **coverageToColorLocation**, with a **VkFormat** of **VK_FORMAT_R8_UINT**, **VK_FORMAT_R8_SINT**, **VK_FORMAT_R16_UINT**, **VK_FORMAT_R16_SINT**, **VK_FORMAT_R32_UINT**, **VK_FORMAT_R32_SINT**, or **VK_FORMAT_R32_SINT**.
Valid Usage (Implicit)

- VUID-VkPipelineCoverageToColorStateCreateInfoNV-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_TO_COLOR_STATE_CREATE_INFO_NV**

- VUID-VkPipelineCoverageToColorStateCreateInfoNV-flags-zerobitmask
  
  **flags** must be 0

```c
// Provided by VK_NV_fragment_coverage_to_color
typedef VkFlags VkPipelineCoverageToColorStateCreateFlagsNV;
```

**VkPipelineCoverageToColorStateCreateFlagsNV** is a bitmask type for setting a mask, but is currently reserved for future use.

### 28.13. Coverage Reduction

Coverage reduction takes the coverage information for a fragment and converts that to a boolean coverage value for each color sample in each pixel covered by the fragment.

#### 28.13.1. Pixel Coverage

Coverage for each pixel is first extracted from the total fragment coverage mask. This consists of **rasterizationSamples** unique coverage samples for each pixel in the fragment area, each with a unique **sample index**. If the fragment only contains a single pixel, coverage for the pixel is equivalent to the fragment coverage.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, pixel coverage is generated in an implementation-dependent manner. If all samples in the fragment are covered, all samples will be covered in each pixel coverage.

If a **shading rate image** is used, and the fragment covers multiple pixels, each pixel's coverage consists of the coverage samples corresponding to that pixel, and each sample retains its unique **sample index** i.

If the **fragment shading rate** is set, and the fragment covers multiple pixels, each pixel's coverage consists of the coverage samples with a **pixel index** matching that pixel, and each sample retains its unique **sample index** i.

#### 28.13.2. Color Sample Coverage

Once pixel coverage is determined, coverage for each individual color sample corresponding to that pixel is determined.

If the number of **rasterizationSamples** is identical to the number of samples in the color attachments. A color sample is covered if the pixel coverage sample with the same **sample index** i is covered.
Otherwise, the coverage for each color sample is computed from the pixel coverage as follows.

If the `VK_AMD_mixed_attachment_samples` extension is enabled, for color samples present in the color attachments, a color sample is covered if the pixel coverage sample with the same sample index \( i \) is covered; additional pixel coverage samples are discarded.

When the `VK_NV_coverage_reduction_mode` extension is enabled, the pipeline state controlling coverage reduction is specified through the members of the `VkPipelineCoverageReductionStateCreateInfoNV` structure.

The `VkPipelineCoverageReductionStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_coverage_reduction_mode
typedef struct VkPipelineCoverageReductionStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageReductionStateCreateFlagsNV flags;
    VkCoverageReductionModeNV coverageReductionMode;
} VkPipelineCoverageReductionStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `coverageReductionMode` is a `VkCoverageReductionModeNV` value controlling how color sample coverage is generated from pixel coverage.

If this structure is not present, or if the extension is not enabled, the default coverage reduction mode is inferred as follows:

- If the `VK_NV_framebuffer_mixed_samples` extension is enabled, then it is as if the `coverageReductionMode` is `VK_COVERAGE_REDUCTION_MODE_MERGE_NV`.
- If the `VK_AMD_mixed_attachment_samples` extension is enabled, then it is as if the `coverageReductionMode` is `VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV`.
- If both `VK_NV_framebuffer_mixed_samples` and `VK_AMD_mixed_attachment_samples` are enabled, then the default coverage reduction mode is implementation-dependent.

### Valid Usage (Implicit)

- VUID-VkPipelineCoverageReductionStateCreateInfoNV-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_REDUCTION_STATE_CREATE_INFO_NV`

- VUID-VkPipelineCoverageReductionStateCreateInfoNV-flags-zero bitmask
  - `flags` must be `0`

- VUID-VkPipelineCoverageReductionStateCreateInfoNV-coverageReductionMode-parameter
  - `coverageReductionMode` must be a valid `VkCoverageReductionModeNV` value
// Provided by VK_NV_coverage_reduction_mode
typedef VkFlags VkPipelineCoverageReductionStateCreateFlagsNV;

VkPipelineCoverageReductionStateCreateFlagsNV is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode, specifying how color sample coverage is generated from pixel coverage, are:

// Provided by VK_NV_coverage_reduction_mode
typedef enum VkCoverageReductionModeNV {
    VK_COVERAGE_REDUCTION_MODE_MERGE_NV = 0,
    VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV = 1,
} VkCoverageReductionModeNV;

- VK_COVERAGE_REDUCTION_MODE_MERGE_NV specifies that each color sample will be associated with an implementation-dependent subset of samples in the pixel coverage. If any of those associated samples are covered, the color sample is covered.

- VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV specifies that for color samples present in the color attachments, a color sample is covered if the pixel coverage sample with the same sample index i is covered; other pixel coverage samples are discarded.

To query the set of mixed sample combinations of coverage reduction mode, rasterization samples and color, depth, stencil attachment sample counts that are supported by a physical device, call:

// Provided by VK_NV_coverage_reduction_mode
VkResult vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pCombinationCount,
    VkFramebufferMixedSamplesCombinationNV*     pCombinations);

- physicalDevice is the physical device from which to query the set of combinations.

- pCombinationCount is a pointer to an integer related to the number of combinations available or queried, as described below.

- pCombinations is either NULL or a pointer to an array of VkFramebufferMixedSamplesCombinationNV values, indicating the supported combinations of coverage reduction mode, rasterization samples, and color, depth, stencil attachment sample counts.

If pCombinations is NULL, then the number of supported combinations for the given physicalDevice is returned in pCombinationCount. Otherwise, pCombinationCount must point to a variable set by the user to the number of elements in the pCombinations array, and on return the variable is overwritten with the number of values actually written to pCombinations. If the value of pCombinationCount is less than the number of combinations supported for the given physicalDevice, at most pCombinationCount values will be written to pCombinations, and VK_INCOMPLETE will be
returned instead of \texttt{VK\_SUCCESS}, to indicate that not all the supported values were returned.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-physicalDevice-parameter
  \texttt{physicalDevice} must be a valid \texttt{VkPhysicalDevice} handle.

- VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-pCombinationCount-parameter
  \texttt{pCombinationCount} must be a valid pointer to a \texttt{uint32\_t} value.

- VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-pCombinations-parameter
  If the value referenced by \texttt{pCombinationCount} is not 0, and \texttt{pCombinations} is not \texttt{NULL}, \texttt{pCombinations} must be a valid pointer to an array of \texttt{pCombinationCount} \texttt{VkFramebufferMixedSamplesCombinationNV} structures.

### Return Codes

**Success**

- \texttt{VK\_SUCCESS}
- \texttt{VK\_INCOMPLETE}

**Failure**

- \texttt{VK\_ERROR\_OUT\_OF\_HOST\_MEMORY}
- \texttt{VK\_ERROR\_OUT\_OF\_DEVICE\_MEMORY}

The \texttt{VkFramebufferMixedSamplesCombinationNV} structure is defined as:

```c
// Provided by VK\_NV\_coverage\_reduction\_mode
typedef struct VkFramebufferMixedSamplesCombinationNV {
    VkStructureType              sType;
    void*                        pNext;
    VkCoverageReductionModeNV    coverageReductionMode;
    VkSampleCountFlagBits        rasterizationSamples;
    VkSampleCountFlags           depthStencilSamples;
    VkSampleCountFlags           colorSamples;
} VkFramebufferMixedSamplesCombinationNV;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{coverageReductionMode} is a \texttt{VkCoverageReductionModeNV} value specifying the coverage reduction mode.
- \texttt{rasterizationSamples} is a \texttt{VkSampleCountFlagBits} specifying the number of rasterization samples in the supported combination.
- \texttt{depthStencilSamples} specifies the number of samples in the depth stencil attachment in the...
supported combination. A value of 0 indicates the combination does not have a depth stencil attachment.

- **colorSamples** specifies the number of color samples in a color attachment in the supported combination. A value of 0 indicates the combination does not have a color attachment.

### Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_FRAMEBUFFER_MIXED_SAMPLES_COMBINATION_NV`.
- `pNext` must be `NULL`.

### 28.13.3. Coverage Modulation

As part of coverage reduction, fragment color values can also be modulated (multiplied) by a value that is a function of fraction of covered rasterization samples associated with that color sample.

Pipeline state controlling coverage modulation is specified through the members of the `VkPipelineCoverageModulationStateCreateInfoNV` structure.

The `VkPipelineCoverageModulationStateCreateInfoNV` structure is defined as:

```c
typedef struct VkPipelineCoverageModulationStateCreateInfoNV {
    VkStructureType sType;                  // Provided by VK_NV_framebuffer_mixed_samples
    const void*     pNext;                  // sType must be VK_STRUCTURE_TYPE_FRAMEBUFFER_MIXED_SAMPLES_COMBINATION_NV
    VkPipelineCoverageModulationStateCreateFlagsNV flags;  // pNext
    VkCoverageModulationModeNV coverageModulationMode;  // NULL
    VkBool32 coverageModulationTableEnable;  // sType
    uint32_t coverageModulationTableCount;  // pNext
    const float* pCoverageModulationTable;  // flags
} VkPipelineCoverageModulationStateCreateInfoNV;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **coverageModulationMode** is a `VkCoverageModulationModeNV` value controlling which color components are modulated.
- **coverageModulationTableEnable** controls whether the modulation factor is looked up from a table in `pCoverageModulationTable`.
- **coverageModulationTableCount** is the number of elements in `pCoverageModulationTable`.
- **pCoverageModulationTable** is a table of modulation factors containing a value for each number of covered samples.
If `coverageModulationTableEnable` is `VK_FALSE`, then for each color sample the associated bits of the pixel coverage are counted and divided by the number of associated bits to produce a modulation factor R in the range (0,1] (a value of zero would have been killed due to a color coverage of 0). Specifically:

- \( N = \) value of `rasterizationSamples`
- \( M = \) value of `VkAttachmentDescription::samples` for any color attachments
- \( R = \frac{\text{popcount}(\text{associated coverage bits})}{(N / M)} \)

If `coverageModulationTableEnable` is `VK_TRUE`, the value R is computed using a programmable lookup table. The lookup table has \( N / M \) elements, and the element of the table is selected by:

- \( R = \) \( \text{pCoverageModulationTable}[\text{popcount}(\text{associated coverage bits})-1] \)

Note that the table does not have an entry for \( \text{popcount}(\text{associated coverage bits}) = 0 \), because such samples would have been killed.

The values of `pCoverageModulationTable` may be rounded to an implementation-dependent precision, which is at least as fine as \( 1 / N \), and clamped to \([0,1]\).

For each color attachment with a floating point or normalized color format, each fragment output color value is replicated to \( M \) values which can each be modulated (multiplied) by that color sample's associated value of R. Which components are modulated is controlled by `coverageModulationMode`.

If this structure is not present, it is as if `coverageModulationMode` is `VK_COVERAGE_MODULATION_MODE_NONE_NV`.

If the coverage reduction mode is `VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV`, each color sample is associated with only a single coverage sample. In this case, it is as if `coverageModulationMode` is `VK_COVERAGE_MODULATION_MODE_NONE_NV`.

**Valid Usage**

- VUID-VkPipelineCoverageModulationStateCreateInfoNV-coverageModulationTableEnable-01405

If `coverageModulationTableEnable` is `VK_TRUE`, `coverageModulationTableCount` must be equal to the number of rasterization samples divided by the number of color samples in the subpass.
Valid Usage (Implicit)

- VUID-VkPipelineCoverageModulationStateCreateInfoNV-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_MODULATION_STATE_CREATE_INFO_NV

- VUID-VkPipelineCoverageModulationStateCreateInfoNV-flags-zerobitmask
  
  flags must be 0

- VUID-VkPipelineCoverageModulationStateCreateInfoNV-coverageModulationMode-parameter
  
  coverageModulationMode must be a valid VkCoverageModulationModeNV value

// Provided by VK_NV_framebuffer_mixed_samples
typedef VkFlags VkPipelineCoverageModulationStateCreateFlagsNV;

VkPipelineCoverageModulationStateCreateFlagsNV is a bitmask type for setting a mask, but is
currently reserved for future use.

Possible values of VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationMode,
specifying which color components are modulated, are:

// Provided by VK_NV_framebuffer_mixed_samples
typedef enum VkCoverageModulationModeNV {
  VK_COVERAGE_MODULATION_MODE_NONE_NV = 0,
  VK_COVERAGE_MODULATION_MODE_RGB_NV = 1,
  VK_COVERAGE_MODULATION_MODE_ALPHA_NV = 2,
  VK_COVERAGE_MODULATION_MODE_RGBA_NV = 3,
} VkCoverageModulationModeNV;

- VK_COVERAGE_MODULATION_MODE_NONE_NV specifies that no components are multiplied by the
  modulation factor.

- VK_COVERAGE_MODULATION_MODE_RGB_NV specifies that the red, green, and blue components are
  multiplied by the modulation factor.

- VK_COVERAGE_MODULATION_MODE_ALPHA_NV specifies that the alpha component is multiplied by the
  modulation factor.

- VK_COVERAGE_MODULATION_MODE_RGBA_NV specifies that all components are multiplied by the
  modulation factor.
Chapter 29. The Framebuffer

29.1. Blending

Blending combines the incoming source fragment’s R, G, B, and A values with the destination R, G, B, and A values of each sample stored in the framebuffer at the fragment’s \((x_f, y_f)\) location. Blending is performed for each color sample covered by the fragment, rather than just once for each fragment.

Source and destination values are combined according to the blend operation, quadruplets of source and destination weighting factors determined by the blend factors, and a blend constant, to obtain a new set of R, G, B, and A values, as described below.

Blending is computed and applied separately to each color attachment used by the subpass, with separate controls for each attachment.

Prior to performing the blend operation, signed and unsigned normalized fixed-point color components undergo an implied conversion to floating-point as specified by Conversion from Normalized Fixed-Point to Floating-Point. Blending computations are treated as if carried out in floating-point, and basic blend operations are performed with a precision and dynamic range no lower than that used to represent destination components. Advanced blending operations are performed with a precision and dynamic range no lower than the smaller of that used to represent destination components or that used to represent 16-bit floating-point values.

**Note**

Blending is only defined for floating-point, UNORM, SNORM, and sRGB formats. Within those formats, the implementation may only support blending on some subset of them. Which formats support blending is indicated by VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT.

The pipeline blend state is included in the VkPipelineColorBlendStateCreateInfo structure during graphics pipeline creation:

The VkPipelineColorBlendStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineColorBlendStateCreateFlags flags;
    VkBool32 logicOpEnable;
    VkLogicOp logicOp;
    uint32_t attachmentCount;
    const VkPipelineColorBlendAttachmentState* pAttachments;
    float blendConstants[4];
} VkPipelineColorBlendStateCreateInfo;
```

- **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is reserved for future use.
• **logicOpEnable** controls whether to apply Logical Operations.
• **logicOp** selects which logical operation to apply.
• **attachmentCount** is the number of VkPipelineColorBlendAttachmentState elements in **pAttachments**.
• **pAttachments** is a pointer to an array of per target attachment states.
• **blendConstants** is a pointer to an array of four values used as the R, G, B, and A components of the blend constant that are used in blending, depending on the **blend factor**.

Each element of the **pAttachments** array is a VkPipelineColorBlendAttachmentState structure specifying per-target blending state for each individual color attachment. If the independent blending feature is not enabled on the device, all VkPipelineColorBlendAttachmentState elements in the **pAttachments** array must be identical.

The value of **attachmentCount** must be greater than the index of all color attachments that are not VK_ATTACHMENT_UNUSED in VkSubpassDescription::pColorAttachments or VkSubpassDescription2::pColorAttachments for the subpass in which this pipeline is used.

### Valid Usage

- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-00605**
  If the independent blending feature is not enabled, all elements of **pAttachments** must be identical

- **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00606**
  If the logic operations feature is not enabled, **logicOpEnable** must be VK_FALSE

- **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00607**
  If **logicOpEnable** is VK_TRUE, **logicOp** must be a valid VkLogicOp value
Valid Usage (Implicit)

- VUID-VkPipelineColorBlendStateCreateInfo-sType-sType
  The `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO`

- VUID-VkPipelineColorBlendStateCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineColorBlendAdvancedStateCreateInfoEXT` or `VkPipelineColorWriteCreateInfoEXT`

- VUID-VkPipelineColorBlendStateCreateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkPipelineColorBlendStateCreateInfo-flags-zerobitmask
  `flags` must be `0`

- VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-parameter
  If `attachmentCount` is not `0`, `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkPipelineColorBlendAttachmentState` structures

---

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineColorBlendStateCreateFlags;
```

`VkPipelineColorBlendStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkPipelineColorBlendAttachmentState` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendAttachmentState {
    VkBool32 blendEnable;
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
    VkColorComponentFlags colorWriteMask;
} VkPipelineColorBlendAttachmentState;
```

- `blendEnable` controls whether blending is enabled for the corresponding color attachment. If blending is not enabled, the source fragment's color for that attachment is passed through unmodified.
- `srcColorBlendFactor` selects which blend factor is used to determine the source factors (S<sub>r</sub>,S<sub>g</sub>,S<sub>b</sub>).
- `dstColorBlendFactor` selects which blend factor is used to determine the destination factors (D<sub>r</sub>,D<sub>g</sub>,D<sub>b</sub>).
- `colorBlendOp` selects which blend operation is used to calculate the RGB values to write to the
color attachment.

- **SrcAlphaBlendFactor** selects which blend factor is used to determine the source factor $S_a$.
- **DstAlphaBlendFactor** selects which blend factor is used to determine the destination factor $D_a$.
- **AlphaBlendOp** selects which blend operation is used to calculate the alpha values to write to the color attachment.
- **ColorWriteMask** is a bitmask of VkColorComponentFlags specifying which of the R, G, B, and/or A components are enabled for writing, as described for the Color Write Mask.
Valid Usage

- **VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-00608**
  If the dual source blending feature is not enabled, *srcColorBlendFactor* must not be
  
  
  - VK_BLEND_FACTOR_SRC1_COLOR,
  - VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR,
  - VK_BLEND_FACTOR_SRC1_ALPHA, or
  - VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- **VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-00609**
  If the dual source blending feature is not enabled, *dstColorBlendFactor* must not be
  
  
  - VK_BLEND_FACTOR_SRC1_COLOR,
  - VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR,
  - VK_BLEND_FACTOR_SRC1_ALPHA, or
  - VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- **VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-00610**
  If the dual source blending feature is not enabled, *srcAlphaBlendFactor* must not be
  
  
  - VK_BLEND_FACTOR_SRC1_COLOR,
  - VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR,
  - VK_BLEND_FACTOR_SRC1_ALPHA, or
  - VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- **VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-00611**
  If the dual source blending feature is not enabled, *dstAlphaBlendFactor* must not be
  
  
  - VK_BLEND_FACTOR_SRC1_COLOR,
  - VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR,
  - VK_BLEND_FACTOR_SRC1_ALPHA, or
  - VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- **VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-01406**
  If either of *colorBlendOp* or *alphaBlendOp* is an advanced blend operation, then *colorBlendOp* must equal *alphaBlendOp*

- **VUID-VkPipelineColorBlendAttachmentState-advancedBlendIndependentBlend-01407**
  If
  
  \[\text{VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend} \neq \text{VK_FALSE}\]

  colorBlendOp must be a valid \texttt{VkBlendOp} value

- VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-parameter
  srcAlphaBlendFactor must be a valid \texttt{VkBlendFactor} value

- VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-parameter
  dstAlphaBlendFactor must be a valid \texttt{VkBlendFactor} value

- VUID-VkPipelineColorBlendAttachmentState-alphaBlendOp-parameter
  alphaBlendOp must be a valid \texttt{VkBlendOp} value

- VUID-VkPipelineColorBlendAttachmentState-colorWriteMask-parameter
  colorWriteMask must be a valid combination of \texttt{VkColorComponentFlagBits} values

\textbf{29.1.1. Blend Factors}

The source and destination color and alpha blending factors are selected from the enum:
typedef enum VkBlendFactor {
    VK_BLEND_FACTOR_ZERO = 0,
    VK_BLEND_FACTOR_ONE = 1,
    VK_BLEND_FACTOR_SRC_COLOR = 2,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR = 3,
    VK_BLEND_FACTOR_DST_COLOR = 4,
    VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR = 5,
    VK_BLEND_FACTOR_SRC_ALPHA = 6,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA = 7,
    VK_BLEND_FACTOR_DST_ALPHA = 8,
    VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA = 9,
    VK_BLEND_FACTOR_CONSTANT_COLOR = 10,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR = 11,
    VK_BLEND_FACTOR_CONSTANT_ALPHA = 12,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA = 13,
    VK_BLEND_FACTOR_SRC_ALPHA_SATURATE = 14,
    VK_BLEND_FACTOR_SRC1_COLOR = 15,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR = 16,
    VK_BLEND_FACTOR_SRC1_ALPHA = 17,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA = 18,
} VkBlendFactor;

The semantics of the enum values are described in the table below:

<table>
<thead>
<tr>
<th>VkBlendFactor</th>
<th>RGB Blend Factors (S_r,S_g,S_b) or (D_r,D_g,D_b)</th>
<th>Alpha Blend Factor (S_a or D_a)</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BLEND_FACTOR_ZERO</td>
<td>(0,0,0)</td>
<td>0</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE</td>
<td>(1,1,1)</td>
<td>1</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC_COLOR</td>
<td>(R_{s0},G_{s0},B_{s0})</td>
<td>A_{s0}</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR</td>
<td>(1-R_{s0},1-G_{s0},1-B_{s0})</td>
<td>1-A_{s0}</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_DST_COLOR</td>
<td>(R_{d0},G_{d0},B_{d0})</td>
<td>A_{d0}</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR</td>
<td>(1-R_{d0},1-G_{d0},1-B_{d0})</td>
<td>1-A_{d0}</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC_ALPHA</td>
<td>(A_{s0},A_{s0},A_{s0})</td>
<td>A_{s0}</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA</td>
<td>(1-A_{s0},1-A_{s0},1-A_{s0})</td>
<td>1-A_{s0}</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_DST_ALPHA</td>
<td>(A_{d0},A_{d0},A_{d0})</td>
<td>A_{d0}</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA</td>
<td>(1-A_{d0},1-A_{d0},1-A_{d0})</td>
<td>1-A_{d0}</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_CONSTANT_COLOR</td>
<td>(R_{c0},G_{c0},B_{c0})</td>
<td>A_{c}</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR</td>
<td>(1-R_{c0},1-G_{c0},1-B_{c0})</td>
<td>1-A_{c}</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_CONSTANT_ALPHA</td>
<td>(A_{c0},A_{c0},A_{c0})</td>
<td>A_{c}</td>
</tr>
</tbody>
</table>
In this table, the following conventions are used:

- $R_{s0}, G_{s0}, B_{s0}$ and $A_{s0}$ represent the first source color R, G, B, and A components, respectively, for the fragment output location corresponding to the color attachment being blended.
- $R_{s1}, G_{s1}, B_{s1}$ and $A_{s1}$ represent the second source color R, G, B, and A components, respectively, used in dual source blending modes, for the fragment output location corresponding to the color attachment being blended.
- $R_{d}, G_{d}, B_{d}$ and $A_{d}$ represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- $R_{c}, G_{c}, B_{c}$ and $A_{c}$ represent the blend constant R, G, B, and A components, respectively.

If the pipeline state object is created without the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled then the `blend constant` ($R_{c}, G_{c}, B_{c}, A_{c}$) is specified via the `blendConstants` member of `VkPipelineColorBlendStateCreateInfo`.

Otherwise, to dynamically set and change the blend constant, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetBlendConstants(
    VkCommandBuffer commandBuffer,
    const float blendConstants[4]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `blendConstants` is a pointer to an array of four values specifying the R, G, B, and A components of the blend constant color used in blending, depending on the blend factor.
Valid Usage (Implicit)

- VUID-vkCmdSetBlendConstants-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetBlendConstants-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetBlendConstants-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>

</tr>
</tbody>
</table>

29.1.2. Dual-Source Blending

Blend factors that use the secondary color input (R_{s1},G_{s1},B_{s1},A_{s1}) (VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, and VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA) may consume implementation resources that could otherwise be used for rendering to multiple color attachments. Therefore, the number of color attachments that can be used in a framebuffer may be lower when using dual-source blending.

Dual-source blending is only supported if the dualSrcBlend feature is enabled.

The maximum number of color attachments that can be used in a subpass when using dual-source blending functions is implementation-dependent and is reported as the maxFragmentDualSrcAttachments member of VkPhysicalDeviceLimits.

When using a fragment shader with dual-source blending functions, the color outputs are bound to the first and second inputs of the blender using the Index decoration, as described in Fragment Output Interface. If the second color input to the blender is not written in the shader, or if no output is bound to the second input of a blender, the result of the blending operation is not defined.
29.1.3. Blend Operations

Once the source and destination blend factors have been selected, they along with the source and destination components are passed to the blending operations. RGB and alpha components can use different operations. Possible values of `VkBlendOp`, specifying the operations, are:

```c
typedef enum VkBlendOp {
    VK_BLEND_OP_ADD = 0,
    VK_BLEND_OP_SUBTRACT = 1,
    VK_BLEND_OP_REVERSE_SUBTRACT = 2,
    VK_BLEND_OP_MIN = 3,
    VK_BLEND_OP_MAX = 4,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_ZERO_EXT = 1000148000,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_EXT = 1000148001,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_EXT = 1000148002,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_OVER_EXT = 1000148003,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_OVER_EXT = 1000148004,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_IN_EXT = 1000148005,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_IN_EXT = 1000148006,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_ATOP_EXT = 1000148009,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_ATOP_EXT = 1000148010,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_XOR_EXT = 1000148011,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_MULTIPLY_EXT = 1000148012,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SCREEN_EXT = 1000148013,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_OVERLAY_EXT = 1000148014,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DARKEN_EXT = 1000148015,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_LIGHTEN_EXT = 1000148016,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_COLORDODGE_EXT = 1000148017,
} VkBlendOp;
```
VK_BLEND_OP_COLORBURN_EXT = 1000148018,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HARDLIGHT_EXT = 1000148019,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_SOFTLIGHT_EXT = 1000148020,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_DIFFERENCE_EXT = 1000148021,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_EXCLUSION_EXT = 1000148022,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_EXT = 1000148023,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_RGB_EXT = 1000148024,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARDODGE_EXT = 1000148025,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARBURN_EXT = 1000148026,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_VIVIDLIGHT_EXT = 1000148027,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARLIGHT_EXT = 1000148028,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PINLIGHT_EXT = 1000148029,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HARDMIX_EXT = 1000148030,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_HUE_EXT = 1000148031,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_SATURATION_EXT = 1000148032,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_COLOR_EXT = 1000148033,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_LUMINOSITY_EXT = 1000148034,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_EXT = 1000148035,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_CLAMPED_EXT = 1000148036,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_CLAMPED_ALPHA_EXT = 1000148037,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_DARKER_EXT = 1000148038,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_MINUS_EXT = 1000148039,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_MINUS_CLAMPED_EXT = 1000148040,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_CONTRAST_EXT = 1000148041,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_OVG_EXT = 1000148042,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_GREEN_EXT = 1000148044,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_BLUE_EXT = 1000148045,
} VkBlendOp;
The semantics of the basic blend operations are described in the table below:

**Table 39. Basic Blend Operations**

<table>
<thead>
<tr>
<th>VkBlendOp</th>
<th>RGB Components</th>
<th>Alpha Component</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BLEND_OP_ADD</td>
<td>( R = R_{s0} \times S_r + R_d \times D_r )</td>
<td>( A = A_{s0} \times S_a + A_d \times D_a )</td>
</tr>
<tr>
<td></td>
<td>( G = G_{s0} \times S_g + G_d \times D_g )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = B_{s0} \times S_b + B_d \times D_b )</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_SUBTRACT</td>
<td>( R = R_{s0} \times S_r - R_d \times D_r )</td>
<td>( A = A_{s0} \times S_a - A_d \times D_a )</td>
</tr>
<tr>
<td></td>
<td>( G = G_{s0} \times S_g - G_d \times D_g )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = B_{s0} \times S_b - B_d \times D_b )</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_REVERSE_SUBTRACT</td>
<td>( R = R_d \times D_r - R_{s0} \times S_r )</td>
<td>( A = A_d \times D_a - A_{s0} \times S_a )</td>
</tr>
<tr>
<td></td>
<td>( G = G_d \times D_g - G_{s0} \times S_g )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = B_d \times D_b - B_{s0} \times S_b )</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_MIN</td>
<td>( R = \min(R_{s0},R_d) )</td>
<td>( A = \min(A_{s0},A_d) )</td>
</tr>
<tr>
<td></td>
<td>( G = \min(G_{s0},G_d) )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = \min(B_{s0},B_d) )</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_MAX</td>
<td>( R = \max(R_{s0},R_d) )</td>
<td>( A = \max(A_{s0},A_d) )</td>
</tr>
<tr>
<td></td>
<td>( G = \max(G_{s0},G_d) )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = \max(B_{s0},B_d) )</td>
<td></td>
</tr>
</tbody>
</table>

In this table, the following conventions are used:

- \( R_{s0}, G_{s0}, B_{s0} \) and \( A_{s0} \) represent the first source color R, G, B, and A components, respectively.
- \( R_d, G_d, B_d \) and \( A_d \) represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- \( S_r, S_g, S_b \) and \( S_a \) represent the source blend factor R, G, B, and A components, respectively.
- \( D_r, D_g, D_b \) and \( D_a \) represent the destination blend factor R, G, B, and A components, respectively.

The blending operation produces a new set of values R, G, B and A, which are written to the framebuffer attachment. If blending is not enabled for this attachment, then R, G, B and A are assigned \( R_{s0}, G_{s0}, B_{s0} \) and \( A_{s0} \), respectively.

If the color attachment is fixed-point, the components of the source and destination values and blend factors are each clamped to \([0,1]\) or \([-1,1]\) respectively for an unsigned normalized or signed normalized color attachment prior to evaluating the blend operations. If the color attachment is floating-point, no clamping occurs.

If the numeric format of a framebuffer attachment uses sRGB encoding, the R, G, and B destination color values (after conversion from fixed-point to floating-point) are considered to be encoded for the sRGB color space and hence are linearized prior to their use in blending. Each R, G, and B component is converted from nonlinear to linear as described in the “sRGB EOTF” section of the Khronos Data Format Specification. If the format is not sRGB, no linearization is performed.

If the numeric format of a framebuffer attachment uses sRGB encoding, then the final R, G and B values are converted into the nonlinear sRGB representation before being written to the framebuffer attachment as described in the “sRGB EOTF” section of the Khronos Data Format Specification.
If the numeric format of a framebuffer color attachment is not sRGB encoded then the resulting color values for R, G and B are unmodified. The value of A is never sRGB encoded. That is, the alpha component is always stored in memory as linear.

If the framebuffer color attachment is `VK_ATTACHMENT_UNUSED`, no writes are performed through that attachment. Writes are not performed to framebuffer color attachments greater than or equal to the `VkSubpassDescription::colorAttachmentCount` or `VkSubpassDescription2::colorAttachmentCount` value.

### 29.1.4. Advanced Blend Operations

The **advanced blend operations** are those listed in tables f/X/Y/Z Advanced Blend Operations, Hue-Saturation-Luminosity Advanced Blend Operations, and Additional RGB Blend Operations.

If the `pNext` chain of `VkPipelineColorBlendStateCreateInfo` includes a `VkPipelineColorBlendAdvancedStateCreateInfoEXT` structure, then that structure includes parameters that affect advanced blend operations.

The `VkPipelineColorBlendAdvancedStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPipelineColorBlendAdvancedStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 srcPremultiplied;
    VkBool32 dstPremultiplied;
    VkBlendOverlapEXT blendOverlap;
} VkPipelineColorBlendAdvancedStateCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcPremultiplied** specifies whether the source color of the blend operation is treated as premultiplied.
- **dstPremultiplied** specifies whether the destination color of the blend operation is treated as premultiplied.
- **blendOverlap** is a `VkBlendOverlapEXT` value specifying how the source and destination sample's coverage is correlated.

If this structure is not present, `srcPremultiplied` and `dstPremultiplied` are both considered to be `VK_TRUE`, and `blendOverlap` is considered to be `VK_BLEND_OVERLAP_UNCORRELATED_EXT`. 

Chapter 29. The Framebuffer | 1581
Valid Usage

- **VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-srcPremultiplied-01424**
  If the non-premultiplied source color property is not supported, `srcPremultiplied` must be `VK_TRUE`.

- **VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-dstPremultiplied-01425**
  If the non-premultiplied destination color property is not supported, `dstPremultiplied` must be `VK_TRUE`.

- **VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-blendOverlap-01426**
  If the correlated overlap property is not supported, `blendOverlap` must be `VK_BLEND_OVERLAP_UNCORRELATED_EXT`.

Valid Usage (Implicit)

- **VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_ADVANCED_STATE_CREATE_INFO_EXT`.

- **VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-blendOverlap-parameter**
  `blendOverlap` must be a valid `VkBlendOverlapEXT` value.

When using one of the operations in table f/X/Y/Z Advanced Blend Operations or Hue-Saturation-Luminosity Advanced Blend Operations, blending is performed according to the following equations:

\[
\begin{align*}
R &= f(R_s', R_d') * p_0(A_s, A_d) + Y * R_s' * p_1(A_s, A_d) + Z * R_d' * p_2(A_s, A_d) \\
G &= f(G_s', G_d') * p_0(A_s, A_d) + Y * G_s' * p_1(A_s, A_d) + Z * G_d' * p_2(A_s, A_d) \\
B &= f(B_s', B_d') * p_0(A_s, A_d) + Y * B_s' * p_1(A_s, A_d) + Z * B_d' * p_2(A_s, A_d) \\
A &= X * p_0(A_s, A_d) + Y * p_1(A_s, A_d) + Z * p_2(A_s, A_d)
\end{align*}
\]

where the function \( f \) and terms \( X, Y, \) and \( Z \) are specified in the table. The \( R, G, \) and \( B \) components of the source color used for blending are derived according to `srcPremultiplied`. If `srcPremultiplied` is set to `VK_TRUE`, the fragment color components are considered to have been premultiplied by the \( A \) component prior to blending. The base source color \((R_s', G_s', B_s')\) is obtained by dividing through by the \( A \) component:

\[
(R_s', G_s', B_s') = \begin{cases} 
(0, 0, 0) & A_s = 0 \\
\left(\frac{R_s}{A_s}, \frac{G_s}{A_s}, \frac{B_s}{A_s}\right) & \text{otherwise}
\end{cases}
\]

If `srcPremultiplied` is `VK_FALSE`, the fragment color components are used as the base color:

\[
(R_s', G_s', B_s') = (R_s, G_s, B_s)
\]

The \( R, G, \) and \( B \) components of the destination color used for blending are derived according to `dstPremultiplied`. If `dstPremultiplied` is set to `VK_TRUE`, the destination components are considered to have been premultiplied by the \( A \) component prior to blending. The base destination color \((R_d', G_d', B_d')\) is obtained by dividing through by the \( A \) component:
If dstPremultiplied is VK_FALSE, the destination color components are used as the base color:

\[(R_d', G_d', B_d') = \begin{cases} (0, 0, 0) & A_d = 0 \\ \left( \frac{R_d}{A_d}, \frac{G_d}{A_d}, \frac{B_d}{A_d} \right) & \text{otherwise} \end{cases}\]

When blending using advanced blend operations, we expect that the R, G, and B components of premultiplied source and destination color inputs be stored as the product of non-premultiplied R, G, and B component values and the A component of the color. If any R, G, or B component of a premultiplied input color is non-zero and the A component is zero, the color is considered ill-formed, and the corresponding component of the blend result is undefined.

All of the advanced blend operation formulas in this chapter compute the result as a premultiplied color. If dstPremultiplied is VK_FALSE, that result color’s R, G, and B components are divided by the A component before being written to the framebuffer. If any R, G, or B component of the color is non-zero and the A component is zero, the result is considered ill-formed, and the corresponding component of the blend result is undefined. If all components are zero, that value is unchanged.

If the A component of any input or result color is less than zero, the color is considered ill-formed, and all components of the blend result are undefined.

The weighting functions \(p_0\), \(p_1\), and \(p_2\) are defined in table Advanced Blend Overlap Modes. In these functions, the A components of the source and destination colors are taken to indicate the portion of the pixel covered by the fragment (source) and the fragments previously accumulated in the pixel (destination). The functions \(p_0\), \(p_1\), and \(p_2\) approximate the relative portion of the pixel covered by the intersection of the source and destination, covered only by the source, and covered only by the destination, respectively.

Possible values of VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap, specifying the blend overlap functions, are:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef enum VkBlendOverlapEXT {
    VK_BLEND_OVERLAP_UNCORRELATED_EXT = 0,
    VK_BLEND_OVERLAP_DISJOINT_EXT = 1,
    VK_BLEND_OVERLAP_CONJOINT_EXT = 2,
} VkBlendOverlapEXT;
```

- **VK_BLEND_OVERLAP_UNCORRELATED_EXT** specifies that there is no correlation between the source and destination coverage.
- **VK_BLEND_OVERLAP_CONJOINT_EXT** specifies that the source and destination coverage are considered to have maximal overlap.
- **VK_BLEND_OVERLAP_DISJOINT_EXT** specifies that the source and destination coverage are considered to have minimal overlap.

When using one of the HSL blend operations in table **Hue-Saturation-Luminosity Advanced Blend Operations** as the blend operation, the RGB color components produced by the function \( f \) are effectively obtained by converting both the non-premultiplied source and destination colors to the HSL (hue, saturation, luminosity) color space, generating a new HSL color by selecting H, S, and L components from the source or destination according to the blend operation, and then converting the result back to RGB. In the equations below, a blended RGB color is produced according to the following pseudocode:

```c
float minv3(vec3 c) {
    return min(min(c.r, c.g), c.b);
}
float maxv3(vec3 c) {
    return max(max(c.r, c.g), c.b);
}
float lumv3(vec3 c) {
```
\[ \text{return } \text{dot}(c, \vec{3}(0.30, 0.59, 0.11)); \]

\[ \text{float } \text{satv3}(\vec{3} c) \{ \]
\[ \text{return } \text{maxv3}(c) - \text{minv3}(c); \]
\[ \}
\]

// If any color components are outside [0,1], adjust the color to
// get the components in range.
vec3 \text{ClipColor}(\vec{3} \text{color}) \{
\[ \text{float } \text{lum} = \text{lumv3}(\text{color}); \]
\[ \text{float } \text{mincol} = \text{minv3}(\text{color}); \]
\[ \text{float } \text{maxcol} = \text{maxv3}(\text{color}); \]
\[ \text{if } (\text{mincol} < \text{0.0}) \{ \]
\[ \text{color} = \text{lum} + ((\text{color}-\text{lum})*\text{lum}) / (\text{lum}-\text{mincol}); \]
\[ \}
\[ \text{if } (\text{maxcol} > \text{1.0}) \{ \]
\[ \text{color} = \text{lum} + ((\text{color}-\text{lum})*(1-\text{lum})) / (\text{maxcol}-\text{lum}); \]
\[ \}
\[ \text{return } \text{color}; \]
\[ \}
\]

// Take the base RGB color <cbase> and override its luminosity
// with that of the RGB color <clum>.
vec3 \text{SetLum}(\vec{3} \text{cbase}, \vec{3} \text{clum}) \{
\[ \text{float } \text{lbase} = \text{lumv3}(\text{cbase}); \]
\[ \text{float } \text{llum} = \text{lumv3}(\text{clum}); \]
\[ \text{float } \text{ldiff} = \text{llum} - \text{lbase}; \]
\[ \text{vec3 } \text{color} = \text{cbase} + \vec{3}(\text{ldiff}); \]
\[ \text{return } \text{ClipColor}(\text{color}); \]
\[ \}
\]

// Take the base RGB color <cbase> and override its saturation with
// that of the RGB color <csat>. The override the luminosity of the
// result with that of the RGB color <clum>.
vec3 \text{SetLumSat}(\vec{3} \text{cbase}, \vec{3} \text{csat}, \vec{3} \text{clum}) \{

### 29.2. Logical Operations

The application can enable a logical operation between the fragment’s color values and the existing value in the framebuffer attachment. This logical operation is applied prior to updating the framebuffer attachment. Logical operations are applied only for signed and unsigned integer and normalized integer framebuffers. Logical operations are not applied to floating-point or sRGB format color attachments.

Logical operations are controlled by the `logicOpEnable` and `logicOp` members of `VkPipelineColorBlendStateCreateInfo`. It can also be controlled by `vkCmdSetLogicOpEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. If `logicOpEnable` is `VK_TRUE`, then a logical operation selected by `logicOp` is applied between each color attachment and the fragment’s corresponding output value, and blending of all attachments is treated as if it were disabled. Any attachments using color formats for which logical operations are not supported simply pass through the color values unmodified. The logical operation is applied independently for each of the red, green, blue, and alpha components. The `logicOp` is selected from the following operations:
typedef enum VkLogicOp {
    VK_LOGIC_OP_CLEAR = 0,
    VK_LOGIC_OP_AND = 1,
    VK_LOGIC_OP_AND_REVERSE = 2,
    VK_LOGIC_OP_COPY = 3,
    VK_LOGIC_OP_AND_INVERTED = 4,
    VK_LOGIC_OP_NO_OP = 5,
    VK_LOGIC_OP_XOR = 6,
    VK_LOGIC_OP_OR = 7,
    VK_LOGIC_OP_NOR = 8,
    VK_LOGIC_OP_EQUIVALENT = 9,
    VK_LOGIC_OP_INVERT = 10,
    VK_LOGIC_OP_OR_REVERSE = 11,
    VK_LOGIC_OP_COPY_INVERTED = 12,
    VK_LOGIC_OP_OR_INVERTED = 13,
    VK_LOGIC_OP_NAND = 14,
    VK_LOGIC_OP_SET = 15,
} VkLogicOp;
The logical operations supported by Vulkan are summarized in the following table in which

- ¬ is bitwise invert,
- ∧ is bitwise and,
- ∨ is bitwise or,
- ⊕ is bitwise exclusive or,
- s is the fragment’s R<sub>s0</sub>, G<sub>s0</sub>, B<sub>s0</sub> or A<sub>s0</sub> component value for the fragment output corresponding to the color attachment being updated, and
- d is the color attachment’s R, G, B or A component value:

</table>

The result of the logical operation is then written to the color attachment as controlled by the component write mask, described in Blend Operations.

To dynamically set the logical operation to apply for blend state:

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetLogicOpEXT(  
    VkCommandBuffer commandBuffer,  
    VkLogicOp logicOp);  
```
• `commandBuffer` is the command buffer into which the command will be recorded.
• `logicOp` specifies the logical operation to apply for blend state.

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

**Valid Usage**

- VUID-vkCmdSetLogicOpEXT-None-04867
  The `extendedDynamicState2LogicOp` feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetLogicOpEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLogicOpEXT-logicOp-parameter
  `logicOp` must be a valid `VkLogicOp` value
- VUID-vkCmdSetLogicOpEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetLogicOpEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

**29.3. Color Write Mask**

Bits which can be set in `VkPipelineColorBlendAttachmentState::colorWriteMask` to determine whether the final color values R, G, B and A are written to the framebuffer attachment are:
typedef enum VkColorComponentFlagBits {
    VK_COLOR_COMPONENT_R_BIT = 0x00000001,
    VK_COLOR_COMPONENT_G_BIT = 0x00000002,
    VK_COLOR_COMPONENT_B_BIT = 0x00000004,
    VK_COLOR_COMPONENT_A_BIT = 0x00000008,
} VkColorComponentFlagBits;

- **VK_COLOR_COMPONENT_R_BIT** specifies that the R value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- **VK_COLOR_COMPONENT_G_BIT** specifies that the G value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- **VK_COLOR_COMPONENT_B_BIT** specifies that the B value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- **VK_COLOR_COMPONENT_A_BIT** specifies that the A value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.

The color write mask operation is applied regardless of whether blending is enabled. The color write mask operation is applied only if **Color Write Enable** is enabled for the respective attachment. Otherwise the color write mask is ignored and writes to all components of the attachment are disabled.

typedef VkFlags VkColorComponentFlags;

VkColorComponentFlags is a bitmask type for setting a mask of zero or more VkColorComponentFlagBits.

### 29.4. Color Write Enable

The **VkPipelineColorWriteCreateInfoEXT** structure is defined as:

```c
// Provided by VK_EXT_color_write_enable
typedef struct VkPipelineColorWriteCreateInfoEXT {
    VkStructureType     sType;
    const void*         pNext;
    uint32_t            attachmentCount;
    const VkBool32*     pColorWriteEnables;
} VkPipelineColorWriteCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **attachmentCount** is the number of **VkBool32** elements in **pColorWriteEnables**.
• \texttt{pColorWriteEnables} is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

When this structure is included in the \texttt{pNext} chain of \texttt{VkPipelineColorBlendStateCreateInfo}, it defines per-attachment color write state. If this structure is not included in the \texttt{pNext} chain, it is equivalent to specifying this structure with \texttt{attachmentCount} equal to the \texttt{attachmentCount} member of \texttt{VkPipelineColorBlendStateCreateInfo}, and \texttt{pColorWriteEnables} set to an array of as many \texttt{VK_TRUE} values.

If the \texttt{colorWriteEnable} feature is not enabled on the device, all \texttt{VkBool32} elements in the \texttt{pColorWriteEnables} array must be \texttt{VK_TRUE}.

Color Write Enable interacts with the Color Write Mask as follows: * If \texttt{colorWriteEnable} is \texttt{VK_TRUE}, writes to the attachment are determined by the \texttt{colorWriteMask}. * If \texttt{colorWriteEnable} is \texttt{VK_FALSE}, the \texttt{colorWriteMask} is ignored and writes to all components of the attachment are disabled. This is equivalent to specifying a \texttt{colorWriteMask} of 0.

### Valid Usage

- VUID-VkPipelineColorWriteCreateInfoEXT-pAttachments-04801
  
  If the \texttt{colorWriteEnable} feature is not enabled, all elements of \texttt{pColorWriteEnables} must be \texttt{VK_TRUE}

- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-04802
  
  \texttt{attachmentCount} must be equal to the \texttt{attachmentCount} member of the \texttt{VkPipelineColorBlendStateCreateInfo} structure specified during pipeline creation

### Valid Usage (Implicit)

- VUID-VkPipelineColorWriteCreateInfoEXT-sType-sType
  
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_PIPELINE_COLOR_WRITE_CREATE_INFO_EXT}

- VUID-VkPipelineColorWriteCreateInfoEXT-pColorWriteEnables-parameter
  
  If \texttt{attachmentCount} is not 0, \texttt{pColorWriteEnables} must be a valid pointer to an array of \texttt{attachmentCount} \texttt{VkBool32} values

To dynamically enable or disable color writes, call:

```c
void vkCmdSetColorWriteEnableEXT(  
    VkCommandBuffer commandBuffer,  
    uint32_t attachmentCount,  
    const VkBool32* pColorWriteEnables);
```

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.
- \texttt{attachmentCount} is the number of \texttt{VkBool32} elements in \texttt{pColorWriteEnables}.

1594 | Chapter 29. The Framebuffer
• `pColorWriteEnables` is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

This command sets the state for a given draw when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.

### Valid Usage

- VUID-vkCmdSetColorWriteEnableEXT-None-04803
  The `colorWriteEnable` feature must be enabled

- VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-04804
  `attachmentCount` must be equal to the `attachmentCount` member of the `VkPipelineColorBlendStateCreateInfo` structure specified during pipeline creation

### Valid Usage (Implicit)

- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetColorWriteEnableEXT-pColorWriteEnables-parameter
  `pColorWriteEnables` must be a valid pointer to an array of `attachmentCount` `VkBool32` values

- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the `recording state`

- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-arraylength
  `attachmentCount` must be greater than 0

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Chapter 30. Dispatching Commands

Dispatching commands (commands with Dispatch in the name) provoke work in a compute pipeline. Dispatching commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound compute pipeline. A compute pipeline must be bound to a command buffer before any dispatch commands are recorded in that command buffer.

To record a dispatch, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatch(
    VkCommandBuffer commandBuffer,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of `groupCountX \times groupCountY \times groupCountZ` local workgroups is assembled.
Valid Usage

- **VUID-vkCmdDispatch-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatch-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatch-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDispatch-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdDispatch-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDispatch-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDispatch-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdDispatch-None-02697**
  For each set \( n \) that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to \( n \) at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set \( n \), with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatch-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility
Compatibility

- VUID-vkCmdDispatch-None-02699
Descriptors in each bound descriptor set, specified via \texttt{vkCmdBindDescriptorSets}, \textbf{must} be valid if they are statically used by the \texttt{VkPipeline} bound to the pipeline bind point used by this command.

- VUID-vkCmdDispatch-None-02700
A valid pipeline \textbf{must} be bound to the pipeline bind point used by this command.

- VUID-vkCmdDispatch-commandBuffer-02701
If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command requires any dynamic state, that state \textbf{must} have been set or inherited for \texttt{commandBuffer}, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdDispatch-None-02859
There \textbf{must} not have been any calls to dynamic state setting commands for any state not specified as dynamic in the \texttt{VkPipeline} object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDispatch-None-02702
If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used to sample from any \texttt{VkImage} with a \texttt{VkImageView} of the type \texttt{VK_IMAGE_VIEW_TYPE_3D}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE}, \texttt{VK_IMAGE_VIEW_TYPE_1D_ARRAY}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY} or \texttt{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY}, in any shader stage.

- VUID-vkCmdDispatch-None-02703
If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions with \texttt{ImplicitLod}, \texttt{Dref} or \texttt{Proj} in their name, in any shader stage.

- VUID-vkCmdDispatch-None-02704
If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDispatch-None-02705
If the \texttt{robust buffer access} feature is not enabled, and if the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a uniform buffer, it \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDispatch-None-02706
If the \texttt{robust buffer access} feature is not enabled, and if the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a storage buffer, it \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDispatch-None-04115
If a \texttt{VkImageView} is accessed using \texttt{OpImageWrite} as a result of this command, then the...
Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- VUID-vkCmdDispatch-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- VUID-vkCmdDispatch-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDispatch-SampledType-04471
  If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDispatch-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDispatch-SampledType-04473
  If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDispatch-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDispatch-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDispatch-groupCountX-00386
  groupCountX must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]

- VUID-vkCmdDispatch-groupCountY-00387
  groupCountY must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]

- VUID-vkCmdDispatch-groupCountZ-00388
  groupCountZ must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]
Valid Usage (Implicit)

- VUID-vkCmdDispatch-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdDispatch-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdDispatch-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdDispatch-renderpass
  
  This command must only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

To record an indirect command dispatch, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatchIndirect(
    VkCommandBuffer commandBuffer,
    const VkBuffer* buffer,
    const VkDeviceSize offset);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `buffer` is the buffer containing dispatch parameters.
- `offset` is the byte offset into `buffer` where parameters begin.

`vkCmdDispatchIndirect` behaves similarly to `vkCmdDispatch` except that the parameters are read by the device from a buffer during execution. The parameters of the dispatch are encoded in a `VkDispatchIndirectCommand` structure taken from `buffer` starting at `offset`.
Valid Usage

- **VUID-vkCmdDispatchIndirect-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatchIndirect-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatchIndirect-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDispatchIndirect-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdDispatchIndirect-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDispatchIndirect-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDispatchIndirect-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdDispatchIndirect-None-02697**
  For each set n that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to n at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set n, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDispatchIndirect-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.
Compatibility

- VUID-vkCmdDispatchIndirect-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- VUID-vkCmdDispatchIndirect-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdDispatchIndirect-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdDispatchIndirect-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDispatchIndirect-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- VUID-vkCmdDispatchIndirect-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- VUID-vkCmdDispatchIndirect-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDispatchIndirect-None-02705
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDispatchIndirect-None-02706
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDispatchIndirect-None-04115
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the...
Type of the Texel operand of that instruction must have at least as many components as the image view's format.

- VUID-vkCmdDispatchIndirect-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format.

- VUID-vkCmdDispatchIndirect-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDispatchIndirect-SampledType-04471
  If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDispatchIndirect-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDispatchIndirect-SampledType-04473
  If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDispatchIndirect-buffer-02708
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdDispatchIndirect-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDispatchIndirect-offset-02710
  offset must be a multiple of 4

- VUID-vkCmdDispatchIndirect-offset-00407
  The sum of offset and the size of VkDispatchIndirectCommand must be less than or equal to the size of buffer
Valid Usage (Implicit)

- VUID-vkCmdDispatchIndirect-commandBuffer-parameter
  
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDispatchIndirect-buffer-parameter
  
  buffer must be a valid VkBuffer handle

- VUID-vkCmdDispatchIndirect-commandBuffer-recording
  
  commandBuffer must be in the recording state

- VUID-vkCmdDispatchIndirect-commandBuffer-cmdpool
  
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdDispatchIndirect-renderpass
  
  This command must only be called outside of a render pass instance

- VUID-vkCmdDispatchIndirect-commonparent
  
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

The VkDispatchIndirectCommand structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDispatchIndirectCommand {
    uint32_t x;
    uint32_t y;
    uint32_t z;
} VkDispatchIndirectCommand;
```

- x is the number of local workgroups to dispatch in the X dimension.
• \( y \) is the number of local workgroups to dispatch in the Y dimension.
• \( z \) is the number of local workgroups to dispatch in the Z dimension.

The members of \( \text{VkDispatchIndirectCommand} \) have the same meaning as the corresponding parameters of \( \text{vkCmdDispatch} \).

### Valid Usage

- VUID-VkDispatchIndirectCommand-x-00417
  \( x \) must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxComputeWorkGroupCount}[0] \)

- VUID-VkDispatchIndirectCommand-y-00418
  \( y \) must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxComputeWorkGroupCount}[1] \)

- VUID-VkDispatchIndirectCommand-z-00419
  \( z \) must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxComputeWorkGroupCount}[2] \)

To record a dispatch using non-zero base values for the components of \( \text{WorkgroupId} \), call:

```c
// Provided by VK_KHR_device_group
void vkCmdDispatchBaseKHR(
  VkCommandBuffer                             commandBuffer,  
  uint32_t                                    baseGroupX,       
  uint32_t                                    baseGroupY,       
  uint32_t                                    baseGroupZ,       
  uint32_t                                    groupCountX,      
  uint32_t                                    groupCountY,      
  uint32_t                                    groupCountZ);     
```

- \( \text{commandBuffer} \) is the command buffer into which the command will be recorded.
- \( \text{baseGroupX} \) is the start value for the X component of \( \text{WorkgroupId} \).
- \( \text{baseGroupY} \) is the start value for the Y component of \( \text{WorkgroupId} \).
- \( \text{baseGroupZ} \) is the start value for the Z component of \( \text{WorkgroupId} \).
- \( \text{groupCountX} \) is the number of local workgroups to dispatch in the X dimension.
- \( \text{groupCountY} \) is the number of local workgroups to dispatch in the Y dimension.
- \( \text{groupCountZ} \) is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of \( \text{groupCountX} \times \text{groupCountY} \times \text{groupCountZ} \) local workgroups is assembled, with \( \text{WorkgroupId} \) values ranging from \( (\text{baseGroup}^*, \text{baseGroup}^* + \text{groupCount}^*) \) in each component. \( \text{vkCmdDispatch} \) is equivalent to \( \text{vkCmdDispatchBase}(0,0,0,\text{groupCountX},\text{groupCountY},\text{groupCountZ}) \).
Valid Usage

• VUID-vkCmdDispatchBase-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDispatchBase-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDispatchBase-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

• VUID-vkCmdDispatchBase-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

• VUID-vkCmdDispatchBase-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDispatchBase-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDispatchBase-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdDispatchBase-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDispatchBase-None-02698
  For each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility
Compatibility

• VUID-vkCmdDispatchBase-None-02699
Descriptors in each bound descriptor set, specified via \texttt{vkCmdBindDescriptorSets}, \textbf{must} be valid if they are statically used by the \texttt{VkPipeline} bound to the pipeline bind point used by this command.

• VUID-vkCmdDispatchBase-None-02700
A valid pipeline \textbf{must} be bound to the pipeline bind point used by this command.

• VUID-vkCmdDispatchBase-commandBuffer-02701
If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command requires any dynamic state, that state \textbf{must} have been set or inherited for \texttt{commandBuffer}, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

• VUID-vkCmdDispatchBase-None-02859
There \textbf{must} not have been any calls to dynamic state setting commands for any state not specified as dynamic in the \texttt{VkPipeline} object bound to the pipeline bind point used by this command, since that pipeline was bound.

• VUID-vkCmdDispatchBase-None-02702
If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used to sample from any \texttt{VkImage} with a \texttt{VkImageView} of the type \texttt{VK_IMAGE_VIEW_TYPE_3D}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE}, \texttt{VK_IMAGE_VIEW_TYPE_1D_ARRAY}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY} or \texttt{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY}, in any shader stage.

• VUID-vkCmdDispatchBase-None-02703
If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions with \texttt{ImplicitLod}, \texttt{Dref} or \texttt{Proj} in their name, in any shader stage.

• VUID-vkCmdDispatchBase-None-02704
If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions that includes a LOD bias or any offset values, in any shader stage.

• VUID-vkCmdDispatchBase-None-02705
If the \texttt{robust buffer access} feature is not enabled, and if the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a uniform buffer, it \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

• VUID-vkCmdDispatchBase-None-02706
If the \texttt{robust buffer access} feature is not enabled, and if the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a storage buffer, it \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

• VUID-vkCmdDispatchBase-None-04115
If a \texttt{VkImageView} is accessed using \texttt{OpImageWrite} as a result of this command, then the...
Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- VUID-vkCmdDispatchBase-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- VUID-vkCmdDispatchBase-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDispatchBase-SampledType-04471
  If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDispatchBase-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDispatchBase-SampledType-04473
  If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDispatchBase-baseGroupX-00421
  baseGroupX must be less than VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]

- VUID-vkCmdDispatchBase-baseGroupX-00422
  baseGroupY must be less than VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]

- VUID-vkCmdDispatchBase-baseGroupZ-00423
  baseGroupZ must be less than VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]

- VUID-vkCmdDispatchBase-groupCountX-00424
  groupCountX must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] minus baseGroupX

- VUID-vkCmdDispatchBase-groupCountY-00425
  groupCountY must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] minus baseGroupY

- VUID-vkCmdDispatchBase-groupCountZ-00426
groupCountZ must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] minus baseGroupZ

- VUID-vkCmdDispatchBase-baseGroupX-00427
  If any of baseGroupX, baseGroupY, or baseGroupZ are not zero, then the bound compute pipeline must have been created with the VK_PIPELINE_CREATE_DISPATCH_BASE flag

Valid Usage (Implicit)

- VUID-vkCmdDispatchBase-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDispatchBase-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDispatchBase-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdDispatchBase-renderpass
  This command must only be called outside of a render pass instance

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Chapter 31. Device-Generated Commands

This chapter discusses the generation of command buffer content on the device, for which these principle steps are to be taken:

- Define via `VkIndirectCommandsLayoutNV` the sequence of commands which should be generated.
- Optionally make use of device-bindable Shader Groups.
- Retrieve device addresses by `vkGetBufferDeviceAddressEXT` for setting buffers on the device.
- Fill one or more `VkBuffer` with the appropriate content that gets interpreted by `VkIndirectCommandsLayoutNV`.
- Create a preprocess `VkBuffer` using the allocation information from `vkGetGeneratedCommandsMemoryRequirementsNV`.
- Optionally preprocess the input data using `vkCmdPreprocessGeneratedCommandsNV` in a separate action.
- Generate and execute the actual commands via `vkCmdExecuteGeneratedCommandsNV` passing all required data.

`vkCmdPreprocessGeneratedCommandsNV` executes in a separate logical pipeline from either graphics or compute. When preprocessing commands in a separate step they must be explicitly synchronized against the command execution. When not preprocessing, the preprocessing is automatically synchronized against the command execution.

### 31.1. Indirect Commands Layout

The device-side command generation happens through an iterative processing of an atomic sequence comprised of command tokens, which are represented by:

```c
// Provided by VK_NV_device_generated_commands
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkIndirectCommandsLayoutNV)
```

#### 31.1.1. Creation and Deletion

Indirect command layouts are created by:

```
// Provided by VK_NV_device_generated_commands
VkResult vkCreateIndirectCommandsLayoutNV(
    VkDevice device,
    const VkIndirectCommandsLayoutCreateInfoNV* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkIndirectCommandsLayoutNV* pIndirectCommandsLayout);
```

- `device` is the logical device that creates the indirect command layout.
- `pCreateInfo` is a pointer to an instance of the `VkIndirectCommandsLayoutCreateInfoNV` structure
containing parameters affecting creation of the indirect command layout.

- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pIndirectCommandsLayout` is a pointer to a `VkIndirectCommandsLayoutNV` handle in which the resulting indirect command layout is returned.

### Valid Usage

- VUID-vkCreateIndirectCommandsLayoutNV-deviceGeneratedCommands-02929
  
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled.

### Valid Usage (Implicit)

- VUID-vkCreateIndirectCommandsLayoutNV-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkCreateIndirectCommandsLayoutNV-pCreateInfo-parameter
  
  `pCreateInfo` must be a valid pointer to a valid `VkIndirectCommandsLayoutCreateInfoNV` structure

- VUID-vkCreateIndirectCommandsLayoutNV-pAllocator-parameter
  
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateIndirectCommandsLayoutNV-pIndirectCommandsLayout-parameter
  
  `pIndirectCommandsLayout` must be a valid pointer to a `VkIndirectCommandsLayoutNV` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkIndirectCommandsLayoutCreateInfoNV` structure is defined as:
```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsLayoutCreateInfoNV {
    VkStructureType                           sType;
    const void*                               pNext;
    VkIndirectCommandsLayoutUsageFlagsNV      flags;
    VkPipelineBindPoint                       pipelineBindPoint;
    uint32_t                                  tokenCount;
    const VkIndirectCommandsLayoutTokenNV*    pTokens;
    uint32_t                                  streamCount;
    const uint32_t*                           pStreamStrides;
} VkIndirectCommandsLayoutCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipelineBindPoint` is the `VkPipelineBindPoint` that this layout targets.
- `flags` is a bitmask of `VkIndirectCommandsLayoutUsageFlagBitsNV` specifying usage hints of this layout.
- `tokenCount` is the length of the individual command sequence.
- `pTokens` is an array describing each command token in detail. See `VkIndirectCommandsTokenTypeNV` and `VkIndirectCommandsLayoutTokenNV` below for details.
- `streamCount` is the number of streams used to provide the token inputs.
- `pStreamStrides` is an array defining the byte stride for each input stream.

The following code illustrates some of the flags:
void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsTokens, sequencesCount, indexbuffer, indexbufferOffset)
{
    for (s = 0; s < sequencesCount; s++)
    {
        sUsed = s;

        if (indirectCommandsLayout.flags & VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV) {
            sUsed = indexbuffer.load_uint32( sUsed * sizeof(uint32_t) + indexbufferOffset);
        }

        if (indirectCommandsLayout.flags & VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV) {
            sUsed = incoherent_implementation_dependent_permutation[ sUsed ];
        }

        cmdProcessSequence( cmd, pipeline, indirectCommandsLayout, pIndirectCommandsTokens, sUsed );
    }
}
Valid Usage

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-02930**
  The pipelineBindPoint must be `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-tokenCount-02931**
  
  tokenCount must be greater than 0 and less than or equal to
  VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenCount

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02932**
  If pTokens contains an entry of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV` it must
  be the first element of the array and there must be only a single element of such token type

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02933**
  If pTokens contains an entry of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV` there
  must be only a single element of such token type

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02934**
  All state tokens in pTokens must occur prior work provoking tokens
  (VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV,
  VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV,
  VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV)

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02935**
  The content of pTokens must include one single work provoking token that is compatible
  with the pipelineBindPoint

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-streamCount-02936**
  streamCount must be greater than 0 and less or equal to
  VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStreamCount

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pStreamStrides-02937**
  each element of pStreamStrides must be greater than 0 and less than or equal to
  VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStreamStride.
  Furthermore the alignment of each token input must be ensured
Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_CREATE_INFO_NV`
- **pNext** must be `NULL`
- **flags** must be a valid combination of `VkIndirectCommandsLayoutUsageFlagBitsNV` values
- **pipelineBindPoint** must be a valid `VkPipelineBindPoint` value
- **pTokens** must be a valid pointer to an array of `tokenCount` valid `VkIndirectCommandsLayoutTokenNV` structures
- **pStreamStrides** must be a valid pointer to an array of `streamCount` `uint32_t` values

Bits which **can** be set in `VkIndirectCommandsLayoutCreateInfoNV::flags`, specifying usage hints of an indirect command layout, are:

```cpp
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectCommandsLayoutUsageFlagBitsNV {
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV = 0x00000001,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV = 0x00000002,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV = 0x00000004,
} VkIndirectCommandsLayoutUsageFlagBitsNV;
```

- **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV** specifies that the layout is always used with the manual preprocessing step through calling `vkCmdPreprocessGeneratedCommandsNV` and executed by `vkCmdExecuteGeneratedCommandsNV` with `isPreprocessed` set to `VK_TRUE`.

- **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV** specifies that the input data for the sequences is not implicitly indexed from 0..sequencesUsed but a user provided `VkBuffer` encoding the index is provided.

- **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV** specifies that the processing of sequences **can** happen at an implementation-dependent order, which is not: guaranteed to be coherent using the same input data.
typedef VkFlags VkIndirectCommandsLayoutUsageFlagsNV;

VkIndirectCommandsLayoutUsageFlagsNV is a bitmask type for setting a mask of zero or more VkIndirectCommandsLayoutUsageFlagBitsNV.

Indirect command layouts are destroyed by:

```c
void vkDestroyIndirectCommandsLayoutNV(
    VkDevice device,        // Provided by VK_NV_device_generated_commands
    VkIndirectCommandsLayoutNV indirectCommandsLayout,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the layout.
- `indirectCommandsLayout` is the layout to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02938
  All submitted commands that refer to `indirectCommandsLayout` must have completed execution.

- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02939
  If `VkAllocationCallbacks` were provided when `indirectCommandsLayout` was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02940
  If no `VkAllocationCallbacks` were provided when `indirectCommandsLayout` was created, `pAllocator` must be NULL.

- VUID-vkDestroyIndirectCommandsLayoutNV-deviceGeneratedCommands-02941
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled.
### Valid Usage (Implicit)

- **VUID-vkDestroyIndirectCommandsLayoutNV-device-parameter**
  
  **device** must be a valid `VkDevice` handle

- **VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-parameter**
  
  If `indirectCommandsLayout` is not `VK_NULL_HANDLE`, `indirectCommandsLayout` must be a valid `VkIndirectCommandsLayoutNV` handle

- **VUID-vkDestroyIndirectCommandsLayoutNV-pAllocator-parameter**
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-parent**
  
  If `indirectCommandsLayout` is a valid handle, it must have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `indirectCommandsLayout` must be externally synchronized

### 31.1.2. Token Input Streams

The `VkIndirectCommandsStreamNV` structure specifies the input data for one or more tokens at processing time.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsStreamNV {
  VkBuffer buffer;
  VkDeviceSize offset;
} VkIndirectCommandsStreamNV;
```

- **buffer** specifies the `VkBuffer` storing the functional arguments for each sequence. These arguments can be written by the device.
- **offset** specifies an offset into `buffer` where the arguments start.
Valid Usage

- VUID-VkIndirectCommandsStreamNV-buffer-02942
  The buffer's usage flag must have the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-VkIndirectCommandsStreamNV-offset-02943
  The offset must be aligned to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment

- VUID-VkIndirectCommandsStreamNV-buffer-02975
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

Valid Usage (Implicit)

- VUID-VkIndirectCommandsStreamNV-buffer-parameter
  buffer must be a valid VkBuffer handle

The input streams can contain raw uint32_t values, existing indirect commands such as:

- VkDrawIndirectCommand
- VkDrawIndexedIndirectCommand
- VkDrawMeshTasksIndirectCommandNV

or additional commands as listed below. How the data is used is described in the next section.

The VkBindShaderGroupIndirectCommandNV structure specifies the input data for the VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindShaderGroupIndirectCommandNV {
    uint32_t groupIndex;
} VkBindShaderGroupIndirectCommandNV;
```

- index specifies which shader group of the current bound graphics pipeline is used.

Valid Usage

- VUID-VkBindShaderGroupIndirectCommandNV-None-02944
  The current bound graphics pipeline, as well as the pipelines it may reference, must have been created with VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV

- VUID-VkBindShaderGroupIndirectCommandNV-index-02945
  The index must be within range of the accessible shader groups of the current bound graphics pipeline. See vkCmdBindPipelineShaderGroupNV for further details
The `VkBindIndexBufferIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV` token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindIndexBufferIndirectCommandNV {
    VkDeviceAddress bufferAddress;
    uint32_t size;
    VkIndexType indexType;
} VkBindIndexBufferIndirectCommandNV;
```

- `bufferAddress` specifies a physical address of the `VkBuffer` used as index buffer.
- `size` is the byte size range which is available for this operation from the provided address.
- `indexType` is a `VkIndexType` value specifying how indices are treated. Instead of the Vulkan enum values, a custom `uint32_t` value can be mapped to an `VkIndexType` by specifying the `VkIndirectCommandsLayoutTokenNV::pIndexTypes` and `VkIndirectCommandsLayoutTokenNV::pIndexTypeValues` arrays.

**Valid Usage**

- VUID-VkBindIndexBufferIndirectCommandNV-None-02946
  The buffer's usage flag from which the address was acquired must have the `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` bit set
- VUID-VkBindIndexBufferIndirectCommandNV-bufferAddress-02947
  The `bufferAddress` must be aligned to the `indexType` used
- VUID-VkBindIndexBufferIndirectCommandNV-None-02948
  Each element of the buffer from which the address was acquired and that is non-sparse must be bound completely and contiguously to a single `VkDeviceMemory` object

**Valid Usage (Implicit)**

- VUID-VkBindIndexBufferIndirectCommandNV-indexType-parameter
  `indexType` must be a valid `VkIndexType` value

The `VkBindVertexBufferIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV` token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindVertexBufferIndirectCommandNV {
    VkDeviceAddress bufferAddress;
    uint32_t size;
    uint32_t stride;
} VkBindVertexBufferIndirectCommandNV;
```
• bufferAddress specifies a physical address of the VkBuffer used as vertex input binding.
• size is the byte size range which is available for this operation from the provided address.
• stride is the byte size stride for this vertex input binding as in VkVertexInputBindingDescription::stride. It is only used if VkIndirectCommandsLayoutTokenNV::vertexDynamicStride was set, otherwise the stride is inherited from the current bound graphics pipeline.

### Valid Usage

- **VUID-VkBindVertexBufferIndirectCommandNV-None-02949**
  The buffer's usage flag from which the address was acquired must have the VK_BUFFER_USAGE_VERTEX_BUFFER_BIT bit set
- **VUID-VkBindVertexBufferIndirectCommandNV-None-02950**
  Each element of the buffer from which the address was acquired and that is non-sparse must be bound completely and contiguously to a single VkDeviceMemory object

The VkSetStateFlagsIndirectCommandNV structure specifies the input data for the VK_INDORECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV token. Which state is changed depends on the VkIndirectStateFlagBitsNV specified at VkIndirectCommandsLayoutNV creation time.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkSetStateFlagsIndirectCommandNV {
    uint32_t data;
} VkSetStateFlagsIndirectCommandNV;
```

- **data** encodes packed state that this command alters.
  - Bit 0: If set represents VK_FRONT_FACE_CLOCKWISE, otherwise VK_FRONT_FACE_COUNTER_CLOCKWISE

A subset of the graphics pipeline state can be altered using indirect state flags:

```c
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectStateFlagBitsNV {
    VK_INDORECT_STATE_FLAG_FRONTFACE_BIT_NV = 0x00000001,
} VkIndirectStateFlagBitsNV;
```

- **VK_INDORECT_STATE_FLAG_FRONTFACE_BIT_NV** allows to toggle the VkFrontFace rasterization state for subsequent draw operations.

```c
// Provided by VK_NV_device_generated_commands
typedef VkFlags VkIndirectStateFlagsNV;
```

VkIndirectStateFlagsNV is a bitmask type for setting a mask of zero or more VkIndirectStateFlagBitsNV.
31.1.3. Tokenized Command Processing

The processing is in principle illustrated below:

```c
void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s)
{
    for (t = 0; t < indirectCommandsLayout.tokenCount; t++)
    {
        uint32_t stream  = indirectCommandsLayout.pTokens[t].stream;
        uint32_t offset  = indirectCommandsLayout.pTokens[t].offset;
        uint32_t stride  = indirectCommandsLayout.pStreamStrides[stream];
        stream            = pIndirectCommandsStreams[stream];
        const void* input = stream.buffer.pointer( stream.offset + stride * s + offset )
        // further details later
        indirectCommandsLayout.pTokens[t].command (cmd, pipeline, input, s);
    }
}

void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, sequencesCount)
{
    for (s = 0; s < sequencesCount; s++)
    {
        cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s);  
    }
}
```

The processing of each sequence is considered stateless, therefore all state changes must occur prior work provoking commands within the sequence. A single sequence is strictly targeting the VkPipelineBindPoint it was created with.

The primary input data for each token is provided through VkBuffer content at preprocessing using vkCmdPreprocessGeneratedCommandsNV or execution time using vkCmdExecuteGeneratedCommandsNV, however some functional arguments, for example binding sets, are specified at layout creation time. The input size is different for each token.

Possible values of those elements of the VkIndirectCommandsLayoutCreateInfoNV::pTokens array which specify command tokens (other elements of the array specify command parameters) are:
// Provided by VK_NV_device_generated_commands

typedef enum VkIndirectCommandsTokenTypeNV {
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV = 0,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV = 1,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV = 2,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV = 3,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV = 4,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV = 5,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV = 6,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV = 7,
} VkIndirectCommandsTokenTypeNV;

Table 45. Supported indirect command tokens

<table>
<thead>
<tr>
<th>Token type</th>
<th>Equivalent command</th>
</tr>

</tbody>
</table>

The `VkIndirectCommandsLayoutTokenNV` structure specifies details to the function arguments that need to be known at layout creation time:
// Provided by VK_NV_device_generated_commands

typedef struct VkIndirectCommandsLayoutTokenNV {
    VkStructureType sType;
    const void* pNext;
    VkIndirectCommandsTokenTypeNV tokenType;
    uint32_t stream;
    uint32_t offset;
    uint32_t vertexBindingUnit;
    VkBool32 vertexDynamicStride;
    VkPipelineLayout pushconstantPipelineLayout;
    VkShaderStageFlags pushconstantShaderStageFlags;
    uint32_t pushconstantOffset;
    uint32_t pushconstantSize;
    VkIndirectStateFlagsNV indirectStateFlags;
    uint32_t indexTypeCount;
    const VkIndexType* pIndexTypes;
    const uint32_t* pIndexTypeValues;
} VkIndirectCommandsLayoutTokenNV;

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **tokenType** specifies the token command type.
• **stream** is the index of the input stream that contains the token argument data.
• **offset** is a relative starting offset within the input stream memory for the token argument data.
• **vertexBindingUnit** is used for the vertex buffer binding command.
• **vertexDynamicStride** sets if the vertex buffer stride is provided by the binding command rather than the current bound graphics pipeline state.
• **pushconstantPipelineLayout** is the **VkPipelineLayout** used for the push constant command.
• **pushconstantShaderStageFlags** are the shader stage flags used for the push constant command.
• **pushconstantOffset** is the offset used for the push constant command.
• **pushconstantSize** is the size used for the push constant command.
• **indirectStateFlags** are the active states for the state flag command.
• **indexTypeCount** is the optional size of the **pIndexTypes** and **pIndexTypeValues** array pairings. If not zero, it allows to register a custom **uint32_t** value to be treated as specific **VkIndexType**.
• **pIndexTypes** is the used **VkIndexType** for the corresponding **uint32_t** value entry in **pIndexTypeValues**.
Valid Usage

• VUID-VkIndirectCommandsLayoutTokenNV-stream-02951
  stream must be smaller than VkIndirectCommandsLayoutCreateInfoNV::streamCount

• VUID-VkIndirectCommandsLayoutTokenNV-offset-02952
  offset must be less than or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenOffset

• VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02976
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV, vertexBindingUnit must stay within device supported limits for the appropriate commands

• VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02977
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, pushconstantPipelineLayout must be valid

• VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02978
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, pushconstantOffset must be a multiple of 4

• VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02979
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, pushconstantSize must be a multiple of 4

• VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02980
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, pushconstantOffset must be less than VkPhysicalDeviceLimits::maxPushConstantsSize

• VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02981
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, pushconstantSize must be less than or equal to VkPhysicalDeviceLimits::maxPushConstantsSize minus pushconstantOffset

• VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02982
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, for each byte in the range specified by pushconstantOffset and pushconstantSize and for each shader stage in pushconstantShaderStageFlags, there must be a push constant range in pushconstantPipelineLayout that includes that byte and that stage

• VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02983
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, for each byte in the range specified by pushconstantOffset and pushconstantSize and for each push constant range that overlaps that byte, pushconstantShaderStageFlags must include all stages in that push constant range's VkPushConstantRange::pushconstantShaderStageFlags

• VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02984
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV, indirectStateFlags must not be 0
Valid Usage (Implicit)

- **VUID-VkIndirectCommandsLayoutTokenNV-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_TOKEN_NV`

- **VUID-VkIndirectCommandsLayoutTokenNV-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-parameter**
  
  `tokenType` must be a valid `VkIndirectCommandsTokenTypeNV` value

- **VUID-VkIndirectCommandsLayoutTokenNV-pushconstantPipelineLayout-parameter**
  
  If `pushconstantPipelineLayout` is not `VK_NULL_HANDLE`, `pushconstantPipelineLayout` must be a valid `VkPipelineLayout` handle

- **VUID-VkIndirectCommandsLayoutTokenNV-pushconstantShaderStageFlags-parameter**
  
  `pushconstantShaderStageFlags` must be a valid combination of `VkShaderStageFlagBits` values

- **VUID-VkIndirectCommandsLayoutTokenNV-indirectStateFlags-parameter**
  
  `indirectStateFlags` must be a valid combination of `VkIndirectStateFlagBitsNV` values

- **VUID-VkIndirectCommandsLayoutTokenNV-pIndexTypes-parameter**
  
  If `indexTypeCount` is not `0`, `pIndexTypes` must be a valid pointer to an array of `VkIndexType` values

- **VUID-VkIndirectCommandsLayoutTokenNV-pIndexTypeValues-parameter**
  
  If `indexTypeCount` is not `0`, `pIndexTypeValues` must be a valid pointer to an array of `uint32_t` values

The following code provides detailed information on how an individual sequence is processed. For valid usage, all restrictions from the regular commands apply.

```c
void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s)
{
    for (uint32_t t = 0; t < indirectCommandsLayout.tokenCount; t++){
        token = indirectCommandsLayout.pTokens[t];

        uint32_t stride   = indirectCommandsLayout.pStreamStrides[token.stream];
        stream            = pIndirectCommandsStreams[token.stream];
        uint32_t offset   = stream.offset + stride * s + token.offset;
        const void* input = stream.buffer.pointer( offset )

        switch(input.type){
            case VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV:
                VkBindShaderGroupIndirectCommandNV* bind = input;

                vkCmdBindPipelineShaderGroupNV(cmd, indirectCommandsLayout.pipelineBindPoint, pipeline, bind->groupIndex);
                break;
```

Chapter 31. Device-Generated Commands | 1625
VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV:
VkSetStateFlagsIndirectCommandNV* state = input;

if (token.indirectStateFlags & VK_INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV){
    if (state.data & (1 << 0)){
        set VK_FRONT_FACE_CLOCKWISE;
    } else {
        set VK_FRONT_FACE_COUNTER_CLOCKWISE;
    }
} break;

VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV:
uint32_t* data = input;

vkCmdPushConstants(cmd,
    token.pushconstantPipelineLayout
    token.pushconstantStageFlags,
    token.pushconstantOffset,
    token.pushconstantSize, data);
break;

VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV:
VkBindIndexBufferIndirectCommandNV* data = input;

// the indexType may optionally be remapped
// from a custom uint32_t value, via
// VkIndirectCommandsLayoutTokenNV::pIndexTypeValues

vkCmdBindIndexBuffer(cmd,
    deriveBuffer(data->bufferAddress),
    deriveOffset(data->bufferAddress),
    data->indexType);
break;

VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV:
VkBindVertexBufferIndirectCommandNV* data = input;

// if token.vertexDynamicStride is VK_TRUE
// then the stride for this binding is set
// using data->stride as well

vkCmdBindVertexBuffers(cmd,
    token.vertexBindingUnit, 1,
    &deriveBuffer(data->bufferAddress),
    &deriveOffset(data->bufferAddress));
break;

VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV:
vkCmdDrawIndexedIndirect(cmd,
    stream.buffer, offset, 1, 0);
break;

VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV:
    vkCmdDrawIndirect(cmd,
        stream.buffer,
        offset, 1, 0);
break;

// only available if VK_NV_mesh_shader is supported
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_NV:
    vkCmdDrawMeshTasksIndirectNV(cmd,
        stream.buffer, offset, 1, 0);
break; }

31.2. Indirect Commands Generation And Execution

The generation of commands on the device requires a preprocess buffer. To retrieve the memory size and alignment requirements of a particular execution state call:

```c
// Provided by VK_NV_device_generated_commands
void vkGetGeneratedCommandsMemoryRequirementsNV(
    VkDevice                                    device,
    const VkGeneratedCommandsMemoryRequirementsInfoNV* pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

- **device** is the logical device that owns the buffer.
- **pInfo** is a pointer to an instance of the `VkGeneratedCommandsMemoryRequirementsInfoNV` structure containing parameters required for the memory requirements query.
- **pMemoryRequirements** is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

**Valid Usage**

- `VUID-vkGetGeneratedCommandsMemoryRequirementsNV-deviceGeneratedCommands-02906`
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled
Valid Usage (Implicit)

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkGeneratedCommandsMemoryRequirementsInfoNV` structure

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pMemoryRequirements-parameter
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkGeneratedCommandsMemoryRequirementsInfoNV {
    VkStructureType               sType;
    const void*                   pNext;
    VkPipelineBindPoint           pipelineBindPoint;
    VkPipeline                    pipeline;
    VkIndirectCommandsLayoutNV    indirectCommandsLayout;
    uint32_t                      maxSequencesCount;
} VkGeneratedCommandsMemoryRequirementsInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pipelineBindPoint` is the `VkPipelineBindPoint` of the `pipeline` that this buffer memory is intended to be used with during the execution.
- `pipeline` is the `VkPipeline` that this buffer memory is intended to be used with during the execution.
- `indirectCommandsLayout` is the `VkIndirectCommandsLayoutNV` that this buffer memory is intended to be used with.
- `maxSequencesCount` is the maximum number of sequences that this buffer memory in combination with the other state provided can be used with.

Valid Usage

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-maxSequencesCount-02907
  `maxSequencesCount` must be less or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount`
Valid Usage (Implicit)

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-sType-sType**
  *sType must be* **VK_STRUCTURE_TYPE_GENERATED_COMMANDS_MEMORY_REQUIREMENTS_INFO_NV**

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pNext-pNext**
  *pNext must be NULL*

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-parameter**
  *pipelineBindPoint must be a valid VkPipelineBindPoint value*

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipeline-parameter**
  *pipeline must be a valid VkPipeline handle*

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-indirectCommandsLayout-parameter**
  *indirectCommandsLayout must be a valid VkIndirectCommandsLayoutNV handle*

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-commonparent**
  *Both of indirectCommandsLayout, and pipeline must have been created, allocated, or retrieved from the same VkDevice*

The actual generation of commands as well as their execution on the device is handled as single action with:

```c
// Provided by VK_NV_device_generated_commands
void vkCmdExecuteGeneratedCommandsNV(
    VkCommandBuffer commandBuffer,     // Provided by VK_NV_device_generated_commands
    VkBool32 isPreprocessed,           // Provided by VK_NV_device_generated_commands
    const VkGeneratedCommandsInfoNV* pGeneratedCommandsInfo);                      // Provided by VK_NV_device_generated_commands
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **isPreprocessed** represents whether the input data has already been preprocessed on the device. If it is **VK_FALSE** this command will implicitly trigger the preprocesing step, otherwise not.
- **pGeneratedCommandsInfo** is a pointer to an instance of the VkGeneratedCommandsInfoNV structure containing parameters affecting the generation of commands.
Valid Usage

- **VUID-vkCmdExecuteGeneratedCommandsNV-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdExecuteGeneratedCommandsNV-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdExecuteGeneratedCommandsNV-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in **Pipeline Layout Compatibility**

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in **Pipeline Layout Compatibility**
Compatibility

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02705
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02706
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-04115
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the...
Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04471
  If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04473
  If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdExecuteGeneratedCommandsNV-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdExecuteGeneratedCommandsNV-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-04584
  Image subresources used as attachments in the current render pass must not be accessed in any way other than as an attachment by this command, except for cases involving...
read-only access to depth/stencil attachments as described in the Render Pass chapter

- **VUID-vkCmdExecuteGeneratedCommandsNV-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` dynamic state enabled, then `vkCmdSetViewportWithCountEXT` **must** have been called in the current command buffer prior to this draw command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- **VUID-vkCmdExecuteGeneratedCommandsNV-scissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, then `vkCmdSetScissorWithCountEXT` **must** have been called in the current command buffer prior to this draw command, and the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT` **must** match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-03419**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic states enabled then both `vkCmdSetViewportWithCountEXT` and `vkCmdSetScissorWithCountEXT` **must** have been called in the current command buffer prior to this draw command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04137**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline **must** have been created with `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCountEXT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04138**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic states enabled then the `viewportCount` parameter in the last call to
\texttt{vkCmdSetViewportWithScalingNV} must be greater than or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCountEXT}.

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04139**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT} dynamic state enabled, but not the \texttt{VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV} dynamic state enabled, then the bound graphics pipeline must have been created with \texttt{VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCountEXT}.

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04140**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT} and \texttt{VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV} dynamic states enabled then the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportShadingRatePaletteNV} must be greater than or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCountEXT}.

- **VUID-vkCmdExecuteGeneratedCommandsNV-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT} dynamic state enabled and an instance of \texttt{VkPipelineViewportSwizzleStateCreateInfoNV} chained from \texttt{VkPipelineViewportCreateInfo}, then the bound graphics pipeline must have been created with \texttt{VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCountEXT}.

- **VUID-vkCmdExecuteGeneratedCommandsNV-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT} dynamic state enabled and an instance of \texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV} chained from \texttt{VkPipelineViewportCreateInfo}, then the bound graphics pipeline must have been created with \texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCountEXT}.

- **VUID-vkCmdExecuteGeneratedCommandsNV-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT} dynamic state enabled then \texttt{vkCmdSetPrimitiveTopologyEXT} must have been called in the current command buffer prior to this draw command, and the \texttt{primitiveTopology} parameter of \texttt{vkCmdSetPrimitiveTopologyEXT} must be of the same topology class as the pipeline \texttt{VkPipelineInputAssemblyStateCreateInfo::topology} state.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04875**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT} dynamic state enabled then \texttt{vkCmdSetPatchControlPointsEXT} must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04876**
  If the bound graphics pipeline state was created with the
• VUID-vkCmdExecuteGeneratedCommandsNV-None-04877
If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT dynamic state enabled then 
vkCmdSetDepthBiasEnableEXT must have been called in the current command buffer prior to this draw command

• VUID-vkCmdExecuteGeneratedCommandsNV-logicOp-04878
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then 
vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this draw command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-04879
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT dynamic state enabled then 
vkCmdSetPrimitiveRestartEnableEXT must have been called in the current command buffer prior to this draw command

• VUID-vkCmdExecuteGeneratedCommandsNV-primitiveFragmentShadingRateWithMultipleViewports-04552
If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then 
vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this draw command, and the viewportCount parameter of 
vkCmdSetViewportWithCountEXT must be 1

• VUID-vkCmdExecuteGeneratedCommandsNV-blendEnable-04727
If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

• VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-04740
If rasterization is not disabled in the bound graphics pipeline, and neither the VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are enabled, then 
VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the current subpass color and/or depth/stencil attachments

• VUID-vkCmdExecuteGeneratedCommandsNV-pStrides-04884
If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, then 
vkCmdBindVertexBuffers2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of 
vkCmdBindVertexBuffers2EXT must not be NULL

• VUID-vkCmdExecuteGeneratedCommandsNV-None-04007
All vertex input bindings accessed via vertex input variables declared in the vertex
Shader entry point’s interface must have either valid or VK_NULL_HANDLE buffers bound

- VUID-vkCmdExecuteGeneratedCommandsNV-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be VK_NULL_HANDLE

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02721
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- VUID-vkCmdExecuteGeneratedCommandsNV-isPreprocessed-02908
  If isPreprocessed is VK_TRUE then vkCmdPreprocessGeneratedCommandsNV must have already been executed on the device, using the same pGeneratedCommandsInfo content as well as the content of the input buffers it references (all except VkGeneratedCommandsInfoNV::preprocessBuffer). Furthermore pGeneratedCommandsInfo's indirectCommandsLayout must have been created with the VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV bit set

- VUID-vkCmdExecuteGeneratedCommandsNV-pipeline-02909
  VkGeneratedCommandsInfoNV::pipeline must match the current bound pipeline at VkGeneratedCommandsInfoNV::pipelineBindPoint

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02910
  Transform feedback must not be active

- VUID-vkCmdExecuteGeneratedCommandsNV-deviceGeneratedCommands-02911
  The VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdExecuteGeneratedCommandsNV-pGeneratedCommandsInfo-parameter
  pGeneratedCommandsInfo must be a valid pointer to a valid VkGeneratedCommandsInfoNV structure

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdExecuteGeneratedCommandsNV-renderpass
  This command must only be called inside of a render pass instance
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

```c
typedef struct VkGeneratedCommandsInfoNV {
    VkStructureType                      sType;
    const void*                          pNext;
    VkPipelineBindPoint                  pipelineBindPoint;
    VkPipeline                           pipeline;
    VkIndirectCommandsLayoutNV           indirectCommandsLayout;
    uint32_t                             streamCount;
    const VkIndirectCommandsStreamNV*    pStreams;
    uint32_t                             sequencesCount;
    VkBuffer                             preprocessBuffer;
    VkDeviceSize                         preprocessSize;
    VkBuffer                             preprocessBufferSize;
    VkBuffer                             sequencesCountBuffer;
    VkDeviceSize                         sequencesCountOffset;
    VkBuffer                             sequencesIndexBuffer;
    VkDeviceSize                         sequencesIndexOffset;
} VkGeneratedCommandsInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipelineBindPoint` is the `VkPipelineBindPoint` used for the `pipeline`.
- `pipeline` is the `VkPipeline` used in the generation and execution process.
- `indirectCommandsLayout` is the `VkIndirectCommandsLayoutNV` that provides the command sequence to generate.
- `streamCount` defines the number of input streams
- `pStreams` provides an array of `VkIndirectCommandsStreamNV` that provide the input data for the tokens used in `indirectCommandsLayout`.
- `sequencesCount` is the maximum number of sequences to reserve. If `sequencesCountBuffer` is
VK_NULL_HANDLE, this is also the actual number of sequences generated.

- preprocessBuffer is the VkBuffer that is used for preprocessing the input data for execution. If this structure is used with vkCmdExecuteGeneratedCommandsNV with its isPreprocessed set to VK_TRUE, then the preprocessing step is skipped and data is only read from this buffer.

- preprocessOffset is the byte offset into preprocessBuffer where the preprocessed data is stored.

- preprocessSize is the maximum byte size within the preprocessBuffer after the preprocessOffset that is available for preprocessing.

- sequencesCountBuffer is a VkBuffer in which the actual number of sequences is provided as single uint32_t value.

- sequencesCountOffset is the byte offset into sequencesCountBuffer where the count value is stored.

- sequencesIndexBuffer is a VkBuffer that encodes the used sequence indices as uint32_t array.

- sequencesIndexOffset is the byte offset into sequencesIndexBuffer where the index values start.
Valid Usage

- **VUID-VkGeneratedCommandsInfoNV-pipeline-02912**
  The provided **pipeline must** match the pipeline bound at execution time.

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02913**
  If the **indirectCommandsLayout** uses a token of **VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV**, then the pipeline **must** have been created with multiple shader groups.

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02914**
  If the **indirectCommandsLayout** uses a token of **VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV**, then the pipeline **must** have been created with **VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV** set in **VkGraphicsPipelineCreateInfo::flags**.

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02915**
  If the **indirectCommandsLayout** uses a token of **VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV**, then the pipeline’s **VkPipelineLayout** **must** match the **VkIndirectCommandsLayoutTokenNV::pushconstantPipelineLayout**.

- **VUID-VkGeneratedCommandsInfoNV-streamCount-02916**
  **streamCount** **must** match the **indirectCommandsLayout**’s **streamCount**.

- **VUID-VkGeneratedCommandsInfoNV-sequencesCount-02917**
  **sequencesCount** **must** be less or equal to **VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount** and **VkGeneratedCommandsMemoryRequirementsInfoNV::maxSequencesCount** that was used to determine the **preprocessSize**.

- **VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-02918**
  **preprocessBuffer must** have the **VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT** bit set in its usage flag.

- **VUID-VkGeneratedCommandsInfoNV-preprocessOffset-02919**
  **preprocessOffset** **must** be aligned to **VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBuffer OffsetAlignment**.

- **VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-02971**
  If **preprocessBuffer** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object.

- **VUID-VkGeneratedCommandsInfoNV-preprocessSize-02920**
  **preprocessSize must** be at least equal to the memory requirement’s size returned by **vkGetGeneratedCommandsMemoryRequirementsNV** using the matching inputs (**indirectCommandsLayout**, ...) as within this structure.

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02921**
  **sequencesCountBuffer can** be set if the actual used count of sequences is sourced from the provided buffer. In that case the **sequencesCount** serves as upper bound.

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02922**
  If **sequencesCountBuffer** is not **VK_NULL_HANDLE**, its usage flag **must** have the **VK_BUFFER_USAGE_INDIRECT_COMMAND_BIT** flag set.
**VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT** bit set

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02923**
  If `sequencesCountBuffer` is not **VK_NULL_HANDLE**, `sequencesCountOffset` must be aligned to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minSequencesCountBufferOffsetAlignment`

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02972**
  If `sequencesCountBuffer` is not **VK_NULL_HANDLE** and is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02924**
  If `indirectCommandsLayout`'s **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV** is set, `sequencesIndexBuffer` must be set otherwise it must be **VK_NULL_HANDLE**

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02925**
  If `sequencesIndexBuffer` is not **VK_NULL_HANDLE**, its usage flag must have the **VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT** bit set

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02926**
  If `sequencesIndexBuffer` is not **VK_NULL_HANDLE**, `sequencesIndexOffset` must be aligned to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minSequencesIndexBufferOffsetAlignment`

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02973**
  If `sequencesIndexBuffer` is not **VK_NULL_HANDLE** and is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object
Valid Usage (Implicit)

- VUID-VkGeneratedCommandsInfoNV-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_GENERATED_COMMANDS_INFO_NV`

- VUID-VkGeneratedCommandsInfoNV-pNext-pNext
  
  **pNext** must be NULL

- VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-parameter
  
  **pipelineBindPoint** must be a valid `VkPipelineBindPoint` value

- VUID-VkGeneratedCommandsInfoNV-pipeline-parameter
  
  **pipeline** must be a valid `VkPipeline` handle

- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-parameter
  
  **indirectCommandsLayout** must be a valid `VkIndirectCommandsLayoutNV` handle

- VUID-VkGeneratedCommandsInfoNV-pStreams-parameter
  
  **pStreams** must be a valid pointer to an array of `streamCount` valid `VkIndirectCommandsStreamNV` structures

- VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-parameter
  
  **preprocessBuffer** must be a valid `VkBuffer` handle

- VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-parameter
  
  If **sequencesCountBuffer** is not `VK_NULL_HANDLE`, **sequencesCountBuffer** must be a valid `VkBuffer` handle

- VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-parameter
  
  If **sequencesIndexBuffer** is not `VK_NULL_HANDLE`, **sequencesIndexBuffer** must be a valid `VkBuffer` handle

- VUID-VkGeneratedCommandsInfoNV-streamCount-arraylength
  
  **streamCount** must be greater than 0

- VUID-VkGeneratedCommandsInfoNV-commonparent
  
  Each of **indirectCommandsLayout**, **pipeline**, **preprocessBuffer**, **sequencesCountBuffer**, and **sequencesIndexBuffer** that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

Referencing the functions defined in Indirect Commands Layout, `vkCmdExecuteGeneratedCommandsNV` behaves as:
uint32_t sequencesCount = sequencesCountBuffer ?
    min(maxSequencesCount, sequencesCountBuffer.load_uint32(sequencesCountOffset)) :
    maxSequencesCount;

cmdProcessAllSequences(commandBuffer, pipeline,
    indirectCommandsLayout, pIndirectCommandsStreams,
    sequencesCount,
    sequencesIndexBuffer, sequencesIndexOffset);

// The stateful commands within indirectCommandsLayout will not
// affect the state of subsequent commands in the target
// command buffer (cmd)

Note
It is important to note that the values of all state related to the pipelineBindPoint
used are undefined after this command.

Commands can be preprocessed prior execution using the following command:

// Provided by VK_NV_device_generated_commands
void vkCmdPreprocessGeneratedCommandsNV(
    VkCommandBuffer commandBuffer,            commandBuffer,
    const VkGeneratedCommandsInfoNV* pGeneratedCommandsInfo);

• commandBuffer is the command buffer which does the preprocessing.
• pGeneratedCommandsInfo is a pointer to an instance of the VkGeneratedCommandsInfoNV
  structure containing parameters affecting the preprocessing step.

Valid Usage

• VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-02927
  pGeneratedCommandsInfo’s indirectCommandsLayout must have been created with the
  VK INDIRECT COMMANDS LAYOUT USAGE EXPLICIT PREPROCESS_BIT_NV bit set

• VUID-vkCmdPreprocessGeneratedCommandsNV-deviceGeneratedCommands-02928
  The VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands feature
  must be enabled
Valid Usage (Implicit)

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-parameter
  \textit{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-parameter
  \texttt{pGeneratedCommandsInfo} must be a valid pointer to a valid \texttt{VkGeneratedCommandsInfoNV} structure

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-recording
  \textit{commandBuffer} must be in the recording state

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \textit{commandBuffer} was allocated from must support graphics, or compute operations

- VUID-vkCmdPreprocessGeneratedCommandsNV-renderpass
  This command must only be called outside of a render pass instance

Host Synchronization

- Host access to \textit{commandBuffer} must be externally synchronized

- Host access to the \texttt{VkCommandPool} that \textit{commandBuffer} was allocated from must be externally synchronized

Chapter 32. Sparse Resources

As documented in Resource Memory Association, VkBuffer and VkImage resources in Vulkan must be bound completely and contiguously to a single VkDeviceMemory object. This binding must be done before the resource is used, and the binding is immutable for the lifetime of the resource.

Sparse resources relax these restrictions and provide these additional features:

• Sparse resources can be bound non-contiguously to one or more VkDeviceMemory allocations.
• Sparse resources can be re-bound to different memory allocations over the lifetime of the resource.
• Sparse resources can have descriptors generated and used orthogonally with memory binding commands.

32.1. Sparse Resource Features

Sparse resources have several features that must be enabled explicitly at resource creation time. The features are enabled by including bits in the flags parameter of VkImageCreateInfo or VkBufferCreateInfo. Each feature also has one or more corresponding feature enables specified in VkPhysicalDeviceFeatures.

• Sparse binding is the base feature, and provides the following capabilities:
  ◦ Resources can be bound at some defined (sparse block) granularity.
  ◦ The entire resource must be bound to memory before use regardless of regions actually accessed.
  ◦ No specific mapping of image region to memory offset is defined, i.e. the location that each texel corresponds to in memory is implementation-dependent.
  ◦ Sparse buffers have a well-defined mapping of buffer range to memory range, where an offset into a range of the buffer that is bound to a single contiguous range of memory corresponds to an identical offset within that range of memory.
  ◦ Requested via the VK_IMAGE_CREATE_SPARSE_BINDING_BIT and VK_BUFFER_CREATE_SPARSE_BINDING_BIT bits.
  ◦ A sparse image created using VK_IMAGE_CREATE_SPARSE_BINDING_BIT (but not VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT) supports all formats that non-sparse usage supports, and supports both VK_IMAGE_TILING_OPTIMAL and VK_IMAGE_TILING_LINEAR tiling.

• Sparse Residency builds on (and requires) the sparseBinding feature. It includes the following capabilities:
  ◦ Resources do not have to be completely bound to memory before use on the device.
  ◦ Images have a prescribed sparse image block layout, allowing specific rectangular regions of the image to be bound to specific offsets in memory allocations.
  ◦ Consistency of access to unbound regions of the resource is defined by the absence or presence of VkPhysicalDeviceSparseProperties::residencyNonResidentStrict. If this property is present, accesses to unbound regions of the resource are well defined and behave as if the
data bound is populated with all zeros; writes are discarded. When this property is absent, accesses are considered safe, but reads will return undefined values.

- Requested via the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` and `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bits.

- Sparse residency support is advertised on a finer grain via the following features:
  
  - `sparseResidencyBuffer`: Support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - `sparseResidencyImage2D`: Support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - `sparseResidencyImage3D`: Support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - `sparseResidency2Samples`: Support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - `sparseResidency4Samples`: Support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - `sparseResidency8Samples`: Support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - `sparseResidency16Samples`: Support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

Implementations supporting `sparseResidencyImage2D` are only **required** to support sparse 2D, single-sampled images. Support for sparse 3D and MSAA images is **optional** and **can** be enabled via `sparseResidencyImage3D`, `sparseResidency2Samples`, `sparseResidency4Samples`, `sparseResidency8Samples`, and `sparseResidency16Samples`.

- A sparse image created using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` supports all non-compressed color formats with power-of-two element size that non-sparse usage supports. Additional formats **may** also be supported and **can** be queried via `vkGetPhysicalDeviceSparseImageFormatProperties`. `VK_IMAGE_TILING_LINEAR` tiling is not supported.

- **Sparse aliasing** provides the following capability that **can** be enabled per resource:

  Allows physical memory ranges to be shared between multiple locations in the same sparse resource or between multiple sparse resources, with each binding of a memory location observing a consistent interpretation of the memory contents.

  See **Sparse Memory Aliasing** for more information.

### 32.2. Sparse Buffers and Fully-Resident Images

Both `VkBuffer` and `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` or `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bits **can** be thought of as a linear region of address space. In the `VkImage` case if `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` is not used, this linear region is entirely opaque, meaning that there is no application-visible mapping between texel location and memory.
Unless `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` or `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` are also used, the entire resource must be bound to one or more `VkDeviceMemory` objects before use.

### 32.2.1. Sparse Buffer and Fully-Resident Image Block Size

The sparse block size in bytes for sparse buffers and fully-resident images is reported as `VkMemoryRequirements::alignment`. `alignment` represents both the memory alignment requirement and the binding granularity (in bytes) for sparse resources.

### 32.3. Sparse Partially-Resident Buffers

`VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bit allow the buffer to be made only partially resident. Partially resident `VkBuffer` objects are allocated and bound identically to `VkBuffer` objects using only the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` feature. The only difference is the ability for some regions of the buffer to be unbound during device use.

### 32.4. Sparse Partially-Resident Images

`VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` bit allow specific rectangular regions of the image called sparse image blocks to be bound to specific ranges of memory. This allows the application to manage residency at either image subresource or sparse image block granularity. Each image subresource (outside of the mip tail) starts on a sparse block boundary and has dimensions that are integer multiples of the corresponding dimensions of the sparse image block.

**Note**

Applications can use these types of images to control LOD based on total memory consumption. If memory pressure becomes an issue the application can unbind and disable specific mipmap levels of images without having to recreate resources or modify texel data of unaffected levels.

The application can also use this functionality to access subregions of the image in a “megatexture” fashion. The application can create a large image and only populate the region of the image that is currently being used in the scene.

### 32.4.1. Accessing Unbound Regions

The following member of `VkPhysicalDeviceSparseProperties` affects how data in unbound regions of sparse resources are handled by the implementation:

- `residencyNonResidentStrict`

If this property is not present, reads of unbound regions of the image will return undefined values. Both reads and writes are still considered safe and will not affect other resources or populated regions of the image.
If this property is present, all reads of unbound regions of the image will behave as if the region was bound to memory populated with all zeros; writes will be discarded.

Formatted accesses to unbound memory **may** still alter some component values in the natural way for those accesses, e.g. substituting a value of one for alpha in formats that do not have an alpha component.

Example: Reading the alpha component of an unbacked `VK_FORMAT_R8_UNORM` image will return a value of 1.0f.

See **Physical Device Enumeration** for instructions for retrieving physical device properties.

### Implementor’s Note

For implementations that **cannot** natively handle access to unbound regions of a resource, the implementation **may** allocate and bind memory to the unbound regions. Reads and writes to unbound regions will access the implementation-managed memory instead.

Given that the values resulting from reads of unbound regions are undefined in this scenario, implementations **may** use the same physical memory for all unbound regions of multiple resources within the same process.

### 32.4.2. Mip Tail Regions

Sparse images created using `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` (without also using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`) have no specific mapping of image region or image subresource to memory offset defined, so the entire image **can** be thought of as a linear opaque address region. However, images created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` do have a prescribed sparse image block layout, and hence each image subresource **must** start on a sparse block boundary. Within each array layer, the set of mip levels that have a smaller size than the sparse block size in bytes are grouped together into a **mip tail region**.

If the `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` flag is present in the **flags** member of `VkSparseImageFormatProperties`, for the image's **format**, then any mip level which has dimensions that are not integer multiples of the corresponding dimensions of the sparse image block, and all subsequent mip levels, are also included in the mip tail region.

The following member of `VkPhysicalDeviceSparseProperties` **may** affect how the implementation places mip levels in the mip tail region:

- `residencyAlignedMipSize`

Each mip tail region is bound to memory as an opaque region (i.e. **must** be bound using a `VkSparseImageOpaqueMemoryBindInfo` structure) and **may** be of a size greater than or equal to the sparse block size in bytes. This size is guaranteed to be an integer multiple of the sparse block size in bytes.
An implementation may choose to allow each array-layer’s mip tail region to be bound to memory independently or require that all array-layer’s mip tail regions be treated as one. This is dictated by `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` in `VkSparseImageMemoryRequirements::flags`.

The following diagrams depict how `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` alter memory usage and requirements.

Figure 19. Sparse Image

In the absence of `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, each array layer contains a mip tail region containing texel data for all mip levels smaller than the sparse image block in any dimension.

Mip levels that are as large or larger than a sparse image block in all dimensions can be bound individually. Right-edges and bottom-edges of each level are allowed to have partially used sparse blocks. Any bound partially-used-sparse-blocks must still have their full sparse block size in bytes allocated in memory.
When `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` is present all array layers will share a single mip tail region.

**Note**

The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.
When `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` is present the first mip level that would contain partially used sparse blocks begins the mip tail region. This level and all subsequent levels are placed in the mip tail. Only the first $N$ mip levels whose dimensions are an exact multiple of the sparse image block dimensions can be bound and unbound on a sparse block basis.

![Sparse Image with Aligned Mip Size and Single Mip Tail](image)

**Figure 22. Sparse Image with Aligned Mip Size and Single Mip Tail**

- **Note**
  The mip tail region is presented here in a 2D array simply for figure size reasons. It is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When both `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` are present the constraints from each of these flags are in effect.

### 32.4.3. Standard Sparse Image Block Shapes

Standard sparse image block shapes define a standard set of dimensions for sparse image blocks that depend on the format of the image. Layout of texels or compressed texel blocks within a sparse image block is implementation dependent. All currently defined standard sparse image block shapes are 64 KB in size.

For block-compressed formats (e.g. `VK_FORMAT_BC5_UNORM_BLOCK`), the texel size is the size of the compressed texel block (e.g. 128-bit for BC5) thus the dimensions of the standard sparse image block shapes apply in terms of compressed texel blocks.
**Note**

For block-compressed formats, the dimensions of a sparse image block in terms of texels can be calculated by multiplying the sparse image block dimensions by the compressed texel block dimensions.

</tr>
</tbody>
</table>

Implementations that support the standard sparse image block shape for all formats listed in the Standard Sparse Image Block Shapes (Single Sample) and Standard Sparse Image Block Shapes (MSAA) tables may advertise the following VkPhysicalDeviceSparseProperties:

- residencyStandard2DBlockShape
- residencyStandard2DMultisampleBlockShape
- residencyStandard3DBlockShape

Reporting each of these features does not imply that all possible image types are supported as sparse. Instead, this indicates that no supported sparse image of the corresponding type will use custom sparse image block dimensions for any formats that have a corresponding standard sparse image block shape.

### 32.4.4. Custom Sparse Image Block Shapes

An implementation that does not support a standard image block shape for a particular sparse partially-resident image may choose to support a custom sparse image block shape for it instead. The dimensions of such a custom sparse image block shape are reported in VkSparseImageFormatProperties::imageGranularity. As with standard sparse image block shapes, the size in bytes of the custom sparse image block shape will be reported in VkMemoryRequirements::alignment.

Custom sparse image block dimensions are reported through vkGetPhysicalDeviceSparseImageFormatProperties and vkGetImageSparseMemoryRequirements.

An implementation must not support both the standard sparse image block shape and a custom...
sparse image block shape for the same image. The standard sparse image block shape must be used if it is supported.

32.4.5. Multiple Aspects

Partially resident images are allowed to report separate sparse properties for different aspects of the image. One example is for depth/stencil images where the implementation separates the depth and stencil data into separate planes. Another reason for multiple aspects is to allow the application to manage memory allocation for implementation-private metadata associated with the image. See the figure below:

![Multiple Aspect Sparse Image](image)

*Figure 23. Multiple Aspect Sparse Image*

**Note**

The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

In the figure above the depth, stencil, and metadata aspects all have unique sparse properties. The per-texel stencil data is \( \frac{1}{4} \) the size of the depth data, hence the stencil sparse blocks include \( 4 \times \) the number of texels. The sparse block size in bytes for all of the aspects is identical and defined by \texttt{VkMemoryRequirements::alignment}.

**Metadata**

The metadata aspect of an image has the following constraints:
• All metadata is reported in the mip tail region of the metadata aspect.
• All metadata must be bound prior to device use of the sparse image.

32.5. Sparse Memory Aliasing

By default sparse resources have the same aliasing rules as non-sparse resources. See Memory Aliasing for more information.

VkDevice objects that have the sparseResidencyAliased feature enabled are able to use the VK_BUFFER_CREATE_SPARSE_ALIASED_BIT and VK_IMAGE_CREATE_SPARSE_ALIASED_BIT flags for resource creation. These flags allow resources to access physical memory bound into multiple locations within one or more sparse resources in a data consistent fashion. This means that reading physical memory from multiple aliased locations will return the same value.

Care must be taken when performing a write operation to aliased physical memory. Memory dependencies must be used to separate writes to one alias from reads or writes to another alias. Writes to aliased memory that are not properly guarded against accesses to different aliases will have undefined results for all accesses to the aliased memory.

Applications that wish to make use of data consistent sparse memory aliasing must abide by the following guidelines:

• All sparse resources that are bound to aliased physical memory must be created with the VK_BUFFER_CREATE_SPARSE_ALIASED_BIT / VK_IMAGE_CREATE_SPARSE_ALIASED_BIT flag.
• All resources that access aliased physical memory must interpret the memory in the same way. This implies the following:
  ◦ Buffers and images cannot alias the same physical memory in a data consistent fashion. The physical memory ranges must be used exclusively by buffers or used exclusively by images for data consistency to be guaranteed.
  ◦ Memory in sparse image mip tail regions cannot access aliased memory in a data consistent fashion.
  ◦ Sparse images that alias the same physical memory must have compatible formats and be using the same sparse image block shape in order to access aliased memory in a data consistent fashion.

Failure to follow any of the above guidelines will require the application to abide by the normal, non-sparse resource aliasing rules. In this case memory cannot be accessed in a data consistent fashion.

Note

Enabling sparse resource memory aliasing can be a way to lower physical memory use, but it may reduce performance on some implementations. An application developer can test on their target HW and balance the memory / performance trade-offs measured.
32.6. Sparse Resource Implementation Guidelines (Informative)
This section is Informative. It is included to aid in implementors’ understanding of sparse resources.

Device Virtual Address

The basic \texttt{sparseBinding} feature allows the resource to reserve its own device virtual address range at resource creation time rather than relying on a bind operation to set this. Without any other creation flags, no other constraints are relaxed compared to normal resources. All pages \textbf{must} be bound to physical memory before the device accesses the resource.

The \texttt{sparse residency} features allow sparse resources to be used even when not all pages are bound to memory. Implementations that support access to unbound pages without causing a fault \textbf{may} support \texttt{residencyNonResidentStrict}.

Not faulting on access to unbound pages is not enough to support \texttt{residencyNonResidentStrict}. An implementation \textbf{must} also guarantee that reads after writes to unbound regions of the resource always return data for the read as if the memory contains zeros. Depending on any caching hierarchy of the implementation this \textbf{may} not always be possible.

Any implementation that does not fault, but does not guarantee correct read values \textbf{must} not support \texttt{residencyNonResidentStrict}.

Any implementation that \textbf{cannot} access unbound pages without causing a fault will require the implementation to bind the entire device virtual address range to physical memory. Any pages that the application does not bind to memory \textbf{may} be bound to one (or more) "`placeholder" physical page(s) allocated by the implementation. Given the following properties:

\begin{itemize}
  \item A process \textbf{must} not access memory from another process
  \item Reads return undefined values
\end{itemize}

It is sufficient for each host process to allocate these placeholder pages and use them for all resources in that process. Implementations \textbf{may} allocate more often (per instance, per device, or per resource).

Binding Memory

The byte size reported in \texttt{VkMemoryRequirements.size} \textbf{must} be greater than or equal to the amount of physical memory \textbf{required} to fully populate the resource. Some implementations require “holes” in the device virtual address range that are never accessed. These holes \textbf{may} be included in the \texttt{size} reported for the resource.

Including or not including the device virtual address holes in the resource size will alter how the implementation provides support for \texttt{VkSparseImageOpaqueMemoryBindInfo}. This operation \textbf{must} be supported for all sparse images, even ones created with \texttt{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT}.

\begin{itemize}
  \item If the holes are included in the size, this bind function becomes very easy. In most cases the \texttt{resourceOffset} is simply a device virtual address offset and the implementation can easily determine what device virtual address to bind. The cost is that the application \textbf{may}
allocate more physical memory for the resource than it needs.

- If the holes are not included in the size, the application can allocate less physical memory than otherwise for the resource. However, in this case the implementation must account for the holes when mapping resourceOffset to the actual device virtual address intended to be mapped.

**Note**

If the application always uses VkSparseImageMemoryBindInfo to bind memory for the non-tail mip levels, any holes that are present in the resource size may never be bound.

Since VkSparseImageMemoryBindInfo uses texel locations to determine which device virtual addresses to bind, it is impossible to bind device virtual address holes with this operation.

**Binding Metadata Memory**

All metadata for sparse images have their own sparse properties and are embedded in the mip tail region for said properties. See the Multiaspect section for details.

Given that metadata is in a mip tail region, and the mip tail region must be reported as contiguous (either globally or per-array-layer), some implementations will have to resort to complicated offset → device virtual address mapping for handling VkSparseImageOpaqueMemoryBindInfo.

To make this easier on the implementation, the VK_SPARSE_MEMORY_BIND_METADATA_BIT explicitly specifies when metadata is bound with VkSparseImageOpaqueMemoryBindInfo. When this flag is not present, the resourceOffset may be treated as a strict device virtual address offset.

When VK_SPARSE_MEMORY_BIND_METADATA_BIT is present, the resourceOffset must have been derived explicitly from the imageMipTailOffset in the sparse resource properties returned for the metadata aspect. By manipulating the value returned for imageMipTailOffset, the resourceOffset does not have to correlate directly to a device virtual address offset, and may instead be whatever value makes it easiest for the implementation to derive the correct device virtual address.

### 32.7. Sparse Resource API

The APIs related to sparse resources are grouped into the following categories:

- Physical Device Features
- Physical Device Sparse Properties
- Sparse Image Format Properties
- Sparse Resource Creation
- Sparse Resource Memory Requirements
- Binding Resource Memory
32.7.1. Physical Device Features

Some sparse-resource related features are reported and enabled in VkPhysicalDeviceFeatures. These features must be supported and enabled on the VkDevice object before applications can use them. See Physical Device Features for information on how to get and set enabled device features, and for more detailed explanations of these features.

Sparse Physical Device Features

- **sparseBinding**: Support for creating VkBuffer and VkImage objects with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT and VK_IMAGE_CREATE_SPARSE_BINDING_BIT flags, respectively.
- **sparseResidencyBuffer**: Support for creating VkBuffer objects with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag.
- **sparseResidencyImage2D**: Support for creating 2D single-sampled VkImage objects with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidencyImage3D**: Support for creating 3D VkImage objects with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency2Samples**: Support for creating 2D VkImage objects with 2 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency4Samples**: Support for creating 2D VkImage objects with 4 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency8Samples**: Support for creating 2D VkImage objects with 8 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency16Samples**: Support for creating 2D VkImage objects with 16 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidencyAliased**: Support for creating VkBuffer and VkImage objects with the VK_BUFFER_CREATE_SPARSE_ALIASED_BIT and VK_IMAGE_CREATE_SPARSE_ALIASED_BIT flags, respectively.

32.7.2. Physical Device Sparse Properties

Some features of the implementation are not possible to disable, and are reported to allow applications to alter their sparse resource usage accordingly. These read-only capabilities are reported in the VkPhysicalDeviceProperties::sparseProperties member, which is a VkPhysicalDeviceSparseProperties structure.

The VkPhysicalDeviceSparseProperties structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceSparseProperties {
    VkBool32 residencyStandard2DBlockShape;
    VkBool32 residencyStandard2DMultisampleBlockShape;
    VkBool32 residencyStandard3DBlockShape;
    VkBool32 residencyAlignedMipSize;
    VkBool32 residencyNonResidentStrict;
} VkPhysicalDeviceSparseProperties;
```
• **residencyStandard2DBlockShape** is VK_TRUE if the physical device will access all single-sample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported the value returned in the imageGranularity member of the VkSparseImageFormatProperties structure for single-sample 2D images is not required to match the standard sparse image block dimensions listed in the table.

• **residencyStandard2DMultisampleBlockShape** is VK_TRUE if the physical device will access all multisample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (MSAA) table. If this property is not supported, the value returned in the imageGranularity member of the VkSparseImageFormatProperties structure for multisample 2D images is not required to match the standard sparse image block dimensions listed in the table.

• **residencyStandard3DBlockShape** is VK_TRUE if the physical device will access all 3D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported, the value returned in the imageGranularity member of the VkSparseImageFormatProperties structure for 3D images is not required to match the standard sparse image block dimensions listed in the table.

• **residencyAlignedMipSize** is VK_TRUE if images with mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block may be placed in the mip tail. If this property is not reported, only mip levels with dimensions smaller than the imageGranularity member of the VkSparseImageFormatProperties structure will be placed in the mip tail. If this property is reported the implementation is allowed to return VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT in the flags member of VkSparseImageFormatProperties, indicating that mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block will be placed in the mip tail.

• **residencyNonResidentStrict** specifies whether the physical device can consistently access non-resident regions of a resource. If this property is VK_TRUE, access to non-resident regions of resources will be guaranteed to return values as if the resource was populated with 0; writes to non-resident regions will be discarded.

### 32.7.3. Sparse Image Format Properties

Given that certain aspects of sparse image support, including the sparse image block dimensions, may be implementation-dependent, vkGetPhysicalDeviceSparseImageFormatProperties can be used to query for sparse image format properties prior to resource creation. This command is used to check whether a given set of sparse image parameters is supported and what the sparse image block shape will be.

**Sparse Image Format Properties API**

The VkSparseImageFormatProperties structure is defined as:
typedef struct VkSparseImageFormatProperties {
    VkImageAspectFlags aspectMask;
    VkExtent3D imageGranularity;
    VkSparseImageFormatFlags flags;
} VkSparseImageFormatProperties;

- **aspectMask** is a bitmask `VkImageAspectFlagBits` specifying which aspects of the image the properties apply to.
- **imageGranularity** is the width, height, and depth of the sparse image block in texels or compressed texel blocks.
- **flags** is a bitmask of `VkSparseImageFormatFlagBits` specifying additional information about the sparse resource.

Bits which **may** be set in `VkSparseImageFormatProperties::flags`, specifying additional information about the sparse resource, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSparseImageFormatFlagBits {
    VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT = 0x00000001,
    VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT = 0x00000002,
    VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT = 0x00000004,
} VkSparseImageFormatFlagBits;
```

- **VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT** specifies that the image uses a single mip tail region for all array layers.
- **VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT** specifies that the first mip level whose dimensions are not integer multiples of the corresponding dimensions of the sparse image block begins the mip tail region.
- **VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT** specifies that the image uses non-standard sparse image block dimensions, and the `imageGranularity` values do not match the standard sparse image block dimensions for the given format.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSparseImageFormatFlags;
```

`VkSparseImageFormatFlags` is a bitmask type for setting a mask of zero or more `VkSparseImageFormatFlagBits`.

`vkGetPhysicalDeviceSparseImageFormatProperties` returns an array of `VkSparseImageFormatProperties`. Each element will describe properties for one set of image aspects that are bound simultaneously in the image. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.
// Provided by VK_VERSION_1_0

void vkGetPhysicalDeviceSparseImageFormatProperties(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkImageType type,
    VkSampleCountFlagBits samples,
    VkImageUsageFlags usage,
    VkImageTiling tiling,
    uint32_t* pPropertyCount,
   VkSparseImageFormatProperties* pProperties);

• **physicalDevice** is the physical device from which to query the sparse image format properties.

• **format** is the image format.

• **type** is the dimensionality of image.

• **samples** is a VkSampleCountFlagBits value specifying the number of samples per texel.

• **usage** is a bitmask describing the intended usage of the image.

• **tiling** is the tiling arrangement of the texel blocks in memory.

• **pPropertyCount** is a pointer to an integer related to the number of sparse format properties available or queried, as described below.

• **pProperties** is either NULL or a pointer to an array of VkSparseImageFormatProperties structures.

If **pProperties** is NULL, then the number of sparse format properties available is returned in **pPropertyCount**. Otherwise, **pPropertyCount** must point to a variable set by the user to the number of elements in the **pProperties** array, and on return the variable is overwritten with the number of structures actually written to **pProperties**. If **pPropertyCount** is less than the number of sparse format properties available, at most **pPropertyCount** structures will be written.

If VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT is not supported for the given arguments, **pPropertyCount** will be set to zero upon return, and no data will be written to **pProperties**.

Multiple aspects are returned for depth/stencil images that are implemented as separate planes by the implementation. The depth and stencil data planes each have unique VkSparseImageFormatProperties data.

Depth/stencil images with depth and stencil data interleaved into a single plane will return a single VkSparseImageFormatProperties structure with the aspectMask set to VK_IMAGE_ASPECT_DEPTH_BIT | VK_IMAGE_ASPECT_STENCIL_BIT.
Valid Usage

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-01094
  samples must be a bit value that is set in VkImageFormatProperties::sampleCounts returned by vkGetPhysicalDeviceImageFormatProperties with format, type, tiling, and usage equal to those in this command and flags equal to the value that is set in VkImageCreateInfo ::flags when the image is created

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-format-parameter
  format must be a valid VkFormat value

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-type-parameter
  type must be a valid VkImageType value

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-parameter
  samples must be a valid VkSampleCountFlagBits value

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-parameter
  usage must be a valid combination of VkImageUsageFlagBits values

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-requiredbitmask
  usage must not be 0

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-tiling-parameter
  tiling must be a valid VkImageTiling value

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pPropertyCount-parameter
  pPropertyCount must be a valid pointer to a uint32_t value

  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkSparseImageFormatProperties structures

In Chapter 32. Sparse Resources, vkGetPhysicalDeviceSparseImageFormatProperties2 returns an array of VkSparseImageFormatProperties2. Each element will describe properties for one set of image aspects that are bound simultaneously in the image. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceSparseImageFormatProperties2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties2* pProperties);

- `physicalDevice` is the physical device from which to query the sparse image format properties.
- `pFormatInfo` is a pointer to a `VkPhysicalDeviceSparseImageFormatInfo2` structure containing input parameters to the command.
- `pPropertyCount` is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkSparseImageFormatProperties2` structures.

`vkGetPhysicalDeviceSparseImageFormatProperties2KHR` behaves identically to `vkGetPhysicalDeviceSparseImageFormatProperties`, with the ability to return extended information by adding extending structures to the `pNext` chain of its `pProperties` parameter.

---

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-physicalDevice-parameter
  `physicalDevice` **must** be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pFormatInfo-parameter
  `pFormatInfo` **must** be a valid pointer to a valid `VkPhysicalDeviceSparseImageFormatInfo2` structure

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pPropertyCount-parameter
  `pPropertyCount` **must** be a valid pointer to a `uint32_t` value

  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkSparseImageFormatProperties2` structures

The `VkPhysicalDeviceSparseImageFormatInfo2` structure is defined as:
typedef struct VkPhysicalDeviceSparseImageFormatInfo2 {
    VkStructureType          sType;
    const void*              pNext;
    VkFormat                  format;
    VkImageType               type;
    VkSampleCountFlagBits    samples;
    VkImageUsageFlags        usage;
    VkImageTiling            tiling;
} VkPhysicalDeviceSparseImageFormatInfo2;

or the equivalent

// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceSparseImageFormatInfo2
VkPhysicalDeviceSparseImageFormatInfo2KHR;

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `format` is the image format.
• `type` is the dimensionality of image.
• `samples` is a `VkSampleCountFlagBits` value specifying the number of samples per texel.
• `usage` is a bitmask describing the intended usage of the image.
• `tiling` is the tiling arrangement of the texel blocks in memory.

**Valid Usage**

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-01095
  samples must be a bit value that is set in `VkImageFormatProperties::sampleCounts` returned by `vkGetPhysicalDeviceImageFormatProperties` with `format`, `type`, `tiling`, and `usage` equal to those in this command and `flags` equal to the value that is set in `VkImageCreateInfo ::flags` when the image is created
Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SPARSE_IMAGE_FORMAT_INFO_2`

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-pNext-pNext**
  
  *pNext* must be `NULL`

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-format-parameter**
  
  *format* must be a valid `VkFormat` value

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-type-parameter**
  
  *type* must be a valid `VkImageType` value

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-parameter**
  
  *samples* must be a valid `VkSampleCountFlagBits` value

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-parameter**
  
  *usage* must be a valid combination of `VkImageUsageFlagBits` values

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-requiredbitmask**
  
  *usage* must not be `0`

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-tiling-parameter**
  
  *tiling* must be a valid `VkImageTiling` value

The `VkSparseImageFormatProperties2` structure is defined as:

```c
typedef struct VkSparseImageFormatProperties2 {
    VkStructureType sType;
    void* pNext;
    VkSparseImageFormatProperties properties;
} VkSparseImageFormatProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkSparseImageFormatProperties2 VkSparseImageFormatProperties2KHR;
```

- *sType* is the type of this structure.
- *pNext* is `NULL` or a pointer to a structure extending this structure.
- *properties* is a `VkSparseImageFormatProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceSparseImageFormatProperties`. 
### 32.7.4. Sparse Resource Creation

Sparse resources require that one or more sparse feature flags be specified (as part of the `VkPhysicalDeviceFeatures` structure described previously in the Physical Device Features section) when calling `vkCreateDevice`. When the appropriate device features are enabled, the `VK_BUFFER_CREATE_SPARSE_*` and `VK_IMAGE_CREATE_SPARSE_*` flags can be used. See `vkCreateBuffer` and `vkCreateImage` for details of the resource creation APIs.

**Note**
Specifying `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` or `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` requires specifying `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` or `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, respectively, as well. This means that resources must be created with the appropriate `*_SPARSE_BINDING_BIT` to be used with the sparse binding command (`vkQueueBindSparse`).

### 32.7.5. Sparse Resource Memory Requirements

Sparse resources have specific memory requirements related to binding sparse memory. These memory requirements are reported differently for `VkBuffer` objects and `VkImage` objects.

**Buffer and Fully-Resident Images**

Buffers (both fully and partially resident) and fully-resident images can be bound to memory using only the data from `VkMemoryRequirements`. For all sparse resources the `VkMemoryRequirements::alignment` member specifies both the bindable sparse block size in bytes and required alignment of `VkDeviceMemory`.

**Partially Resident Images**

Partially resident images have a different method for binding memory. As with buffers and fully resident images, the `VkMemoryRequirements::alignment` field specifies the bindable sparse block size in bytes for the image.

Requesting sparse memory requirements for `VkImage` objects using `vkGetImageSparseMemoryRequirements` will return an array of one or more `VkSparseImageMemoryRequirements` structures. Each structure describes the sparse memory requirements for a group of aspects of the image.

The sparse image must have been created using the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag to
Sparse Image Memory Requirements

The \texttt{VkSparseImageMemoryRequirements} structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryRequirements {
    VkSparseImageFormatProperties formatProperties;
    uint32_t imageMipTailFirstLod;
    VkDeviceSize imageMipTailSize;
    VkDeviceSize imageMipTailOffset;
    VkDeviceSize imageMipTailStride;
} VkSparseImageMemoryRequirements;
```

- \texttt{formatProperties.aspectMask} is the set of aspects of the image that this sparse memory requirement applies to. This will usually have a single aspect specified. However, depth/stencil images may have depth and stencil data interleaved in the same sparse block, in which case both \texttt{VK_IMAGE_ASPECT_DEPTH_BIT} and \texttt{VK_IMAGE_ASPECT_STENCIL_BIT} would be present.

- \texttt{formatProperties.imageGranularity} describes the dimensions of a single bindable sparse image block in texel units. For aspect \texttt{VK_IMAGE_ASPECT_METADATA_BIT}, all dimensions will be zero. All metadata is located in the mip tail region.

- \texttt{formatProperties.flags} is a bitmask of \texttt{VkSparseImageFormatFlagBits}:
  - If \texttt{VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT} is set the image uses a single mip tail region for all array layers.
  - If \texttt{VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT} is set the dimensions of mip levels must be integer multiples of the corresponding dimensions of the sparse image block for levels not located in the mip tail.
  - If \texttt{VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT} is set the image uses non-standard sparse image block dimensions. The \texttt{formatProperties.imageGranularity} values do not match the standard sparse image block dimension corresponding to the image's format.

- \texttt{imageMipTailFirstLod} is the first mip level at which image subresources are included in the mip tail region.

- \texttt{imageMipTailSize} is the memory size (in bytes) of the mip tail region. If \texttt{formatProperties.flags} contains \texttt{VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT}, this is the size of the whole mip tail, otherwise this is the size of the mip tail of a single array layer. This value is guaranteed to be a multiple of the sparse block size in bytes.

- \texttt{imageMipTailOffset} is the opaque memory offset used with \texttt{VkSparseImageOpaqueMemoryBindInfo} to bind the mip tail region(s).

- \texttt{imageMipTailStride} is the offset stride between each array-layer's mip tail, if \texttt{formatProperties.flags} does not contain \texttt{VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT} (otherwise the value is undefined).

To query sparse memory requirements for an image, call:
void vkGetImageSparseMemoryRequirements(
    VkDevice device, 
    VkImage image, 
    uint32_t* pSparseMemoryRequirementCount, 
    VkSparseImageMemoryRequirements* pSparseMemoryRequirements);

- device is the logical device that owns the image.
- image is the VkImage object to get the memory requirements for.
- pSparseMemoryRequirementCount is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
- pSparseMemoryRequirements is either NULL or a pointer to an array of VkSparseImageMemoryRequirements structures.

If pSparseMemoryRequirements is NULL, then the number of sparse memory requirements available is returned in pSparseMemoryRequirementCount. Otherwise, pSparseMemoryRequirementCount must point to a variable set by the user to the number of elements in the pSparseMemoryRequirements array, and on return the variable is overwritten with the number of structures actually written to pSparseMemoryRequirements. If pSparseMemoryRequirementCount is less than the number of sparse memory requirements available, at most pSparseMemoryRequirementCount structures will be written.

If the image was not created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT then pSparseMemoryRequirementCount will be set to zero and pSparseMemoryRequirements will not be written to.

Note
It is legal for an implementation to report a larger value in VkMemoryRequirements::size than would be obtained by adding together memory sizes for all VkSparseImageMemoryRequirements returned by vkGetImageSparseMemoryRequirements. This may occur when the implementation requires unused padding in the address range describing the resource.
Valid Usage (Implicit)

- **VUID-vkGetImageSparseMemoryRequirements-device-parameter**
  
device must be a valid VkDevice handle

- **VUID-vkGetImageSparseMemoryRequirements-image-parameter**
  
image must be a valid VkImage handle

- **VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter**
  
pSparseMemoryRequirementCount must be a valid pointer to a uint32_t value

- **VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter**
  
If the value referenced by pSparseMemoryRequirementCount is not 0, and pSparseMemoryRequirements is not NULL, pSparseMemoryRequirements must be a valid pointer to an array of pSparseMemoryRequirementCount VkSparseImageMemoryRequirements structures

- **VUID-vkGetImageSparseMemoryRequirements-image-parent**
  
image must have been created, allocated, or retrieved from device

To query sparse memory requirements for an image, call:

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetImageSparseMemoryRequirements2KHR(
    VkDevice                                    device,
    const VkImageSparseMemoryRequirementsInfo2* pInfo,
    uint32_t*                                   pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2*           pSparseMemoryRequirements);
```

- **device** is the logical device that owns the image.
- **pInfo** is a pointer to a VkImageSparseMemoryRequirementsInfo2 structure containing parameters required for the memory requirements query.
- **pSparseMemoryRequirementCount** is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
- **pSparseMemoryRequirements** is either NULL or a pointer to an array of VkSparseImageMemoryRequirements2 structures.
Valid Usage (Implicit)

- VUID-vkGetImageSparseMemoryRequirements2-device-parameter
device **must** be a valid VkDevice handle

- VUID-vkGetImageSparseMemoryRequirements2-pInfo-parameter
  pInfo **must** be a valid pointer to a valid VkImageSparseMemoryRequirementsInfo2 structure

- VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirementCount-parameter
  pSparseMemoryRequirementCount **must** be a valid pointer to a uint32_t value

- VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirements-parameter
  If the value referenced by pSparseMemoryRequirementCount is not 0, and pSparseMemoryRequirements is not NULL, pSparseMemoryRequirements **must** be a valid pointer to an array of pSparseMemoryRequirementCount VkSparseImageMemoryRequirements2 structures

The VkImageSparseMemoryRequirementsInfo2 structure is defined as:

```c
typedef struct VkImageSparseMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageSparseMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageSparseMemoryRequirementsInfo2 VkImageSparseMemoryRequirementsInfo2KHR;
```

- sType is the type of this structure.
- pNext is **NULL** or a pointer to a structure extending this structure.
- image is the image to query.

Valid Usage (Implicit)

- VUID-VkImageSparseMemoryRequirementsInfo2-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMAGE_SPARSE_MEMORY_REQUIREMENTS_INFO_2

- VUID-VkImageSparseMemoryRequirementsInfo2-pNext-pNext
  pNext **must** be **NULL**

- VUID-VkImageSparseMemoryRequirementsInfo2-image-parameter
  image **must** be a valid VkImage handle

The VkSparseImageMemoryRequirements2 structure is defined as:
typedef struct VkSparseImageMemoryRequirements2 {
    VkStructureType sType;
    void* pNext;
    VkSparseImageMemoryRequirements memoryRequirements;
} VkSparseImageMemoryRequirements2;

or the equivalent

// Provided by VK_KHR_get_memory_requirements2
typedef VkSparseImageMemoryRequirements2 VkSparseImageMemoryRequirements2KHR;

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **memoryRequirements** is a **VkSparseImageMemoryRequirements** structure describing the memory requirements of the sparse image.

### Valid Usage (Implicit)

- VUID-VkSparseImageMemoryRequirements2-sType-sType  
  **sType** must be **VK_STRUCTURE_TYPE_SPARSE_IMAGE_MEMORY_REQUIREMENTS_2**
- VUID-VkSparseImageMemoryRequirements2-pNext-pNext  
  **pNext** must be **NULL**

32.7.6. Binding Resource Memory

Non-sparse resources are backed by a single physical allocation prior to device use (via `vkBindImageMemory` or `vkBindBufferMemory`), and their backing must not be changed. On the other hand, sparse resources can be bound to memory non-contiguously and these bindings can be altered during the lifetime of the resource.

**Note**

It is important to note that freeing a **VkDeviceMemory** object with `vkFreeMemory` will not cause resources (or resource regions) bound to the memory object to become unbound. Applications must not access resources bound to memory that has been freed.

Sparse memory bindings execute on a queue that includes the **VK_QUEUE_SPARSE_BINDING_BIT** bit. Applications must use synchronization primitives to guarantee that other queues do not access ranges of memory concurrently with a binding change. Applications can access other ranges of the same resource while a bind operation is executing.
Implementations **must** provide a guarantee that simultaneously binding sparse blocks while another queue accesses those same sparse blocks via a sparse resource **must** not access memory owned by another process or otherwise corrupt the system.

While some implementations **may** include `VK_QUEUE_SPARSE_BINDING_BIT` support in queue families that also include graphics and compute support, other implementations **may** only expose a `VK_QUEUE_SPARSE_BINDING_BIT`-only queue family. In either case, applications **must** use **synchronization primitives** to explicitly request any ordering dependencies between sparse memory binding operations and other graphics/compute/transfer operations, as sparse binding operations are not automatically ordered against command buffer execution, even within a single queue.

When binding memory explicitly for the `VK_IMAGE_ASPECT_METADATA_BIT` the application **must** use the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` in the `VkSparseMemoryBind::flags` field when binding memory. Binding memory for metadata is done the same way as binding memory for the mip tail, with the addition of the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` flag.

Binding the mip tail for any aspect **must** only be performed using `VkSparseImageOpaqueMemoryBindInfo`. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, then it **can** be bound with a single `VkSparseMemoryBind` structure, with `resourceOffset = imageMipTailOffset` and `size = imageMipTailSize`.

If `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` then the offset for the mip tail in each array layer is given as:

```
arrayMipTailOffset = imageMipTailOffset + arrayLayer * imageMipTailStride;
```

and the mip tail **can** be bound with `layerCount` `VkSparseMemoryBind` structures, each using `size = imageMipTailSize` and `resourceOffset = arrayMipTailOffset` as defined above.

Sparse memory binding is handled by the following APIs and related data structures.

**Sparse Memory Binding Functions**

The `VkSparseMemoryBind` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseMemoryBind {
    VkDeviceSize resourceOffset;
    VkDeviceSize size;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    VkSparseMemoryBindFlags flags;
} VkSparseMemoryBind;
```
• `resourceOffset` is the offset into the resource.
• `size` is the size of the memory region to be bound.
• `memory` is the `VkDeviceMemory` object that the range of the resource is bound to. If `memory` is `VK_NULL_HANDLE`, the range is unbound.
• `memoryOffset` is the offset into the `VkDeviceMemory` object to bind the resource range to. If `memory` is `VK_NULL_HANDLE`, this value is ignored.
• `flags` is a bitmask of `VkSparseMemoryBindFlagBits` specifying usage of the binding operation.

The binding range `[resourceOffset, resourceOffset + size)` has different constraints based on `flags`. If `flags` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range **must** be within the mip tail region of the metadata aspect. This metadata region is defined by:

```
metadataRegion = [base, base + imageSizeTailSize)
```

```
base = imageSizeTailOffset + imageSizeTailStride × n
```

and `imageSizeTailOffset`, `imageSizeTailSize`, and `imageSizeTailStride` values are from the `VkSparseImageMemoryRequirements` corresponding to the metadata aspect of the image, and `n` is a valid array layer index for the image,

`imageSizeTailStride` is considered to be zero for aspects where `VkSparseImageMemoryRequirements::formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`.

If `flags` does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range **must** be within the range `[0, VkMemoryRequirements::size)`.
Valid Usage

- VUID-VkSparseMemoryBind-memory-01096
  If `memory` is not `VK_NULL_HANDLE`, `memory` and `memoryOffset` must match the memory requirements of the resource, as described in section Resource Memory Association.

- VUID-VkSparseMemoryBind-memory-01097
  If `memory` is not `VK_NULL_HANDLE`, `memory` must not have been created with a memory type that reports `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set.

- VUID-VkSparseMemoryBind-size-01098
  `size` must be greater than 0

- VUID-VkSparseMemoryBind-resourceOffset-01099
  `resourceOffset` must be less than the size of the resource

- VUID-VkSparseMemoryBind-size-01100
  `size` must be less than or equal to the size of the resource minus `resourceOffset`

- VUID-VkSparseMemoryBind-memoryOffset-01101
  `memoryOffset` must be less than the size of `memory`

- VUID-VkSparseMemoryBind-size-01102
  `size` must be less than or equal to the size of `memory` minus `memoryOffset`

- VUID-VkSparseMemoryBind-memory-02730
  If `memory` was created with `VkExportMemoryAllocateInfo::handleTypes` not equal to 0, at least one handle type it contained must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created.

- VUID-VkSparseMemoryBind-memory-02731
  If `memory` was created by a memory import operation, the external handle type of the imported memory must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created.

Valid Usage (Implicit)

- VUID-VkSparseMemoryBind-memory-parameter
  If `memory` is not `VK_NULL_HANDLE`, `memory` must be a valid `VkDeviceMemory` handle

- VUID-VkSparseMemoryBind-flags-parameter
  `flags` must be a valid combination of `VkSparseMemoryBindFlagBits` values

Bits which can be set in `VkSparseMemoryBind::flags`, specifying usage of a sparse memory binding operation, are:
typedef enum VkSparseMemoryBindFlagBits {
    VK_SPARSE_MEMORY_BIND_METADATA_BIT = 0x00000001,
} VkSparseMemoryBindFlagBits;

- **VK_SPARSE_MEMORY_BIND_METADATA_BIT** specifies that the memory being bound is only for the metadata aspect.

typedef VkFlags VkSparseMemoryBindFlags;

VkSparseMemoryBindFlags is a bitmask type for setting a mask of zero or more VkSparseMemoryBindFlagBits.

Memory is bound to VkBuffer objects created with the **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** flag using the following structure:

typedef struct VkSparseBufferMemoryBindInfo {
    VkBuffer                     buffer;
    uint32_t                     bindCount;
    const VkSparseMemoryBind*    pBinds;
} VkSparseBufferMemoryBindInfo;

- **buffer** is the VkBuffer object to be bound.
- **bindCount** is the number of VkSparseMemoryBind structures in the pBinds array.
- **pBinds** is a pointer to an array of VkSparseMemoryBind structures.

**Valid Usage (Implicit)**

- **VUID-VkSparseBufferMemoryBindInfo-buffer-parameter**
  - **buffer** must be a valid VkBuffer handle

- **VUID-VkSparseBufferMemoryBindInfo-pBinds-parameter**
  - **pBinds** must be a valid pointer to an array of bindCount valid VkSparseMemoryBind structures

- **VUID-VkSparseBufferMemoryBindInfo-bindCount-arraylength**
  - **bindCount** must be greater than 0

Memory is bound to opaque regions of VkImage objects created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag using the following structure:
typedef struct VkSparseImageOpaqueMemoryBindInfo {
    VkImage                     image;
    uint32_t                     bindCount;
    const VkSparseMemoryBind*   pBinds;
} VkSparseImageOpaqueMemoryBindInfo;

- `image` is the `VkImage` object to be bound.
- `bindCount` is the number of `VkSparseMemoryBind` structures in the `pBinds` array.
- `pBinds` is a pointer to an array of `VkSparseMemoryBind` structures.

### Valid Usage

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-01103
  If the `flags` member of any element of `pBinds` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range defined must be within the mip tail region of the metadata aspect of `image`.

### Valid Usage (Implicit)

- VUID-VkSparseImageOpaqueMemoryBindInfo-image-parameter
  `image` must be a valid `VkImage` handle

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-parameter
  `pBinds` must be a valid pointer to an array of `bindCount` valid `VkSparseMemoryBind` structures

- VUID-VkSparseImageOpaqueMemoryBindInfo-bindCount-arraylength
  `bindCount` must be greater than 0
Note

This operation is normally used to bind memory to fully-resident sparse images or for mip tail regions of partially resident images. However, it can also be used to bind memory for the entire binding range of partially resident images.

In case flags does not contain VK_SPARSE_MEMORY_BIND_METADATA_BIT, the resourceOffset is in the range [0, VkMemoryRequirements::size). This range includes data from all aspects of the image, including metadata. For most implementations this will probably mean that the resourceOffset is a simple device address offset within the resource. It is possible for an application to bind a range of memory that includes both resource data and metadata. However, the application would not know what part of the image the memory is used for, or if any range is being used for metadata.

When flags contains VK_SPARSE_MEMORY_BIND_METADATA_BIT, the binding range specified must be within the mip tail region of the metadata aspect. In this case the resourceOffset is not required to be a simple device address offset within the resource. However, it is defined to be within [imageMipTailOffset, imageMipTailOffset + imageMipTailSize) for the metadata aspect. See VkSparseMemoryBind for the full constraints on binding region with this flag present.

Memory can be bound to sparse image blocks of VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag using the following structure:

```c
typedef struct VkSparseImageMemoryBindInfo {
    VkImage image;
    uint32_t bindCount;
    const VkSparseImageMemoryBind* pBinds;
} VkSparseImageMemoryBindInfo;
```

- **image** is the VkImage object to be bound
- **bindCount** is the number of VkSparseImageMemoryBind structures in pBinds array
- **pBinds** is a pointer to an array of VkSparseImageMemoryBind structures
Valid Usage

- **VUID-VkSparseImageMemoryBindInfo-subresource-01722**
  The `subresource.mipLevel` member of each element of `pBinds` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

- **VUID-VkSparseImageMemoryBindInfo-subresource-01723**
  The `subresource.arrayLayer` member of each element of `pBinds` must be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

- **VUID-VkSparseImageMemoryBindInfo-image-02901**
  `image` must have been created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set.

Valid Usage (Implicit)

- **VUID-VkSparseImageMemoryBindInfo-image-parameter**
  `image` must be a valid `VkImage` handle.

- **VUID-VkSparseImageMemoryBindInfo-pBinds-parameter**
  `pBinds` must be a valid pointer to an array of `bindCount` valid `VkSparseImageMemoryBind` structures.

- **VUID-VkSparseImageMemoryBindInfo-bindCount-arraylength**
  `bindCount` must be greater than 0.

The `VkSparseImageMemoryBind` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBind {
    VkImageSubresource subresource;
    VkOffset3D offset;
    VkExtent3D extent;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    VkSparseMemoryBindFlags flags;
} VkSparseImageMemoryBind;
```

- `subresource` is the image aspect and region of interest in the image.
- `offset` are the coordinates of the first texel within the image subresource to bind.
- `extent` is the size in texels of the region within the image subresource to bind. The extent must be a multiple of the sparse image block dimensions, except when binding sparse image blocks along the edge of an image subresource it can instead be such that any coordinate of `offset + extent` equals the corresponding dimensions of the image subresource.
- `memory` is the `VkDeviceMemory` object that the sparse image blocks of the image are bound to. If `memory` is `VK_NULL_HANDLE`, the sparse image blocks are unbound.
- `memoryOffset` is an offset into `VkDeviceMemory` object. If `memory` is `VK_NULL_HANDLE`, this value...
is ignored.

- **flags** are sparse memory binding flags.

**Valid Usage**

- **VUID-VkSparseImageMemoryBind-memory-01104**
  If the sparse aliased residency feature is not enabled, and if any other resources are bound to ranges of **memory**, the range of **memory** being bound **must** not overlap with those bound ranges.

- **VUID-VkSparseImageMemoryBind-memory-01105**
  **memory** and **memoryOffset** **must** match the memory requirements of the calling command’s **image**, as described in section Resource Memory Association.

- **VUID-VkSparseImageMemoryBind-subresource-01106**
  **subresource** **must** be a valid image subresource for **image** (see Image Views).

- **VUID-VkSparseImageMemoryBind-offset-01107**
  **offset.x** **must** be a multiple of the sparse image block width (**VkSparseImageFormatProperties::imageGranularity.width**) of the image.

- **VUID-VkSparseImageMemoryBind-extent-01108**
  **extent.width** **must** either be a multiple of the sparse image block width of the image, or else \((\text{extent.width} + \text{offset.x})\) **must** equal the width of the image subresource.

- **VUID-VkSparseImageMemoryBind-offset-01109**
  **offset.y** **must** be a multiple of the sparse image block height (**VkSparseImageFormatProperties::imageGranularity.height**) of the image.

- **VUID-VkSparseImageMemoryBind-extent-01110**
  **extent.height** **must** either be a multiple of the sparse image block height of the image, or else \((\text{extent.height} + \text{offset.y})\) **must** equal the height of the image subresource.

- **VUID-VkSparseImageMemoryBind-offset-01111**
  **offset.z** **must** be a multiple of the sparse image block depth (**VkSparseImageFormatProperties::imageGranularity.depth**) of the image.

- **VUID-VkSparseImageMemoryBind-extent-01112**
  **extent.depth** **must** either be a multiple of the sparse image block depth of the image, or else \((\text{extent.depth} + \text{offset.z})\) **must** equal the depth of the image subresource.

- **VUID-VkSparseImageMemoryBind-memory-02732**
  If **memory** was created with **VkExportMemoryAllocateInfo::handleTypes** not equal to 0, at least one handle type it contained **must** also have been set in **VkExternalMemoryImageCreateInfo::handleTypes** when the image was created.

- **VUID-VkSparseImageMemoryBind-memory-02733**
  If **memory** was created by a memory import operation, the external handle type of the imported memory **must** also have been set in **VkExternalMemoryImageCreateInfo::handleTypes** when **image** was created.
Valid Usage (Implicit)

- **VUID-VkSparseImageMemoryBind-subresource-parameter**
  subresource must be a valid VkImageSubresource structure

- **VUID-VkSparseImageMemoryBind-memory-parameter**
  If memory is not VK_NULL_HANDLE, memory must be a valid VkDeviceMemory handle

- **VUID-VkSparseImageMemoryBind-flags-parameter**
  flags must be a valid combination of VkSparseMemoryBindFlagBits values

To submit sparse binding operations to a queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueBindSparse(
    VkQueue                                     queue,
    uint32_t                                    bindInfoCount,
    const VkBindSparseInfo*                     pBindInfo,
    VkFence                                     fence);
```

- **queue** is the queue that the sparse binding operations will be submitted to.
- **bindInfoCount** is the number of elements in the pBindInfo array.
- **pBindInfo** is a pointer to an array of VkBindSparseInfo structures, each specifying a sparse binding submission batch.
- **fence** is an optional handle to a fence to be signaled. If fence is not VK_NULL_HANDLE, it defines a fence signal operation.

_vkQueueBindSparse_ is a queue submission command, with each batch defined by an element of pBindInfo as a VkBindSparseInfo structure. Batches begin execution in the order they appear in pBindInfo, but may complete out of order.

Within a batch, a given range of a resource must not be bound more than once. Across batches, if a range is to be bound to one allocation and offset and then to another allocation and offset, then the application must guarantee (usually using semaphores) that the binding operations are executed in the correct order, as well as to order binding operations against the execution of command buffer submissions.

As no operation to _vkQueueBindSparse_ causes any pipeline stage to access memory, synchronization primitives used in this command effectively only define execution dependencies.

Additional information about fence and semaphore operation is described in the synchronization chapter.
Valid Usage

- VUID-vkQueueBindSparse-fence-01113
  If fence is not VK_NULL_HANDLE, fence must be unsignaled

- VUID-vkQueueBindSparse-fence-01114
  If fence is not VK_NULL_HANDLE, fence must not be associated with any other queue command that has not yet completed execution on that queue

- VUID-vkQueueBindSparse-pSignalSemaphores-01115
  Each element of the pSignalSemaphores member of each element of pBindInfo must be unsignaled when the semaphore signal operation it defines is executed on the device

- VUID-vkQueueBindSparse-pWaitSemaphores-01116
  When a semaphore wait operation referring to a binary semaphore defined by any element of the pWaitSemaphores member of any element of pBindInfo executes on queue, there must be no other queues waiting on the same semaphore

- VUID-vkQueueBindSparse-pWaitSemaphores-01117
  All elements of the pWaitSemaphores member of all elements of the pBindInfo parameter referring to a binary semaphore must be semaphores that are signaled, or have semaphore signal operations previously submitted for execution

- VUID-vkQueueBindSparse-pWaitSemaphores-03245
  All elements of the pWaitSemaphores member of all elements of pBindInfo created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) must have also been submitted for execution

Valid Usage (Implicit)

- VUID-vkQueueBindSparse-queue-parameter
  queue must be a valid VkQueue handle

- VUID-vkQueueBindSparse-pBindInfo-parameter
  If bindInfoCount is not 0, pBindInfo must be a valid pointer to an array of bindInfoCount valid VkBindSparseInfo structures

- VUID-vkQueueBindSparse-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

- VUID-vkQueueBindSparse-queuetype
  The queue must support sparse binding operations

- VUID-vkQueueBindSparse-commonparent
  Both of fence, and queue that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to queue must be externally synchronized
- Host access to pBindInfo[].pBufferBinds[].buffer must be externally synchronized
- Host access to pBindInfo[].pImageOpaqueBinds[].image must be externally synchronized
- Host access to pBindInfo[].pImageBinds[].image must be externally synchronized
- Host access to fence must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The VkBindSparseInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBindSparseInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t bufferBindCount;
    const VkSparseBufferMemoryBindInfo* pBufferBinds;
    uint32_t imageOpaqueBindCount;
    const VkSparseImageOpaqueMemoryBindInfo* pImageOpaqueBinds;
    uint32_t imageBindCount;
    const VkSparseImageMemoryBindInfo* pImageBinds;
    uint32_t signalSemaphoreCount;
    const VkSemaphore* pSignalSemaphores;
} VkBindSparseInfo;
```
sType is the type of this structure.

pNext is NULL or a pointer to a structure extending this structure.

waitSemaphoreCount is the number of semaphores upon which to wait before executing the sparse binding operations for the batch.

pWaitSemaphores is a pointer to an array of semaphores upon which to wait on before the sparse binding operations for this batch begin execution. If semaphores to wait on are provided, they define a semaphore wait operation.

bufferBindCount is the number of sparse buffer bindings to perform in the batch.

pBufferBinds is a pointer to an array of VkSparseBufferMemoryBindInfo structures.

imageOpaqueBindCount is the number of opaque sparse image bindings to perform.

pImageOpaqueBinds is a pointer to an array of VkSparseImageOpaqueMemoryBindInfo structures, indicating opaque sparse image bindings to perform.

imageBindCount is the number of sparse image bindings to perform.

pImageBinds is a pointer to an array of VkSparseImageMemoryBindInfo structures, indicating sparse image bindings to perform.

signalSemaphoreCount is the number of semaphores to be signaled once the sparse binding operations specified by the structure have completed execution.

pSignalSemaphores is a pointer to an array of semaphores which will be signaled when the sparse binding operations for this batch have completed execution. If semaphores to be signaled are provided, they define a semaphore signal operation.
Valid Usage

- VUID-VkBindSparseInfo-pWaitSemaphores-03246
  If any element of `pWaitSemaphores` or `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then the `pNext` chain must include a `VkTimelineSemaphoreSubmitInfo` structure.

- VUID-VkBindSparseInfo-pNext-03247
  If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pWaitSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `waitSemaphoreValueCount` member must equal `waitSemaphoreCount`.

- VUID-VkBindSparseInfo-pNext-03248
  If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `signalSemaphoreValueCount` member must equal `signalSemaphoreCount`.

- VUID-VkBindSparseInfo-pSignalSemaphores-03249
  For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value greater than the current value of the semaphore when the semaphore signal operation is executed.

- VUID-VkBindSparseInfo-pWaitSemaphores-03250
  For each element of `pWaitSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues` must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.

- VUID-VkBindSparseInfo-pSignalSemaphores-03251
  For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.
Valid Usage (Implicit)

• VUID-VkBindSparseInfo-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_BIND_SPARSE_INFO

• VUID-VkBindSparseInfo-pNext-pNext
  
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceGroupBindSparseInfo or VkTimelineSemaphoreSubmitInfo

• VUID-VkBindSparseInfo-sType-unique
  
  The sType value of each struct in the pNext chain must be unique

• VUID-VkBindSparseInfo-pWaitSemaphores-parameter
  
  If waitSemaphoreCount is not 0, pWaitSemaphores must be a valid pointer to an array of waitSemaphoreCount valid VkSemaphore handles

• VUID-VkBindSparseInfo-pBufferBinds-parameter
  
  If bufferBindCount is not 0, pBufferBinds must be a valid pointer to an array of bufferBindCount valid VkSparseBufferMemoryBindInfo structures

• VUID-VkBindSparseInfo-pImageOpaqueBinds-parameter
  
  If imageOpaqueBindCount is not 0, pImageOpaqueBinds must be a valid pointer to an array of imageOpaqueBindCount valid VkSparseImageOpaqueMemoryBindInfo structures

• VUID-VkBindSparseInfo-pImageBinds-parameter
  
  If imageBindCount is not 0, pImageBinds must be a valid pointer to an array of imageBindCount valid VkSparseImageMemoryBindInfo structures

• VUID-VkBindSparseInfo-pSignalSemaphores-parameter
  
  If signalSemaphoreCount is not 0, pSignalSemaphores must be a valid pointer to an array of signalSemaphoreCount valid VkSemaphore handles

• VUID-VkBindSparseInfo-commonparent
  
  Both of the elements of pSignalSemaphores, and the elements of pWaitSemaphores that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

To specify the values to use when waiting for and signaling semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, add a VkTimelineSemaphoreSubmitInfo structure to the pNext chain of the VkBindSparseInfo structure.

If the pNext chain of VkBindSparseInfo includes a VkDeviceGroupBindSparseInfo structure, then that structure includes device indices specifying which instance of the resources and memory are bound.

The VkDeviceGroupBindSparseInfo structure is defined as:
typedef struct VkDeviceGroupBindSparseInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           resourceDeviceIndex;
    uint32_t           memoryDeviceIndex;
} VkDeviceGroupBindSparseInfo;

or the equivalent

// Provided by VK_KHR_device_group
typedef VkDeviceGroupBindSparseInfo VkDeviceGroupBindSparseInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **resourceDeviceIndex** is a device index indicating which instance of the resource is bound.
- **memoryDeviceIndex** is a device index indicating which instance of the memory the resource instance is bound to.

These device indices apply to all buffer and image memory binds included in the batch pointing to this structure. The semaphore waits and signals for the batch are executed only by the physical device specified by the **resourceDeviceIndex**.

If this structure is not present, **resourceDeviceIndex** and **memoryDeviceIndex** are assumed to be zero.

### Valid Usage

- **VUID-VkDeviceGroupBindSparseInfo-resourceDeviceIndex-01118**
  - **resourceDeviceIndex** and **memoryDeviceIndex** must both be valid device indices

- **VUID-VkDeviceGroupBindSparseInfo-memoryDeviceIndex-01119**
  - Each memory allocation bound in this batch must have allocated an instance for **memoryDeviceIndex**

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupBindSparseInfo-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_DEVICE_GROUP_BIND_SPARSE_INFO**
Chapter 33. Window System Integration (WSI)

This chapter discusses the window system integration (WSI) between the Vulkan API and the various forms of displaying the results of rendering to a user. Since the Vulkan API can be used without displaying results, WSI is provided through the use of optional Vulkan extensions. This chapter provides an overview of WSI. See the appendix for additional details of each WSI extension, including which extensions must be enabled in order to use each of the functions described in this chapter.

33.1. WSI Platform

A platform is an abstraction for a window system, OS, etc. Some examples include MS Windows, Android, and Wayland. The Vulkan API may be integrated in a unique manner for each platform.

The Vulkan API does not define any type of platform object. Platform-specific WSI extensions are defined, each containing platform-specific functions for using WSI. Use of these extensions is guarded by preprocessor symbols as defined in the Window System-Specific Header Control appendix.

In order for an application to be compiled to use WSI with a given platform, it must either:

- define the appropriate preprocessor symbol prior to including the vulkan.h header file, or
- include vulkan_core.h and any native platform headers, followed by the appropriate platform-specific header.

The preprocessor symbols and platform-specific headers are defined in the Window System Extensions and Headers table.

Each platform-specific extension is an instance extension. The application must enable instance extensions with vkCreateInstance before using them.

33.2. WSI Surface

Native platform surface or window objects are abstracted by surface objects, which are represented by VkSurfaceKHR handles:

```c
// Provided by VK_KHR_surface
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSurfaceKHR)
```

The VK_KHR_surface extension declares the VkSurfaceKHR object, and provides a function for destroying VkSurfaceKHR objects. Separate platform-specific extensions each provide a function for creating a VkSurfaceKHR object for the respective platform. From the application's perspective this is an opaque handle, just like the handles of other Vulkan objects.
Note
On certain platforms, the Vulkan loader and ICDs may have conventions that treat the handle as a pointer to a structure containing the platform-specific information about the surface. This will be described in the documentation for the loader-ICD interface, and in the `vk_icd.h` header file of the LoaderAndTools source-code repository. This does not affect the loader-layer interface; layers may wrap `VkSurfaceKHR` objects.

### 33.2.1. Android Platform

To create a `VkSurfaceKHR` object for an Android native window, call:

```c
// Provided by VK_KHR_android_surface
VkResult vkCreateAndroidSurfaceKHR(
    VkInstance instance,
    const VkAndroidSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkAndroidSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

During the lifetime of a surface created using a particular `ANativeWindow` handle any attempts to create another surface for the same `ANativeWindow` and any attempts to connect to the same `ANativeWindow` through other platform mechanisms will fail.

Note
In particular, only one `VkSurfaceKHR` can exist at a time for a given window. Similarly, a native window cannot be used by both a `VkSurfaceKHR` and `EGLSurface` simultaneously.

If successful, `vkCreateAndroidSurfaceKHR` increments the `ANativeWindow`'s reference count, and `vkDestroySurfaceKHR` will decrement it.

On Android, when a swapchain's `imageExtent` does not match the surface's `currentExtent`, the presentable images will be scaled to the surface's dimensions during presentation. `minImageExtent` is (1,1), and `maxImageExtent` is the maximum image size supported by the consumer. For the system compositor, `currentExtent` is the window size (i.e. the consumer's preferred size).
Valid Usage (Implicit)

• VUID-vkCreateAndroidSurfaceKHR-instance-parameter
  instance must be a valid VkInstance handle

• VUID-vkCreateAndroidSurfaceKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkAndroidSurfaceCreateInfoKHR structure

• VUID-vkCreateAndroidSurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateAndroidSurfaceKHR-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkAndroidSurfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_android_surface
typedef struct VkAndroidSurfaceCreateInfoKHR {
    VkStructureType                   sType;
    const void*                       pNext;
    VkAndroidSurfaceCreateFlagsKHR    flags;
    struct ANativeWindow*             window;
} VkAndroidSurfaceCreateInfoKHR;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• window is a pointer to the ANativeWindow to associate the surface with.

Valid Usage

• VUID-VkAndroidSurfaceCreateInfoKHR-window-01248
  window must point to a valid Android ANativeWindow
Valid Usage (Implicit)

- VUID-VkAndroidSurfaceCreateInfoKHR-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_ANDROID_SURFACE_CREATE_INFO_KHR

- VUID-VkAndroidSurfaceCreateInfoKHR-pNext-pNext
  
  pNext must be NULL

- VUID-VkAndroidSurfaceCreateInfoKHR-flags-zerobitmask
  
  flags must be 0

To remove an unnecessary compile-time dependency, an incomplete type definition of `ANativeWindow` is provided in the Vulkan headers:

```c
// Provided by VK_KHR_android_surface
struct ANativeWindow;
```

The actual `ANativeWindow` type is defined in Android NDK headers:

```c
// Provided by VK_KHR_android_surface
typedef VkFlags VkAndroidSurfaceCreateFlagsKHR;
```

`VkAndroidSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.2. Wayland Platform

To create a `VkSurfaceKHR` object for a Wayland surface, call:

```c
// Provided by VK_KHR_wayland_surface
VkResult vkCreateWaylandSurfaceKHR(
    VkInstance                                  instance,
    const VkWaylandSurfaceCreateInfoKHR*        pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSurfaceKHR*                               pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkWaylandSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.
Valid Usage (Implicit)

- **VUID-vkCreateWaylandSurfaceKHR-instance-parameter**
  
  instance must be a valid VkInstance handle

- **VUID-vkCreateWaylandSurfaceKHR-pCreateInfo-parameter**
  
  pCreateInfo must be a valid pointer to a valid VkWaylandSurfaceCreateInfoKHR structure

- **VUID-vkCreateWaylandSurfaceKHR-pAllocator-parameter**
  
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- **VUID-vkCreateWaylandSurfaceKHR-pSurface-parameter**
  
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The **VkWaylandSurfaceCreateInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_wayland_surface
typedef struct VkWaylandSurfaceCreateInfoKHR {
    VkStructureType                   sType;
    const void*                       pNext;
    VkWaylandSurfaceCreateFlagsKHR    flags;
    struct wl_display*                display;
    struct wl_surface*                surface;
} VkWaylandSurfaceCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **display** and **surface** are pointers to the Wayland **wl_display** and **wl_surface** to associate the surface with.
Valid Usage

- VUID-VkWaylandSurfaceCreateInfoKHR-display-01304
display must point to a valid Wayland wl_display

- VUID-VkWaylandSurfaceCreateInfoKHR-surface-01305
surface must point to a valid Wayland wl_surface

Valid Usage (Implicit)

- VUID-VkWaylandSurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_WAYLAND_SURFACE_CREATE_INFO_KHR

- VUID-VkWaylandSurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkWaylandSurfaceCreateInfoKHR-flags-zerobitmask
  flags must be 0

On Wayland, currentExtent is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface. Whatever the application sets a swapchain's imageExtent to will be the size of the window, after the first image is presented. minImageExtent is (1,1), and maxImageExtent is the maximum supported surface size. Any calls to vkGetPhysicalDeviceSurfacePresentModesKHR on a surface created with vkCreateWaylandSurfaceKHR are required to return VK_PRESENT_MODE_MAILBOX_KHR as one of the valid present modes.

Some Vulkan functions may send protocol over the specified wl_display connection when using a swapchain or presentable images created from a VkSurfaceKHR referring to a wl_surface. Applications must therefore ensure that both the wl_display and the wl_surface remain valid for the lifetime of any VkSwapchainKHR objects created from a particular wl_display and wl_surface. Also, calling vkQueuePresentKHR will result in Vulkan sending wl_surface.commit requests to the underlying wl_surface of each VkSwapchainKHR objects referenced by pPresentInfo. If the swapchain is created with a present mode of VK_PRESENT_MODE_MAILBOX_KHR or VK_PRESENT_MODE_IMMEDIATE_KHR, then the corresponding wl_surface.attach, wl_surface.damage, and wl_surface.commit request must be issued by the implementation during the call to vkQueuePresentKHR and must not be issued by the implementation outside of vkQueuePresentKHR. This ensures that any Wayland requests sent by the client after the call to vkQueuePresentKHR returns will be received by the compositor after the wl_surface.commit. Regardless of the mode of swapchain creation, a new wl_event_queue must be created for each successful vkCreateWaylandSurfaceKHR call, and every Wayland object created by the implementation must be assigned to this event queue. If the platform provides Wayland 1.11 or greater, this must be implemented by the use of Wayland proxy object wrappers, to avoid race conditions.

If the application wishes to synchronize any window changes with a particular frame, such requests must be sent to the Wayland display server prior to calling vkQueuePresentKHR. For full control over interactions between Vulkan rendering and other Wayland protocol requests and events, a present mode of VK_PRESENT_MODE_MAILBOX_KHR should be used.
VkWaylandSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.3. Win32 Platform

To create a VkSurfaceKHR object for a Win32 window, call:

```c
// Provided by VK_KHR_win32_surface
VkResult vkCreateWin32SurfaceKHR(
    VkInstance instance,         // must be a valid VkInstance handle
    const VkWin32SurfaceCreateInfoKHR* pCreateInfo, // must be a valid pointer to a valid VkWin32SurfaceCreateInfoKHR structure
    const VkAllocationCallbacks* pAllocator, // must be a valid pointer to a valid VkAllocationCallbacks structure
    VkSurfaceKHR* pSurface);       // must be a valid pointer to a VkSurfaceKHR handle
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a VkWin32SurfaceCreateInfoKHR structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

**Valid Usage (Implicit)**

- `VkSurfaceKHR` handles in `pSurface` must be created with a valid `VkInstance` handle.
- `VkSurfaceKHR` handles in `pSurface` must be created with a valid `VkWin32SurfaceCreateInfoKHR` structure.
- If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.
- `pSurface` must be a valid pointer to a VkSurfaceKHR handle.
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkWin32SurfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_win32_surface
typedef struct VkWin32SurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWin32SurfaceCreateFlagsKHR flags;
    HINSTANCE hinstance;
    HWND hwnd;
} VkWin32SurfaceCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `hinstance` is the Win32 `HINSTANCE` for the window to associate the surface with.
- `hwnd` is the Win32 `HWND` for the window to associate the surface with.

Valid Usage

- VUID-VkWin32SurfaceCreateInfoKHR-hinstance-01307
  `hinstance` must be a valid Win32 `HINSTANCE`

- VUID-VkWin32SurfaceCreateInfoKHR-hwnd-01308
  `hwnd` must be a valid Win32 `HWND`

Valid Usage (Implicit)

- VUID-VkWin32SurfaceCreateInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_WIN32_SURFACE_CREATE_INFO_KHR`

- VUID-VkWin32SurfaceCreateInfoKHR-pNext-pNext
  `pNext` must be NULL

- VUID-VkWin32SurfaceCreateInfoKHR-flags-zerobitmask
  `flags` must be 0
With Win32, \texttt{minImageExtent}, \texttt{maxImageExtent}, and \texttt{currentExtent} must always equal the window size. The \texttt{currentExtent} of a Win32 surface must have both \texttt{width} and \texttt{height} greater than 0, or both of them 0.

\begin{itemize}
  \item \textbf{Note}
  \end{itemize}

Due to above restrictions, it is only possible to create a new swapchain on this platform with \texttt{imageExtent} being equal to the current size of the window.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.

\begin{verbatim}
// Provided by VK_KHR_win32_surface
typedef VkFlags VkWin32SurfaceCreateFlagsKHR;
\end{verbatim}

\texttt{VkWin32SurfaceCreateFlagsKHR} is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.4. XCB Platform

To create a \texttt{VkSurfaceKHR} object for an X11 window, using the XCB client-side library, call:

\begin{verbatim}
// Provided by VK_KHR_xcb_surface
VkResult vkCreateXcbSurfaceKHR(
    VkInstance instance,
    const VkXcbSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
\end{verbatim}

• \texttt{instance} is the instance to associate the surface with.

• \texttt{pCreateInfo} is a pointer to a \texttt{VkXcbSurfaceCreateInfoKHR} structure containing parameters affecting the creation of the surface object.

• \texttt{pAllocator} is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

• \texttt{pSurface} is a pointer to a \texttt{VkSurfaceKHR} handle in which the created surface object is returned.
Valid Usage (Implicit)

- **VUID-vkCreateXcbSurfaceKHR-instance-parameter**
  
  instance must be a valid VkInstance handle

- **VUID-vkCreateXcbSurfaceKHR-pCreateInfo-parameter**
  
  pCreateInfo must be a valid pointer to a valid VkXcbSurfaceCreateInfoKHR structure

- **VUID-vkCreateXcbSurfaceKHR-pAllocator-parameter**
  
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- **VUID-vkCreateXcbSurfaceKHR-pSurface-parameter**
  
  pSurface must be a valid pointer to a VkSurfaceKHR handle

---

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkXcbSurfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_xcb_surface
typedef struct VkXcbSurfaceCreateInfoKHR {
    VkStructureType               sType;
    const void*                   pNext;
    VkXcbSurfaceCreateFlagsKHR    flags;
    xcb_connection_t*             connection;
    xcb_window_t                  window;
} VkXcbSurfaceCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **connection** is a pointer to an xcb_connection_t to the X server.
- **window** is the xcb_window_t for the X11 window to associate the surface with.
Valid Usage

- VUID-VkXcbSurfaceCreateInfoKHR-connection-01310
  
  `connection` must point to a valid X11 xcb_connection_t

- VUID-VkXcbSurfaceCreateInfoKHR-window-01311
  
  `window` must be a valid X11 xcb_window_t

Valid Usage (Implicit)

- VUID-VkXcbSurfaceCreateInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_XCB_SURFACE_CREATE_INFO_KHR`

- VUID-VkXcbSurfaceCreateInfoKHR-pNext-pNext
  
  `pNext` must be NULL

- VUID-VkXcbSurfaceCreateInfoKHR-flags-zerobitmask
  
  `flags` must be 0

With Xcb, `minImageExtent`, `maxImageExtent`, and `currentExtent` must always equal the window size.

The `currentExtent` of an Xcb surface must have both `width` and `height` greater than 0, or both of them 0.

*Note*

Due to above restrictions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.

Some Vulkan functions may send protocol over the specified xcb connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to an xcb window. Applications must therefore ensure the xcb connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with xcb-based swapchains must

- Avoid holding a server grab on an xcb connection while waiting for Vulkan operations to complete using a swapchain derived from a different xcb connection referring to the same X server instance. Failing to do so may result in deadlock.

// Provided by VK_KHR_xcb_surface

typedef VkFlags VkXcbSurfaceCreateFlagsKHR;

`VkXcbSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.
33.2.5. Xlib Platform

To create a `VkSurfaceKHR` object for an X11 window, using the Xlib client-side library, call:

```c
// Provided by VK_KHR_xlib_surface
VkResult vkCreateXlibSurfaceKHR(
    VkInstance                                  instance,           // Provided by VK_KHR_xlib_surface
    const VkXlibSurfaceCreateInfoKHR*           pCreateInfo,         // Provided by VK_KHR_xlib_surface
    const VkAllocationCallbacks*                pAllocator,           // Provided by VK_KHR_xlib_surface
    VkSurfaceKHR*                               pSurface);            // Provided by VK_KHR_xlib_surface
```

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a `VkXlibSurfaceCreateInfoKHR` structure containing the parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateXlibSurfaceKHR-instance-parameter**
  - `instance` must be a valid `VkInstance` handle
- **VUID-vkCreateXlibSurfaceKHR-pCreateInfo-parameter**
  - `pCreateInfo` must be a valid pointer to a valid `VkXlibSurfaceCreateInfoKHR` structure
- **VUID-vkCreateXlibSurfaceKHR-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreateXlibSurfaceKHR-pSurface-parameter**
  - `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkXlibSurfaceCreateInfoKHR` structure is defined as:
typedef struct VkXlibSurfaceCreateInfoKHR {
    VkStructureType                   sType;
    const void*                       pNext;
    VkXlibSurfaceCreateFlagsKHR       flags;
    Display*                          dpy;
    Window                            window;
} VkXlibSurfaceCreateInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **dpy** is a pointer to an Xlib Display connection to the X server.
- **window** is an Xlib Window to associate the surface with.

### Valid Usage

- VUID-VkXlibSurfaceCreateInfoKHR-dpy-01313
  
  **dpy** must point to a valid Xlib Display

- VUID-VkXlibSurfaceCreateInfoKHR-window-01314
  
  **window** must be a valid Xlib Window

### Valid Usage (Implicit)

- VUID-VkXlibSurfaceCreateInfoKHR-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_XLIB_SURFACE_CREATE_INFO_KHR**

- VUID-VkXlibSurfaceCreateInfoKHR-pNext-pNext
  
  **pNext** must be NULL

- VUID-VkXlibSurfaceCreateInfoKHR-flags-zerobitmask
  
  **flags** must be 0

With Xlib, **minImageExtent**, **maxImageExtent**, and **currentExtent** must always equal the window size.

The **currentExtent** of an Xlib surface must have both **width** and **height** greater than 0, or both of them 0.

**Note**

Due to above restrictions, it is only possible to create a new swapchain on this platform with **imageExtent** being equal to the current size of the window.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.
Some Vulkan functions \textbf{may} send protocol over the specified Xlib Display connection when using a swapchain or presentable images created from a \texttt{VkSurfaceKHR} referring to an Xlib window. Applications \textbf{must} therefore ensure the display connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with Xlib-based swapchains \textbf{must}

- Avoid holding a server grab on a display connection while waiting for Vulkan operations to complete using a swapchain derived from a different display connection referring to the same X server instance. Failing to do so \textbf{may} result in deadlock.

Some implementations may require threads to implement some presentation modes so applications \textbf{must} call \texttt{XInitThreads}() before calling any other Xlib functions.

\begin{verbatim}
// Provided by VK_KHR_xlib_surface
typedef VkFlags VkXlibSurfaceCreateFlagsKHR;
\end{verbatim}

\texttt{VkXlibSurfaceCreateFlagsKHR} is a bitmask type for setting a mask, but is currently reserved for future use.

\subsection*{33.2.6. DirectFB Platform}

To create a \texttt{VkSurfaceKHR} object for a DirectFB surface, call:

\begin{verbatim}
// Provided by VK_EXT_directfb_surface
VkResult vkCreateDirectFBSurfaceEXT(
    VkInstance                                  instance,
    const VkDirectFBSurfaceCreateInfoEXT*       pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSurfaceKHR*                               pSurface);
\end{verbatim}

- \texttt{instance} is the instance to associate the surface with.
- \texttt{pCreateInfo} is a pointer to a \texttt{VkDirectFBSurfaceCreateInfoEXT} structure containing parameters affecting the creation of the surface object.
- \texttt{pAllocator} is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see \texttt{Memory Allocation}).
- \texttt{pSurface} is a pointer to a \texttt{VkSurfaceKHR} handle in which the created surface object is returned.
Valid Usage (Implicit)

- VUID-vkCreateDirectFBSurfaceEXT-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkCreateDirectFBSurfaceEXT-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkDirectFBSurfaceCreateInfoEXT structure

- VUID-vkCreateDirectFBSurfaceEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateDirectFBSurfaceEXT-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDirectFBSurfaceCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_directfb_surface
typedef struct VkDirectFBSurfaceCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDirectFBSurfaceCreateFlagsEXT flags;
    IDirectFB* dfb;
    IDirectFBSurface* surface;
} VkDirectFBSurfaceCreateInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- dfb is a pointer to the IDirectFB main interface of DirectFB.
- surface is a pointer to a IDirectFBSurface surface interface.
Valid Usage

- VUID-VkDirectFBSurfaceCreateInfoEXT-dfb-04117
dfb must point to a valid DirectFB IDirectFB

- VUID-VkDirectFBSurfaceCreateInfoEXT-surface-04118
surface must point to a valid DirectFB IDirectFBSurface

Valid Usage (Implicit)

- VUID-VkDirectFBSurfaceCreateInfoEXT-sType-sType
sType must be VK_STRUCTURE_TYPE_DIRECTFB_SURFACE_CREATE_INFO_EXT

- VUID-VkDirectFBSurfaceCreateInfoEXT-pNext-pNext
pNext must be NULL

- VUID-VkDirectFBSurfaceCreateInfoEXT-flags-zerobitmask
flags must be 0

With DirectFB, minImageExtent, maxImageExtent, and currentExtent must always equal the surface size.

```c
// Provided by VK_EXT_directfb_surface
typedef VkFlags VkDirectFBSurfaceCreateFlagsEXT;
```

VkDirectFBSurfaceCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.7. Fuchsia Platform

To create a VkSurfaceKHR object for a Fuchsia ImagePipe, call:

```c
// Provided by VK_FUCHSIA_imagepipe_surface
VkResult vkCreateImagePipeSurfaceFUCHSIA(
    instance,
pCreateInfo,       
pAllocator,        
pSurface);
```

- instance is the instance to associate with the surface.
- pCreateInfo is a pointer to a VkImagePipeSurfaceCreateInfoFUCHSIA structure containing parameters affecting the creation of the surface object.
- pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.
Valid Usage (Implicit)

- VUID-vkCreateImagePipeSurfaceFUCHSIA-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkImagePipeSurfaceCreateInfoFUCHSIA structure

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkImagePipeSurfaceCreateInfoFUCHSIA structure is defined as:

```c
// Provided by VK_FUCHSIA_imagepipe_surface
typedef struct VkImagePipeSurfaceCreateInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkImagePipeSurfaceCreateFlagsFUCHSIA flags;
    zx_handle_t imagePipeHandle;
} VkImagePipeSurfaceCreateInfoFUCHSIA;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- imagePipeHandle is a zx_handle_t referring to the ImagePipe to associate with the surface.

Valid Usage

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-imagePipeHandle-04863
  imagePipeHandle must be a valid zx_handle_t
Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_IMAGEPIPE_SURFACE_CREATE_INFO_FUCHSIA`
- `pNext` must be `NULL`
- `flags` must be `0`

On Fuchsia, the surface `currentExtent` is the special value `(0xFFFFFFFF, 0xFFFFFFFF)`, indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

```c
// Provided by VK_FUCHSIA_imagepipe_surface
typedef VkFlags VkImagePipeSurfaceCreateFlagsFUCHSIA;
```

`VkImagePipeSurfaceCreateFlagsFUCHSIA` is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.8. Google Games Platform

To create a `VkSurfaceKHR` object for a Google Games Platform stream descriptor, call:

```c
// Provided by VK_GGP_stream_descriptor_surface
VkResult vkCreateStreamDescriptorSurfaceGGP(
    VkInstance                                  instance,
    const VkStreamDescriptorSurfaceCreateInfoGGP* pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSurfaceKHR*                               pSurface);
```

- `instance` is the instance to associate with the surface.
- `pCreateInfo` is a pointer to a `VkStreamDescriptorSurfaceCreateInfoGGP` structure containing parameters that affect the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.
Valid Usage (Implicit)

- VUID-vkCreateStreamDescriptorSurfaceGGP-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkCreateStreamDescriptorSurfaceGGP-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkStreamDescriptorSurfaceCreateInfoGGP structure

- VUID-vkCreateStreamDescriptorSurfaceGGP-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateStreamDescriptorSurfaceGGP-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
  - VK_SUCCESS

Failure
  - VK_ERROR_OUT_OF_HOST_MEMORY
  - VK_ERROR_OUT_OF_DEVICE_MEMORY
  - VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkStreamDescriptorSurfaceCreateInfoGGP structure is defined as:

```c
// Provided by VK_GGP_stream_descriptor_surface
typedef struct VkStreamDescriptorSurfaceCreateInfoGGP {
  VkStructureType sType;
  const void* pNext;
  VkStreamDescriptorSurfaceCreateFlagsGGP flags;
  GgpStreamDescriptor streamDescriptor;
} VkStreamDescriptorSurfaceCreateInfoGGP;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **streamDescriptor** is a GgpStreamDescriptor referring to the GGP stream descriptor to associate with the surface.
Valid Usage

• VUID-VkStreamDescriptorSurfaceCreateInfoGGP-streamDescriptor-02681
  streamDescriptor must be a valid GgpStreamDescriptor

Valid Usage (Implicit)

• VUID-VkStreamDescriptorSurfaceCreateInfoGGP-sType-sType
  sType must be VK_STRUCTURE_TYPE_STREAM_DESCRIPTOR_SURFACE_CREATE_INFO_GGP

• VUID-VkStreamDescriptorSurfaceCreateInfoGGP-pNext-pNext
  pNext must be NULL

• VUID-VkStreamDescriptorSurfaceCreateInfoGGP-flags-zerobitmask
  flags must be 0

On Google Games Platform, the surface extents are dynamic. The minImageExtent will never be greater than 1080p and the maxImageExtent will never be less than 1080p. The currentExtent will reflect the current optimal resolution.

Applications are expected to choose an appropriate size for the swapchain’s imageExtent, within the bounds of the surface. Using the surface’s currentExtent will offer the best performance and quality. When a swapchain's imageExtent does not match the surface's currentExtent, the presentable images are scaled to the surface's dimensions during presentation if possible and VK_SUBOPTIMAL_KHR is returned, otherwise presentation fails with VK_ERROR_OUT_OF_DATE_KHR.

// Provided by VK_GGP_stream_descriptor_surface
typedef VkFlags VkStreamDescriptorSurfaceCreateFlagsGGP;

VkStreamDescriptorSurfaceCreateFlagsGGP is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.9. iOS Platform

To create a VkSurfaceKHR object for an iOS UIView or CAMetalLayer, call:

// Provided by VK_MVK_ios_surface
VkResult vkCreateIOSSurfaceMVK(
    VkInstance instance,
    const VkIOSurfaceCreateInfoMVK* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
The `vkCreateIOSSurfaceMVK` function is considered deprecated and has been superseded by `vkCreateMetalSurfaceEXT` from the `VK_EXT_metal_surface` extension.

- **instance** is the instance with which to associate the surface.
- **pCreateInfo** is a pointer to a `VkIOSSurfaceCreateInfoMVK` structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateIOSSurfaceMVK-instance-parameter
  **instance** must be a valid `VkInstance` handle
- VUID-vkCreateIOSSurfaceMVK-pCreateInfo-parameter
  **pCreateInfo** must be a valid pointer to a valid `VkIOSSurfaceCreateInfoMVK` structure
- VUID-vkCreateIOSSurfaceMVK-pAllocator-parameter
  If **pAllocator** is not `NULL`, **pAllocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateIOSSurfaceMVK-pSurface-parameter
  **pSurface** must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR**

The `VkIOSSurfaceCreateInfoMVK` structure is defined as:
typedef struct VkIOSurfaceCreateInfoMVK {
    VkStructureType               sType;
    const void*                   pNext;
    VkIOSurfaceCreateFlagsMVK    flags;
    const void*                   pView;
} VkIOSurfaceCreateInfoMVK;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **pView** is a reference to either a CAMetalLayer object or a UIView object.

**Valid Usage**

- VUID-VkIOSurfaceCreateInfoMVK-pView-04143
  If pView is a CAMetalLayer object, it must be a valid CAMetalLayer.

- VUID-VkIOSurfaceCreateInfoMVK-pView-01316
  If pView is a UIView object, it must be a valid UIView, must be backed by a CALayer object of type CAMetalLayer, and vkCreateIOSurfaceMVK must be called on the main thread.

**Valid Usage (Implicit)**

- VUID-VkIOSurfaceCreateInfoMVK-sType-sType
  sType must be VK_STRUCTURE_TYPE_IOS_SURFACE_CREATE_INFO_MVK

- VUID-VkIOSurfaceCreateInfoMVK-pNext-pNext
  pNext must be NULL

- VUID-VkIOSurfaceCreateInfoMVK-flags-zerobitmask
  flags must be 0

// Provided by VK_MVK_ios_surface
typedef VkFlags VkIOSurfaceCreateFlagsMVK;

VkIOSurfaceCreateFlagsMVK is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.10. macOS Platform

To create a VkSurfaceKHR object for a macOS NSView or CAMetalLayer, call:
The `vkCreateMacOSSurfaceMVK` function is considered deprecated and has been superseded by `vkCreateMetalSurfaceEXT` from the `VK_EXT_metal_surface` extension.

- **instance** is the instance with which to associate the surface.
- **pCreateInfo** is a pointer to a `VkMacOSSurfaceCreateInfoMVK` structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateMacOSSurfaceMVK-instance-parameter**
  - `instance` must be a valid `VkInstance` handle
- **VUID-vkCreateMacOSSurfaceMVK-pCreateInfo-parameter**
  - `pCreateInfo` must be a valid pointer to a valid `VkMacOSSurfaceCreateInfoMVK` structure
- **VUID-vkCreateMacOSSurfaceMVK-pAllocator-parameter**
  - If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreateMacOSSurfaceMVK-pSurface-parameter**
  - `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

#### Success
- **VK_SUCCESS**

#### Failure
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR**

The `VkMacOSSurfaceCreateInfoMVK` structure is defined as:
typedef struct VkMacOSSurfaceCreateInfoMVK {
    VkStructureType sType;
    const void* pNext;
    VkMacOSSurfaceCreateFlagsMVK flags;
    const void* pView;
} VkMacOSSurfaceCreateInfoMVK;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• pView is a reference to either a CAMetalLayer object or an NSView object.

Valid Usage

• VUID-VkMacOSSurfaceCreateInfoMVK-pView-04144
  If pView is a CAMetalLayer object, it must be a valid CAMetalLayer.

• VUID-VkMacOSSurfaceCreateInfoMVK-pView-01317
  If pView is an NSView object, it must be a valid NSView, must be backed by a CALayer object of type CAMetalLayer, and vkCreateMacOSSurfaceMVK must be called on the main thread.

Valid Usage (Implicit)

• VUID-VkMacOSSurfaceCreateInfoMVK-sType-sType
  sType must be VK_STRUCTURE_TYPE_MACOS_SURFACE_CREATE_INFO_MVK

• VUID-VkMacOSSurfaceCreateInfoMVK-pNext-pNext
  pNext must be NULL

• VUID-VkMacOSSurfaceCreateInfoMVK-flags-zerobitmask
  flags must be 0

VkMacOSSurfaceCreateFlagsMVK is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.11. VI Platform

To create a VkSurfaceKHR object for an nn::vi::Layer, query the layer's native handle using nn::vi::GetNativeWindow, and then call:
VkResult vkCreateViSurfaceNN(
  VkInstance instance,
  const VkViSurfaceCreateInfoNN* pCreateInfo,
  const VkAllocationCallbacks* pAllocator,
  VkSurfaceKHR* pSurface);
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The `VkViSurfaceCreateInfoNN` structure is defined as:

```c
// Provided by VK_NN_vi_surface
typedef struct VkViSurfaceCreateInfoNN {
    VkStructureType             sType;
    const void*                 pNext;
    VkViSurfaceCreateFlagsNN    flags;
    void*                       window;
} VkViSurfaceCreateInfoNN;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `window` is the `nn::vi::NativeWindowHandle` for the `nn::vi::Layer` with which to associate the surface.

Valid Usage

- `VUID-VkViSurfaceCreateInfoNN-window-01318` window must be a valid `nn::vi::NativeWindowHandle`

Valid Usage (Implicit)

- `VUID-VkViSurfaceCreateInfoNN-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_VI_SURFACE_CREATE_INFO_NN`
- `VUID-VkViSurfaceCreateInfoNN-pNext-pNext` `pNext` must be NULL
- `VUID-VkViSurfaceCreateInfoNN-flags-zerobitmask` `flags` must be 0
typedef VkFlags VkViSurfaceCreateFlagsNN;

VkViSurfaceCreateFlagsNN is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.12. Metal Platform

To create a VkSurfaceKHR object for a CAMetalLayer, call:

```c
// Provided by VK_EXT_metal_surface
VkResult vkCreateMetalSurfaceEXT(
    VkInstance                                  instance,
    const VkMetalSurfaceCreateInfoEXT*          pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSurfaceKHR*                               pSurface);
```

- **instance** is the instance with which to associate the surface.
- **pCreateInfo** is a pointer to a VkMetalSurfaceCreateInfoEXT structure specifying parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateMetalSurfaceEXT-instance-parameter**
  instance must be a valid VkInstance handle
- **VUID-vkCreateMetalSurfaceEXT-pCreateInfo-parameter**
  pCreateInfo must be a valid pointer to a valid VkMetalSurfaceCreateInfoEXT structure
- **VUID-vkCreateMetalSurfaceEXT-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- **VUID-vkCreateMetalSurfaceEXT-pSurface-parameter**
  pSurface must be a valid pointer to a VkSurfaceKHR handle
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The `VkMetalSurfaceCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_metal_surface
typedef struct VkMetalSurfaceCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMetalSurfaceCreateFlagsEXT flags;
    const CAMetalLayer* pLayer;
} VkMetalSurfaceCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `pLayer` is a reference to a `CAMetalLayer` object representing a renderable surface.

Valid Usage (Implicit)

- VUID-VkMetalSurfaceCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_METAL_SURFACE_CREATE_INFO_EXT`
- VUID-VkMetalSurfaceCreateInfoEXT-pNext-pNext
  `pNext` must be `NULL`
- VUID-VkMetalSurfaceCreateInfoEXT-flags-zerobitmask
  `flags` must be `0`

To remove an unnecessary compile-time dependency, an incomplete type definition of `CAMetalLayer` is provided in the Vulkan headers:
The actual `CAMetalLayer` type is defined in the QuartzCore framework.

`VkMetalSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.13. QNX Screen Platform

To create a `VkSurfaceKHR` object for a QNX Screen surface, call:

```c
// Provided by VK_QNX_screen_surface
VkResult vkCreateScreenSurfaceQNX(
    VkInstance                                  instance,           // instance is the instance to associate the surface with.
    const VkScreenSurfaceCreateInfoQNX*         pCreateInfo,       // pCreateInfo is a pointer to a VkScreenSurfaceCreateInfoQNX structure containing parameters affecting the creation of the surface object.
    const VkAllocationCallbacks*                pAllocator,         // pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
    VkSurfaceKHR*                               pSurface);          // pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.
```
Valid Usage (Implicit)

- **VUID-vkCreateScreenSurfaceQNX-instance-parameter**
  
  instance must be a valid `VkInstance` handle

- **VUID-vkCreateScreenSurfaceQNX-pCreateInfo-parameter**
  
  `pCreateInfo` must be a valid pointer to a valid `VkScreenSurfaceCreateInfoQNX` structure

- **VUID-vkCreateScreenSurfaceQNX-pAllocator-parameter**
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateScreenSurfaceQNX-pSurface-parameter**
  
  `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkScreenSurfaceCreateInfoQNX` structure is defined as:

```c
// Provided by VK_QNX_screen_surface
typedef struct VkScreenSurfaceCreateInfoQNX {
    VkStructureType                  sType;
    const void*                      pNext;
    VkScreenSurfaceCreateFlagsQNX    flags;
    struct _screen_context*          context;
    struct _screen_window*           window;
} VkScreenSurfaceCreateInfoQNX;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `context` and `window` are QNX Screen context and window to associate the surface with.
Valid Usage

- VUID-VkScreenSurfaceCreateInfoQNX-context-04741
  context must point to a valid QNX Screen struct _screen_context

- VUID-VkScreenSurfaceCreateInfoQNX-window-04742
  window must point to a valid QNX Screen struct _screen_window

Valid Usage (Implicit)

- VUID-VkScreenSurfaceCreateInfoQNX-sType-sType
  sType must be VK_STRUCTURE_TYPE_SCREEN_SURFACE_CREATE_INFO_QNX

- VUID-VkScreenSurfaceCreateInfoQNX-pNext-pNext
  pNext must be NULL

- VUID-VkScreenSurfaceCreateInfoQNX-flags-zerobitmask
  flags must be 0

// Provided by VK_QNX_screen_surface
typedef VkFlags VkScreenSurfaceCreateFlagsQNX;

VkScreenSurfaceCreateFlagsQNX is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.14. Platform-Independent Information

Once created, VkSurfaceKHR objects can be used in this and other extensions, in particular the VK_KHR_swapchain extension.

Several WSI functions return VK_ERROR_SURFACE_LOST_KHR if the surface becomes no longer available. After such an error, the surface (and any child swapchain, if one exists) should be destroyed, as there is no way to restore them to a not-lost state. Applications may attempt to create a new VkSurfaceKHR using the same native platform window object, but whether such re-creation will succeed is platform-dependent and may depend on the reason the surface became unavailable. A lost surface does not otherwise cause devices to be lost.

To destroy a VkSurfaceKHR object, call:

// Provided by VK_KHR_surface
void vkDestroySurfaceKHR(
    VkInstance instance,
    VkSurfaceKHR surface,
    const VkAllocationCallbacks* pAllocator);

- instance is the instance used to create the surface.
• *surface* is the surface to destroy.

• *pAllocator* is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

Destroying a *VkSurfaceKHR* merely severs the connection between Vulkan and the native surface, and does not imply destroying the native surface, closing a window, or similar behavior.

### Valid Usage

- VUID-vkDestroySurfaceKHR-surface-01266
  All *VkSwapchainKHR* objects created for *surface* must have been destroyed prior to destroying *surface*

- VUID-vkDestroySurfaceKHR-surface-01267
  If *VkAllocationCallbacks* were provided when *surface* was created, a compatible set of callbacks must be provided here

- VUID-vkDestroySurfaceKHR-surface-01268
  If no *VkAllocationCallbacks* were provided when *surface* was created, *pAllocator* must be NULL

### Valid Usage (Implicit)

- VUID-vkDestroySurfaceKHR-instance-parameter
  *instance* must be a valid *VkInstance* handle

- VUID-vkDestroySurfaceKHR-surface-parameter
  If *surface* is not *VK_NULL_HANDLE*, *surface* must be a valid *VkSurfaceKHR* handle

- VUID-vkDestroySurfaceKHR-pAllocator-parameter
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure

- VUID-vkDestroySurfaceKHR-surface-parent
  If *surface* is a valid handle, it must have been created, allocated, or retrieved from *instance*

### Host Synchronization

- Host access to *surface* must be externally synchronized

### 33.3. Presenting Directly to Display Devices

In some environments applications can also present Vulkan rendering directly to display devices without using an intermediate windowing system. This can be useful for embedded applications, or implementing the rendering/presentation backend of a windowing system using Vulkan. The *VK_KHR_display* extension provides the functionality necessary to enumerate display devices and create *VkSurfaceKHR* objects that target displays.
33.3.1. Display Enumeration

Displays are represented by `VkDisplayKHR` handles:

```c
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayKHR)
```

Various functions are provided for enumerating the available display devices present on a Vulkan physical device. To query information about the available displays, call:

```c
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPropertiesKHR(
    VkPhysicalDevice                            physicalDevice,  // physicalDevice
    uint32_t*                                   pPropertyCount,  // pPropertyCount is a pointer to an integer related to the number of display devices available or queried, as described below.
    VkDisplayPropertiesKHR*                     pProperties);  // pProperties is either NULL or a pointer to an array of VkDisplayPropertiesKHR structures.
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either NULL or a pointer to an array of `VkDisplayPropertiesKHR` structures.

If `pProperties` is NULL, then the number of display devices available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display devices for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

**Valid Usage (Implicit)**

- `VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-physicalDevice-parameter` `physicalDevice` must be a valid `VkPhysicalDevice` handle
- `VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pPropertyCount-parameter` `pPropertyCount` must be a valid pointer to a `uint32_t` value
- `VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pProperties-parameter` If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPropertiesKHR` structures
Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplayPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPropertiesKHR {
    VkDisplayKHR                  display;
    const char*                   displayName;
    VkExtent2D                    physicalDimensions;
    VkExtent2D                    physicalResolution;
    VkSurfaceTransformFlagsKHR    supportedTransforms;
    VkBool32                      planeReorderPossible;
    VkBool32                      persistentContent;
} VkDisplayPropertiesKHR;
```

- **display** is a handle that is used to refer to the display described here. This handle will be valid for the lifetime of the Vulkan instance.

- **displayName** is `NULL` or a pointer to a null-terminated UTF-8 string containing the name of the display. Generally, this will be the name provided by the display's EDID. If `NULL`, no suitable name is available. If not `NULL`, the memory pointed to must remain accessible as long as display is valid.

- **physicalDimensions** describes the physical width and height of the visible portion of the display, in millimeters.

- **physicalResolution** describes the physical, native, or preferred resolution of the display.

  - **Note**
    For devices which have no natural value to return here, implementations should return the maximum resolution supported.

- **supportedTransforms** is a bitmask of `VkSurfaceTransformFlagBitsKHR` describing which transforms are supported by this display.

- **planeReorderPossible** tells whether the planes on this display can have their z order changed. If this is VK_TRUE, the application can re-arrange the planes on this display in any order relative to each other.

- **persistentContent** tells whether the display supports self-refresh/internal buffering. If this is
true, the application can submit persistent present operations on swapchains created against this display.

**Note**

Persistent presents **may** have higher latency, and **may** use less power when the screen content is updated infrequently, or when only a portion of the screen needs to be updated in most frames.

To query information about the available displays, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayProperties2KHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pPropertyCount,
    VkDisplayProperties2KHR*                    pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPropertiesKHR`, with the ability to return extended information via chained output structures.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pProperties-parameter If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayProperties2KHR` structures
Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The \texttt{VkDisplayProperties2KHR} structure is defined as:

```c
typedef struct VkDisplayProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPropertiesKHR displayProperties;
} VkDisplayProperties2KHR;
```

- **\texttt{sType}** is the type of this structure.
- **\texttt{pNext}** is \texttt{NULL} or a pointer to a structure extending this structure.
- **\texttt{displayProperties}** is a \texttt{VkDisplayPropertiesKHR} structure.

Valid Usage (Implicit)

- **\texttt{VUID-VkDisplayProperties2KHR-sType-sType}**
  - \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR}
- **\texttt{VUID-VkDisplayProperties2KHR-pNext-pNext}**
  - \texttt{pNext} must be \texttt{NULL}

Acquiring and Releasing Displays

On some platforms, access to displays is limited to a single process or native driver instance. On such platforms, some or all of the displays may not be available to Vulkan if they are already in use by a native windowing system or other application.

To acquire permission to directly access a display in Vulkan from an X11 server, call:

```c
// Provided by VK_EXT_acquire_xlib_display
VkResult vkAcquireXlibDisplayEXT(
    VkPhysicalDevice physicalDevice,
    Display* dpy,
    VkDisplayKHR display);
```
• **physicalDevice** The physical device the display is on.
• **dpy** A connection to the X11 server that currently owns display.
• **display** The display the caller wishes to control in Vulkan.

All permissions necessary to control the display are granted to the Vulkan instance associated with `physicalDevice` until the display is released or the X11 connection specified by `dpy` is terminated. Permission to access the display **may** be temporarily revoked during periods when the X11 server from which control was acquired itself loses access to `display`. During such periods, operations which require access to the display **must** fail with an appropriate error code. If the X11 server associated with `dpy` does not own `display`, or if permission to access it has already been acquired by another entity, the call **must** return the error code `VK_ERROR_INITIALIZATION_FAILED`.

**Note**
One example of when an X11 server loses access to a display is when it loses ownership of its virtual terminal.

**Valid Usage (Implicit)**

- VUID-vkAcquireXlibDisplayEXT-physicalDevice-parameter
  `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkAcquireXlibDisplayEXT-dpy-parameter
  `dpy` **must** be a valid pointer to a `Display` value
- VUID-vkAcquireXlibDisplayEXT-display-parameter
  `display` **must** be a valid `VkDisplayKHR` handle
- VUID-vkAcquireXlibDisplayEXT-display-parent
  `display` **must** have been created, allocated, or retrieved from `physicalDevice`

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

When acquiring displays from an X11 server, an application may also wish to enumerate and identify them using a native handle rather than a `VkDisplayKHR` handle. To determine the `VkDisplayKHR` handle corresponding to an X11 RandR Output, call:
VkResult vkGetRandROutputDisplayEXT(
    VkPhysicalDevice                            physicalDevice,
    Display*                                    dpy,
    RROutput                                    rrOutput,
    VkDisplayKHR*                               pDisplay);

• **physicalDevice** The physical device to query the display handle on.
• **dpy** A connection to the X11 server from which **rrOutput** was queried.
• **rrOutput** An X11 RandR output ID.
• **pDisplay** The corresponding **VkDisplayKHR** handle will be returned here.

If there is no **VkDisplayKHR** corresponding to **rrOutput** on **physicalDevice**, **VK_NULL_HANDLE** must be returned in **pDisplay**.

### Valid Usage (Implicit)

- **VUID-vkGetRandROutputDisplayEXT-physicalDevice-parameter**
  **physicalDevice** must be a valid **VkPhysicalDevice** handle
- **VUID-vkGetRandROutputDisplayEXT-dpy-parameter**
  **dpy** must be a valid pointer to a **Display** value
- **VUID-vkGetRandROutputDisplayEXT-pDisplay-parameter**
  **pDisplay** must be a valid pointer to a **VkDisplayKHR** handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**

To acquire permission to directly access a display in Vulkan on Windows 10, call:

vkAcquireWinrtDisplayNV(
    VkPhysicalDevice                            physicalDevice,
    VkDisplayKHR                                display);
All permissions necessary to control the display are granted to the Vulkan instance associated with `physicalDevice` until the display is released or the application is terminated. Permission to access the display may be revoked by events that cause Windows 10 itself to lose access to `display`. If this has happened, operations which require access to the display must fail with an appropriate error code. If permission to access `display` has already been acquired by another entity, the call must return the error code `VK_ERROR_INITIALIZATION_FAILED`. 

**Note**
The Vulkan instance acquires control of a “winrt::Windows::Devices::Display::Core::DisplayTarget” by performing an operation equivalent to “winrt::Windows::Devices::Display::Core::DisplayManager.TryAcquireTarget()” on the “DisplayTarget”.

**Note**
One example of when Windows 10 loses access to a display is when the display is hot-unplugged.

**Note**
One example of when a display has already been acquired by another entity is when the Windows desktop compositor (DWM) is in control of the display. Beginning with Windows 10 version 2004 it is possible to cause DWM to release a display by using the “Advanced display settings” sub-page of the “Display settings” control panel. `vkAcquireWinrtDisplayNV` does not itself cause DWM to release a display; this action must be performed outside of Vulkan.

**Valid Usage (Implicit)**

- `VUID-vkAcquireWinrtDisplayNV-physicalDevice-parameter` 
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- `VUID-vkAcquireWinrtDisplayNV-display-parameter` 
  `display` must be a valid `VkDisplayKHR` handle
- `VUID-vkAcquireWinrtDisplayNV-display-parent` 
  `display` must have been created, allocated, or retrieved from `physicalDevice`
Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_INITIALIZATION_FAILED

When acquiring displays on Windows 10, an application may also wish to enumerate and identify them using a native handle rather than a VkDisplayKHR handle.

To determine the VkDisplayKHR handle corresponding to a “winrt::Windows::Devices::Display::Core::DisplayTarget”, call:

```c
// Provided by VK_NV_acquire_winrt_display
VkResult vkGetWinrtDisplayNV(
    VkPhysicalDevice                            physicalDevice,
    uint32_t                                    deviceRelativeId,
    VkDisplayKHR*                               pDisplay);
```

- **physicalDevice** The physical device on which to query the display handle.
- **deviceRelativeId** The value of the “AdapterRelativeId” property of a “DisplayTarget” that is enumerated by a “DisplayAdapter” with an “Id” property matching the deviceLUID property of a VkPhysicalDeviceIDProperties for physicalDevice.
- **pDisplay** The corresponding VkDisplayKHR handle will be returned here.

If there is no VkDisplayKHR corresponding to deviceRelativeId on physicalDevice, VK_NULL_HANDLE must be returned in pDisplay.

**Valid Usage (Implicit)**

- `VUID-vkGetWinrtDisplayNV-physicalDevice-parameter` physicalDevice must be a valid VkPhysicalDevice handle
- `VUID-vkGetWinrtDisplayNV-pDisplay-parameter` pDisplay must be a valid pointer to a VkDisplayKHR handle
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_INITIALIZATION_FAILED

To release a previously acquired display, call:

```c
// Provided by VK_EXT_direct_mode_display
VkResult vkReleaseDisplayEXT(
    VkPhysicalDevice                            physicalDevice,
    VkDisplayKHR                                display);
```

- `physicalDevice` The physical device the display is on.
- `display` The display to release control of.

Valid Usage (Implicit)

- VUID-vkReleaseDisplayEXT-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkReleaseDisplayEXT-display-parameter
  `display` must be a valid `VkDisplayKHR` handle

- VUID-vkReleaseDisplayEXT-display-parent
  `display` must have been created, allocated, or retrieved from `physicalDevice`

Display Planes

Images are presented to individual planes on a display. Devices **must** support at least one plane on each display. Planes **can** be stacked and blended to composite multiple images on one display. Devices **may** support only a fixed stacking order and fixed mapping between planes and displays, or they **may** allow arbitrary application specified stacking orders and mappings between planes and displays. To query the properties of device display planes, call:
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPlanePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPlanePropertiesKHR* pProperties);

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlanePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display planes available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display planes for `physicalDevice`, at most `pPropertyCount` structures will be written.

**Valid Usage (Implicit)**
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pPropertyCount-parameter
  `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pProperties-parameter
  If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPlanePropertiesKHR` structures

**Return Codes**

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlanePropertiesKHR` structure is defined as:
typedef struct VkDisplayPlanePropertiesKHR {
    VkDisplayKHR    currentDisplay;
    uint32_t        currentStackIndex;
} VkDisplayPlanePropertiesKHR;

- `currentDisplay` is the handle of the display the plane is currently associated with. If the plane is not currently attached to any displays, this will be `VK_NULL_HANDLE`.

- `currentStackIndex` is the current z-order of the plane. This will be between 0 and the value returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` in `pPropertyCount`.

To query the properties of a device’s display planes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayPlaneProperties2KHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pPropertyCount,
    VkDisplayPlaneProperties2KHR*               pProperties);
```

- `physicalDevice` is a physical device.

- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.

- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlaneProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayPlaneProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`, with the ability to return extended information via chained output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-physicalDevice-parameter
  physicalDevice must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pPropertyCount-parameter
  `pPropertyCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pProperties-parameter
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPlaneProperties2KHR` structures
Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplayPlaneProperties2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlanePropertiesKHR displayPlaneProperties;
} VkDisplayPlaneProperties2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayPlaneProperties` is a `VkDisplayPlanePropertiesKHR` structure.

**Valid Usage (Implicit)**

- VUID-VkDisplayPlaneProperties2KHR-sType-sType
  - `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR`
- VUID-VkDisplayPlaneProperties2KHR-pNext-pNext
  - `pNext` **must** be `NULL`

To determine which displays a plane is usable with, call

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneSupportedDisplaysKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t planeIndex,
    uint32_t* pDisplayCount,
    VkDisplayKHR* pDisplays);
```

- `physicalDevice` is a physical device.
- `planeIndex` is the plane which the application wishes to use, and **must** be in the range [0, physical device plane count - 1].
• `pDisplayCount` is a pointer to an integer related to the number of displays available or queried, as described below.

• `pDisplays` is either `NULL` or a pointer to an array of `VkDisplayKHR` handles.

If `pDisplays` is `NULL`, then the number of displays usable with the specified `planeIndex` for `physicalDevice` is returned in `pDisplayCount`. Otherwise, `pDisplayCount` must point to a variable set by the user to the number of elements in the `pDisplays` array, and on return the variable is overwritten with the number of handles actually written to `pDisplays`. If the value of `pDisplayCount` is less than the number of usable display-plane pairs for `physicalDevice`, at most `pDisplayCount` handles will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available pairs were returned.

Valid Usage

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-planeIndex-01249
  `planeIndex` must be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplayCount-parameter
  `pDisplayCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplays-parameter
  If the value referenced by `pDisplayCount` is not 0, and `pDisplays` is not `NULL`, `pDisplays` must be a valid pointer to an array of `pDisplayCount` `VkDisplayKHR` handles

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Additional properties of displays are queried using specialized query functions.

Display Modes

Display modes are represented by `VkDisplayModeKHR` handles:
Each display has one or more supported modes associated with it by default. These built-in modes are queried by calling:

```c
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayModeKHR)
```

```c
VkResult vkGetDisplayModePropertiesKHR(
    VkPhysicalDevice                            physicalDevice,
    VkDisplayKHR                                display,
    uint32_t*                                   pPropertyCount,
    VkDisplayModePropertiesKHR*                 pProperties);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display modes available on the specified `display` for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display modes for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available display modes were returned.

**Valid Usage (Implicit)**

- VUID-vkGetDisplayModePropertiesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayModePropertiesKHR-display-parameter
  `display` must be a valid `VkDisplayKHR` handle
- VUID-vkGetDisplayModePropertiesKHR-pPropertyCount-parameter
  `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayModePropertiesKHR-pProperties-parameter
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount ` `VkDisplayModePropertiesKHR` structures
- VUID-vkGetDisplayModePropertiesKHR-display-parent
  `display` must have been created, allocated, or retrieved from `physicalDevice`
Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplayModePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModePropertiesKHR {
    VkDisplayModeKHR displayMode;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModePropertiesKHR;
```

- `displayMode` is a handle to the display mode described in this structure. This handle will be valid for the lifetime of the Vulkan instance.
- `parameters` is a `VkDisplayModeParametersKHR` structure describing the display parameters associated with `displayMode`.

```c
// Provided by VK_KHR_display
typedef VkFlags VkDisplayModeCreateFlagsKHR;
```

`VkDisplayModeCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To query the properties of a device’s built-in display modes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayModeProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    uint32_t* pPropertyCount,
    VkDisplayModeProperties2KHR* pProperties);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
• `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModeProperties2KHR` structures.

`vkGetDisplayModeProperties2KHR` behaves similarly to `vkGetDisplayModePropertiesKHR`, with the ability to return extended information via chained output structures.

### Valid Usage (Implicit)

- VUID-vkGetDisplayModeProperties2KHR-physicalDevice-parameter  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayModeProperties2KHR-display-parameter  
  `display` must be a valid `VkDisplayKHR` handle
- VUID-vkGetDisplayModeProperties2KHR-pPropertyCount-parameter  
  `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayModeProperties2KHR-pProperties-parameter  
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayModeProperties2KHR` structures
- VUID-vkGetDisplayModeProperties2KHR-display-parent  
  `display` must have been created, allocated, or retrieved from `physicalDevice`

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayModeProperties2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2  
typedef struct VkDisplayModeProperties2KHR {
    VkStructureType               sType;  
    void*                         pNext;  
    VkDisplayModePropertiesKHR    displayModeProperties;
} VkDisplayModeProperties2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayModeProperties` is a `VkDisplayModePropertiesKHR` structure.
Valid Usage (Implicit)

- VUID-VkDisplayModeProperties2KHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR`

- VUID-VkDisplayModeProperties2KHR-pNext-pNext
  
  `pNext` must be `NULL`

The `VkDisplayModeParametersKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModeParametersKHR {
    VkExtent2D visibleRegion;
    uint32_t refreshRate;
} VkDisplayModeParametersKHR;
```

- `visibleRegion` is the 2D extents of the visible region.
- `refreshRate` is a `uint32_t` that is the number of times the display is refreshed each second multiplied by 1000.

**Note**
For example, a 60Hz display mode would report a `refreshRate` of 60,000.

Valid Usage

- VUID-VkDisplayModeParametersKHR-width-01990
  
  The `width` member of `visibleRegion` must be greater than 0

- VUID-VkDisplayModeParametersKHR-height-01991
  
  The `height` member of `visibleRegion` must be greater than 0

- VUID-VkDisplayModeParametersKHR-refreshRate-01992
  
  `refreshRate` must be greater than 0

Additional modes may also be created by calling:

```c
// Provided by VK_KHR_display
VkResult vkCreateDisplayModeKHR(
    VkPhysicalDevice                            physicalDevice,
    VkDisplayKHR                                display,
    const VkDisplayModeCreateInfoKHR*           pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkDisplayModeKHR*                           pMode);
```

- `physicalDevice` is the physical device associated with `display`. 
• `display` is the display to create an additional mode for.

• `pCreateInfo` is a pointer to a `VkDisplayModeCreateInfoKHR` structure describing the new mode to create.

• `pAllocator` is the allocator used for host memory allocated for the display mode object when there is no more specific allocator available (see Memory Allocation).

• `pMode` is a pointer to a `VkDisplayModeKHR` handle in which the mode created is returned.

### Valid Usage (Implicit)

- `VUID-vkCreateDisplayModeKHR-physicalDevice-parameter` physicalDevice must be a valid `VkPhysicalDevice` handle

- `VUID-vkCreateDisplayModeKHR-display-parameter` display must be a valid `VkDisplayKHR` handle

- `VUID-vkCreateDisplayModeKHR-pCreateInfo-parameter` pCreateInfo must be a valid pointer to a valid `VkDisplayModeCreateInfoKHR` structure

- `VUID-vkCreateDisplayModeKHR-pAllocator-parameter` If pAllocator is not NULL, pAllocator must be a valid pointer to a valid `VkAllocationCallbacks` structure

- `VUID-vkCreateDisplayModeKHR-pMode-parameter` pMode must be a valid pointer to a `VkDisplayModeKHR` handle

- `VUID-vkCreateDisplayModeKHR-display-parent` display must have been created, allocated, or retrieved from physicalDevice

### Host Synchronization

- Host access to display must be externally synchronized

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

- `VK_ERROR_INITIALIZATION_FAILED`

The `VkDisplayModeCreateInfoKHR` structure is defined as:
typedef struct VkDisplayModeCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplayModeCreateFlagsKHR flags;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModeCreateInfoKHR;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is reserved for future use, and must be zero.
• **parameters** is a VkDisplayModeParametersKHR structure describing the display parameters to use in creating the new mode. If the parameters are not compatible with the specified display, the implementation must return VK_ERROR_INITIALIZATION_FAILED.

### Valid Usage (Implicit)

- VUID-VkDisplayModeCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR
- VUID-VkDisplayModeCreateInfoKHR-pNext-pNext
  pNext must be NULL
- VUID-VkDisplayModeCreateInfoKHR-flags-zerobitmask
  flags must be 0
- VUID-VkDisplayModeCreateInfoKHR-parameters-parameter
  parameters must be a valid VkDisplayModeParametersKHR structure

Applications that wish to present directly to a display must select which layer, or “plane” of the display they wish to target, and a mode to use with the display. Each display supports at least one plane. The capabilities of a given mode and plane combination are determined by calling:

// Provided by VK_KHR_display

```c
VkResult vkGetDisplayPlaneCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayModeKHR mode,
    uint32_t planeIndex,
    VkDisplayPlaneCapabilitiesKHR* pCapabilities);
```

- **physicalDevice** is the physical device associated with the display specified by **mode**
- **mode** is the display mode the application intends to program when using the specified plane. Note this parameter also implicitly specifies a display.
- **planeIndex** is the plane which the application intends to use with the display, and is less than the number of display planes supported by the device.
• `pCapabilities` is a pointer to a `VkDisplayPlaneCapabilitiesKHR` structure in which the capabilities are returned.

### Valid Usage (Implicit)

- `VUID-vkGetDisplayPlaneCapabilitiesKHR-physicalDevice-parameter` physicalDevice must be a valid `VkPhysicalDevice` handle
- `VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parameter` mode must be a valid `VkDisplayModeKHR` handle
- `VUID-vkGetDisplayPlaneCapabilitiesKHR-pCapabilities-parameter` `pCapabilities` must be a valid pointer to a `VkDisplayPlaneCapabilitiesKHR` structure

### Host Synchronization

- Host access to `mode` must be externally synchronized

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlaneCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlaneCapabilitiesKHR {
    VkDisplayPlaneAlphaFlagsKHR supportedAlpha;
    VkOffset2D minSrcPosition;
    VkOffset2D maxSrcPosition;
    VkExtent2D minSrcExtent;
    VkExtent2D maxSrcExtent;
    VkOffset2D minDstPosition;
    VkOffset2D maxDstPosition;
    VkExtent2D minDstExtent;
    VkExtent2D maxDstExtent;
} VkDisplayPlaneCapabilitiesKHR;
```

- `supportedAlpha` is a bitmask of `VkDisplayPlaneAlphaFlagBitsKHR` describing the supported alpha blending modes.
- `minSrcPosition` is the minimum source rectangle offset supported by this plane using the
maxSrcPosition is the maximum source rectangle offset supported by this plane using the specified mode. The x and y components of maxSrcPosition must each be greater than or equal to the x and y components of minSrcPosition, respectively.

- minSrcExtent is the minimum source rectangle size supported by this plane using the specified mode.

- maxSrcExtent is the maximum source rectangle size supported by this plane using the specified mode.

- minDstPosition, maxDstPosition, minDstExtent, maxDstExtent all have similar semantics to their corresponding *Src* equivalents, but apply to the output region within the mode rather than the input region within the source image. Unlike the *Src* offsets, minDstPosition and maxDstPosition may contain negative values.

The minimum and maximum position and extent fields describe the implementation limits, if any, as they apply to the specified display mode and plane. Vendors may support displaying a subset of a swapchain's presentable images on the specified display plane. This is expressed by returning minSrcPosition, maxSrcPosition, minSrcExtent, and maxSrcExtent values that indicate a range of possible positions and sizes which may be used to specify the region within the presentable images that source pixels will be read from when creating a swapchain on the specified display mode and plane.

Vendors may also support mapping the presentable images' content to a subset or superset of the visible region in the specified display mode. This is expressed by returning minDstPosition, maxDstPosition, minDstExtent and maxDstExtent values that indicate a range of possible positions and sizes which may be used to describe the region within the display mode that the source pixels will be mapped to.

Other vendors may support only a 1-1 mapping between pixels in the presentable images and the display mode. This may be indicated by returning (0,0) for minSrcPosition, maxSrcPosition, minDstPosition, and maxDstPosition, and (display mode width, display mode height) for minSrcExtent, maxSrcExtent, minDstExtent, and maxDstExtent.

The value supportedAlpha must contain at least one valid VkDisplayPlaneAlphaFlagBitsKHR bit.

These values indicate the limits of the implementation's individual fields. Not all combinations of values within the offset and extent ranges returned in VkDisplayPlaneCapabilitiesKHR are guaranteed to be supported. Presentation requests specifying unsupported combinations may fail.

To query the capabilities of a given mode and plane combination, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayPlaneCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkDisplayPlaneInfo2KHR* pDisplayPlaneInfo,
    VkDisplayPlaneCapabilities2KHR* pCapabilities);
```

- physicalDevice is the physical device associated with pDisplayPlaneInfo.
• **pDisplayPlaneInfo** is a pointer to a *VkDisplayPlaneInfo2KHR* structure describing the plane and mode.

• **pCapabilities** is a pointer to a *VkDisplayPlaneCapabilities2KHR* structure in which the capabilities are returned.

`vkGetDisplayPlaneCapabilities2KHR` behaves similarly to `vkGetDisplayPlaneCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

### Valid Usage (Implicit)

- **VUID-vkGetDisplayPlaneCapabilities2KHR-physicalDevice-parameter**
  
  `physicalDevice` must be a valid *VkPhysicalDevice handle*

- **VUID-vkGetDisplayPlaneCapabilities2KHR-pDisplayPlaneInfo-parameter**
  
  `pDisplayPlaneInfo` must be a valid pointer to a valid *VkDisplayPlaneInfo2KHR structure*

- **VUID-vkGetDisplayPlaneCapabilities2KHR-pCapabilities-parameter**
  
  `pCapabilities` must be a valid pointer to a *VkDisplayPlaneCapabilities2KHR structure*

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The *VkDisplayPlaneInfo2KHR* structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneInfo2KHR {
    VkStructureType     sType;
    const void*         pNext;
    VkDisplayModeKHR    mode;
    uint32_t            planeIndex;
} VkDisplayPlaneInfo2KHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **mode** is the display mode the application intends to program when using the specified plane.
Note
This parameter also implicitly specifies a display.

- `planeIndex` is the plane which the application intends to use with the display.

The members of `VkDisplayPlaneInfo2KHR` correspond to the arguments to `vkGetDisplayPlaneCapabilitiesKHR`, with `sType` and `pNext` added for extensibility.

### Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR`
- **pNext** must be `NULL`
- **mode** must be a valid `VkDisplayModeKHR` handle

### Host Synchronization

- Host access to **mode** must be externally synchronized

The `VkDisplayPlaneCapabilities2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlaneCapabilitiesKHR capabilities;
} VkDisplayPlaneCapabilities2KHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **capabilities** is a `VkDisplayPlaneCapabilitiesKHR` structure.

### Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR`
- **pNext** must be `NULL`
33.3.2. Display Control

To set the power state of a display, call:

```c
// Provided by VK_EXT_display_control
VkResult vkDisplayPowerControlEXT(
    VkDevice                                    device,
    VkDisplayKHR                                display,
    const VkDisplayPowerInfoEXT*                pDisplayPowerInfo);
```

- `device` is a logical device associated with `display`.
- `display` is the display whose power state is modified.
- `pDisplayPowerInfo` is a pointer to a `VkDisplayPowerInfoEXT` structure specifying the new power state of `display`.

### Valid Usage (Implicit)

- `VUID-vkDisplayPowerControlEXT-device-parameter`  
  `device` must be a valid `VkDevice` handle
- `VUID-vkDisplayPowerControlEXT-display-parameter`  
  `display` must be a valid `VkDisplayKHR` handle
- `VUID-vkDisplayPowerControlEXT-pDisplayPowerInfo-parameter`  
  `pDisplayPowerInfo` must be a valid pointer to a valid `VkDisplayPowerInfoEXT` structure
- `VUID-vkDisplayPowerControlEXT-commonparent`  
  Both of `device`, and `display` must have been created, allocated, or retrieved from the same `VkPhysicalDevice`

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkDisplayPowerInfoEXT` structure is defined as:
typedef struct VkDisplayPowerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDisplayPowerStateEXT powerState;
} VkDisplayPowerInfoEXT;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `powerState` is a `VkDisplayPowerStateEXT` value specifying the new power state of the display.

### Valid Usage (Implicit)

- `VUID-VkDisplayPowerInfoEXT-sType-sType`  
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT`

- `VUID-VkDisplayPowerInfoEXT-pNext-pNext`  
  `pNext` **must** be `NULL`

- `VUID-VkDisplayPowerInfoEXT-powerState-parameter`  
  `powerState` **must** be a valid `VkDisplayPowerStateEXT` value

Possible values of `VkDisplayPowerInfoEXT::powerState`, specifying the new power state of a display, are:

```c
// Provided by VK_EXT_display_control
typedef enum VkDisplayPowerStateEXT {
    VK_DISPLAY_POWER_STATE_OFF_EXT = 0,
    VK_DISPLAY_POWER_STATE_SUSPEND_EXT = 1,
    VK_DISPLAY_POWER_STATE_ON_EXT = 2,
} VkDisplayPowerStateEXT;
```

- `VK_DISPLAY_POWER_STATE_OFF_EXT` specifies that the display is powered down.
- `VK_DISPLAY_POWER_STATE_SUSPEND_EXT` specifies that the display is put into a low power mode, from which it **may** be able to transition back to `VK_DISPLAY_POWER_STATE_ON_EXT` more quickly than if it were in `VK_DISPLAY_POWER_STATE_OFF_EXT`. This state **may** be the same as `VK_DISPLAY_POWER_STATE_OFF_EXT`.
- `VK_DISPLAY_POWER_STATE_ON_EXT` specifies that the display is powered on.

### 33.3.3. Display Surfaces

A complete display configuration includes a mode, one or more display planes and any parameters describing their behavior, and parameters describing some aspects of the images associated with those planes. Display surfaces describe the configuration of a single plane within a complete display configuration. To create a `VkSurfaceKHR` object for a display plane, call:
// Provided by VK_KHR_display

VkResult vkCreateDisplayPlaneSurfaceKHR(
    VkInstance instance,
    const VkDisplaySurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);

• `instance` is the instance corresponding to the physical device the targeted display is on.

• `pCreateInfo` is a pointer to a `VkDisplaySurfaceCreateInfoKHR` structure specifying which mode, plane, and other parameters to use, as described below.

• `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

• `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface is returned.

Valid Usage (Implicit)

• VUID-vkCreateDisplayPlaneSurfaceKHR-instance-parameter
  `instance` must be a valid `VkInstance` handle

• VUID-vkCreateDisplayPlaneSurfaceKHR-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkDisplaySurfaceCreateInfoKHR` structure

• VUID-vkCreateDisplayPlaneSurfaceKHR-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

• VUID-vkCreateDisplayPlaneSurfaceKHR-pSurface-parameter
  `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success

• `VK_SUCCESS`

Failure

• `VK_ERROR_OUT_OF_HOST_MEMORY`

• `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplaySurfaceCreateInfoKHR` structure is defined as:
typedef struct VkDisplaySurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplaySurfaceCreateFlagsKHR flags;
    VkDisplayModeKHR displayMode;
    uint32_t planeIndex;
    uint32_t planeStackIndex;
    VkSurfaceTransformFlagBitsKHR transform;
    float globalAlpha;
    VkDisplayPlaneAlphaFlagBitsKHR alphaMode;
    VkExtent2D imageExtent;
} VkDisplaySurfaceCreateInfoKHR;

• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is reserved for future use, and must be zero.

• **displayMode** is a [VkDisplayModeKHR](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkDisplayModeKHR.html) handle specifying the mode to use when displaying this surface.

• **planeIndex** is the plane on which this surface appears.

• **planeStackIndex** is the z-order of the plane.

• **transform** is a [VkSurfaceTransformFlagBitsKHR](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkSurfaceTransformFlagBitsKHR.html) value specifying the transformation to apply to images as part of the scanout operation.

• **globalAlpha** is the global alpha value. This value is ignored if **alphaMode** is not [VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VKDISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR.html).

• **alphaMode** is a [VkDisplayPlaneAlphaFlagBitsKHR](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkDisplayPlaneAlphaFlagBitsKHR.html) value specifying the type of alpha blending to use.

• **imageExtent** is the size of the presentable images to use with the surface.

---

**Note**

Creating a display surface must not modify the state of the displays, planes, or other resources it names. For example, it must not apply the specified mode to be set on the associated display. Application of display configuration occurs as a side effect of presenting to a display surface.
Valid Usage

- **VUID-VkDisplaySurfaceCreateInfoKHR-planeIndex-01252**
  
  \textit{planeIndex} must be less than the number of display planes supported by the device as determined by calling \texttt{vkGetPhysicalDeviceDisplayPlanePropertiesKHR}

- **VUID-VkDisplaySurfaceCreateInfoKHR-planeOrderPossible-01253**
  
  If the \texttt{planeOrderPossible} member of the \texttt{VkDisplayPropertiesKHR} structure returned by \texttt{vkGetPhysicalDeviceDisplayPropertiesKHR} for the display corresponding to \texttt{displayMode} is \texttt{VK_TRUE} then \textit{planeStackIndex} must be less than the number of display planes supported by the device as determined by calling \texttt{vkGetPhysicalDeviceDisplayPlanePropertiesKHR}; otherwise \textit{planeStackIndex} must equal the \texttt{currentStackIndex} member of \texttt{VkDisplayPlanePropertiesKHR} returned by \texttt{vkGetPhysicalDeviceDisplayPlanePropertiesKHR} for the display plane corresponding to \texttt{displayMode}

- **VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01254**
  
  If \texttt{alphaMode} is \texttt{VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR} then \texttt{globalAlpha} must be between 0 and 1, inclusive

- **VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01255**
  
  \texttt{alphaMode} must be one of the bits present in the \texttt{supportedAlpha} member of \texttt{VkDisplayPlaneCapabilitiesKHR} for the display plane corresponding to \texttt{displayMode}

- **VUID-VkDisplaySurfaceCreateInfoKHR-width-01256**
  
  The width and height members of \texttt{imageExtent} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxImageDimension2D}

Valid Usage (Implicit)

- **VUID-VkDisplaySurfaceCreateInfoKHR-sType-sType**
  
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR}

- **VUID-VkDisplaySurfaceCreateInfoKHR-pNext-pNext**
  
  \texttt{pNext} must be \texttt{NULL}

- **VUID-VkDisplaySurfaceCreateInfoKHR-flags-zerobitmask**
  
  \texttt{flags} must be 0

- **VUID-VkDisplaySurfaceCreateInfoKHR-displayMode-parameter**
  
  \texttt{displayMode} must be a valid \texttt{VkDisplayModeKHR} handle

- **VUID-VkDisplaySurfaceCreateInfoKHR-transform-parameter**
  
  \texttt{transform} must be a valid \texttt{VkSurfaceTransformFlagBitsKHR} value

- **VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-parameter**
  
  \texttt{alphaMode} must be a valid \texttt{VkDisplayPlaneAlphaFlagBitsKHR} value

// Provided by VK_KHR_display

typedef VkFlags VkDisplaySurfaceCreateFlagsKHR;
 VkDisplaySurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkDisplaySurfaceCreateInfoKHR::alphaMode, specifying the type of alpha blending to use on a display, are:

```
// Provided by VK_KHR_display
typedef enum VkDisplayPlaneAlphaFlagBitsKHR {
    VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR = 0x00000002,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR = 0x00000004,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR = 0x00000008,
} VkDisplayPlaneAlphaFlagBitsKHR;
```

- **VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR** specifies that the source image will be treated as opaque.
- **VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR** specifies that a global alpha value must be specified that will be applied to all pixels in the source image.
- **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR** specifies that the alpha value will be determined by the alpha channel of the source image’s pixels. If the source format contains no alpha values, no blending will be applied. The source alpha values are not premultiplied into the source image’s other color channels.
- **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR** is equivalent to **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR**, except the source alpha values are assumed to be premultiplied into the source image’s other color channels.

```
// Provided by VK_KHR_display
typedef VkFlags VkDisplayPlaneAlphaFlagsKHR;
```

VkDisplayPlaneAlphaFlagsKHR is a bitmask type for setting a mask of zero or more VkDisplayPlaneAlphaFlagBitsKHR.

### 33.3.4. Presenting to headless surfaces

Vulkan rendering can be presented to a headless surface, where the presentation operation is a no-op producing no externally-visible result.
Note

Because there is no real presentation target, the headless presentation engine may be extended to impose an arbitrary or customisable set of restrictions and features. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

The usual surface query mechanisms must be used to determine the actual restrictions and features of the implementation.

To create a headless `VkSurfaceKHR` object, call:

```c
// Provided by VK_EXT_headless_surface
VkResult vkCreateHeadlessSurfaceEXT(
    VkInstance                                                  instance,   // instance
    const VkHeadlessSurfaceCreateInfoEXT* pCreateInfo,        // pCreateInfo
    const VkAllocationCallbacks* pAllocator,                   // pAllocator
    VkSurfaceKHR* pSurface                                      // pSurface
);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkHeadlessSurfaceCreateInfoEXT` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateHeadlessSurfaceEXT-instance-parameter**
  - `instance` must be a valid `VkInstance` handle

- **VUID-vkCreateHeadlessSurfaceEXT-pCreateInfo-parameter**
  - `pCreateInfo` must be a valid pointer to a valid `VkHeadlessSurfaceCreateInfoEXT` structure

- **VUID-vkCreateHeadlessSurfaceEXT-pAllocationCallbacks-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateHeadlessSurfaceEXT-pSurface-parameter**
  - `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OFDEVICE_MEMORY

The VkHeadlessSurfaceCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_headless_surface
typedef struct VkHeadlessSurfaceCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkHeadlessSurfaceCreateFlagsEXT flags;
} VkHeadlessSurfaceCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

Valid Usage (Implicit)

- VUID-VkHeadlessSurfaceCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_HEADLESS_SURFACE_CREATE_INFO_EXT

- VUID-VkHeadlessSurfaceCreateInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkHeadlessSurfaceCreateInfoEXT-flags-zerobitmask
  flags must be 0

For headless surfaces, `currentExtent` is the reserved value (0xFFFFFFFF, 0xFFFFFFFF). Whatever the application sets a swapchain’s `imageExtent` to will be the size of the surface, after the first image is presented.

```c
// Provided by VK_EXT_headless_surface
typedef VkFlags VkHeadlessSurfaceCreateFlagsEXT;
```

`VkHeadlessSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.
33.4. Querying for WSI Support

Not all physical devices will include WSI support. Within a physical device, not all queue families will support presentation. WSI support and compatibility can be determined in a platform-neutral manner (which determines support for presentation to a particular surface object) and additionally may be determined in platform-specific manners (which determine support for presentation on the specified physical device but do not guarantee support for presentation to a particular surface object).

To determine whether a queue family of a physical device supports presentation to a given surface, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceSupportKHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t                                    queueFamilyIndex,
    VkSurfaceKHR                                surface,
    VkBool32*                                   pSupported);
```

- **physicalDevice** is the physical device.
- **queueFamilyIndex** is the queue family.
- **surface** is the surface.
- **pSupported** is a pointer to a `VkBool32`, which is set to `VK_TRUE` to indicate support, and `VK_FALSE` otherwise.

### Valid Usage

- **VUID-vkGetPhysicalDeviceSurfaceSupportKHR-queueFamilyIndex-01269**
  
  `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSurfaceSupportKHR-physicalDevice-parameter**
  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceSurfaceSupportKHR-surface-parameter**
  
  `surface` must be a valid `VkSurfaceKHR` handle

- **VUID-vkGetPhysicalDeviceSurfaceSupportKHR-pSupported-parameter**
  
  `pSupported` must be a valid pointer to a `VkBool32` value

- **VUID-vkGetPhysicalDeviceSurfaceSupportKHR-commonparent**
  
  Both of `physicalDevice`, and `surface` must have been created, allocated, or retrieved from the same `VkInstance`
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_SURFACE_LOST_KHR

33.4.1. Android Platform

On Android, all physical devices and queue families must be capable of presentation with any native window. As a result there is no Android-specific query for these capabilities.

33.4.2. Wayland Platform

To determine whether a queue family of a physical device supports presentation to a Wayland compositor, call:

```c
// Provided by VK_KHR_wayland_surface
VkBool32 vkGetPhysicalDeviceWaylandPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    struct wl_display* display);
```

• `physicalDevice` is the physical device.
• `queueFamilyIndex` is the queue family index.
• `display` is a pointer to the `wl_display` associated with a Wayland compositor.

This platform-specific function can be called prior to creating a surface.

Valid Usage

• VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-queueFamilyIndex-01306
  queueFamilyIndex must be less than `pQueueFamilyPropertyCount` returned by
  `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-display-parameter
  display must be a valid pointer to a wl_display value

33.4.3. Win32 Platform

To determine whether a queue family of a physical device supports presentation to the Microsoft Windows desktop, call:

```c
// Provided by VK_KHR_win32_surface
VkBool32 vkGetPhysicalDeviceWin32PresentationSupportKHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t                                    queueFamilyIndex);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-queueFamilyIndex-01309
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by
  vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

33.4.4. XCB Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the XCB client-side library, call:
// Provided by VK_KHR_xcb_surface
VkBool32 vkGetPhysicalDeviceXcbPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    xcb_connection_t* connection,
    xcb_visualid_t visual_id);

• `physicalDevice` is the physical device.
• `queueFamilyIndex` is the queue family index.
• `connection` is a pointer to an `xcb_connection_t` to the X server.
• `visual_id` is an X11 visual (`xcb_visualid_t`).

This platform-specific function can be called prior to creating a surface.

Valid Usage

• VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-queueFamilyIndex-01312
  `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by
  `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

• VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-connection-parameter
  `connection` must be a valid pointer to an `xcb_connection_t` value

33.4.5. Xlib Platform

To determine whether a queue family of a physical device supports presentation to an X11 server,
using the Xlib client-side library, call:

// Provided by VK_KHR_xlib_surface
VkBool32 vkGetPhysicalDeviceXlibPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    Display* dpy,
    VisualID visualID);

• `physicalDevice` is the physical device.
• `queueFamilyIndex` is the queue family index.
• `dpy` is a pointer to an Xlib `Display` connection to the server.
• visualId is an X11 visual (VisualID).

This platform-specific function can be called prior to creating a surface.

Valid Usage

• VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-queueFamilyIndex-01315
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by
  vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-dpy-parameter
  dpy must be a valid pointer to a Display value

33.4.6. DirectFB Platform

To determine whether a queue family of a physical device supports presentation with DirectFB library, call:

```c
// Provided by VK_EXT_directfb_surface
VkBool32 vkGetPhysicalDeviceDirectFBPresentationSupportEXT(
  VkPhysicalDevice physicalDevice,
  uint32_t queueFamilyIndex,
  IDirectFB* dfb);
```

• physicalDevice is the physical device.

• queueFamilyIndex is the queue family index.

• dfb is a pointer to the IDirectFB main interface of DirectFB.

This platform-specific function can be called prior to creating a surface.

Valid Usage

• VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-queueFamilyIndex-04119
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by
  vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-dfb-parameter
  dfb must be a valid pointer to an IDirectFB value

33.4.7. Fuchsia Platform

On Fuchsia, all physical devices and queue families must be capable of presentation with any ImagePipe. As a result there is no Fuchsia-specific query for these capabilities.

33.4.8. Google Games Platform

On Google Games Platform, all physical devices and queue families with the VkQueueGraphicsBit or VkQueueComputeBit capabilities must be capable of presentation with any Google Games Platform stream descriptor. As a result, there is no query specific to Google Games Platform for these capabilities.

33.4.9. iOS Platform

On iOS, all physical devices and queue families must be capable of presentation with any layer. As a result there is no iOS-specific query for these capabilities.

33.4.10. macOS Platform

On macOS, all physical devices and queue families must be capable of presentation with any layer. As a result there is no macOS-specific query for these capabilities.

33.4.11. VI Platform

On VI, all physical devices and queue families must be capable of presentation with any layer. As a result there is no VI-specific query for these capabilities.

33.4.12. QNX Screen Platform

To determine whether a queue family of a physical device supports presentation to a QNX Screen compositor, call:

```c
// Provided by VK_QNX_screen_surface
VkBool32 vkGetPhysicalDeviceScreenPresentationSupportQNX(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    struct _screen_window* window);
```

- physicalDevice is the physical device.
• `queueFamilyIndex` is the queue family index.

• `window` is the QNX Screen `window` object.

This platform-specific function can be called prior to creating a surface.

### Valid Usage

- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-queueFamilyIndex-04743
  `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-window-parameter
  `window` must be a valid pointer to a `_screen_window` value

### 33.5. Surface Queries

The capabilities of a swapchain targeting a surface are the intersection of the capabilities of the WSI platform, the native window or display, and the physical device. The resulting capabilities can be obtained with the queries listed below in this section.

**Note**

In addition to the surface capabilities as obtained by surface queries below, swapchain images are also subject to ordinary image creation limits as reported by `vkGetPhysicalDeviceImageFormatProperties`. As an application is instructed by the appropriate Valid Usage sections, both the surface capabilities and the image creation limits have to be satisfied whenever swapchain images are created.

### 33.5.1. Surface Capabilities

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceCapabilitiesKHR(
    VkPhysicalDevice                               physicalDevice,
    VkSurfaceKHR                                    surface,
    VkSurfaceCapabilitiesKHR*                      pSurfaceCapabilities);
```

• `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
• surface is the surface that will be associated with the swapchain.

• pSurfaceCapabilities is a pointer to a VkSurfaceCapabilitiesKHR structure in which the capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-parameter surface must be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-pSurfaceCapabilities-parameter pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilitiesKHR structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-commonparent Both of physicalDevice, and surface must have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceCapabilitiesKHR structure is defined as:

```c
// Provided by VK_KHR_surface
typedef struct VkSurfaceCapabilitiesKHR {
    uint32_t minImageCount;
    uint32_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
} VkSurfaceCapabilitiesKHR;
```

• minImageCount is the minimum number of images the specified device supports for a swapchain
created for the surface, and will be at least one.

- **maxImageCount** is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to **minImageCount**. A value of 0 means that there is no limit on the number of images, though there **may** be limits related to the total amount of memory used by presentable images.

- **currentExtent** is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

- **minImageExtent** contains the smallest valid swapchain extent for the surface on the specified device. The **width** and **height** of the extent will each be less than or equal to the corresponding **width** and **height** of **currentExtent**, unless **currentExtent** has the special value described above.

- **maxImageExtent** contains the largest valid swapchain extent for the surface on the specified device. The **width** and **height** of the extent will each be greater than or equal to the corresponding **width** and **height** of **minImageExtent**. The **width** and **height** of the extent will each be greater than or equal to the corresponding **width** and **height** of **currentExtent**, unless **currentExtent** has the special value described above.

- **maxImageArrayLayers** is the maximum number of layers presentable images **can** have for a swapchain created for this device and surface, and will be at least one.

- **supportedTransforms** is a bitmask of **VkSurfaceTransformFlagBitsKHR** indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.

- **currentTransform** is **VkSurfaceTransformFlagBitsKHR** value indicating the surface's current transform relative to the presentation engine's natural orientation.

- **supportedCompositeAlpha** is a bitmask of **VkCompositeAlphaFlagBitsKHR**, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition **can** be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

- **supportedUsageFlags** is a bitmask of **VkImageUsageFlagBits** representing the ways the application **can** use the presentable images of a swapchain created with **VkPresentModeKHR** set to **VK_PRESENT_MODE_IMMEDIATE_KHR**, **VK_PRESENT_MODE_MAILBOX_KHR**, **VK_PRESENT_MODE_FIFO_KHR**, or **VK_PRESENT_MODE_FIFO_RELAXED_KHR** for the surface on the specified device. **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** **must** be included in the set but implementations **may** support additional usages.

**Note**

Supported usage flags of a presentable image when using **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** or **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR** presentation mode are provided by **VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags**.
Formulas such as \( \min(N, \text{maxImageCount}) \) are not correct, since \( \text{maxImageCount} \) may be zero.

To query the basic capabilities of a surface defined by the core or extensions, call:

```c
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceCapabilities2KHR(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR*      pSurfaceInfo,
    VkSurfaceCapabilities2KHR*                  pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilities2KHR` structure in which the capabilities are returned.

`vkGetPhysicalDeviceSurfaceCapabilities2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

**Valid Usage**

- `VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-02671`
  If a `VkSurfaceCapabilitiesFullScreenExclusiveEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure must be included in the `pNext` chain of `pSurfaceInfo`

**Valid Usage (Implicit)**

- `VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-physicalDevice-parameter`
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- `VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-parameter`
  `pSurfaceInfo` must be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure

- `VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceCapabilities-parameter`
  `pSurfaceCapabilities` must be a valid pointer to a `VkSurfaceCapabilities2KHR` structure
Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The `VkPhysicalDeviceSurfaceInfo2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkPhysicalDeviceSurfaceInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceKHR surface;
} VkPhysicalDeviceSurfaceInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surface` is the surface that will be associated with the swapchain.

The members of `VkPhysicalDeviceSurfaceInfo2KHR` correspond to the arguments to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with `sType` and `pNext` added for extensibility.

Additional capabilities of a surface may be available to swapchains created with different full-screen exclusive settings - particularly if exclusive full-screen access is application controlled. These additional capabilities can be queried by adding a `VkSurfaceFullScreenExclusiveInfoEXT` structure to the `pNext` chain of this structure when used to query surface properties. Additionally, for Win32 surfaces with application controlled exclusive full-screen access, chaining a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure may also report additional surface capabilities. These additional capabilities only apply to swapchains created with the same parameters included in the `pNext` chain of `VkSwapchainCreateInfoKHR`.

Valid Usage

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-02672

If the `pNext` chain includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure with its `fullScreenExclusive` member set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, and `surface` was created using `vkCreateWin32SurfaceKHR`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure must be included in the `pNext` chain.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-sType
  
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-pNext
  
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkSurfaceFullScreenExclusiveInfoEXT or VkSurfaceFullScreenExclusiveWin32InfoEXT

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-unique
  
The sType value of each struct in the pNext chain must be unique

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-parameter
  
surface must be a valid VkSurfaceKHR handle

If the pNext chain of VkSwapchainCreateInfoKHR includes a VkSurfaceFullScreenExclusiveInfoEXT structure, then that structure specifies the application's preferred full-screen transition behavior.

The VkSurfaceFullScreenExclusiveInfoEXT structure is defined as:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveInfoEXT {
    VkStructureType             sType;
    void*                       pNext;
    VkFullScreenExclusiveEXT    fullScreenExclusive;
} VkSurfaceFullScreenExclusiveInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- fullScreenExclusive is a VkFullScreenExclusiveEXT value specifying the preferred full-screen transition behavior.

If this structure is not present, fullScreenExclusive is considered to be VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT.

Valid Usage (Implicit)

- VUID-VkSurfaceFullScreenExclusiveInfoEXT-sType-sType
  
sType must be VK_STRUCTURE_TYPE_SURFACE_FULLSCREEN_EXCLUSIVE_INFO_EXT

- VUID-VkSurfaceFullScreenExclusiveInfoEXT-fullScreenExclusive-parameter
  
  fullScreenExclusive must be a valid VkFullScreenExclusiveEXT value

Possible values of VkSurfaceFullScreenExclusiveInfoEXT::fullScreenExclusive are:
typedef enum VkFullScreenExclusiveEXT {
    VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT = 0,
    VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT = 1,
    VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT = 2,
    VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT = 3,
} VkFullScreenExclusiveEXT;

- **VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT** indicates the implementation should determine the appropriate full-screen method by whatever means it deems appropriate.

- **VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT** indicates the implementation may use full-screen exclusive mechanisms when available. Such mechanisms may result in better performance and/or the availability of different presentation capabilities, but may require a more disruptive transition during swapchain initialization, first presentation and/or destruction.

- **VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT** indicates the implementation should avoid using full-screen mechanisms which rely on disruptive transitions.

- **VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT** indicates the application will manage full-screen exclusive mode by using the `vkAcquireFullScreenExclusiveModeEXT` and `vkReleaseFullScreenExclusiveModeEXT` commands.

The `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure is defined as:

```
// Provided by VK_EXT_full_screen_exclusive with VK_KHR_win32_surface
typedef struct VkSurfaceFullScreenExclusiveWin32InfoEXT {
    VkStructureType sType;
    const void* pNext;
    HMONITOR hmonitor;
} VkSurfaceFullScreenExclusiveWin32InfoEXT;
```

- **sType** is the type of this structure.

- **pNext** is NULL or a pointer to a structure extending this structure.

- **hmonitor** is the Win32 `HMONITOR` handle identifying the display to create the surface with.

**Note**

If `hmonitor` is invalidated (e.g. the monitor is unplugged) during the lifetime of a swapchain created with this structure, operations on that swapchain will return `VK_ERROR_OUT_OF_DATE_KHR`.

**Note**

It is the responsibility of the application to change the display settings of the targeted Win32 display using the appropriate platform APIs. Such changes may alter the surface capabilities reported for the created surface.
Valid Usage

- VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-hmonitor-02673
  \textit{hmonitor} must be a valid \texttt{HMONITOR}

Valid Usage (Implicit)

- VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-sType-sType
  \textit{sType} must be \texttt{VK_STRUCTURE_TYPE_SURFACE_FULLSCREEN_EXCLUSIVE_WIN32_INFO_EXT}

The \texttt{VkSurfaceCapabilities2KHR} structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceCapabilities2KHR {
    VkStructureType             sType;
    void*                       pNext;
    VkSurfaceCapabilitiesKHR    surfaceCapabilities;
} VkSurfaceCapabilities2KHR;
```

- \textit{sType} is the type of this structure.
- \textit{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \textit{surfaceCapabilities} is a \texttt{VkSurfaceCapabilitiesKHR} structure describing the capabilities of the specified surface.

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilities2KHR-sType-sType
  \textit{sType} must be \texttt{VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR}

- VUID-VkSurfaceCapabilities2KHR-pNext-pNext
  Each \textit{pNext} member of any structure (including this one) in the \textit{pNext} chain must be either \texttt{NULL} or a pointer to a valid instance of \texttt{VkDisplayNativeHdrSurfaceCapabilitiesAMD}, \texttt{VkSharedPresentSurfaceCapabilitiesKHR}, \texttt{VkSurfaceCapabilitiesFullScreenExclusiveEXT}, or \texttt{VkSurfaceProtectedCapabilitiesKHR}

- VUID-VkSurfaceCapabilities2KHR-sType-unique
  The \textit{sType} value of each struct in the \textit{pNext} chain must be unique

An application queries if a protected \texttt{VkSurfaceKHR} is displayable on a specific windowing system using \texttt{VkSurfaceProtectedCapabilitiesKHR}, which can be passed in \textit{pNext} parameter of \texttt{VkSurfaceCapabilities2KHR}.

The \texttt{VkSurfaceProtectedCapabilitiesKHR} structure is defined as:
typedef struct VkSurfaceProtectedCapabilitiesKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           supportsProtected;
} VkSurfaceProtectedCapabilitiesKHR;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **supportsProtected** specifies whether a protected swapchain created from `VkPhysicalDeviceSurfaceInfo2KHR::surface` for a particular windowing system can be displayed on screen or not. If `supportsProtected` is `VK_TRUE`, then creation of swapchains with the `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR` flag set must be supported for `surface`.

### Valid Usage (Implicit)
• VUID-VkSurfaceProtectedCapabilitiesKHR-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_SURFACE_PROTECTED_CAPABILITIES_KHR`

The `VkSharedPresentSurfaceCapabilitiesKHR` structure is defined as:

typedef struct VkSharedPresentSurfaceCapabilitiesKHR {
    VkStructureType      sType;
    void*                pNext;
    VkImageUsageFlags    sharedPresentSupportedUsageFlags;
} VkSharedPresentSurfaceCapabilitiesKHR;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **sharedPresentSupportedUsageFlags** is a bitmask of `VkImageUsageFlagBits` representing the ways the application can use the shared presentable image from a swapchain created with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` for the surface on the specified device. `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` must be included in the set but implementations may support additional usages.

### Valid Usage (Implicit)
• VUID-VkSharedPresentSurfaceCapabilitiesKHR-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR`

The `VkDisplayNativeHdrSurfaceCapabilitiesAMD` structure is defined as:
typedef struct VkDisplayNativeHdrSurfaceCapabilitiesAMD {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           localDimmingSupport;
} VkDisplayNativeHdrSurfaceCapabilitiesAMD;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **localDimmingSupport** specifies whether the surface supports local dimming. If this is **VK_TRUE**, `VkSwapchainDisplayNativeHdrCreateInfoAMD` can be used to explicitly enable or disable local dimming for the surface. Local dimming may also be overridden by `vkSetLocalDimmingAMD` during the lifetime of the swapchain.

**Valid Usage (Implicit)**

- VUID-VkDisplayNativeHdrSurfaceCapabilitiesAMD-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_NATIVE_HDR_SURFACE_CAPABILITIES_AMD

The `VkSurfaceCapabilitiesFullScreenExclusiveEXT` structure is defined as:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceCapabilitiesFullScreenExclusiveEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           fullScreenExclusiveSupported;
} VkSurfaceCapabilitiesFullScreenExclusiveEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **fullScreenExclusiveControlSupported** is a boolean describing whether the surface is able to make use of exclusive full-screen access.

This structure can be included in the **pNext** chain of `VkSurfaceCapabilities2KHR` to determine support for exclusive full-screen access. If **fullScreenExclusiveSupported** is **VK_FALSE**, it indicates that exclusive full-screen access is not obtainable for this surface.

Applications must not attempt to create swapchains with **VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT** set if **fullScreenExclusiveSupported** is **VK_FALSE**.
To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_EXT_display_surface_counter
VkResult vkGetPhysicalDeviceSurfaceCapabilities2EXT(
    VkPhysicalDevice                            physicalDevice,
    VkSurfaceKHR                                surface,
    VkSurfaceCapabilities2EXT*                  pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilities2EXT` structure in which the capabilities are returned.

`vkGetPhysicalDeviceSurfaceCapabilities2EXT` behaves similarly to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with the ability to return extended information by adding extending structures to the `pNext` chain of its `pSurfaceCapabilities` parameter.
Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceCapabilities2EXT structure is defined as:

```c
// Provided by VK_EXT_display_surface_counter
typedef struct VkSurfaceCapabilities2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t minImageCount;
    uint32_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
    VkSurfaceCounterFlagsEXT supportedSurfaceCounters;
} VkSurfaceCapabilities2EXT;
```

All members of VkSurfaceCapabilities2EXT are identical to the corresponding members of VkSurfaceCapabilitiesKHR where one exists. The remaining members are:

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **supportedSurfaceCounters** is a bitmask of VkSurfaceCounterFlagBitsEXT indicating the supported surface counter types.

Valid Usage

- VUID-VkSurfaceCapabilities2EXT-supportedSurfaceCounters-01246

  **supportedSurfaceCounters must not include** VK_SURFACE_COUNTER_VBLANK_BIT_EXT **unless the surface queried is a display surface**
Valid Usage (Implicit)

- **VUID-VkSurfaceCapabilities2EXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_EXT`

- **VUID-VkSurfaceCapabilities2EXT-pNext-pNext**
  
  `pNext` must be `NULL`

Bits which **can** be set in `VkSurfaceCapabilities2EXT::supportedSurfaceCounters`, indicating supported surface counter types, are:

```c
// Provided by VK_EXT_display_surface_counter
typedef enum VkSurfaceCounterFlagBitsEXT {
    VK_SURFACE_COUNTER_VBLANK_BIT_EXT = 0x00000001,
    VK_SURFACE_COUNTER_VBLANK_EXT = VK_SURFACE_COUNTER_VBLANK_BIT_EXT,
} VkSurfaceCounterFlagBitsEXT;
```

- **VK_SURFACE_COUNTER_VBLANK_BIT_EXT** specifies a counter incrementing once every time a vertical blanking period occurs on the display associated with the surface.

```c
// Provided by VK_EXT_display_surface_counter
typedef VkFlags VkSurfaceCounterFlagsEXT;
```

`VkSurfaceCounterFlagsEXT` is a bitmask type for setting a mask of zero or more `VkSurfaceCounterFlagBitsEXT`.

Bits which **may** be set in `VkSurfaceCapabilitiesKHR::supportedTransforms` indicating the presentation transforms supported for the surface on the specified device, and possible values of `VkSurfaceCapabilitiesKHR::currentTransform` indicating the surface's current transform relative to the presentation engine's natural orientation, are:

```c
// Provided by VK_KHR_surface
typedef enum VkSurfaceTransformFlagBitsKHR {
    VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR = 0x00000001,
    VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR = 0x00000002,
    VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR = 0x00000004,
    VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR = 0x00000008,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR = 0x00000010,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR = 0x00000020,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR = 0x00000040,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR = 0x00000080,
    VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR = 0x00000100,
} VkSurfaceTransformFlagBitsKHR;
```

- **VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR** specifies that image content is presented without being transformed.
• **VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR** specifies that image content is rotated 90 degrees clockwise.

• **VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR** specifies that image content is rotated 180 degrees clockwise.

• **VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR** specifies that image content is rotated 270 degrees clockwise.

• **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR** specifies that image content is mirrored horizontally.

• **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 90 degrees clockwise.

• **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 180 degrees clockwise.

• **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 270 degrees clockwise.

• **VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR** specifies that the presentation transform is not specified, and is instead determined by platform-specific considerations and mechanisms outside Vulkan.

```cpp
// Provided by VK_KHR_display
typedef VkFlags VkSurfaceTransformFlagsKHR;
```

**VkSurfaceTransformFlagsKHR** is a bitmask type for setting a mask of zero or more **VkSurfaceTransformFlagBitsKHR**.

The **supportedCompositeAlpha** member is of type **VkCompositeAlphaFlagBitsKHR**, which contains the following values:

```cpp
// Provided by VK_KHR_surface
typedef enum VkCompositeAlphaFlagBitsKHR {
    VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR = 0x00000002,
    VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR = 0x00000004,
    VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR = 0x00000008,
} VkCompositeAlphaFlagBitsKHR;
```

These values are described as follows:

• **VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR**: The alpha channel, if it exists, of the images is ignored in the compositing process. Instead, the image is treated as if it has a constant alpha of 1.0.

• **VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR**: The alpha channel, if it exists, of the images is respected in the compositing process. The non-alpha channels of the image are expected to already be multiplied by the alpha channel by the application.

• **VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR**: The alpha channel, if it exists, of the images is respected in the compositing process. The non-alpha channels of the image are not expected to
already be multiplied by the alpha channel by the application; instead, the compositor will multiply the non-alpha channels of the image by the alpha channel during compositing.

- **VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR**: The way in which the presentation engine treats the alpha channel in the images is unknown to the Vulkan API. Instead, the application is responsible for setting the composite alpha blending mode using native window system commands. If the application does not set the blending mode using native window system commands, then a platform-specific default will be used.

```
// Provided by VK_KHR_surface
typedef VkFlags VkCompositeAlphaFlagsKHR;
```

**VkCompositeAlphaFlagsKHR** is a bitmask type for setting a mask of zero or more **VkCompositeAlphaFlagBitsKHR**.

### 33.5.2. Surface Format Support

To query the supported swapchain format-color space pairs for a surface, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceFormatsKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pSurfaceFormatCount,
    VkSurfaceFormatKHR* pSurfaceFormats);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for **vkCreateSwapchainKHR**.
- **surface** is the surface that will be associated with the swapchain.
- **pSurfaceFormatCount** is a pointer to an integer related to the number of format pairs available or queried, as described below.
- **pSurfaceFormats** is either **NULL** or a pointer to an array of **VkSurfaceFormatKHR** structures.

If **pSurfaceFormats** is **NULL**, then the number of format pairs supported for the given **surface** is returned in **pSurfaceFormatCount**. Otherwise, **pSurfaceFormatCount** must point to a variable set by the user to the number of elements in the **pSurfaceFormats** array, and on return the variable is overwritten with the number of structures actually written to **pSurfaceFormats**. If the value of **pSurfaceFormatCount** is less than the number of format pairs supported, at most **pSurfaceFormatCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available format pairs were returned.

The number of format pairs supported must be greater than or equal to 1. **pSurfaceFormats** must not contain an entry whose value for **format** is **VK_FORMAT_UNDEFINED**.

If **pSurfaceFormats** includes an entry whose value for **colorSpace** is **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** and whose value for **format** is a UNORM (or SRGB) format and the corresponding SRGB (or UNORM) format is a color renderable format for
VK_IMAGE_TILING_OPTIMAL, then pSurfaceFormats must also contain an entry with the same value for colorSpace and format equal to the corresponding SRGB (or UNORM) format.

**Valid Usage**

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-02739
  surface must be supported by physicalDevice, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-parameter surface must be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormatCount-parameter pSurfaceFormatCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormats-parameter If the value referenced by pSurfaceFormatCount is not 0, and pSurfaceFormats is not NULL, pSurfaceFormats must be a valid pointer to an array of pSurfaceFormatCount VkSurfaceFormatKHR structures
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-commonparent Both of physicalDevice, and surface must have been created, allocated, or retrieved from the same VkInstance

**Return Codes**

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceFormatKHR structure is defined as:
typedef struct VkSurfaceFormatKHR {
  VkFormat         format;
  VkColorSpaceKHR  colorSpace;
} VkSurfaceFormatKHR;

- `format` is a `VkFormat` that is compatible with the specified surface.
- `colorSpace` is a presentation `VkColorSpaceKHR` that is compatible with the surface.

To query the supported swapchain format tuples for a surface, call:

```c
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceFormats2KHR(
  VkPhysicalDevice                            physicalDevice,
  const VkPhysicalDeviceSurfaceInfo2KHR*      pSurfaceInfo,
  uint32_t*                                   pSurfaceFormatCount,
  VkSurfaceFormat2KHR*                        pSurfaceFormats);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- `pSurfaceFormatCount` is a pointer to an integer related to the number of format tuples available or queried, as described below.
- `pSurfaceFormats` is either `NULL` or a pointer to an array of `VkSurfaceFormat2KHR` structures.

`vkGetPhysicalDeviceSurfaceFormats2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceFormatsKHR`, with the ability to be extended via `pNext` chains.

If `pSurfaceFormats` is `NULL`, then the number of format tuples supported for the given `surface` is returned in `pSurfaceFormatCount`. Otherwise, `pSurfaceFormatCount must` point to a variable set by the user to the number of elements in the `pSurfaceFormats` array, and on return the variable is overwritten with the number of structures actually written to `pSurfaceFormats`. If the value of `pSurfaceFormatCount` is less than the number of format tuples supported, at most `pSurfaceFormatCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available values were returned.

**Valid Usage**

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-02740
  `pSurfaceInfo->surface must be supported by physicalDevice, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism`
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-physicalDevice-parameter
  
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-parameter
  
  pSurfaceInfo must be a valid pointer to a valid VkPhysicalDeviceSurfaceInfo2KHR structure

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormatCount-parameter
  
  pSurfaceFormatCount must be a valid pointer to a uint32_t value

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormats-parameter
  
  If the value referenced by pSurfaceFormatCount is not 0, and pSurfaceFormats is not NULL, pSurfaceFormats must be a valid pointer to an array of pSurfaceFormatCount VkSurfaceFormat2KHR structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceFormat2KHR structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceFormat2KHR {
    VkStructureType       sType;
    void*                 pNext;
    VkSurfaceFormatKHR    surfaceFormat;
} VkSurfaceFormat2KHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- surfaceFormat is a VkSurfaceFormatKHR structure describing a format-color space pair that is compatible with the specified surface.
Valid Usage (Implicit)

- VUID-VkSurfaceFormat2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR

- VUID-VkSurfaceFormat2KHR-pNext-pNext
  pNext must be NULL

While the format of a presentable image refers to the encoding of each pixel, the colorSpace determines how the presentation engine interprets the pixel values. A color space in this document refers to a specific color space (defined by the chromaticities of its primaries and a white point in CIE Lab), and a transfer function that is applied before storing or transmitting color data in the given color space.

Possible values of VkSurfaceFormatKHR::colorSpace, specifying supported color spaces of a presentation engine, are:
typedef enum VkColorSpaceKHR {
    VK_COLOR_SPACE_SRGB_NONLINEAR_KHR = 0,
    VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT = 1000104001,
    VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT = 1000104002,
    VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT = 1000104003,
    VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT = 1000104004,
    VK_COLOR_SPACE_BT709_LINEAR_EXT = 1000104005,
    VK_COLOR_SPACE_BT709_NONLINEAR_EXT = 1000104006,
    VK_COLOR_SPACE_BT2020_LINEAR_EXT = 1000104007,
    VK_COLOR_SPACE_HDR10_ST2084_EXT = 1000104008,
    VK_COLOR_SPACE_DOLBYVISION_EXT = 1000104009,
    VK_COLOR_SPACE_HDR10_HLG_EXT = 1000104010,
    VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT = 1000104011,
    VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT = 1000104012,
    VK_COLOR_SPACE_PASS_THROUGH_EXT = 1000104013,
    VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT = 1000104014,
    VK_COLORSPACE_SRGB_NONLINEAR_KHR = VK_COLOR_SPACE_SRGB_NONLINEAR_KHR,
    VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT = VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT,
} VkColorSpaceKHR;

- **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** specifies support for the sRGB color space.
- **VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT** specifies support for the Display-P3 color space to be displayed using an sRGB-like EOTF (defined below).
- **VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT** specifies support for the extended sRGB color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT** specifies support for the extended sRGB color space to be displayed using an sRGB EOTF.
- **VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT** specifies support for the Display-P3 color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT** specifies support for the DCI-P3 color space to be displayed
using the DCI-P3 EOTF. Note that values in such an image are interpreted as XYZ encoded color data by the presentation engine.

- **VK_COLOR_SPACE_BT709_LINEAR_EXT** specifies support for the BT709 color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_BT709_NONLINEAR_EXT** specifies support for the BT709 color space to be displayed using the SMPTE 170M EOTF.
- **VK_COLOR_SPACE_BT2020_LINEAR_EXT** specifies support for the BT2020 color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_HDR10_ST2084_EXT** specifies support for the HDR10 (BT2020 color) space to be displayed using the SMPTE ST2084 Perceptual Quantizer (PQ) EOTF.
- **VK_COLOR_SPACE_DOLBYVISION_EXT** specifies support for the Dolby Vision (BT2020 color space), proprietary encoding, to be displayed using the SMPTE ST2084 EOTF.
- **VK_COLOR_SPACE_HDR10_HLG_EXT** specifies support for the HDR10 (BT2020 color space) to be displayed using the Hybrid Log Gamma (HLG) EOTF.
- **VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT** specifies support for the AdobeRGB color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT** specifies support for the AdobeRGB color space to be displayed using the Gamma 2.2 EOTF.
- **VK_COLOR_SPACE_PASS_THROUGH_EXT** specifies that color components are used “as is”. This is intended to allow applications to supply data for color spaces not described here.
- **VK_COLOR_SPACE_DISPLAY_NATIVE_AMD** specifies support for the display’s native color space. This matches the color space expectations of AMD’s FreeSync2 standard, for displays supporting it.

**Note**
In the initial release of the **VK_KHR_surface** and **VK_KHR_swapchain** extensions, the token **VK_COLORSPACE_SRGB_NONLINEAR_KHR** was used. Starting in the 2016-05-13 updates to the extension branches, matching release 1.0.13 of the core API specification, **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** is used instead for consistency with Vulkan naming rules. The older enum is still available for backwards compatibility.

**Note**
In older versions of this extension **VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT** was misnamed **VK_COLOR_SPACE_DCI_P3_LINEAR_EXT**. This has been updated to indicate that it uses RGB color encoding, not XYZ. The old name is deprecated but is maintained for backwards compatibility.

The color components of non-linear color space swap chain images must have had the appropriate transfer function applied. The color space selected for the swap chain image will not affect the processing of data written into the image by the implementation. Vulkan requires that all implementations support the sRGB transfer function by use of an SRGB pixel format. Other transfer functions, such as SMPTE 170M or SMPTE2084, can be performed by the application shader. This extension defines enums for **VkColorSpaceKHR** that correspond to the following color spaces:
Table 48. Color Spaces and Attributes

The transfer functions are described in the “Transfer Functions” chapter of the Khronos Data Format Specification.

Except Display-P3 OETF, which is:

\[
E = \begin{cases} 
1.055 \times L^{\frac{1}{2.4}} - 0.055 & \text{for } 0.0030186 \leq L \leq 1 \\
12.92 \times L & \text{for } 0 \leq L < 0.0030186 
\end{cases}
\]

where L is the linear value of a color channel and E is the encoded value (as stored in the image in memory).

**Note**

For most uses, the sRGB OETF is equivalent.

### 33.5.3. Surface Presentation Mode Support

To query the supported presentation modes for a surface, call:
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfacePresentModesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pPresentModeCount,
    VkPresentModeKHR* pPresentModes);

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- **surface** is the surface that will be associated with the swapchain.
- **pPresentModeCount** is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- **pPresentModes** is either NULL or a pointer to an array of `VkPresentModeKHR` values, indicating the supported presentation modes.

If **pPresentModes** is NULL, then the number of presentation modes supported for the given **surface** is returned in **pPresentModeCount**. Otherwise, **pPresentModeCount** must point to a variable set by the user to the number of elements in the **pPresentModes** array, and on return the variable is overwritten with the number of values actually written to **pPresentModes**. If the value of **pPresentModeCount** is less than the number of presentation modes supported, at most **pPresentModeCount** values will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available modes were returned.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-physicalDevice-parameter**
  - **physicalDevice** must be a valid **VkPhysicalDevice** handle
- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-parameter**
  - **surface** must be a valid **VkSurfaceKHR** handle
- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModeCount-parameter**
  - **pPresentModeCount** must be a valid pointer to a **uint32_t** value
- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModes-parameter**
  - If the value referenced by **pPresentModeCount** is not 0, and **pPresentModes** is not NULL, **pPresentModes** must be a valid pointer to an array of **pPresentModeCount** **VkPresentModeKHR** values
- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-commonparent**
  - Both of **physicalDevice**, and **surface** must have been created, allocated, or retrieved from the same **VkInstance**
Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

Alternatively, to query the supported presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```c
// Provided by VK_EXT_full_screen_exclusive
VkResult vkGetPhysicalDeviceSurfacePresentModes2EXT(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR*      pSurfaceInfo,
    uint32_t*                                   pPresentModeCount,
    VkPresentModeKHR*                           pPresentModes);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- `pPresentModeCount` is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- `pPresentModes` is either `NULL` or a pointer to an array of `VkPresentModeKHR` values, indicating the supported presentation modes.

`vkGetPhysicalDeviceSurfacePresentModes2EXT` behaves similarly to `vkGetPhysicalDeviceSurfacePresentModesKHR`, with the ability to specify extended inputs via chained input structures.
Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-physicalDevice-parameter**
  *physicalDevice* must be a valid *VkPhysicalDevice* handle

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-parameter**
  *pSurfaceInfo* must be a valid pointer to a valid *VkPhysicalDeviceSurfaceInfo2KHR* structure

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModeCount-parameter**
  *pPresentModeCount* must be a valid pointer to a *uint32_t* value

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModes-parameter**
  If the value referenced by *pPresentModeCount* is not 0, and *pPresentModes* is not NULL, *pPresentModes* must be a valid pointer to an array of *pPresentModeCount* *VkPresentModeKHR* values

Return Codes

Success

- **VK_SUCCESS**
- **VK_INCOMPLETE**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_SURFACE_LOST_KHR**

Possible values of elements of the *vkGetPhysicalDeviceSurfacePresentModesKHR::*::*pPresentModes* array, indicating the supported presentation modes for a surface, are:

```c
// Provided by VK_KHR_surface
typedef enum VkPresentModeKHR {
    VK_PRESENT_MODE_IMMEDIATE_KHR = 0,
    VK_PRESENT_MODE_MAILBOX_KHR = 1,
    VK_PRESENT_MODE_FIFO_KHR = 2,
    VK_PRESENT_MODE_FIFO_RELAXED_KHR = 3,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR = 1000111000,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR = 1000111001,
} VkPresentModeKHR;
```

- **VK_PRESENT_MODE_IMMEDIATE_KHR** specifies that the presentation engine does not wait for a vertical blanking period to update the current image, meaning this mode *may* result in visible tearing. No internal queuing of presentation requests is needed, as the requests are applied
immediately.

- **VK_PRESENT_MODE_MAILBOX_KHR** specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing **cannot** be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for re-use by the application. One request is removed from the queue and processed during each vertical blanking period in which the queue is non-empty.

- **VK_PRESENT_MODE_FIFO_KHR** specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing **cannot** be observed. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty. This is the only value of `presentMode` that is **required** to be supported.

- **VK_PRESENT_MODE_FIFO_RELAXED_KHR** specifies that the presentation engine generally waits for the next vertical blanking period to update the current image. If a vertical blanking period has already passed since the last update of the current image then the presentation engine does not wait for another vertical blanking period for the update, meaning this mode **may** result in visible tearing in this case. This mode is useful for reducing visual stutter with an application that will mostly present a new image before the next vertical blanking period, but may occasionally be late, and present a new image just after the next vertical blanking period. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during or after each vertical blanking period in which the queue is non-empty.

- **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a **shared presentable image**. The presentation engine is only required to update the current image after a new presentation request is received. Therefore the application **must** make a presentation request whenever an update is required. However, the presentation engine **may** update the current image at any point, meaning this mode **may** result in visible tearing.

- **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a **shared presentable image**. The presentation engine periodically updates the current image on its regular refresh cycle. The application is only required to make one initial presentation request, after which the presentation engine **must** update the current image without any need for further presentation requests. The application **can** indicate the image contents have been updated by making a presentation request, but this does not guarantee the timing of when it will be updated. This mode **may** result in visible tearing if rendering to the image is not timed correctly.

The supported **VkImageUsageFlagBits** of the presentable images of a swapchain created for a surface **may** differ depending on the presentation mode, and can be determined as per the table below:

*Table 49. Presentable image usage queries*
### 33.6. Full Screen Exclusive Control

Swapchains created with `fullScreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` must acquire and release exclusive full-screen access explicitly, using the following commands.

To acquire exclusive full-screen access for a swapchain, call:

```c
// Provided by VK_EXT_full_screen_exclusive
VkResult vkAcquireFullScreenExclusiveModeEXT(
    VkDevice device, // device is the device associated with swapchain.
    VkSwapchainKHR swapchain); // swapchain is the swapchain to acquire exclusive full-screen access for.
```
Valid Usage

• VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02674
  swapchain must not be in the retired state

• VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02675
  swapchain must be a swapchain created with a VkSurfaceFullScreenExclusiveInfoEXT
  structure, with fullScreenExclusive set to VK_FULL_SCREEN_EXCLUSIVE_APPLICATION.Controlled_EXT

• VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02676
  swapchain must not currently have exclusive full-screen access

A return value of VK_SUCCESS indicates that the swapchain successfully acquired exclusive full-screen access. The swapchain will retain this exclusivity until either the application releases exclusive full-screen access with vkReleaseFullScreenExclusiveModeEXT, destroys the swapchain, or if any of the swapchain commands return VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT indicating that the mode was lost because of platform-specific changes.

If the swapchain was unable to acquire exclusive full-screen access to the display then VK_ERROR_INITIALIZATION_FAILED is returned. An application can attempt to acquire exclusive full-screen access again for the same swapchain even if this command fails, or if VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT has been returned by a swapchain command.

Valid Usage (Implicit)

• VUID-vkAcquireFullScreenExclusiveModeEXT-device-parameter
  device must be a valid VkDevice handle

• VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

• VUID-vkAcquireFullScreenExclusiveModeEXT-commonparent
  Both of device, and swapchain must have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INITIALIZATION_FAILED
• VK_ERROR_SURFACE_LOST_KHR
To release exclusive full-screen access from a swapchain, call:

```c
// Provided by VK_EXT_full_screen_exclusive
VkResult vkReleaseFullScreenExclusiveModeEXT(
    VkDevice                                    device,
    VkSwapchainKHR                              swapchain);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to release exclusive full-screen access from.

**Note**

Applications will not be able to present to `swapchain` after this call until exclusive full-screen access is reacquired. This is usually useful to handle when an application is minimised or otherwise intends to stop presenting for a time.

**Valid Usage**

- `VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02677`  
  `swapchain` must not be in the retired state
- `VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02678`  
  `swapchain` must be a swapchain created with a `VkSurfaceFullScreenExclusiveInfoEXT` structure, with `fullScreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`

### 33.7. Device Group Queries

A logical device that represents multiple physical devices may support presenting from images on more than one physical device, or combining images from multiple physical devices.

To query these capabilities, call:

```c
// Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with VK_KHR_surface
VkResult vkGetDeviceGroupPresentCapabilitiesKHR(
    VkDevice                                    device,
    VkDeviceGroupPresentCapabilitiesKHR*        pDeviceGroupPresentCapabilities);
```

- `device` is the logical device.
- `pDeviceGroupPresentCapabilities` is a pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure in which the device's capabilities are returned.
Valid Usage (Implicit)

- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-pDeviceGroupPresentCapabilities-parameter
  
  `pDeviceGroupPresentCapabilities` must be a valid pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDeviceGroupPresentCapabilitiesKHR` structure is defined as:

```c
typedef struct VkDeviceGroupPresentCapabilitiesKHR {
  VkStructureType                     sType;
  const void*                         pNext;
  uint32_t                            presentMask[VK_MAX_DEVICE_GROUP_SIZE];
  VkDeviceGroupPresentModeFlagsKHR    modes;
} VkDeviceGroupPresentCapabilitiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `presentMask` is an array of `VK_MAX_DEVICE_GROUP_SIZE uint32_t` masks, where the mask at element `i` is non-zero if physical device `i` has a presentation engine, and where bit `j` is set in element `i` if physical device `i` can present swapchain images from physical device `j`. If element `i` is non-zero, then bit `i` must be set.
- `modes` is a bitmask of `VkDeviceGroupPresentModeFlagBitsKHR` indicating which device group presentation modes are supported.

`modes` always has `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR` set.

The present mode flags are also used when presenting an image, in `VkDeviceGroupPresentInfoKHR::mode`.

If a device group only includes a single physical device, then `modes` must equal `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`. 
Valid Usage (Implicit)

- **VUID-VkDeviceGroupPresentCapabilitiesKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR`

- **VUID-VkDeviceGroupPresentCapabilitiesKHR-pNext-pNext**
  - `pNext` must be `NULL`

Bits which **may** be set in `VkDeviceGroupPresentCapabilitiesKHR::modes` to indicate which device group presentation modes are supported are:

```c
typedef enum VkDeviceGroupPresentModeFlagBitsKHR {
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR = 0x00000001,
    VK DEVICEGROUP_PRESENT_MODE_REMOTE_BIT_KHR = 0x00000002,
    VK DEVICEGROUP_PRESENT_MODE_SUM_BIT_KHR = 0x00000004,
    VK DEVICEGROUP_PRESENT_MODE_LOCAL_MULTI DEVICE_BIT_KHR = 0x00000008,
} VkDeviceGroupPresentModeFlagBitsKHR;
```

- **VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR** specifies that any physical device with a presentation engine can present its own swapchain images.
- **VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR** specifies that any physical device with a presentation engine can present swapchain images from any physical device in its `presentMask`.
- **VK DEVICEGROUP_PRESENT_MODE_SUM_BIT_KHR** specifies that any physical device with a presentation engine can present the sum of swapchain images from any physical devices in its `presentMask`.
- **VK DEVICEGROUP_PRESENT_MODE_LOCAL MULTI DEVICE_BIT_KHR** specifies that multiple physical devices with a presentation engine can each present their own swapchain images.

```c
typedef VkFlags VkDeviceGroupPresentModeFlagsKHR;
```

`VkDeviceGroupPresentModeFlagsKHR` is a bitmask type for setting a mask of zero or more `VkDeviceGroupPresentModeFlagBitsKHR`.

Some surfaces **may** not be capable of using all the device group present modes.

To query the supported device group present modes for a particular surface, call:
// Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with VK_KHR_surface

```c
VkResult vkGetDeviceGroupSurfacePresentModesKHR(
    VkDevice device,                  // Logical device
    VkSurfaceKHR surface,             // Surface
    VkDeviceGroupPresentModeFlagsKHR* pModes); // Pointer to supported device group present modes
```

- **device** is the logical device.
- **surface** is the surface.
- **pModes** is a pointer to a `VkDeviceGroupPresentModeFlagsKHR` in which the supported device group present modes for the surface are returned.

The modes returned by this command are not invariant, and may change in response to the surface being moved, resized, or occluded. These modes must be a subset of the modes returned by `vkGetDeviceGroupPresentCapabilitiesKHR`.

### Valid Usage (Implicit)

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-device-parameter
  
  **device** must be a valid `VkDevice` handle

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-parameter
  
  **surface** must be a valid `VkSurfaceKHR` handle

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-pModes-parameter
  
  **pModes** must be a valid pointer to a `VkDeviceGroupPresentModeFlagsKHR` value

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-commonparent
  
  Both of **device**, and **surface** must have been created, allocated, or retrieved from the same `VkInstance`

### Host Synchronization

- Host access to **surface** must be externally synchronized

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
Alternatively, to query the supported device group presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```c
// Provided by VK_EXT_full_screen_exclusive with VK_KHR_device_group,
// VK_EXT_full_screen_exclusive with VK_VERSION_1_1
VkResult vkGetDeviceGroupSurfacePresentModes2EXT(
    VkDevice                                    device,
    const VkPhysicalDeviceSurfaceInfo2KHR*      pSurfaceInfo,
    VkDeviceGroupPresentModeFlagsKHR*           pModes);
```

- `device` is the logical device.
- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- `pModes` is a pointer to a `VkDeviceGroupPresentModeFlagsKHR` in which the supported device group present modes for the surface are returned.

`vkGetDeviceGroupSurfacePresentModes2EXT` behaves similarly to `vkGetDeviceGroupSurfacePresentModesKHR`, with the ability to specify extended inputs via chained input structures.

### Valid Usage (Implicit)

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-parameter
  `pSurfaceInfo` must be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure
- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pModes-parameter
  `pModes` must be a valid pointer to a `VkDeviceGroupPresentModeFlagsKHR` value

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

When using `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, the application may need to know which regions of the surface are used when presenting locally on each physical device. Presentation of swapchain images to this surface need only have valid contents in the regions...
returned by this command.

To query a set of rectangles used in presentation on the physical device, call:

```c
// Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with
// VK_KHR_surface
VkResult vkGetPhysicalDevicePresentRectanglesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pRectCount,
    VkRect2D* pRects);
```

- `physicalDevice` is the physical device.
- `surface` is the surface.
- `pRectCount` is a pointer to an integer related to the number of rectangles available or queried, as described below.
- `pRects` is either `NULL` or a pointer to an array of `VkRect2D` structures.

If `pRects` is `NULL`, then the number of rectangles used when presenting the given `surface` is returned in `pRectCount`. Otherwise, `pRectCount` must point to a variable set by the user to the number of elements in the `pRects` array, and on return the variable is overwritten with the number of structures actually written to `pRects`. If the value of `pRectCount` is less than the number of rectangles, at most `pRectCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available rectangles were returned.

The values returned by this command are not invariant, and may change in response to the surface being moved, resized, or occluded.

The rectangles returned by this command must not overlap.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDevicePresentRectanglesKHR-physicalDevice-parameter**
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- **VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-parameter**
  `surface` must be a valid `VkSurfaceKHR` handle
- **VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRectCount-parameter**
  `pRectCount` must be a valid pointer to a `uint32_t` value
- **VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRects-parameter**
  If the value referenced by `pRectCount` is not 0, and `pRects` is not `NULL`, `pRects` must be a valid pointer to an array of `pRectCount` `VkRect2D` structures
- **VUID-vkGetPhysicalDevicePresentRectanglesKHR-commonparent**
  Both of `physicalDevice`, and `surface` must have been created, allocated, or retrieved from the same `VkInstance`
33.8. Display Timing Queries

Traditional game and real-time-animation applications frequently use VK_PRESENT_MODE_FIFO_KHR so that presentable images are updated during the vertical blanking period of a given refresh cycle (RC) of the presentation engine's display. This avoids the visual anomaly known as tearing.

However, synchronizing the presentation of images with the RC does not prevent all forms of visual anomalies. Stuttering occurs when the geometry for each presentable image is not accurately positioned for when that image will be displayed. The geometry may appear to move too little some RCs, and too much for others. Sometimes the animation appears to freeze, when the same image is used for more than one RC.

In order to minimize stuttering, an application needs to correctly position their geometry for when the presentable image will be displayed to the user. To accomplish this, applications need various timing information about the presentation engine's display. They need to know when presentable images were actually presented, and when they could have been presented. Applications also need to tell the presentation engine to display an image no sooner than a given time. This can allow the application's animation to look smooth to the user, with no stuttering. The VK_GOOGLE_display_timing extension allows an application to satisfy these needs.

The presentation engine's display typically refreshes the pixels that are displayed to the user on a periodic basis. The period may be fixed or variable. In many cases, the presentation engine is associated with fixed refresh rate (FRR) display technology, with a fixed refresh rate (RR, e.g. 60Hz). In some cases, the presentation engine is associated with variable refresh rate (VRR) display technology, where each refresh cycle (RC) can vary in length. This extension treats VRR displays as if they are FRR.

To query the duration of a refresh cycle (RC) for the presentation engine's display, call:
VkResult vkGetRefreshCycleDurationGOOGLE(
    VkDevice                                    device,
    VkSwapchainKHR                              swapchain,
    VkRefreshCycleDurationGOOGLE*               pDisplayTimingProperties);

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to obtain the refresh duration for.
- **pDisplayTimingProperties** is a pointer to a **VkRefreshCycleDurationGOOGLE** structure.

### Valid Usage (Implicit)

- **VUID-vkGetRefreshCycleDurationGOOGLE-device-parameter**
  - **device** must be a valid **VkDevice** handle
- **VUID-vkGetRefreshCycleDurationGOOGLE-swapchain-parameter**
  - **swapchain** must be a valid **VkSwapchainKHR** handle
- **VUID-vkGetRefreshCycleDurationGOOGLE-pDisplayTimingProperties-parameter**
  - **pDisplayTimingProperties** must be a valid pointer to a **VkRefreshCycleDurationGOOGLE** structure
- **VUID-vkGetRefreshCycleDurationGOOGLE-commonparent**
  - Both of **device**, and **swapchain** must have been created, allocated, or retrieved from the same **VkInstance**

### Host Synchronization

- Host access to **swapchain** must be externally synchronized

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_DEVICE_LOST**
- **VK_ERROR_SURFACE_LOST_KHR**

The **VkRefreshCycleDurationGOOGLE** structure is defined as:
typedef struct VkRefreshCycleDurationGOOGLE {
    uint64_t refreshDuration;
} VkRefreshCycleDurationGOOGLE;

- **refreshDuration** is the number of nanoseconds from the start of one refresh cycle to the next.

**Note**

The rate at which an application renders and presents new images is known as the image present rate (IPR, aka frame rate). The inverse of IPR, or the duration between each image present, is the image present duration (IPD). In order to provide a smooth, stutter-free animation, an application will want its IPD to be a multiple of **refreshDuration**. For example, if a display has a 60Hz refresh rate, **refreshDuration** will be a value in nanoseconds that is approximately equal to 16.67ms. In such a case, an application will want an IPD of 16.67ms (1X multiplier of **refreshDuration**), or 33.33ms (2X multiplier of **refreshDuration**), or 50.0ms (3X multiplier of **refreshDuration**), etc.

In order to determine a target IPD for a display (i.e. a multiple of **refreshDuration**), an application needs to determine when its images are actually displayed. Let's say that an application has an initial target IPD of 16.67ms (1X multiplier of **refreshDuration**). It will therefore position the geometry of a new image 16.67ms later than the previous image. Let's say that this application is running on slower hardware, so that it actually takes 20ms to render each new image. This will create visual anomalies, because the images will not be displayed to the user every 16.67ms, nor every 20ms. In this case, it is better for the application to adjust its target IPD to 33.33ms (i.e. a 2X multiplier of **refreshDuration**), and tell the presentation engine to not present images any sooner than every 33.33ms. This will allow the geometry to be correctly positioned for each presentable image.

Adjustments to an application's IPD may be needed because different views of an application's geometry can take different amounts of time to render. For example, looking at the sky may take less time to render than looking at multiple, complex items in a room. In general, it is good to not frequently change IPD, as that can cause visual anomalies. Adjustments to a larger IPD because of late images should happen quickly, but adjustments to a smaller IPD should only happen if the **actualPresentTime** and **earliestPresentTime** members of the **VkPastPresentationTimingGOOGLE** structure are consistently different, and if **presentMargin** is consistently large, over multiple images.

The implementation will maintain a limited amount of history of timing information about previous presents. Because of the asynchronous nature of the presentation engine, the timing information for a given **vkQueuePresentKHR** command will become available some time later. These time values can be asynchronously queried, and will be returned if available. All time values are in nanoseconds, relative to a monotonically-increasing clock (e.g. **CLOCK_MONOTONIC** (see clock_gettime(2)) on Android and Linux).
To asynchronously query the presentation engine, for newly-available timing information about one or more previous presents to a given swapchain, call:

```c
// Provided by VK_GOOGLE_display_timing
VkResult vkGetPastPresentationTimingGOOGLE(
    VkDevice                                    device,                     
    VkSwapchainKHR                              swapchain,                 
    uint32_t*                                   pPresentationTimingCount, 
    VkPastPresentationTimingGOOGLE*             pPresentationTimings);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to obtain presentation timing information duration for.
- `pPresentationTimingCount` is a pointer to an integer related to the number of `VkPastPresentationTimingGOOGLE` structures to query, as described below.
- `pPresentationTimings` is either `NULL` or a pointer to an array of `VkPastPresentationTimingGOOGLE` structures.

If `pPresentationTimings` is `NULL`, then the number of newly-available timing records for the given `swapchain` is returned in `pPresentationTimingCount`. Otherwise, `pPresentationTimingCount` must point to a variable set by the user to the number of elements in the `pPresentationTimings` array, and on return the variable is overwritten with the number of structures actually written to `pPresentationTimings`. If the value of `pPresentationTimingCount` is less than the number of newly-available timing records, at most `pPresentationTimingCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available timing records were returned.

### Valid Usage (Implicit)

- **VUID-vkGetPastPresentationTimingGOOGLE-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetPastPresentationTimingGOOGLE-swapchain-parameter**
  `swapchain` must be a valid `VkSwapchainKHR` handle

- **VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimingCount-parameter**
  `pPresentationTimingCount` must be a valid pointer to a `uint32_t` value

- **VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimings-parameter**
  If the value referenced by `pPresentationTimingCount` is not 0, and `pPresentationTimings` is not `NULL`, `pPresentationTimings` must be a valid pointer to an array of `pPresentationTimingCount` `VkPastPresentationTimingGOOGLE` structures

- **VUID-vkGetPastPresentationTimingGOOGLE-commonparent**
  Both of `device`, and `swapchain` must have been created, allocated, or retrieved from the same `VkInstance`
Host Synchronization

- Host access to swapchain must be externally synchronized

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR

The `VkPastPresentationTimingGOOGLE` structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPastPresentationTimingGOOGLE {
    uint32_t    presentID;
    uint64_t    desiredPresentTime;
    uint64_t    actualPresentTime;
    uint64_t    earliestPresentTime;
    uint64_t    presentMargin;
} VkPastPresentationTimingGOOGLE;
```

- `presentID` is an application-provided value that was given to a previous `vkQueuePresentKHR` command via `VkPresentTimeGOOGLE::presentID` (see below). It can be used to uniquely identify a previous present with the `vkQueuePresentKHR` command.

- `desiredPresentTime` is an application-provided value that was given to a previous `vkQueuePresentKHR` command via `VkPresentTimeGOOGLE::desiredPresentTime`. If non-zero, it was used by the application to indicate that an image not be presented any sooner than `desiredPresentTime`.

- `actualPresentTime` is the time when the image of the swapchain was actually displayed.

- `earliestPresentTime` is the time when the image of the swapchain could have been displayed. This may differ from `actualPresentTime` if the application requested that the image be presented no sooner than `VkPresentTimeGOOGLE::desiredPresentTime`.

- `presentMargin` is an indication of how early the `vkQueuePresentKHR` command was processed compared to how soon it needed to be processed, and still be presented at `earliestPresentTime`.

The results for a given swapchain and `presentID` are only returned once from
The application can use the `VkPastPresentationTimingGOOGLE` values to occasionally adjust its timing. For example, if `actualPresentTime` is later than expected (e.g. one `refreshDuration` late), the application may increase its target IPD to a higher multiple of `refreshDuration` (e.g. decrease its frame rate from 60Hz to 30Hz). If `actualPresentTime` and `earliestPresentTime` are consistently different, and if `presentMargin` is consistently large enough, the application may decrease its target IPD to a smaller multiple of `refreshDuration` (e.g. increase its frame rate from 30Hz to 60Hz). If `actualPresentTime` and `earliestPresentTime` are same, and if `presentMargin` is consistently high, the application may delay the start of its input-render-present loop in order to decrease the latency between user input and the corresponding present (always leaving some margin in case a new image takes longer to render than the previous image). An application that desires its target IPD to always be the same as `refreshDuration`, can also adjust features until `actualPresentTime` is never late and `presentMargin` is satisfactory.

The full `VK_GOOGLE_display_timing` extension semantics are described for swapchains created with `VK_PRESENT_MODE_FIFO_KHR`. For example, non-zero values of `VkPresentTimeGOOGLE::desiredPresentTime` must be honored, and `vkGetPastPresentationTimingGOOGLE` should return a `VkPastPresentationTimingGOOGLE` structure with valid values for all images presented with `vkQueuePresentKHR`. The semantics for other present modes are as follows:

- **VK_PRESENT_MODE_IMMEDIATE_KHR.** The presentation engine may ignore non-zero values of `VkPresentTimeGOOGLE::desiredPresentTime` in favor of presenting immediately. The value of `VkPastPresentationTimingGOOGLE::earliestPresentTime` must be the same as `VkPastPresentationTimingGOOGLE::actualPresentTime`, which should be when the presentation engine displayed the image.

- **VK_PRESENT_MODE_MAILBOX_KHR.** The intention of using this present mode with this extension is to handle cases where an image is presented late, and the next image is presented soon enough to replace it at the next vertical blanking period. For images that are displayed to the user, the value of `VkPastPresentationTimingGOOGLE::actualPresentTime` must be when the image was displayed. For images that are not displayed to the user, `vkGetPastPresentationTimingGOOGLE` may not return a `VkPastPresentationTimingGOOGLE` structure, or it may return a `VkPastPresentationTimingGOOGLE` structure with the value of zero for both `VkPastPresentationTimingGOOGLE::actualPresentTime` and `VkPastPresentationTimingGOOGLE::earliestPresentTime`. It is possible that an application can submit images with `VkPresentTimeGOOGLE::desiredPresentTime` values such that new images may not be displayed. For example, if `VkPresentTimeGOOGLE::desiredPresentTime` is far enough in the future that an image is not presented before `vkQueuePresentKHR` is called to present another image, the first image will not be displayed to the user. If the application continues to do that, the presentation may not display new images.

- **VK_PRESENT_MODE_FIFO_RELAXED_KHR.** For images that are presented in time to be displayed at the next vertical blanking period, the semantics are identical as for `VK_PRESENT_MODE_FIFO_RELAXED_KHR`. For images that are presented late, and are displayed after the start of the vertical blanking period (i.e. with tearing), the values of `VkPastPresentationTimingGOOGLE` may be treated as if the image was displayed at the start of the vertical blanking period, or may be treated the same as for `VK_PRESENT_MODE_IMMEDIATE_KHR`. 

Chapter 33. Window System Integration (WSI) | 1795
33.9. WSI Swapchain

A swapchain object (a.k.a. swapchain) provides the ability to present rendering results to a surface. Swapchain objects are represented by `VkSwapchainKHR` handles:

```cpp
// Provided by VK_KHR_swapchain
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSwapchainKHR)
```

A swapchain is an abstraction for an array of presentable images that are associated with a surface. The presentable images are represented by `VkImage` objects created by the platform. One image (which can be an array image for multiview/stereoscopic-3D surfaces) is displayed at a time, but multiple images can be queued for presentation. An application renders to the image, and then queues the image for presentation to the surface.

A native window cannot be associated with more than one non-retired swapchain at a time. Further, swapchains cannot be created for native windows that have a non-Vulkan graphics API surface associated with them.

```
Note
The presentation engine is an abstraction for the platform’s compositor or display engine.

The presentation engine may be synchronous or asynchronous with respect to the application and/or logical device.

Some implementations may use the device’s graphics queue or dedicated presentation hardware to perform presentation.
```

The presentable images of a swapchain are owned by the presentation engine. An application can acquire use of a presentable image from the presentation engine. Use of a presentable image must occur only after the image is returned by `vkAcquireNextImageKHR`, and before it is released by `vkQueuePresentKHR`. This includes transitioning the image layout and rendering commands.

An application can acquire use of a presentable image with `vkAcquireNextImageKHR`. After acquiring a presentable image and before modifying it, the application must use a synchronization primitive to ensure that the presentation engine has finished reading from the image. The application can then transition the image’s layout, queue rendering commands to it, etc. Finally, the application presents the image with `vkQueuePresentKHR`, which releases the acquisition of the image.

The presentation engine controls the order in which presentable images are acquired for use by the application.

```
Note
This allows the platform to handle situations which require out-of-order return of images after presentation. At the same time, it allows the application to generate command buffers referencing all of the images in the swapchain at initialization time, rather than in its main loop.
```
How this all works is described below.

If a swapchain is created with presentMode set to either VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, a single presentable image can be acquired, referred to as a shared presentable image. A shared presentable image may be concurrently accessed by the application and the presentation engine, without transitioning the image’s layout after it is initially presented.

- With VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR, the presentation engine is only required to update to the latest contents of a shared presentable image after a present. The application must call vkQueuePresentKHR to guarantee an update. However, the presentation engine may update from it at any time.

- With VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, the presentation engine will automatically present the latest contents of a shared presentable image during every refresh cycle. The application is only required to make one initial call to vkQueuePresentKHR, after which the presentation engine will update from it without any need for further present calls. The application can indicate the image contents have been updated by calling vkQueuePresentKHR, but this does not guarantee the timing of when updates will occur.

The presentation engine may access a shared presentable image at any time after it is first presented. To avoid tearing, an application should coordinate access with the presentation engine. This requires presentation engine timing information through platform-specific mechanisms and ensuring that color attachment writes are made available during the portion of the presentation engine’s refresh cycle they are intended for.

Note

The VK_KHR_shared_presentable_image extension does not provide functionality for determining the timing of the presentation engine’s refresh cycles.

In order to query a swapchain’s status when rendering to a shared presentable image, call:

```c
// Provided by VK_KHR_shared_presentable_image
VkResult vkGetSwapchainStatusKHR(
    VkDevice            device,  // device is the device associated with swapchain.
    VkSwapchainKHR     swapchain);  // swapchain is the swapchain to query.
```
Valid Usage (Implicit)

- VUID-vkGetSwapchainStatusKHR-device-parameter  
  
  **device must be a valid** VkDevice **handle**

- VUID-vkGetSwapchainStatusKHR-swapchain-parameter  
  
  **swapchain must be a valid** VkSwapchainKHR **handle**

- VUID-vkGetSwapchainStatusKHR-commonparent  
  
  Both of **device**, and **swapchain must** have been created, allocated, or retrieved from the same VkInstance

Host Synchronization

- Host access to **swapchain must** be externally synchronized

Return Codes

**Success**

- VK_SUCCESS
- VK_SUBOPTIMAL_KHR

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

The possible return values for *vkGetSwapchainStatusKHR* should be interpreted as follows:

- **VK_SUCCESS** specifies the presentation engine is presenting the contents of the shared presentable image, as per the swapchain’s VkPresentModeKHR.
- **VK_SUBOPTIMAL_KHR** the swapchain no longer matches the surface properties exactly, but the presentation engine is presenting the contents of the shared presentable image, as per the swapchain’s VkPresentModeKHR.
- **VK_ERROR_OUT_OF_DATE_KHR** the surface has changed in such a way that it is no longer compatible with the swapchain.
- **VK_ERROR_SURFACE_LOST_KHR** the surface is no longer available.
The swapchain state may be cached by implementations, so applications should regularly call \texttt{vkGetSwapchainStatusKHR} when using a swapchain with \texttt{VkPresentModeKHR} set to \texttt{VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR}.

To create a swapchain, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkCreateSwapchainKHR(
    VkDevice                                    device,
    const VkSwapchainCreateInfoKHR*             pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSwapchainKHR*                             pSwapchain);
```

- \texttt{device} is the device to create the swapchain for.
- \texttt{pCreateInfo} is a pointer to a \texttt{VkSwapchainCreateInfoKHR} structure specifying the parameters of the created swapchain.
- \texttt{pAllocator} is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).
- \texttt{pSwapchain} is a pointer to a \texttt{VkSwapchainKHR} handle in which the created swapchain object will be returned.

If the \texttt{oldSwapchain} parameter of \texttt{pCreateInfo} is a valid swapchain, which has exclusive full-screen access, that access is released from \texttt{oldSwapchain}. If the command succeeds in this case, the newly created swapchain will automatically acquire exclusive full-screen access from \texttt{oldSwapchain}.

This implicit transfer is intended to avoid exiting and entering full-screen exclusive mode, which may otherwise cause unwanted visual updates to the display.

In some cases, swapchain creation may fail if exclusive full-screen mode is requested for application control, but for some implementation-specific reason exclusive full-screen access is unavailable for the particular combination of parameters provided. If this occurs, \texttt{VK_ERROR_INITIALIZATION_FAILED} will be returned.

In particular, it will fail if the \texttt{imageExtent} member of \texttt{pCreateInfo} does not match the extents of the monitor. Other reasons for failure may include the app not being set as high-dpi aware, or if the physical device and monitor are not compatible in this mode.

When the \texttt{VkSurfaceKHR} in \texttt{VkSwapchainCreateInfoKHR} is a display surface, then the \texttt{VkDisplayModeKHR} in display surface’s \texttt{VkDisplaySurfaceCreateInfoKHR} is associated with a particular \texttt{VkDisplayKHR}. Swapchain creation may fail if that \texttt{VkDisplayKHR} is not acquired by the...
application. In this scenario `VK_ERROR_INITIALIZATION_FAILED` is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateSwapchainKHR-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkCreateSwapchainKHR-pCreateInfo-parameter**
  - `pCreateInfo` must be a valid pointer to a valid `VkSwapchainCreateInfoKHR` structure
- **VUID-vkCreateSwapchainKHR-pAllocator-parameter**
  - If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreateSwapchainKHR-pSwapchain-parameter**
  - `pSwapchain` must be a valid pointer to a `VkSwapchainKHR` handle

### Host Synchronization

- Host access to `pCreateInfo->surface` must be externally synchronized
- Host access to `pCreateInfo->oldSwapchain` must be externally synchronized

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkSwapchainCreateInfoKHR` structure is defined as:
typedef struct VkSwapchainCreateInfoKHR {
    VkStructureType      sType;
    const void*           pNext;
    VkSwapchainCreateFlagsKHR flags;
    VkSurfaceKHR          surface;
    uint32_t              minImageCount;
    VkFormat              imageFormat;
    VkColorSpaceKHR       imageColorSpace;
    VkExtent2D            imageExtent;
    uint32_t              imageArrayLayers;
    VkImageUsageFlags     imageUsage;
    VkSharingMode         imageSharingMode;
    uint32_t              queueFamilyIndexCount;
    const uint32_t*       pQueueFamilyIndices;
    VkSurfaceTransformFlagBitsKHR preTransform;
    VkCompositeAlphaFlagBitsKHR compositeAlpha;
    VkPresentModeKHR      presentMode;
    VkBool32              clipped;
    VkSwapchainKHR        oldSwapchain;
} VkSwapchainCreateInfoKHR;

• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is a bitmask of VkSwapchainCreateFlagBitsKHR indicating parameters of the swapchain creation.

• **surface** is the surface onto which the swapchain will present images. If the creation succeeds, the swapchain becomes associated with **surface**.

• **minImageCount** is the minimum number of presentable images that the application needs. The implementation will either create the swapchain with at least that many images, or it will fail to create the swapchain.

• **imageFormat** is a VkFormat value specifying the format the swapchain image(s) will be created with.

• **imageColorSpace** is a VkColorSpaceKHR value specifying the way the swapchain interprets image data.

• **imageExtent** is the size (in pixels) of the swapchain image(s). The behavior is platform-dependent if the image extent does not match the surface’s **currentExtent** as returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR.

---

**Note**

On some platforms, it is normal that **maxImageExtent** may become (0, 0), for example when the window is minimized. In such a case, it is not possible to create a swapchain due to the Valid Usage requirements.

• **imageArrayLayers** is the number of views in a multiview/stereo surface. For non-stereoscopic-3D
Applications, this value is 1.

- **imageUsage** is a bitmask of VkImageUsageFlagBits describing the intended usage of the (acquired) swapchain images.

- **imageSharingMode** is the sharing mode used for the image(s) of the swapchain.

- **queueFamilyIndexCount** is the number of queue families having access to the image(s) of the swapchain when imageSharingMode is VK_SHARING_MODE_CONCURRENT.

- **pQueueFamilyIndices** is a pointer to an array of queue family indices having access to the image(s) of the swapchain when imageSharingMode is VK_SHARING_MODE_CONCURRENT.

- **preTransform** is a VkSurfaceTransformFlagBitsKHR value describing the transform, relative to the presentation engine's natural orientation, applied to the image content prior to presentation. If it does not match the currentTransform value returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR, the presentation engine will transform the image content as part of the presentation operation.

- **compositeAlpha** is a VkCompositeAlphaFlagBitsKHR value indicating the alpha compositing mode to use when this surface is composited together with other surfaces on certain window systems.

- **presentMode** is the presentation mode the swapchain will use. A swapchain's present mode determines how incoming present requests will be processed and queued internally.

- **clipped** specifies whether the Vulkan implementation is allowed to discard rendering operations that affect regions of the surface that are not visible.
  - If set to VK_TRUE, the presentable images associated with the swapchain may not own all of their pixels. Pixels in the presentable images that correspond to regions of the target surface obscured by another window on the desktop, or subject to some other clipping mechanism will have undefined content when read back. Fragment shaders may not execute for these pixels, and thus any side effects they would have had will not occur. Setting VK_TRUE does not guarantee any clipping will occur, but allows more efficient presentation methods to be used on some platforms.
  - If set to VK_FALSE, presentable images associated with the swapchain will own all of the pixels they contain.

**Note**

Applications should set this value to VK_TRUE if they do not expect to read back the content of presentable images before presenting them or after reacquiring them, and if their fragment shaders do not have any side effects that require them to run for all pixels in the presentable image.

- **oldSwapchain** is VK_NULL_HANDLE, or the existing non-retired swapchain currently associated with surface. Providing a valid oldSwapchain may aid in the resource reuse, and also allows the application to still present any images that are already acquired from it.

Upon calling vkCreateSwapchainKHR with an oldSwapchain that is not VK_NULL_HANDLE, oldSwapchain is retired — even if creation of the new swapchain fails. The new swapchain is created in the non-retired state whether or not oldSwapchain is VK_NULL_HANDLE.

Upon calling vkCreateSwapchainKHR with an oldSwapchain that is not VK_NULL_HANDLE, any images
from `oldSwapchain` that are not acquired by the application may be freed by the implementation, which may occur even if creation of the new swapchain fails. The application can destroy `oldSwapchain` to free all memory associated with `oldSwapchain`.

**Note**

Multiple retired swapchains can be associated with the same `VkSurfaceKHR` through multiple uses of `oldSwapchain` that outnumber calls to `vkDestroySwapchainKHR`.

After `oldSwapchain` is retired, the application can pass to `vkQueuePresentKHR` any images it had already acquired from `oldSwapchain`. E.g., an application may present an image from the old swapchain before an image from the new swapchain is ready to be presented. As usual, `vkQueuePresentKHR` may fail if `oldSwapchain` has entered a state that causes `VK_ERROR_OUT_OF_DATE_KHR` to be returned.

The application can continue to use a shared presentable image obtained from `oldSwapchain` until a presentable image is acquired from the new swapchain, as long as it has not entered a state that causes it to return `VK_ERROR_OUT_OF_DATE_KHR`. 
**Valid Usage**

- **VUID-VkSwapchainCreateInfoKHR-surface-01270**
  
  **surface** must be a surface that is supported by the device as determined using `vkGetPhysicalDeviceSurfaceSupportKHR`

- **VUID-VkSwapchainCreateInfoKHR-minImageCount-01272**
  
  **minImageCount** must be less than or equal to the value returned in the **maxImageCount** member of the **VkSurfaceCapabilitiesKHR** structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface if the returned **maxImageCount** is not zero

- **VUID-VkSwapchainCreateInfoKHR-presentMode-02839**
  
  If **presentMode** is not **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** nor **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR**, then **minImageCount** must be greater than or equal to the value returned in the **minImageCount** member of the **VkSurfaceCapabilitiesKHR** structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface

- **VUID-VkSwapchainCreateInfoKHR-minImageCount-01383**
  
  **minImageCount** must be **1** if **presentMode** is either **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** or **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR**

- **VUID-VkSwapchainCreateInfoKHR-imageFormat-01273**
  
  **imageFormat** and **imageColorSpace** must match the **format** and **colorSpace** members, respectively, of one of the **VkSurfaceFormatKHR** structures returned by `vkGetPhysicalDeviceSurfaceFormatsKHR` for the surface

- **VUID-VkSwapchainCreateInfoKHR-imageExtent-01274**
  
  **imageExtent** must be between **minImageExtent** and **maxImageExtent**, inclusive, where **minImageExtent** and **maxImageExtent** are members of the **VkSurfaceCapabilitiesKHR** structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface

- **VUID-VkSwapchainCreateInfoKHR-imageExtent-01689**
  
  **imageExtent** members **width** and **height** must both be non-zero

- **VUID-VkSwapchainCreateInfoKHR-imageArrayLayers-01275**
  
  **imageArrayLayers** must be greater than **0** and less than or equal to the **maxImageArrayLayers** member of the **VkSurfaceCapabilitiesKHR** structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface

- **VUID-VkSwapchainCreateInfoKHR-presentMode-01427**
  
  If **presentMode** is **VK_PRESENT_MODE_IMMEDIATE_KHR**, **VK_PRESENT_MODE_MAILBOX_KHR**, **VK_PRESENT_MODE_FIFO_KHR** or **VK_PRESENT_MODE_FIFO_RELAXED_KHR**, **imageUsage** must be a subset of the supported usage flags present in the **supportedUsageFlags** member of the **VkSurfaceCapabilitiesKHR** structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface

- **VUID-VkSwapchainCreateInfoKHR-imageUsage-01384**
  
  If **presentMode** is **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** or **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR**, **imageUsage** must be a subset of the supported usage flags present in the **sharedPresentSupportedUsageFlags** member of the structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface
> VkSharedPresentSurfaceCapabilitiesKHR structure returned by

> If a `VkImageFormatListCreateInfo` structure was included in the `pNext` chain and
> `VkImageFormatListCreateInfo`::`viewFormatCount` is not zero then all of the formats in
> `VkImageFormatListCreateInfo`::`pViewFormats` must be compatible with the format as
> described in the compatibility table
If `flags` does not contain `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` and the `pNext` chain include a `VkImageFormatListCreateInfo` structure then `VkImageFormatListCreateInfo::viewFormatCount` must be 0 or 1.

If `flags` contains `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR`, then `VkSurfaceProtectedCapabilitiesKHR::supportsProtected` must be `VK_TRUE` in the `VkSurfaceProtectedCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilities2KHR` for `surface`.

If the `pNext` chain includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure with its `fullScreenExclusive` member set to `VK_FULL_SCREEN_EXCLUSIVEAPPLICATIONCONTROLLED_EXT`, and `surface` was created using `vkCreateWin32SurfaceKHR`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure must be included in the `pNext` chain.
Valid Usage (Implicit)

- **VUID-VkSwapchainCreateInfoKHR-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR`

- **VUID-VkSwapchainCreateInfoKHR-pNext-pNext**
  
  Each *pNext* member of any structure (including this one) in the *pNext* chain must be either `NULL` or a pointer to a valid instance of `VkDeviceGroupSwapchainCreateInfoKHR`, `VkImageFormatListCreateInfo`, `VkSurfaceFullScreenExclusiveInfoEXT`, `VkSurfaceFullScreenExclusiveWin32InfoEXT`, `VkSwapchainCounterCreateInfoEXT`, or `VkSwapchainDisplayNativeHdrCreateInfoAMD`

- **VUID-VkSwapchainCreateInfoKHR-sType-unique**

  The *sType* value of each struct in the *pNext* chain must be unique

- **VUID-VkSwapchainCreateInfoKHR-flags-parameter**
  
  *flags* must be a valid combination of `VkSwapchainCreateFlagBitsKHR` values

- **VUID-VkSwapchainCreateInfoKHR-surface-parameter**
  
  *surface* must be a valid `VkSurfaceKHR` handle

- **VUID-VkSwapchainCreateInfoKHR-imageFormat-parameter**
  
  *imageFormat* must be a valid `VkFormat` value

- **VUID-VkSwapchainCreateInfoKHR-imageColorSpace-parameter**
  
  *imageColorSpace* must be a valid `VkColorSpaceKHR` value

- **VUID-VkSwapchainCreateInfoKHR-imageUsage-parameter**
  
  *imageUsage* must be a valid combination of `VkImageUsageFlagBits` values

  *imageUsage* must not be 0

- **VUID-VkSwapchainCreateInfoKHR-imageSharingMode-parameter**
  
  *imageSharingMode* must be a valid `VkSharingMode` value

- **VUID-VkSwapchainCreateInfoKHR-preTransform-parameter**
  
  *preTransform* must be a valid `VkSurfaceTransformFlagBitsKHR` value

- **VUID-VkSwapchainCreateInfoKHR-compositeAlpha-parameter**
  
  *compositeAlpha* must be a valid `VkCompositeAlphaFlagBitsKHR` value

- **VUID-VkSwapchainCreateInfoKHR-presentMode-parameter**
  
  *presentMode* must be a valid `VkPresentModeKHR` value

- **VUID-VkSwapchainCreateInfoKHR-oldSwapchain-parameter**

  If *oldSwapchain* is not `VK_NULL_HANDLE`, *oldSwapchain* must be a valid `VkSwapchainKHR` handle

- **VUID-VkSwapchainCreateInfoKHR-oldSwapchain-parent**

  If *oldSwapchain* is a valid handle, it must have been created, allocated, or retrieved from *surface*

- **VUID-VkSwapchainCreateInfoKHR-commonparent**

  Both of *oldSwapchain*, and *surface* that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkInstance`
Bits which can be set in `VkSwapchainCreateInfoKHR::flags`, specifying parameters of swapchain creation, are:

```c
// Provided by VK_KHR_swapchain
typedef enum VkSwapchainCreateFlagBitsKHR {
    // Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with
    VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = 0x00000001,
    // Provided by VK_KHR_swapchain with VK_VERSION_1_1
    VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR = 0x00000002,
    // Provided by VK_KHR_swapchain_mutable_format
    VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR = 0x00000004,
} VkSwapchainCreateFlagBitsKHR;
```

- `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR` specifies that images created from the swapchain (i.e. with the `swapchain` member of `VkImageSwapchainCreateInfoKHR` set to this swapchain's handle) must use `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT`.

- `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` specifies that the images of the swapchain can be used to create a `VkImageView` with a different format than what the swapchain was created with. The list of allowed image view formats is specified by adding a `VkImageFormatListCreateInfo` structure to the `pNext` chain of `VkSwapchainCreateInfoKHR`. In addition, this flag also specifies that the swapchain can be created with usage flags that are not supported for the format the swapchain is created with but are supported for at least one of the allowed image view formats.

```c
// Provided by VK_KHR_swapchain
typedef VkFlags VkSwapchainCreateFlagsKHR;
```

`VkSwapchainCreateFlagsKHR` is a bitmask type for setting a mask of zero or more `VkSwapchainCreateFlagBitsKHR`.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkDeviceGroupSwapchainCreateInfoKHR` structure, then that structure includes a set of device group present modes that the swapchain can be used with.

The `VkDeviceGroupSwapchainCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with
VkKHR_swapchain
typedef struct VkDeviceGroupSwapchainCreateInfoKHR {
    VkStructureType                     sType;
    const void*                         pNext;
    VkDeviceGroupPresentModeFlagsKHR    modes;
} VkDeviceGroupSwapchainCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• modes is a bitfield of modes that the swapchain can be used with.

If this structure is not present, modes is considered to be VKDEVICEGROUP_PRESENT_MODE_LOCAL_BIT_KHR.

Valid Usage (Implicit)

- VUID-VkDeviceGroupSwapchainCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-parameter
  modes must be a valid combination of VkDeviceGroupPresentModeFlagBitsKHR values
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-requiredbitmask
  modes must not be 0

If the pNext chain of VkSwapchainCreateInfoKHR includes a VkSwapchainDisplayNativeHdrCreateInfoAMD structure, then that structure includes additional swapchain creation parameters specific to display native HDR support.

The VkSwapchainDisplayNativeHdrCreateInfoAMD structure is defined as:

```c
// Provided by VK_AMD_display_native_hdr
typedef struct VkSwapchainDisplayNativeHdrCreateInfoAMD {
    VkStructureType sType;
    const void* pNext;
    VkBool32 localDimmingEnable;
} VkSwapchainDisplayNativeHdrCreateInfoAMD;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• localDimmingEnable specifies whether local dimming is enabled for the swapchain.

If the pNext chain of VkSwapchainCreateInfoKHR does not include this structure, the default value for localDimmingEnable is VK_TRUE, meaning local dimming is initially enabled for the swapchain.

Valid Usage (Implicit)

- VUID-VkSwapchainDisplayNativeHdrCreateInfoAMD-sType-sType
  sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_DISPLAY_NATIVE_HDR_CREATE_INFO_AMD
It is only valid to set `localDimmingEnable` to `VK_TRUE` if `VkDisplayNativeHdrSurfaceCapabilitiesAMD::localDimmingSupport` is supported.

The local dimming HDR setting may also be changed over the life of a swapchain by calling:

```c
// Provided by VK_AMD_display_native_hdr
void vkSetLocalDimmingAMD(
    VkDevice device,
    VkSwapchainKHR swapChain,
    VkBool32 localDimmingEnable);
```

- `device` is the device associated with `swapChain`.
- `swapChain` handle to enable local dimming.
- `localDimmingEnable` specifies whether local dimming is enabled for the swapchain.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure, then that structure specifies the application’s preferred full-screen presentation behavior. If this structure is not present, `fullScreenExclusive` is considered to be `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT`.

To enable surface counters when creating a swapchain, add a `VkSwapchainCounterCreateInfoEXT` structure to the `pNext` chain of `VkSwapchainCreateInfoKHR`. `VkSwapchainCounterCreateInfoEXT` is defined as:

```
```
typedef struct VkSwapchainCounterCreateInfoEXT {
    VkStructureType             sType;
    const void*                 pNext;
    VkSurfaceCounterFlagsEXT    surfaceCounters;
} VkSwapchainCounterCreateInfoEXT;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **surfaceCounters** is a bitmask of VkSurfaceCounterFlagBitsEXT specifying surface counters to enable for the swapchain.

### Valid Usage

- **VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-01244**
  The bits in `surfaceCounters` must be supported by `VkSwapchainCreateInfoKHR::surface`, as reported by `vkGetPhysicalDeviceSurfaceCapabilities2EXT`.

### Valid Usage (Implicit)

- **VUID-VkSwapchainCounterCreateInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT`
- **VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-parameter**
  `surfaceCounters` must be a valid combination of `VkSurfaceCounterFlagBitsEXT` values.

The requested counters become active when the first presentation command for the associated swapchain is processed by the presentation engine. To query the value of an active counter, use:

```c
// Provided by VK_EXT_display_control
VkResult vkGetSwapchainCounterEXT(
    VkDevice                                    device,
    VkSwapchainKHR                              swapchain,
    VkSurfaceCounterFlagBitsEXT                 counter,
    uint64_t*                                   pCounterValue);
```

- **device** is the `VkDevice` associated with `swapchain`.
- **swapchain** is the swapchain from which to query the counter value.
- **counter** is a `VkSurfaceCounterFlagBitsEXT` value specifying the counter to query.
- **pCounterValue** will return the current value of the counter.

If a counter is not available because the swapchain is out of date, the implementation **may** return `VK_ERROR_OUT_OF_DATE_KHR`. 
Valid Usage

- VUID-vkGetSwapchainCounterEXT-swapchain-01245
  
  One or more present commands on swapchain must have been processed by the presentation engine.

Valid Usage (Implicit)

- VUID-vkGetSwapchainCounterEXT-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkGetSwapchainCounterEXT-swapchain-parameter
  
  swapchain must be a valid VkSwapchainKHR handle

- VUID-vkGetSwapchainCounterEXT-counter-parameter
  
  counter must be a valid VkSurfaceCounterFlagBitsEXT value

- VUID-vkGetSwapchainCounterEXT-pCounterValue-parameter
  
  pCounterValue must be a valid pointer to a uint64_t value

- VUID-vkGetSwapchainCounterEXT-commonparent
  
  Both of device, and swapchain must have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR

As mentioned above, if vkCreateSwapchainKHR succeeds, it will return a handle to a swapchain containing an array of at least minImageCount presentable images.

While acquired by the application, presentable images can be used in any way that equivalent non-presentable images can be used. A presentable image is equivalent to a non-presentable image created with the following VkImageCreateInfo parameters:
<table>
<thead>
<tr>
<th>VkImageCreateInfo Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>flags</td>
<td>VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT is set if VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR is set and VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT_KHR and VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR are both set if VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR is set and all other bits are unset</td>
</tr>
<tr>
<td>imageType</td>
<td>VK_IMAGE_TYPE_2D</td>
</tr>
<tr>
<td>format</td>
<td>pCreateInfo-&gt;imageFormat</td>

<td>pCreateInfo-&gt;pQueueFamilyIndices</td>
</tr>
<tr>
<td>initialLayout</td>
<td>VK_IMAGE_LAYOUT_UNDEFINED</td>
</tr>
</tbody>
</table>

The surface **must** not be destroyed until after the swapchain is destroyed.

If oldSwapchain is VK_NULL_HANDLE, and the native window referred to by surface is already associated with a Vulkan swapchain, VK_ERROR_NATIVE_WINDOW_IN_USE_KHR **must** be returned.

If the native window referred to by surface is already associated with a non-Vulkan graphics API surface, VK_ERROR_NATIVE_WINDOW_IN_USE_KHR **must** be returned.

The native window referred to by surface **must** not become associated with a non-Vulkan graphics API surface before all associated Vulkan swapchains have been destroyed.

Like core functions, several WSI functions, including vkCreateSwapchainKHR return VK_ERROR_DEVICE_LOST if the logical device was lost. See Lost Device. As with most core objects, VkSwapchainKHR is a child of the device and is affected by the lost state; it **must** be destroyed before destroying the VkDevice. However, VkSurfaceKHR is not a child of any VkDevice and is not otherwise affected by the lost device. After successfully recreating a VkDevice, the same VkSurfaceKHR can be used to create a new VkSwapchainKHR, provided the previous one was destroyed.
Note

As mentioned in Lost Device, after a lost device event, the VkPhysicalDevice may also be lost. If other VkPhysicalDevice are available, they can be used together with the same VkSurfaceKHR to create the new VkSwapchainKHR, however the application must query the surface capabilities again, because they may differ on a per-physical device basis.

To destroy a swapchain object call:

```c
// Provided by VK_KHR_swapchain
void vkDestroySwapchainKHR(
    VkDevice                                    device,
    VkSwapchainKHR                              swapchain,
    const VkAllocationCallbacks*                pAllocator);
```

- device is the VkDevice associated with swapchain.
- swapchain is the swapchain to destroy.
- pAllocator is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).

The application must not destroy a swapchain until after completion of all outstanding operations on images that were acquired from the swapchain. swapchain and all associated VkImage handles are destroyed, and must not be acquired or used any more by the application. The memory of each VkImage will only be freed after that image is no longer used by the presentation engine. For example, if one image of the swapchain is being displayed in a window, the memory for that image may not be freed until the window is destroyed, or another swapchain is created for the window. Destroying the swapchain does not invalidate the parent VkSurfaceKHR, and a new swapchain can be created with it.

When a swapchain associated with a display surface is destroyed, if the image most recently presented to the display surface is from the swapchain being destroyed, then any display resources modified by presenting images from any swapchain associated with the display surface must be reverted by the implementation to their state prior to the first present performed on one of these swapchains, or such resources must be left in their current state.

If swapchain has exclusive full-screen access, it is released before the swapchain is destroyed.
Valid Usage

- VUID-vkDestroySwapchainKHR-swapchain-01282
  All uses of presentable images acquired from swapchain must have completed execution

- VUID-vkDestroySwapchainKHR-swapchain-01283
  If VkAllocationCallbacks were provided when swapchain was created, a compatible set of callbacks must be provided here

- VUID-vkDestroySwapchainKHR-swapchain-01284
  If no VkAllocationCallbacks were provided when swapchain was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroySwapchainKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroySwapchainKHR-swapchain-parameter
  If swapchain is not VK_NULL_HANDLE, swapchain must be a valid VkSwapchainKHR handle

- VUID-vkDestroySwapchainKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroySwapchainKHR-commonparent
  Both of device, and swapchain that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkInstance

Host Synchronization

- Host access to swapchain must be externally synchronized

When the VK_KHR_display_swapchain extension is enabled, multiple swapchains that share presentable images are created by calling:

```c
// Provided by VK_KHR_display_swapchain
VkResult vkCreateSharedSwapchainsKHR(
  VkDevice device,
  uint32_t swapchainCount,
  const VkSwapchainCreateInfoKHR* pCreateInfos,
  const VkAllocationCallbacks* pAllocator,
  VkSwapchainKHR* pSwapchains);
```

- device is the device to create the swapchains for.
- swapchainCount is the number of swapchains to create.
• **pCreateInfos** is a pointer to an array of `VkSwapchainCreateInfoKHR` structures specifying the parameters of the created swapchains.

• **pAllocator** is the allocator used for host memory allocated for the swapchain objects when there is no more specific allocator available (see Memory Allocation).

• **pSwapchains** is a pointer to an array of `VkSwapchainKHR` handles in which the created swapchain objects will be returned.

`vkCreateSharedSwapchainsKHR` is similar to `vkCreateSwapchainKHR`, except that it takes an array of `VkSwapchainCreateInfoKHR` structures, and returns an array of swapchain objects.

The swapchain creation parameters that affect the properties and number of presentable images must match between all the swapchains. If the displays used by any of the swapchains do not use the same presentable image layout or are incompatible in a way that prevents sharing images, swapchain creation will fail with the result code `VK_ERROR_INCOMPATIBLE_DISPLAY_KHR`. If any error occurs, no swapchains will be created. Images presented to multiple swapchains must be re-acquired from all of them before transitioning away from `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`. After destroying one or more of the swapchains, the remaining swapchains and the presentable images can continue to be used.

### Valid Usage (Implicit)

- **VUID-vkCreateSharedSwapchainsKHR-device-parameter**
  device must be a valid `VkDevice` handle

- **VUID-vkCreateSharedSwapchainsKHR-pCreateInfos-parameter**
  `pCreateInfos` must be a valid pointer to an array of `swapchainCount` valid `VkSwapchainCreateInfoKHR` structures

- **VUID-vkCreateSharedSwapchainsKHR-pAllocator-parameter**
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateSharedSwapchainsKHR-pSwapchains-parameter**
  `pSwapchains` must be a valid pointer to an array of `swapchainCount` `VkSwapchainKHR` handles

- **VUID-vkCreateSharedSwapchainsKHR-swapchainCount-arraylength**
  `swapchainCount` must be greater than 0

### Host Synchronization

- Host access to `pCreateInfos[]`.surface must be externally synchronized

- Host access to `pCreateInfos[]`.oldSwapchain must be externally synchronized
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INCOMPATIBLE_DISPLAY_KHR
• VK_ERROR_DEVICE_LOST
• VK_ERROR_SURFACE_LOST_KHR

To obtain the array of presentable images associated with a swapchain, call:

```
// Provided by VK_KHR_swapchain
VkResult vkGetSwapchainImagesKHR(
    VkDevice device,                        // device
    VkSwapchainKHR swapchain,              // swapchain
    uint32_t* pSwapchainImageCount,        // pSwapchainImageCount
    VkImage* pSwapchainImages);           // pSwapchainImages
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to query.
- **pSwapchainImageCount** is a pointer to an integer related to the number of presentable images available or queried, as described below.
- **pSwapchainImages** is either **NULL** or a pointer to an array of **VkImage** handles.

If **pSwapchainImages** is **NULL**, then the number of presentable images for **swapchain** is returned in **pSwapchainImageCount**. Otherwise, **pSwapchainImageCount** must point to a variable set by the user to the number of elements in the **pSwapchainImages** array, and on return the variable is overwritten with the number of structures actually written to **pSwapchainImages**. If the value of **pSwapchainImageCount** is less than the number of presentable images for **swapchain**, at most **pSwapchainImageCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available presentable images were returned.
Valid Usage (Implicit)

- VUID-vkGetSwapchainImagesKHR-device-parameter
  *device* must be a valid *VkDevice* handle

- VUID-vkGetSwapchainImagesKHR-swapchain-parameter
  *swapchain* must be a valid *VkSwapchainKHR* handle

- VUID-vkGetSwapchainImagesKHR-pSwapchainImageCount-parameter
  *pSwapchainImageCount* must be a valid pointer to a *uint32_t* value

- VUID-vkGetSwapchainImagesKHR-pSwapchainImages-parameter
  If the value referenced by *pSwapchainImageCount* is not 0, and *pSwapchainImages* is not NULL,
  *pSwapchainImages* must be a valid pointer to an array of *pSwapchainImageCount* *VkImage* handles

- VUID-vkGetSwapchainImagesKHR-commonparent
  Both of *device*, and *swapchain* must have been created, allocated, or retrieved from the same *VkInstance*

Return Codes

**Success**

- VK_SUCCESS
- VK_INCOMPLETE

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

**Note**

By knowing all presentable images used in the swapchain, the application can create command buffers that reference these images prior to entering its main rendering loop.

Images returned by *vkGetSwapchainImagesKHR* are fully backed by memory before they are passed to the application. All presentable images are initially in the *VK_IMAGE_LAYOUT_UNDEFINED* layout, thus before using presentable images, the application must transition them to a valid layout for the intended use.

Further, the lifetime of presentable images is controlled by the implementation, so applications must not destroy a presentable image. See *vkDestroySwapchainKHR* for further details on the lifetime of presentable images.

Images can also be created by using *vkCreateImage* with *VkImageSwapchainCreateInfoKHR* and bound to swapchain memory using *vkBindImageMemory2KHR* with *VkBindImageMemorySwapchainInfoKHR*. These images can be used anywhere swapchain images
are used, and are useful in logical devices with multiple physical devices to create peer memory bindings of swapchain memory. These images and bindings have no effect on what memory is presented. Unlike images retrieved from `vkGetSwapchainImagesKHR`, these images **must** be destroyed with `vkDestroyImage`.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkAcquireNextImageKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint64_t timeout,
    VkSemaphore semaphore,
    VkFence fence,
    uint32_t* pImageIndex);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the non-retired swapchain from which an image is being acquired.
- **timeout** specifies how long the function waits, in nanoseconds, if no image is available.
- **semaphore** is **VK_NULL_HANDLE** or a semaphore to signal.
- **fence** is **VK_NULL_HANDLE** or a fence to signal.
- **pImageIndex** is a pointer to a `uint32_t` in which the index of the next image to use (i.e. an index into the array of images returned by `vkGetSwapchainImagesKHR`) is returned.
Valid Usage

- VUID-vkAcquireNextImageKHR-swapchain-01285
  - `swapchain` must not be in the retired state

- VUID-vkAcquireNextImageKHR-semaphore-01286
  - If `semaphore` is not `VK_NULL_HANDLE` it must be unsignaled

- VUID-vkAcquireNextImageKHR-semaphore-01779
  - If `semaphore` is not `VK_NULL_HANDLE` it must not have any uncompleted signal or wait operations pending

- VUID-vkAcquireNextImageKHR-fence-01287
  - If `fence` is not `VK_NULL_HANDLE` it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue

- VUID-vkAcquireNextImageKHR-semaphore-01780
  - `semaphore` and `fence` must not both be equal to `VK_NULL_HANDLE`

- VUID-vkAcquireNextImageKHR-swapchain-01802
  - If the number of currently acquired images is greater than the difference between the number of images in `swapchain` and the value of `VkSurfaceCapabilitiesKHR::minImageCount` as returned by a call to `vkGetPhysicalDeviceSurfaceCapabilities2KHR` with the `surface` used to create `swapchain`, `timeout` must not be `UINT64_MAX`

- VUID-vkAcquireNextImageKHR-semaphore-03265
  - `semaphore` must have a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`
**Valid Usage (Implicit)**

- **VUID-vkAcquireNextImageKHR-device-parameter**
  
  device **must** be a valid VkDevice handle

- **VUID-vkAcquireNextImageKHR-swapchain-parameter**

  swapchain **must** be a valid VkSwapchainKHR handle

- **VUID-vkAcquireNextImageKHR-semaphore-parameter**

  If semaphore is not VK_NULL_HANDLE, semaphore **must** be a valid VkSemaphore handle

- **VUID-vkAcquireNextImageKHR-fence-parameter**

  If fence is not VK_NULL_HANDLE, fence **must** be a valid VkFence handle

- **VUID-vkAcquireNextImageKHR-pImageIndex-parameter**

  pImageIndex **must** be a valid pointer to a uint32_t value

- **VUID-vkAcquireNextImageKHR-semaphore-parent**

  If semaphore is a valid handle, it **must** have been created, allocated, or retrieved from device

- **VUID-vkAcquireNextImageKHR-fence-parent**

  If fence is a valid handle, it **must** have been created, allocated, or retrieved from device

- **VUID-vkAcquireNextImageKHR-commonparent**

  Both of device, and swapchain that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkInstance

**Host Synchronization**

- Host access to swapchain **must** be externally synchronized
- Host access to semaphore **must** be externally synchronized
- Host access to fence **must** be externally synchronized
Return Codes

Success

• VK_SUCCESS
• VK_TIMEOUT
• VK_NOT_READY
• VK_SUBOPTIMAL_KHR

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_DEVICE_LOST
• VK_ERROR_OUT_OF_DATE_KHR
• VK_ERROR_SURFACE_LOST_KHR
• VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

When successful, `vkAcquireNextImageKHR` acquires a presentable image from `swapchain` that an application can use, and sets `pImageIndex` to the index of that image within the swapchain. The presentation engine may not have finished reading from the image at the time it is acquired, so the application must use semaphore and/or fence to ensure that the image layout and contents are not modified until the presentation engine reads have completed. If semaphore is not `VK_NULL_HANDLE`, the application may assume that, once `vkAcquireNextImageKHR` returns, the semaphore signal operation referenced by semaphore has been submitted for execution. The order in which images are acquired is implementation-dependent, and may be different than the order the images were presented.

If `timeout` is zero, then `vkAcquireNextImageKHR` does not wait, and will either successfully acquire an image, or fail and return `VK_NOT_READY` if no image is available.

If the specified timeout period expires before an image is acquired, `vkAcquireNextImageKHR` returns `VK_TIMEOUT`. If `timeout` is `UINT64_MAX`, the timeout period is treated as infinite, and `vkAcquireNextImageKHR` will block until an image is acquired or an error occurs.

`vkAcquireNextImageKHR` should not be called if the number of images that the application has currently acquired is greater than the difference between the number of images in `swapchain` and the value of `VkSurfaceCapabilitiesKHR::minImageCount`.

If an image is acquired successfully, `vkAcquireNextImageKHR` must either return `VK_SUCCESS`, or `VK_SUBOPTIMAL_KHR` if the swapchain no longer matches the surface properties exactly, but can still be used for presentation.
This **may** happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain in this state, or to re-create the swapchain to better match the platform surface properties.

If the swapchain images no longer match native surface properties, either `VK_SUBOPTIMAL_KHR` or `VK_ERROR_OUT_OF_DATE_KHR` must be returned. If `VK_ERROR_OUT_OF_DATE_KHR` is returned, no image is acquired and attempts to present previously acquired images to the swapchain will also fail with `VK_ERROR_OUT_OF_DATE_KHR`. Applications need to create a new swapchain for the surface to continue presenting if `VK_ERROR_OUT_OF_DATE_KHR` is returned.

If device loss occurs (see Lost Device) before the timeout has expired, `vkAcquireNextImageKHR` must return in finite time with either one of the allowed success codes, or `VK_ERROR_DEVICE_LOST`.

If `semaphore` is not `VK_NULL_HANDLE`, the semaphore **must** be unsignaled, with no signal or wait operations pending. It will become signaled when the application **can** use the image.

If `fence` is not equal to `VK_NULL_HANDLE`, the fence **must** be unsignaled, with no signal operations pending. It will become signaled when the application **can** use the image.

Applications **should** not rely on `vkAcquireNextImageKHR` blocking in order to meter their rendering speed. The implementation **may** return from this function immediately regardless of how many presentation requests are queued, and regardless of when queued presentation requests will complete relative to the call. Instead, applications **can** use `fence` to meter their frame generation work to match the presentation rate.

An application **must** wait until either the `semaphore` or `fence` is signaled before accessing the image’s data.

When the presentable image will be accessed by some stage S, the recommended idiom for ensuring correct synchronization is:

- The `VkSubmitInfo` used to submit the image layout transition for execution includes `vkAcquireNextImageKHR::semaphore` in its `pWaitSemaphores` member, with the corresponding element of `pWaitDstStageMask` including S.

- The synchronization command that performs any necessary image layout transition includes S in both the `srcStageMask` and `dstStageMask`. 
After a successful return, the image indicated by `pImageIndex` and its data will be unmodified compared to when it was presented.

**Note**

Exclusive ownership of presentable images corresponding to a swapchain created with `VK_SHARING_MODE_EXCLUSIVE` as defined in Resource Sharing is not altered by a call to `vkAcquireNextImageKHR`. That means upon the first acquisition from such a swapchain presentable images are not owned by any queue family, while at subsequent acquisitions the presentable images remain owned by the queue family the image was previously presented on.

The possible return values for `vkAcquireNextImageKHR` depend on the `timeout` provided:

- **VK_SUCCESS** is returned if an image became available.
- **VK_ERROR_SURFACE_LOST_KHR** is returned if the surface becomes no longer available.
- **VK_NOT_READY** is returned if `timeout` is zero and no image was available.
- **VK_TIMEOUT** is returned if `timeout` is greater than zero and less than `UINT64_MAX`, and no image became available within the time allowed.
- **VK_SUBOPTIMAL_KHR** is returned if an image became available, and the swapchain no longer matches the surface properties exactly, but can still be used to present to the surface successfully.

**Note**

This may happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain indefinitely or temporarily in this state, or to recreate the swapchain to better match the platform surface properties.

- **VK_ERROR_OUT_OF_DATE_KHR** is returned if the surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications must query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.

If the native surface and presented image sizes no longer match, presentation may fail. If presentation does succeed, the mapping from the presented image to the native surface is implementation-defined. It is the application's responsibility to detect surface size changes and react appropriately. If presentation fails because of a mismatch in the surface and presented image sizes, a **VK_ERROR_OUT_OF_DATE_KHR** error will be returned.
Note

For example, consider a 4x3 window/surface that gets resized to be 3x4 (taller than wider). On some window systems, the portion of the window/surface that was previously and still is visible (the 3x3 part) will contain the same contents as before, while the remaining parts of the window will have undefined contents. Other window systems may squash/stretch the image to fill the new window size without any undefined contents, or apply some other mapping.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```c
// Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with VK_KHR_swapchain
VkResult vkAcquireNextImage2KHR(
    VkDevice device,              // Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with VK_KHR_swapchain
    const VkAcquireNextImageInfoKHR* pAcquireInfo,              // Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with VK_KHR_swapchain
    uint32_t* pImageIndex);  // Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with VK_KHR_swapchain
```

- `device` is the device associated with swapchain.
- `pAcquireInfo` is a pointer to a `VkAcquireNextImageInfoKHR` structure containing parameters of the acquire.
- `pImageIndex` is a pointer to a `uint32_t` that is set to the index of the next image to use.

Valid Usage

- VUID-vkAcquireNextImage2KHR-swapchain-01803
  If the number of currently acquired images is greater than the difference between the number of images in the `swapchain` member of `pAcquireInfo` and the value of `VkSurfaceCapabilitiesKHR::minImageCount` as returned by a call to `vkGetPhysicalDeviceSurfaceCapabilities2KHR` with the `surface` used to create `swapchain`, the `timeout` member of `pAcquireInfo` must not be `UINT64_MAX`.

Valid Usage (Implicit)

- VUID-vkAcquireNextImage2KHR-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkAcquireNextImage2KHR-pAcquireInfo-parameter
  `pAcquireInfo` must be a valid pointer to a valid `VkAcquireNextImageInfoKHR` structure
- VUID-vkAcquireNextImage2KHR-pImageIndex-parameter
  `pImageIndex` must be a valid pointer to a `uint32_t` value
Return Codes

**Success**
- VK_SUCCESS
- VK_TIMEOUT
- VK_NOT_READY
- VK_SUBOPTIMAL_KHR

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

The `VkAcquireNextImageInfoKHR` structure is defined as:

```c
typedef struct VkAcquireNextImageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
    uint64_t timeout;
    VkSemaphore semaphore;
    VkFence fence;
    uint32_t deviceMask;
} VkAcquireNextImageInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchain` is a non-retired swapchain from which an image is acquired.
- `timeout` specifies how long the function waits, in nanoseconds, if no image is available.
- `semaphore` is `VK_NULL_HANDLE` or a semaphore to signal.
- `fence` is `VK_NULL_HANDLE` or a fence to signal.
- `deviceMask` is a mask of physical devices for which the swapchain image will be ready to use when the semaphore or fence is signaled.

If `vkAcquireNextImageInfoKHR` is used, the device mask is considered to include all physical devices in the logical device.
Note

vkAcquireNextImage2KHR signals at most one semaphore, even if the application requests waiting for multiple physical devices to be ready via the `deviceMask`. However, only a single physical device can wait on that semaphore, since the semaphore becomes unsignaled when the wait succeeds. For other physical devices to wait for the image to be ready, it is necessary for the application to submit semaphore signal operation(s) to that first physical device to signal additional semaphore(s) after the wait succeeds, which the other physical device(s) can wait upon.

Valid Usage

- VUID-VkAcquireNextImageInfoKHR-swapchain-01675
  `swapchain` must not be in the retired state

- VUID-VkAcquireNextImageInfoKHR-semaphore-01288
  If `semaphore` is not `VK_NULL_HANDLE` it must be unsignaled

- VUID-VkAcquireNextImageInfoKHR-semaphore-01781
  If `semaphore` is not `VK_NULL_HANDLE` it must not have any uncompleted signal or wait operations pending

- VUID-VkAcquireNextImageInfoKHR-fence-01289
  If `fence` is not `VK_NULL_HANDLE` it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue

- VUID-VkAcquireNextImageInfoKHR-semaphore-01782
  `semaphore` and `fence` must not both be equal to `VK_NULL_HANDLE`

- VUID-VkAcquireNextImageInfoKHR-deviceMask-01290
  `deviceMask` must be a valid device mask

- VUID-VkAcquireNextImageInfoKHR-deviceMask-01291
  `deviceMask` must not be zero

- VUID-VkAcquireNextImageInfoKHR-semaphore-03266
  `semaphore` must have a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`
Valid Usage (Implicit)

- **VUID-VkAcquireNextImageInfoKHR-sType-sType**
  
  *sType must be* VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR

- **VUID-VkAcquireNextImageInfoKHR-pNext-pNext**
  
  *pNext must be* NULL

- **VUID-VkAcquireNextImageInfoKHR-swapchain-parameter**
  
  *swapchain must be a valid VkSwapchainKHR handle*

- **VUID-VkAcquireNextImageInfoKHR-semaphore-parameter**
  
  If *semaphore* is not VK_NULL_HANDLE, *semaphore must be a valid* VkSemaphore handle

- **VUID-VkAcquireNextImageInfoKHR-fence-parameter**
  
  If *fence* is not VK_NULL_HANDLE, *fence must be a valid* VkFence handle

- **VUID-VkAcquireNextImageInfoKHR-commonparent**
  
  Each of fence, semaphore, and swapchain that are valid handles of non-ignored parameters *must* have been created, allocated, or retrieved from the same VkInstance

Host Synchronization

- Host access to swapchain *must be* externally synchronized
- Host access to semaphore *must be* externally synchronized
- Host access to fence *must be* externally synchronized

After queueing all rendering commands and transitioning the image to the correct layout, to queue an image for presentation, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkQueuePresentKHR(
    VkQueue                                     queue,
    const VkPresentInfoKHR*                     pPresentInfo);
```

- **queue** is a queue that is capable of presentation to the target surface's platform on the same device as the image's swapchain.

- **pPresentInfo** is a pointer to a VkPresentInfoKHR structure specifying parameters of the presentation.

  **Note**

  There is no requirement for an application to present images in the same order that they were acquired - applications can arbitrarily present any image that is currently acquired.
Valid Usage

- **VUID-vkQueuePresentKHR-pSwapchains-01292**
  Each element of `pSwapchains` member of `pPresentInfo` must be a swapchain that is created for a surface for which presentation is supported from `queue` as determined using a call to `vkGetPhysicalDeviceSurfaceSupportKHR`.

- **VUID-vkQueuePresentKHR-pSwapchains-01293**
  If more than one member of `pSwapchains` was created from a display surface, all display surfaces referenced that refer to the same display must use the same display mode.

- **VUID-vkQueuePresentKHR-pWaitSemaphores-01294**
  When a semaphore wait operation referring to a binary semaphore defined by the elements of the `pWaitSemaphores` member of `pPresentInfo` executes on `queue`, there must be no other queues waiting on the same semaphore.

- **VUID-vkQueuePresentKHR-pWaitSemaphores-01295**
  All elements of the `pWaitSemaphores` member of `pPresentInfo` must be semaphores that are signaled, or have semaphore signal operations previously submitted for execution.

- **VUID-vkQueuePresentKHR-pWaitSemaphores-03267**
  All elements of the `pWaitSemaphores` member of `pPresentInfo` must be created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`.

- **VUID-vkQueuePresentKHR-pWaitSemaphores-03268**
  All elements of the `pWaitSemaphores` member of `pPresentInfo` must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) must have also been submitted for execution.

Any writes to memory backing the images referenced by the `pImageIndices` and `pSwapchains` members of `pPresentInfo`, that are available before `vkQueuePresentKHR` is executed, are automatically made visible to the read access performed by the presentation engine. This automatic visibility operation for an image happens-after the semaphore signal operation, and happens-before the presentation engine accesses the image.

Queueing an image for presentation defines a set of queue operations, including waiting on the semaphores and submitting a presentation request to the presentation engine. However, the scope of this set of queue operations does not include the actual processing of the image by the presentation engine.

**Note**

The origin of the native orientation of the surface coordinate system is not specified in the Vulkan specification; it depends on the platform. For most platforms the origin is by default upper-left, meaning the pixel of the presented `VkImage` at coordinates (0,0) would appear at the upper left pixel of the platform surface (assuming `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, and the display standing the right way up).

If `vkQueuePresentKHR` fails to enqueue the corresponding set of queue operations, it may return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation must...
ensure that the state and contents of any resources or synchronization primitives referenced is unaffected by the call or its failure.

If `vkQueuePresentKHR` fails in such a way that the implementation is unable to make that guarantee, the implementation must return `VK_ERROR_DEVICE_LOST`.

However, if the presentation request is rejected by the presentation engine with an error `VK_ERROR_OUT_OF_DATE_KHR`, `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`, or `VK_ERROR_SURFACE_LOST_KHR`, the set of queue operations are still considered to be enqueued and thus any semaphore wait operation specified in `VkPresentInfoKHR` will execute when the corresponding queue operation is complete.

If any swapchain member of `pPresentInfo` was created with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` will be returned if that swapchain does not have exclusive full-screen access, possibly for implementation-specific reasons outside of the application’s control.

**Valid Usage (Implicit)**

- `VUID-vkQueuePresentKHR-queue-parameter`  
  `queue` must be a valid `VkQueue` handle
- `VUID-vkQueuePresentKHR-pPresentInfo-parameter`  
  `pPresentInfo` must be a valid pointer to a valid `VkPresentInfoKHR` structure

**Host Synchronization**

- Host access to `queue` must be externally synchronized
- Host access to `pPresentInfo->pWaitSemaphores[]` must be externally synchronized
- Host access to `pPresentInfo->pSwapchains[]` must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>
Return Codes

Success
- VK_SUCCESS
- VK_SUBOPTIMAL_KHR

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

The VkPresentInfoKHR structure is defined as:

```c
// Provided by VK_KHR_swapchain
typedef struct VkPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t swapchainCount;
    const VkSwapchainKHR* pSwapchains;
    const uint32_t* pImageIndices;
    VkResult* pResults;
} VkPresentInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores to wait for before issuing the present request. The number may be zero.
- `pWaitSemaphores` is NULL or a pointer to an array of `VkSemaphore` objects with `waitSemaphoreCount` entries, and specifies the semaphores to wait for before issuing the present request.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pSwapchains` is a pointer to an array of `VkSwapchainKHR` objects with `swapchainCount` entries. A given swapchain must not appear in this list more than once.
- `pImageIndices` is a pointer to an array of indices into the array of each swapchain’s presentable images, with `swapchainCount` entries. Each entry in this array identifies the image to present on the corresponding entry in the `pSwapchains` array.
- `pResults` is a pointer to an array of `VkResult` typed elements with `swapchainCount` entries.
Applications that do not need per-swapchain results can use NULL for pResults. If non-NULL, each entry in pResults will be set to the VkResult for presenting the swapchain corresponding to the same index in pSwapchains.

Before an application can present an image, the image's layout must be transitioned to the VK_IMAGE_LAYOUT_PRESENT_SRC_KHR layout, or for a shared presentable image the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR layout.

Note
When transitioning the image to VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR or VK_IMAGE_LAYOUT_PRESENT_SRC_KHR, there is no need to delay subsequent processing, or perform any visibility operations (as vkQueuePresentKHR performs automatic visibility operations). To achieve this, the dstAccessMask member of the VkImageMemoryBarrier should be set to 0, and the dstStageMask parameter should be set to VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT.

Valid Usage

- VUID-VkPresentInfoKHR-pImageIndices-01430

Each element of pImageIndices must be the index of a presentable image acquired from the swapchain specified by the corresponding element of the pSwapchains array, and the presented image subresource must be in the VK_IMAGE_LAYOUT_PRESENT_SRC_KHR or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR layout at the time the operation is executed on a VkDevice.
Valid Usage (Implicit)

- **VUID-VkPresentInfoKHR-sType-sType**
  
  *sType must be Vk_STRUCTURE_TYPE_PRESENT_INFO_KHR*

- **VUID-VkPresentInfoKHR-pNext-pNext**
  
  Each *pNext* member of any structure (including this one) in the *pNext* chain *must* be either NULL or a pointer to a valid instance of VkDeviceGroupPresentInfoKHR, VkDisplayPresentInfoKHR, VkPresentFrameTokenGGP, VkPresentRegionsKHR, or VkPresentTimesInfoGOOGLE

- **VUID-VkPresentInfoKHR-sType-unique**
  
  The *sType* value of each struct in the *pNext* chain *must* be unique

- **VUID-VkPresentInfoKHR-pWaitSemaphores-parameter**
  
  If *waitSemaphoreCount* is not 0, *pWaitSemaphores* *must* be a valid pointer to an array of *waitSemaphoreCount* valid VkSemaphore handles

- **VUID-VkPresentInfoKHR-pSwapchains-parameter**
  
  *pSwapchains must be a valid pointer to an array of *swapchainCount* valid VkSwapchainKHR handles*

- **VUID-VkPresentInfoKHR-pImageIndices-parameter**
  
  *pImageIndices must be a valid pointer to an array of *swapchainCount* uint32_t values*

- **VUID-VkPresentInfoKHR-pResults-parameter**
  
  If *pResults* is not NULL, *pResults* *must* be a valid pointer to an array of *swapchainCount* VkResult values

- **VUID-VkPresentInfoKHR-swapchainCount-arraylength**
  
  *swapchainCount must be greater than 0*

- **VUID-VkPresentInfoKHR-commonparent**
  
  Both of the elements of *pSwapchains*, and the elements of *pWaitSemaphores* that are valid handles of non-ignored parameters *must* have been created, allocated, or retrieved from the same VkInstance

When the **VK_KHR_incremental_present** extension is enabled, additional fields can be specified that allow an application to specify that only certain rectangular regions of the presentable images of a swapchain are changed. This is an optimization hint that a presentation engine may use to only update the region of a surface that is actually changing. The application still must ensure that all pixels of a presented image contain the desired values, in case the presentation engine ignores this hint. An application can provide this hint by adding a VkPresentRegionsKHR structure to the *pNext* chain of the VkPresentInfoKHR structure.

The **VkPresentRegionsKHR** structure is defined as:
// Provided by VK_KHR_incremental_present

typedef struct VkPresentRegionsKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentRegionKHR* pRegions;
} VkPresentRegionsKHR;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• swapchainCount is the number of swapchains being presented to by this command.
• pRegions is NULL or a pointer to an array of VkPresentRegionKHR elements with swapchainCount entries. If not NULL, each element of pRegions contains the region that has changed since the last present to the swapchain in the corresponding entry in the VkPresentInfoKHR::pSwapchains array.

Valid Usage

• VUID-VkPresentRegionsKHR-swapchainCount-01260
  swapchainCount must be the same value as VkPresentInfoKHR::swapchainCount, where VkPresentInfoKHR is included in the pNext chain of this VkPresentRegionsKHR structure.

Valid Usage (Implicit)

• VUID-VkPresentRegionsKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR

• VUID-VkPresentRegionsKHR-pRegions-parameter
  If pRegions is not NULL, pRegions must be a valid pointer to an array of swapchainCount valid VkPresentRegionKHR structures

• VUID-VkPresentRegionsKHR-swapchainCount-arraylength
  swapchainCount must be greater than 0

For a given image and swapchain, the region to present is specified by the VkPresentRegionKHR structure, which is defined as:

// Provided by VK_KHR_incremental_present

typedef struct VkPresentRegionKHR {
    uint32_t rectangleCount;
    const VkRectLayerKHR* pRectangles;
} VkPresentRegionKHR;

• rectangleCount is the number of rectangles in pRectangles, or zero if the entire image has changed and should be presented.
• `pRectangles` is either `NULL` or a pointer to an array of `VkRectLayerKHR` structures. The `VkRectLayerKHR` structure is the framebuffer coordinates, plus layer, of a portion of a presentable image that has changed and **must** be presented. If non-`NULL`, each entry in `pRectangles` is a rectangle of the given image that has changed since the last image was presented to the given swapchain. The rectangles **must** be specified relative to `VkSurfaceCapabilitiesKHR::currentTransform`, regardless of the swapchain’s `preTransform`. The presentation engine will apply the `preTransform` transformation to the rectangles, along with any further transformation it applies to the image content.

**Valid Usage (Implicit)**

- **VUID-VkPresentRegionKHR-pRectangles-parameter**
  If `rectangleCount` is not 0, and `pRectangles` is not `NULL`, `pRectangles` **must** be a valid pointer to an array of `rectangleCount` valid `VkRectLayerKHR` structures.

The `VkRectLayerKHR` structure is defined as:

```c
// Provided by VK_KHR_incremental_present
typedef struct VkRectLayerKHR {
    VkOffset2D  offset;
    VkExtent2D  extent;
    uint32_t    layer;
} VkRectLayerKHR;
```

- `offset` is the origin of the rectangle, in pixels.
- `extent` is the size of the rectangle, in pixels.
- `layer` is the layer of the image. For images with only one layer, the value of `layer` **must** be 0.

Some platforms allow the size of a surface to change, and then scale the pixels of the image to fit the surface. `VkRectLayerKHR` specifies pixels of the swapchain’s image(s), which will be constant for the life of the swapchain.

**Valid Usage**

- **VUID-VkRectLayerKHR-layer-01262**
  `layer` **must** be less than the `imageArrayLayers` member of the `VkSwapchainCreateInfoKHR` structure passed to `vkCreateSwapchainKHR`.

- **VUID-VkRectLayerKHR-offset-04864**
  The sum of `offset` and `extent`, after being transformed according to the `preTransform` member of the `VkSwapchainCreateInfoKHR` structure, **must** be no greater than the `imageExtent` member of the `VkSwapchainCreateInfoKHR` structure passed to `vkCreateSwapchainKHR`.

When the `VK_KHR_display_swapchain` extension is enabled additional fields **can** be specified when
presenting an image to a swapchain by setting `VkPresentInfoKHR::pNext` to point to a `VkDisplayPresentInfoKHR` structure.

The `VkDisplayPresentInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_display_swapchain
typedef struct VkDisplayPresentInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkRect2D           srcRect;
    VkRect2D           dstRect;
    VkBool32           persistent;
} VkDisplayPresentInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcRect` is a rectangular region of pixels to present. It **must** be a subset of the image being presented. If `VkDisplayPresentInfoKHR` is not specified, this region will be assumed to be the entire presentable image.
- `dstRect` is a rectangular region within the visible region of the swapchain's display mode. If `VkDisplayPresentInfoKHR` is not specified, this region will be assumed to be the entire visible region of the swapchain's mode. If the specified rectangle is a subset of the display mode's visible region, content from display planes below the swapchain's plane will be visible outside the rectangle. If there are no planes below the swapchain's, the area outside the specified rectangle will be black. If portions of the specified rectangle are outside of the display's visible region, pixels mapping only to those portions of the rectangle will be discarded.
- `persistent`: If this is `VK_TRUE`, the display engine will enable buffered mode on displays that support it. This allows the display engine to stop sending content to the display until a new image is presented. The display will instead maintain a copy of the last presented image. This allows less power to be used, but **may** increase presentation latency. If `VkDisplayPresentInfoKHR` is not specified, persistent mode will not be used.

If the extent of the `srcRect` and `dstRect` are not equal, the presented pixels will be scaled accordingly.
Valid Usage

- VUID-VkDisplayPresentInfoKHR-srcRect-01257
  srcRect must specify a rectangular region that is a subset of the image being presented

- VUID-VkDisplayPresentInfoKHR-dstRect-01258
  dstRect must specify a rectangular region that is a subset of the visibleRegion parameter of the display mode the swapchain being presented uses

- VUID-VkDisplayPresentInfoKHR-persistentContent-01259
  If the persistentContent member of the VkDisplayPropertiesKHR structure returned by vkGetPhysicalDeviceDisplayPropertiesKHR for the display the present operation targets is VK_FALSE, then persistent must be VK_FALSE

Valid Usage (Implicit)

- VUID-VkDisplayPresentInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR

If the pNext chain of VkPresentInfoKHR includes a VkDeviceGroupPresentInfoKHR structure, then that structure includes an array of device masks and a device group present mode.

The VkDeviceGroupPresentInfoKHR structure is defined as:

```c
// Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkDeviceGroupPresentInfoKHR {
    VkStructureType                        sType;
    const void*                           pNext;
    uint32_t                               swapchainCount;
    const uint32_t*                        pDeviceMasks;
    VkDeviceGroupPresentModeFlagBitsKHR    mode;
} VkDeviceGroupPresentInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- swapchainCount is zero or the number of elements in pDeviceMasks.
- pDeviceMasks is a pointer to an array of device masks, one for each element of VkPresentInfoKHR::pSwapchains.
- mode is a VkDeviceGroupPresentModeFlagBitsKHR value specifying the device group present mode that will be used for this present.

If mode is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR, then each element of pDeviceMasks selects which instance of the swapchain image is presented. Each element of pDeviceMasks must have exactly one bit set, and the corresponding physical device must have a presentation engine as
If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR`, then each element of `pDeviceMasks` selects which instance of the swapchain image is presented. Each element of `pDeviceMasks` must have exactly one bit set, and some physical device in the logical device must include that bit in its `VkDeviceGroupPresentCapabilitiesKHR::presentMask`.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR`, then each element of `pDeviceMasks` selects which instances of the swapchain image are component-wise summed and the sum of those images is presented. If the sum in any component is outside the representable range, the value of that component is undefined. Each element of `pDeviceMasks` must have a value for which all set bits are set in one of the elements of `VkDeviceGroupPresentCapabilitiesKHR::presentMask`.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, then each element of `pDeviceMasks` selects which instance(s) of the swapchain images are presented. For each bit set in each element of `pDeviceMasks`, the corresponding physical device must have a presentation engine as reported by `VkDeviceGroupPresentCapabilitiesKHR`.

If `VkDeviceGroupPresentInfoKHR` is not provided or `swapchainCount` is zero then the masks are considered to be 1. If `VkDeviceGroupPresentInfoKHR` is not provided, `mode` is considered to be `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`. 
Valid Usage

• VUID-VkDeviceGroupPresentInfoKHR-swapchainCount-01297
  swapchainCount must equal 0 or VkPresentInfoKHR::swapchainCount

• VUID-VkDeviceGroupPresentInfoKHR-mode-01298
  If mode is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR, then each element of pDeviceMasks must have exactly one bit set, and the corresponding element of VkDeviceGroupPresentCapabilitiesKHR::presentMask must be non-zero

• VUID-VkDeviceGroupPresentInfoKHR-mode-01299
  If mode is VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR, then each element of pDeviceMasks must have exactly one bit set, and some physical device in the logical device must include that bit in its VkDeviceGroupPresentCapabilitiesKHR::presentMask

• VUID-VkDeviceGroupPresentInfoKHR-mode-01300
  If mode is VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR, then each element of pDeviceMasks must have a value for which all set bits are set in one of the elements of VkDeviceGroupPresentCapabilitiesKHR::presentMask

• VUID-VkDeviceGroupPresentInfoKHR-mode-01301
  If mode is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR, then for each bit set in each element of pDeviceMasks, the corresponding element of VkDeviceGroupPresentCapabilitiesKHR::presentMask must be non-zero

• VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-01302
  The value of each element of pDeviceMasks must be equal to the device mask passed in VkAcquireNextImageInfoKHR::deviceMask when the image index was last acquired

• VUID-VkDeviceGroupPresentInfoKHR-mode-01303
  mode must have exactly one bit set, and that bit must have been included in VkDeviceGroupSwapchainCreateInfoKHR::modes

Valid Usage (Implicit)

• VUID-VkDeviceGroupPresentInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR

• VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-parameter
  If swapchainCount is not 0, pDeviceMasks must be a valid pointer to an array of swapchainCount uint32_t values

• VUID-VkDeviceGroupPresentInfoKHR-mode-parameter
  mode must be a valid VkDeviceGroupPresentModeFlagBitsKHR value

When the VK_GOOGLE_display_timing extension is enabled, additional fields can be specified that allow an application to specify the earliest time that an image should be displayed. This allows an application to avoid stutter that is caused by an image being displayed earlier than planned. Such stuttering can occur with both fixed and variable-refresh-rate displays, because stuttering occurs when the geometry is not correctly positioned for when the image is displayed. An application can
instruct the presentation engine that an image should not be displayed earlier than a specified time by adding a `VkPresentTimesInfoGOOGLE` structure to the `pNext` chain of the `VkPresentInfoKHR` structure.

The `VkPresentTimesInfoGOOGLE` structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPresentTimesInfoGOOGLE {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentTimeGOOGLE* pTimes;
} VkPresentTimesInfoGOOGLE;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pTimes` is `NULL` or a pointer to an array of `VkPresentTimeGOOGLE` elements with `swapchainCount` entries. If not `NULL`, each element of `pTimes` contains the earliest time to present the image corresponding to the entry in the `VkPresentInfoKHR::pImageIndices` array.

### Valid Usage

- `VUID-VkPresentTimesInfoGOOGLE-swapchainCount-01247`
  ```
  swapchainCount must be the same value as VkPresentInfoKHR::swapchainCount, where VkPresentInfoKHR is included in the pNext chain of this VkPresentTimesInfoGOOGLE structure
  ```

### Valid Usage (Implicit)

- `VUID-VkPresentTimesInfoGOOGLE-sType-sType`
  ```
  sType must be VK_STRUCTURE_TYPE_PRESENT_TIMES_INFO_GOOGLE
  ```
- `VUID-VkPresentTimesInfoGOOGLE-pTimes-parameter`  
  ```
  If pTimes is not NULL, pTimes must be a valid pointer to an array of VkPresentTimeGOOGLE structures
  ```
- `VUID-VkPresentTimesInfoGOOGLE-swapchainCount-arraylength`  
  ```
  swapchainCount must be greater than 0
  ```

The `VkPresentTimeGOOGLE` structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPresentTimeGOOGLE {
    uint32_t presentID;
    uint64_t desiredPresentTime;
} VkPresentTimeGOOGLE;
```
• presentID is an application-provided identification value, that can be used with the results of vkGetPastPresentationTimingGOOGLE, in order to uniquely identify this present. In order to be useful to the application, it should be unique within some period of time that is meaningful to the application.

• desiredPresentTime specifies that the image given should not be displayed to the user any earlier than this time. desiredPresentTime is a time in nanoseconds, relative to a monotonically-increasing clock (e.g. CLOCK_MONOTONIC (see clock_gettime(2)) on Android and Linux). A value of zero specifies that the presentation engine may display the image at any time. This is useful when the application desires to provide presentID, but does not need a specific desiredPresentTime.

When the VK_GGP_frame_token extension is enabled, a Google Games Platform frame token can be specified when presenting an image to a swapchain by adding a VkPresentFrameTokenGGP structure to the pNext chain of the VkPresentInfoKHR structure.

The VkPresentFrameTokenGGP structure is defined as:

```cpp
// Provided by VK_GGP_frame_token
typedef struct VkPresentFrameTokenGGP {
    VkStructureType sType;
    const void* pNext;
    GgpFrameToken frameToken;
} VkPresentFrameTokenGGP;
```

• sType is the type of this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• frameToken is the Google Games Platform frame token.

Valid Usage

- VUID-VkPresentFrameTokenGGP-frameToken-02680
  frameToken must be a valid GgpFrameToken

Valid Usage (Implicit)

- VUID-VkPresentFrameTokenGGP-sType-sType
  sType must be VK_STRUCTURE_TYPE_PRESENT_FRAME_TOKEN_GGP

vkQueuePresentKHR, releases the acquisition of the images referenced by imageIndices. The queue family corresponding to the queue vkQueuePresentKHR is executed on must have ownership of the presented images as defined in Resource Sharing. vkQueuePresentKHR does not alter the queue family ownership, but the presented images must not be used again before they have been reacquired using vkAcquireNextImageKHR.

The processing of the presentation happens in issue order with other queue operations, but
semaphores have to be used to ensure that prior rendering and other commands in the specified queue complete before the presentation begins. The presentation command itself does not delay processing of subsequent commands on the queue, however, presentation requests sent to a particular queue are always performed in order. Exact presentation timing is controlled by the semantics of the presentation engine and native platform in use.

If an image is presented to a swapchain created from a display surface, the mode of the associated display will be updated, if necessary, to match the mode specified when creating the display surface. The mode switch and presentation of the specified image will be performed as one atomic operation.

The result codes `VK_ERROR_OUT_OF_DATE_KHR` and `VK_SUBOPTIMAL_KHR` have the same meaning when returned by `vkQueuePresentKHR` as they do when returned by `vkAcquireNextImageKHR`. If multiple swapchains are presented, the result code is determined applying the following rules in order:

- If the device is lost, `VK_ERROR_DEVICE_LOST` is returned.
- If any of the target surfaces are no longer available the error `VK_ERROR_SURFACE_LOST_KHR` is returned.
- If any of the presents would have a result of `VK_ERROR_OUT_OF_DATE_KHR` if issued separately then `VK_ERROR_OUT_OF_DATE_KHR` is returned.
- If any of the presents would have a result of `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` if issued separately then `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` is returned.
- If any of the presents would have a result of `VK_SUBOPTIMAL_KHR` if issued separately then `VK_SUBOPTIMAL_KHR` is returned.
- Otherwise `VK_SUCCESS` is returned.

Presentation is a read-only operation that will not affect the content of the presentable images. Upon reacquiring the image and transitioning it away from the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, the contents will be the same as they were prior to transitioning the image to the present source layout and presenting it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

Note

The application can continue to present any acquired images from a retired swapchain as long as the swapchain has not entered a state that causes `vkQueuePresentKHR` to return `VK_ERROR_OUT_OF_DATE_KHR`.

33.10. Hdr Metadata

To improve color reproduction of content it is useful to have information that can be used to better reproduce the colors as seen on the reference monitor. That information can be provided to an implementation by calling `vkSetHdrMetadataEXT`. The metadata will be applied to the specified `VkSwapchainKHR` objects at the next `vkQueuePresentKHR` call using that `VkSwapchainKHR` object. The metadata will persist until a subsequent `vkSetHdrMetadataEXT` changes it. The definitions below are from the associated SMPTE 2086, CTA 861.3 and CIE 15:2004 specifications.
The definition of `vkSetHdrMetadataEXT` is:

```c
// Provided by VK_EXT_hdr_metadata
void vkSetHdrMetadataEXT(
    VkDevice device,                  // Provided by VK_EXT_hdr_metadata
    uint32_t swapchainCount,         // Provided by VK_EXT_hdr_metadata
    const VkSwapchainKHR* pSwapchains,  // Provided by VK_EXT_hdr_metadata
    const VkHdrMetadataEXT* pMetadata); // Provided by VK_EXT_hdr_metadata
```

- `device` is the logical device where the swapchain(s) were created.
- `swapchainCount` is the number of swapchains included in `pSwapchains`.
- `pSwapchains` is a pointer to an array of `swapchainCount` `VkSwapchainKHR` handles.
- `pMetadata` is a pointer to an array of `swapchainCount` `VkHdrMetadataEXT` structures.

**Valid Usage (Implicit)**

- **VUID-vkSetHdrMetadataEXT-device-parameter**
  
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkSetHdrMetadataEXT-pSwapchains-parameter**

  `pSwapchains` **must** be a valid pointer to an array of `swapchainCount` valid `VkSwapchainKHR` handles

- **VUID-vkSetHdrMetadataEXT-pMetadata-parameter**

  `pMetadata` **must** be a valid pointer to an array of `swapchainCount` valid `VkHdrMetadataEXT` structures

- **VUID-vkSetHdrMetadataEXT-swapchainCount-arraylength**

  `swapchainCount` **must** be greater than 0

- **VUID-vkSetHdrMetadataEXT-commonparent**

  Both of `device` and the elements of `pSwapchains` **must** have been created, allocated, or retrieved from the same `VkInstance`

```c
// Provided by VK_EXT_hdr_metadata
typedef struct VkXYColorEXT {
    float x;
    float y;
} VkXYColorEXT;
```

Chromaticity coordinates x and y are as specified in CIE 15:2004 “Calculation of chromaticity coordinates” (Section 7.3) and are limited to between 0 and 1 for real colors for the reference monitor.
// Provided by VK_EXT_hdr_metadata

typedef struct VkHdrMetadataEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkXYColorEXT       displayPrimaryRed;
    VkXYColorEXT       displayPrimaryGreen;
    VkXYColorEXT       displayPrimaryBlue;
    VkXYColorEXT       whitePoint;
    float              maxLuminance;
    float              minLuminance;
    float              maxContentLightLevel;
    float              maxFrameAverageLightLevel;
} VkHdrMetadataEXT;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **displayPrimaryRed** is the reference monitor's red primary in chromaticity coordinates
- **displayPrimaryGreen** is the reference monitor's green primary in chromaticity coordinates
- **displayPrimaryBlue** is the reference monitor's blue primary in chromaticity coordinates
- **whitePoint** is the reference monitor's white-point in chromaticity coordinates
- **maxLuminance** is the maximum luminance of the reference monitor in nits
- **minLuminance** is the minimum luminance of the reference monitor in nits
- **maxContentLightLevel** is content's maximum luminance in nits
- **maxFrameAverageLightLevel** is the maximum frame average light level in nits

**Valid Usage (Implicit)**

- VUID-VkHdrMetadataEXT-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_HDR_METADATA_EXT**

- VUID-VkHdrMetadataEXT-pNext-pNext
  
  **pNext** must be NULL

**Note**

The validity and use of this data is outside the scope of Vulkan.
Chapter 34. Deferred Host Operations

Certain Vulkan commands are inherently expensive for the host CPU to execute. It is often desirable to offload such work onto background threads, and to parallelize the work across multiple CPUs. The concept of deferred operations allows applications and drivers to coordinate the execution of expensive host commands using an application-managed thread pool.

The VK_KHR_deferred_host_operations extension defines the infrastructure and usage patterns for deferrable commands, but does not specify any commands as deferrable. This is left to additional dependant extensions. Commands must not be deferred unless the deferral is specifically allowed by another extension which depends on VK_KHR_deferred_host_operations. This specification will refer to such extensions as deferral extensions.

34.1. Requesting Deferral

When an application requests an operation deferral, the implementation may defer the operation. When deferral is requested and the implementation defers any operation, the implementation must return VK_OPERATION_DEFERRED_KHR as the success code if no errors occurred. When deferral is requested, the implementation should defer the operation when the workload is significant, however if the implementation chooses not to defer any of the requested operations and instead executes all of them immediately, the implementation must return VK_OPERATION_NOT_DEFERRED_KHR as the success code if no errors occurred.

A deferred operation is created complete with an initial result value of VK_SUCCESS. The deferred operation becomes pending when an operation has been successfully deferred with that deferred operation object.

A deferred operation is considered pending until the deferred operation completes. A pending deferred operation becomes complete when it has been fully executed by one or more threads. Pending deferred operations will never complete until they are joined by an application thread, using vkDeferredOperationJoinKHR. Applications can join multiple threads to the same deferred operation, enabling concurrent execution of subtasks within that operation.

The application can query the status of a VkDeferredOperationKHR using the vkGetDeferredOperationMaxConcurrencyKHR or vkGetDeferredOperationResultKHR commands.

Parameters to the command requesting a deferred operation may be accessed at any time until the deferred operation enters the pending state. While a deferred operation is pending:

- Externally synchronized parameters must not be accessed.
- Pointer parameters must not be modified (e.g. reallocated/freed).
- The contents of pointer parameters which may be read by the command must not be modified.
- The contents of pointer parameters which may be written by the command must not be read.
- Vulkan object parameters must not be passed as externally synchronized parameters to any other command.

When the deferred operation is complete, the application should call
vkGetDeferredOperationResultKHR to obtain the VkResult indicating success or failure of the operation. The VkResult value returned will be one of the values that the command requesting the deferred operation is able to return. Writes to output parameters of the requesting command will happen-before the deferred operation is complete.

### 34.2. Deferred Host Operations API

The VkDeferredOperationKHR handle is defined as:

```c
// Provided by VK_KHR_deferred_host_operations
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeferredOperationKHR)
```

This handle refers to a tracking structure which manages the execution state for a deferred command.

To construct the tracking object for a deferred command, call:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkCreateDeferredOperationKHR(
    VkDevice device,
    const VkAllocationCallbacks* pAllocator,
    VkDeferredOperationKHR* pDeferredOperation);
```

- **device** is the device which owns operation.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pDeferredOperation** is a pointer to a handle in which the created VkDeferredOperationKHR is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateDeferredOperationKHR-device-parameter**
  
  **device** must be a valid VkDevice handle

- **VUID-vkCreateDeferredOperationKHR-pAllocator-parameter**
  
  If **pAllocator** is not NULL, **pAllocator** must be a valid pointer to a valid VkAllocationCallbacks structure

- **VUID-vkCreateDeferredOperationKHR-pDeferredOperation-parameter**
  
  **pDeferredOperation** must be a valid pointer to a VkDeferredOperationKHR handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY

To assign a thread to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkDeferredOperationJoinKHR(
    VkDevice device,                // device is the device which owns operation.
    VkDeferredOperationKHR operation); // operation is the deferred operation that the calling thread should work on.
```

The `vkDeferredOperationJoinKHR` command will execute a portion of the deferred operation on the calling thread.

The return value will be one of the following:

- A return value of **VK_SUCCESS** indicates that **operation** is complete. The application **should** use `vkGetDeferredOperationResultKHR` to retrieve the result of **operation**.

- A return value of **VK_THREAD_DONE_KHR** indicates that the deferred operation is not complete, but there is no work remaining to assign to threads. Future calls to `vkDeferredOperationJoinKHR` are not necessary and will simply harm performance. This situation **may** occur when other threads executing `vkDeferredOperationJoinKHR` are about to complete **operation**, and the implementation is unable to partition the workload any further.

- A return value of **VK_THREAD_IDLE_KHR** indicates that the deferred operation is not complete, and there is no work for the thread to do at the time of the call. This situation **may** occur if the operation encounters a temporary reduction in parallelism. By returning **VK_THREAD_IDLE_KHR**, the implementation is signaling that it expects that more opportunities for parallelism will emerge as execution progresses, and that future calls to `vkDeferredOperationJoinKHR` **can** be beneficial. In the meantime, the application **can** perform other work on the calling thread.

Implementations **must** guarantee forward progress by enforcing the following invariants:

1. If only one thread has invoked `vkDeferredOperationJoinKHR` on a given operation, that thread **must** execute the operation to completion and return **VK_SUCCESS**.
2. If multiple threads have concurrently invoked `vkDeferredOperationJoinKHR` on the same operation, then at least one of them **must** complete the operation and return **VK_SUCCESS**.

Chapter 34. Deferred Host Operations | 1847
Valid Usage (Implicit)

- VUID-vkDeferredOperationJoinKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkDeferredOperationJoinKHR-operation-parameter
operation must be a valid VkDeferredOperationKHR handle

- VUID-vkDeferredOperationJoinKHR-operation-parent
operation must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_THREAD_DONE_KHR
- VK_THREAD_IDLE_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

When a deferred operation is completed, the application can destroy the tracking object by calling:

```c
// Provided by VK_KHR_deferred_host_operations
void vkDestroyDeferredOperationKHR(
    VkDevice                                    device,
    VkDeferredOperationKHR                      operation,
    const VkAllocationCallbacks*                pAllocator);
```

- device is the device which owns operation.
- operation is the completed operation to be destroyed.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage

- VUID-vkDestroyDeferredOperationKHR-operation-03434
  If VkAllocationCallbacks were provided when operation was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyDeferredOperationKHR-operation-03435
  If no VkAllocationCallbacks were provided when operation was created, pAllocator must be NULL.

- VUID-vkDestroyDeferredOperationKHR-operation-03436
  operation must be completed.

Valid Usage (Implicit)

- VUID-vkDestroyDeferredOperationKHR-device-parameter
  device must be a valid VkDevice handle.

- VUID-vkDestroyDeferredOperationKHR-operation-parameter
  If operation is not VK_NULL_HANDLE, operation must be a valid VkDeferredOperationKHR handle.

- VUID-vkDestroyDeferredOperationKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure.

- VUID-vkDestroyDeferredOperationKHR-operation-parent
  If operation is a valid handle, it must have been created, allocated, or retrieved from device.

Host Synchronization

- Host access to operation must be externally synchronized.

To query the number of additional threads that can usefully be joined to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
uint32_t vkGetDeferredOperationMaxConcurrencyKHR(
    VkDevice device,
    VkDeferredOperationKHR operation);
```

- device is the device which owns operation.
- operation is the deferred operation to be queried.

The returned value is the maximum number of threads that can usefully execute a deferred operation concurrently, reported for the state of the deferred operation at the point this command is called. This value is intended to be used to better schedule work onto available threads.
Applications **can** join any number of threads to the deferred operation and expect it to eventually complete, though excessive joins **may** return VK_THREAD_DONE_KHR immediately, performing no useful work.

If **operation** is complete, vkGetDeferredOperationMaxConcurrencyKHR returns zero.

If **operation** is currently joined to any threads, the value returned by this command **may** immediately be out of date.

If **operation** is pending, implementations **must** not return zero unless at least one thread is currently executing vkDeferredOperationJoinKHR on **operation**. If there are such threads, the implementation **should** return an estimate of the number of additional threads which it could profitably use.

Implementations **may** return $2^{32}-1$ to indicate that the maximum concurrency is unknown and cannot be easily derived. Implementations **may** return values larger than the maximum concurrency available on the host CPU. In these situations, an application **should** clamp the return value rather than oversubscribing the machine.

**Note**

The recommended usage pattern for applications is to query this value once, after deferral, and schedule no more than the specified number of threads to join the operation. Each time a joined thread receives VK_THREAD_IDLE_KHR, the application should schedule an additional join at some point in the future, but is not required to do so.

**Valid Usage (Implicit)**

- **VUID-vkGetDeferredOperationMaxConcurrencyKHR-device-parameter**
  - **device** must be a valid VkDevice handle
- **VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parameter**
  - **operation** must be a valid VkDeferredOperationKHR handle
- **VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parent**
  - **operation** must have been created, allocated, or retrieved from **device**

The vkGetDeferredOperationResultKHR function is defined as:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkGetDeferredOperationResultKHR(  
    VkDevice device,  
    VkDeferredOperationKHR operation);
```

- **device** is the device which owns **operation**.
- **operation** is the operation whose deferred result is being queried.

If no command has been deferred on **operation**, vkGetDeferredOperationResultKHR returns
If the deferred operation is pending, `vkGetDeferredOperationResultKHR` returns `VK_NOT_READY`.

If the deferred operation is complete, it returns the appropriate return value from the original command. This value **must** be one of the `VkResult` values which could have been returned by the original command if the operation had not been deferred.

### Valid Usage (Implicit)

- **VUID-vkGetDeferredOperationResultKHR-device-parameter**
  
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkGetDeferredOperationResultKHR-operation-parameter**
  
  `operation` **must** be a valid `VkDeferredOperationKHR` handle

- **VUID-vkGetDeferredOperationResultKHR-operation-parent**
  
  `operation` **must** have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_NOT_READY`
Chapter 35. Private Data

The private data extension provides a way for users to associate arbitrary user defined data with Vulkan objects. This association is accomplished by storing 64-bit unsigned integers of user defined data in private data slots.

An application can reserve private data slots at device creation. To reserve private data slots, insert a `VkDevicePrivateDataCreateInfoEXT` in the pNext chain in `VkDeviceCreateInfo` before device creation. Multiple `VkDevicePrivateDataCreateInfoEXT` structures can be chained together, and the sum of the requested slots will be reserved. This is an exception to the specified valid usage for structure pointer chains. Reserving slots in this manner is not strictly necessary but it may improve performance.

Private data slots are represented by `VkPrivateDataSlotEXT` handles:

```c
// Provided by VK_EXT_private_data
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPrivateDataSlotEXT)
```

To create a private data slot, call:

```c
// Provided by VK_EXT_private_data
VkResult vkCreatePrivateDataSlotEXT(
    VkDevice device,                     // device
    const VkPrivateDataSlotCreateInfoEXT* pCreateInfo, // pCreateInfo
    const VkAllocationCallbacks* pAllocator, // pAllocator
    VkPrivateDataSlotEXT* pPrivateDataSlot); // pPrivateDataSlot
```

- `device` is the logical device associated with the creation of the object(s) holding the private data slot.
- `pCreateInfo` is a pointer to a `VkPrivateDataSlotCreateInfoEXT`.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPrivateDataSlot` is a pointer to a `VkPrivateDataSlotEXT` handle in which the resulting private data slot is returned.

**Valid Usage**

- VUID-vkCreatePrivateDataSlotEXT-privateData-04564

  The privateData feature must be enabled.
Valid Usage (Implicit)

- VUID-vkCreatePrivateDataSlotEXT-device-parameter
  
  `device` **must** be a valid `VkDevice` handle

- VUID-vkCreatePrivateDataSlotEXT-pCreateInfo-parameter
  
  `pCreateInfo` **must** be a valid pointer to a valid `VkPrivateDataSlotCreateInfoEXT` structure

- VUID-vkCreatePrivateDataSlotEXT-pAllocator-parameter
  
  If `pAllocator` is not NULL, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreatePrivateDataSlotEXT-pPrivateDataSlot-parameter
  
  `pPrivateDataSlot` **must** be a valid pointer to a `VkPrivateDataSlotEXT` handle

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkPrivateDataSlotCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_private_data
typedef struct VkPrivateDataSlotCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPrivateDataSlotCreateFlagsEXT flags;
} VkPrivateDataSlotCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPrivateDataSlotCreateFlagsEXT` specifying additional parameters of the new private data slot.
Valid Usage (Implicit)

- **VUID-VkPrivateDataSlotCreateInfoEXT-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PRIVATE_DATA_SLOT_CREATE_INFO_EXT`

- **VUID-VkPrivateDataSlotCreateInfoEXT-pNext-pNext**
  
  `pNext` **must** be `NULL`

- **VUID-VkPrivateDataSlotCreateInfoEXT-flags-zerobitmask**
  
  `flags` **must** be `0`

// Provided by VK_EXT_private_data
typedef enum VkPrivateDataSlotCreateFlagBitsEXT {
} VkPrivateDataSlotCreateFlagBitsEXT;

// Provided by VK_EXT_private_data
typedef VkFlags VkPrivateDataSlotCreateFlagsEXT;

`VkPrivateDataSlotCreateFlagsEXT` is a bitmask type for setting a mask of zero or more `VkPrivateDataSlotCreateFlagBitsEXT`.

To destroy a private data slot, call:

// Provided by VK_EXT_private_data
void vkDestroyPrivateDataSlotEXT(
    VkDevice device,  
    VkPrivateDataSlotEXT privateDataSlot,  
    const VkAllocationCallbacks* pAllocator);

- **device** is the logical device associated with the creation of the object(s) holding the private data slot.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **privateDataSlot** is the private data slot to destroy.

Valid Usage

- **VUID-vkDestroyPrivateDataSlotEXT-privateDataSlot-04062**
  
  If `VkAllocationCallbacks` were provided when `privateDataSlot` was created, a compatible set of callbacks **must** be provided here

- **VUID-vkDestroyPrivateDataSlotEXT-privateDataSlot-04063**
  
  If no `VkAllocationCallbacks` were provided when `privateDataSlot` was created, **pAllocator must be NULL**
Valid Usage (Implicit)

- VUID-vkDestroyPrivateDataSlotEXT-device-parameter
  *device* must be a valid *VkDevice* handle

- VUID-vkDestroyPrivateDataSlotEXT-privateDataSlot-parameter
  If *privateDataSlot* is not *VK_NULL_HANDLE*, *privateDataSlot* must be a valid *VkPrivateDataSlotEXT* handle

- VUID-vkDestroyPrivateDataSlotEXT-pAllocator-parameter
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure

- VUID-vkDestroyPrivateDataSlotEXT-privateDataSlot-parent
  If *privateDataSlot* is a valid handle, it must have been created, allocated, or retrieved from *device*

Host Synchronization

- Host access to *privateDataSlot* must be externally synchronized

To store user defined data in a slot associated with a Vulkan object, call:

```c
// Provided by VK_EXT_private_data
VkResult vkSetPrivateDataEXT(
    VkDevice                                    device,           
    VkObjectType                                objectType,       
    uint64_t                                    objectHandle,    
    VkPrivateDataSlotEXT                        privateDataSlot, 
    uint64_t                                    data);           
```

- *device* is the device that created the object.
- *objectType* is a *VkObjectType* specifying the type of object to associate data with.
- *objectHandle* is a handle to the object to associate data with.
- *privateDataSlot* is a handle to a *VkPrivateDataSlotEXT* specifying location of private data storage.
- *data* is user defined data to associate the object with. This data will be stored at *privateDataSlot*.

Valid Usage

- VUID-vkSetPrivateDataEXT-objectHandle-04016
  *objectHandle* must be *device* or a child of *device*

- VUID-vkSetPrivateDataEXT-objectHandle-04017
  *objectHandle* must be a valid handle to an object of type *objectType*
Valid Usage (Implicit)

- **VUID-vkSetPrivateDataEXT-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkSetPrivateDataEXT-objectType-parameter**
  - `objectType` must be a valid `VkObjectType` value

- **VUID-vkSetPrivateDataEXT-privateDataSlot-parameter**
  - `privateDataSlot` must be a valid `VkPrivateDataSlotEXT` handle

- **VUID-vkSetPrivateDataEXT-privateDataSlot-parent**
  - `privateDataSlot` must have been created, allocated, or retrieved from `device`

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`

To retrieve user defined data from a slot associated with a Vulkan object, call:

```c
// Provided by VK_EXT_private_data
void vkGetPrivateDataEXT(
    VkDevice device,                      // device is the device that created the object
    VkObjectType objectType,              // objectType is a VkObjectType specifying the type of object data is associated with.
    uint64_t objectHandle,               // objectHandle is a handle to the object data is associated with.
    VkPrivateDataSlotEXT privateDataSlot, // privateDataSlot is a handle to a VkPrivateDataSlotEXT specifying location of private data pointer storage.
    uint64_t* pData)                     // pData is a pointer to specify where user data is returned. 0 will be written in the absence of a previous call to vkSetPrivateDataEXT using the object specified by objectHandle.
```

**Note**
Due to platform details on Android, implementations might not be able to reliably return 0 from calls to `vkGetPrivateDataEXT` for `VkSwapchainKHR` objects on which `vkSetPrivateDataEXT` has not previously been called. This erratum is exclusive to the Android platform and objects of type `VkSwapchainKHR`.
Valid Usage

- VUID-vkGetPrivateDataEXT-objectType-04018
  
  **objectType** must be **VK_OBJECT_TYPE_DEVICE**, or an object type whose parent is **VkDevice**

Valid Usage (Implicit)

- VUID-vkGetPrivateDataEXT-device-parameter
  
  **device** must be a valid **VkDevice** handle

- VUID-vkGetPrivateDataEXT-objectType-parameter
  
  **objectType** must be a valid **VkObjectType** value

- VUID-vkGetPrivateDataEXT-privateDataSlot-parameter
  
  **privateDataSlot** must be a valid **VkPrivateDataSlotEXT** handle

- VUID-vkGetPrivateDataEXT-pData-parameter
  
  **pData** must be a valid pointer to a **uint64_t** value

- VUID-vkGetPrivateDataEXT-privateDataSlot-parent
  
  **privateDataSlot** must have been created, allocated, or retrieved from **device**
Chapter 36. Acceleration Structures

36.1. Acceleration Structures

_Acceleration structures_ are data structures used by the implementation to efficiently manage scene geometry as it is _traversed during a ray tracing query_. The application is responsible for managing acceleration structure objects (see _Acceleration Structures_), including allocation, destruction, executing builds or updates, and synchronizing resources used during ray tracing queries.

There are two types of acceleration structures, _top level acceleration structures_ and _bottom level acceleration structures_.

![Acceleration Structure Diagram](image)

*Figure 24. Acceleration Structure*

The diagram shows the relationship between top and bottom level acceleration structures.

36.1.1. Geometry

_Geometries_ refer to a triangle or axis-aligned bounding box.

36.1.2. Top Level Acceleration Structures

Opaque acceleration structure for an array of instances. The descriptor or device address referencing this is the starting point for traversal.

The top level acceleration structure takes a reference to any bottom level acceleration structure referenced by its instances. Those bottom level acceleration structure objects _must_ be valid when the top level acceleration structure is accessed.
36.1.3. Bottom Level Acceleration Structures

Opaque acceleration structure for an array of geometries.

36.1.4. Acceleration Structure Update Rules

The API defines two types of operations to produce acceleration structures from geometry:

- A **build** operation is used to construct an acceleration structure.
- An **update** operation is used to modify an existing acceleration structure.

An update operation imposes certain constraints on the input, in exchange for considerably faster execution. When performing an update, the application is required to provide a full description of the acceleration structure, but is prohibited from changing anything other than instance definitions, transform matrices, and vertex or AABB positions. All other aspects of the description must exactly match the one from the original build.

More precisely, the application must not use an update operation to do any of the following:

- Change primitives or instances from **active** to **inactive** (as defined in Inactive Primitives and Instances).
- Change the index or vertex formats of triangle geometry.
- Change triangle geometry transform pointers from null to non-null or vice versa.
- Change the number of geometries or instances in the structure.
- Change the geometry flags for any geometry in the structure.
- Change the number of vertices or primitives for any geometry in the structure.

36.1.5. Inactive Primitives and Instances

Acceleration structures allow the use of particular input values to signal **inactive** primitives or instances.

An **inactive** triangle is one for which the first (X) component of each vertex is NaN. If any other vertex component is NaN, and the first is not, the behavior is undefined. If the vertex format does not have a NaN representation, then all triangles are considered active.

An **inactive** instance is one whose acceleration structure handle is **VK_NULL_HANDLE**.

An **inactive** AABB is one for which the minimum X coordinate is NaN. If any other component is NaN, and the first is not, the behavior is undefined.

In the above definitions, "NaN" refers to any type of NaN. Signaling, non-signaling, quiet, loud, or otherwise.

An inactive object is considered invisible to all rays, and should not be represented in the acceleration structure. Implementations should ensure that the presence of inactive objects does not seriously degrade traversal performance.
Inactive objects are counted in the auto-generated index sequences which are provided to shaders via InstanceId and PrimitiveId SPIR-V decorations. This allows objects in the scene to change freely between the active and inactive states, without affecting the layout of any arrays which are being indexed using the ID values.

Any transition between the active and inactive states requires a full acceleration structure rebuild. Applications must not perform an acceleration structure update where an object is active in the source acceleration structure but would be inactive in the destination, or vice versa.

### 36.1.6. Building Acceleration Structures

To build an acceleration structure call:

```c
// Provided by VK_NV_ray_tracing
void vkCmdBuildAccelerationStructureNV(
    VkCommandBuffer commandBuffer,
    const VkAccelerationStructureInfoNV* pInfo,
    VkBuffer instanceData,
    VkDeviceSize instanceOffset,
    VkBool32 update,
    VkAccelerationStructureNV dst,
    VkAccelerationStructureNV src,
    VkBuffer scratch,
    VkDeviceSize scratchOffset);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` contains the shared information for the acceleration structure's structure.
- `instanceData` is the buffer containing an array of `VkAccelerationStructureInstanceKHR` structures defining acceleration structures. This parameter must be `NULL` for bottom level acceleration structures.
- `instanceOffset` is the offset in bytes (relative to the start of `instanceData`) at which the instance data is located.
- `update` specifies whether to update the `dst` acceleration structure with the data in `src`.
- `dst` is a pointer to the target acceleration structure for the build.
- `src` is a pointer to an existing acceleration structure that is to be used to update the `dst` acceleration structure.
- `scratch` is the `VkBuffer` that will be used as scratch memory for the build.
- `scratchOffset` is the offset in bytes relative to the start of `scratch` that will be used as a scratch memory.

Accesses to `dst`, `src`, and `scratch` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`.
Valid Usage

- **VUID-vkCmdBuildAccelerationStructureNV-geometryCount-02241**
  
  `geometryCount` must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxGeometryCount`.

- **VUID-vkCmdBuildAccelerationStructureNV-dst-02488**

  `dst` must have been created with compatible `VkAccelerationStructureInfoNV` where `VkAccelerationStructureInfoNV::type` and `VkAccelerationStructureInfoNV::flags` are identical, `VkAccelerationStructureInfoNV::instanceCount` and `VkAccelerationStructureInfoNV::geometryCount` for `dst` are greater than or equal to the build size and each geometry in `VkAccelerationStructureInfoNV::pGeometries` for `dst` has greater than or equal to the number of vertices, indices, and AABBs.

- **VUID-vkCmdBuildAccelerationStructureNV-update-02489**

  If `update` is `VK_TRUE`, `src` must not be `VK_NULL_HANDLE`.

- **VUID-vkCmdBuildAccelerationStructureNV-update-02490**

  If `update` is `VK_TRUE`, `src` must have been built before with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_NV` set in `VkAccelerationStructureInfoNV::flags`.

- **VUID-vkCmdBuildAccelerationStructureNV-update-02491**

  If `update` is `VK_FALSE`, the size member of the `VkMemoryRequirements` structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `VkAccelerationStructureMemoryRequirementsInfoNV::accelerationStructure` set to `dst` and `VkAccelerationStructureMemoryRequirementsInfoNV::type` set to `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV` must be less than or equal to the size of `scratch` minus `scratchOffset`.

- **VUID-vkCmdBuildAccelerationStructureNV-update-02492**

  If `update` is `VK_TRUE`, the size member of the `VkMemoryRequirements` structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `VkAccelerationStructureMemoryRequirementsInfoNV::accelerationStructure` set to `dst` and `VkAccelerationStructureMemoryRequirementsInfoNV::type` set to `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV` must be less than or equal to the size of `scratch` minus `scratchOffset`.

- **VUID-vkCmdBuildAccelerationStructureNV-scratch-03522**

  `scratch` must have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag.

- **VUID-vkCmdBuildAccelerationStructureNV-instanceData-03523**

  If `instanceData` is not `VK_NULL_HANDLE`, `instanceData` must have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag.

- **VUID-vkCmdBuildAccelerationStructureNV-accelerationStructureReference-03786**

  Each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `instanceData` must be a valid device address containing a value obtained from `vkGetAccelerationStructureHandleNV`.

- **VUID-vkCmdBuildAccelerationStructureNV-update-03524**

  If `update` is `VK_TRUE`, then objects that were previously active must not be made inactive as per Inactive Primitives and Instances.
• VUID-vkCmdBuildAccelerationStructureNV-update-03525

If `update` is `VK_TRUE`, then objects that were previously inactive **must** not be made active as per Inactive Primitives and Instances

• VUID-vkCmdBuildAccelerationStructureNV-update-03526

If `update` is `VK_TRUE`, the `src` and `dst` objects **must** either be the same object or not have any memory aliasing

### Valid Usage (Implicit)

• VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-parameter

  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

• VUID-vkCmdBuildAccelerationStructureNV-pInfo-parameter

  `pInfo` **must** be a valid pointer to a valid `VkAccelerationStructureInfoNV` structure

• VUID-vkCmdBuildAccelerationStructureNV-instanceData-parameter

  If `instanceData` is not `VK_NULL_HANDLE`, `instanceData` **must** be a valid `VkBuffer` handle

• VUID-vkCmdBuildAccelerationStructureNV-dst-parameter

  `dst` **must** be a valid `VkAccelerationStructureNV` handle

• VUID-vkCmdBuildAccelerationStructureNV-src-parameter

  If `src` is not `VK_NULL_HANDLE`, `src` **must** be a valid `VkAccelerationStructureNV` handle

• VUID-vkCmdBuildAccelerationStructureNV-scratch-parameter

  `scratch` **must** be a valid `VkBuffer` handle

• VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-recording

  `commandBuffer` **must** be in the recording state

• VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-cmdpool

  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

• VUID-vkCmdBuildAccelerationStructureNV-renderpass

  This command **must** only be called outside of a render pass instance

• VUID-vkCmdBuildAccelerationStructureNV-commonparent

  Each of `commandBuffer`, `dst`, `instanceData`, `scratch`, and `src` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

• Host access to `commandBuffer` **must** be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
To build acceleration structures call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdBuildAccelerationStructuresKHR(
    VkCommandBuffer                     commandBuffer,
    uint32_t                            infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of acceleration structures to build. It specifies the number of the `pInfos` structures and `ppBuildRangeInfos` pointers that must be provided.
- `pInfos` is an array of `infoCount` `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- `ppBuildRangeInfos` is an array of `infoCount` pointers to arrays of `VkAccelerationStructureBuildRangeInfoKHR` structures. Each `ppBuildRangeInfos[i]` is an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i]`.

The `vkCmdBuildAccelerationStructuresKHR` command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

**Note**

This means that an application cannot build a top-level acceleration structure in the same `vkCmdBuildAccelerationStructuresKHR` call as the associated bottom-level or instance acceleration structures are being built. There also cannot be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

Accesses to the acceleration structure scratch buffers as identified by the `VkAccelerationStructureBuildGeometryInfoKHR::scratchData` buffer device addresses must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`. Similarly for accesses to each `VkAccelerationStructureBuildGeometryInfoKHR::srcAccelerationStructure` and `VkAccelerationStructureBuildGeometryInfoKHR::dstAccelerationStructure`. 
Accesses to other input buffers as identified by any used values of
`VkAccelerationStructureGeometryTrianglesDataKHR::vertexData`,
`VkAccelerationStructureGeometryTrianglesDataKHR::indexData`,
`VkAccelerationStructureGeometryTrianglesDataKHR::transformData`,
`VkAccelerationStructureGeometryAabbsDataKHR::data`, and
`VkAccelerationStructureGeometryInstancesDataKHR::data` must be synchronized with the
`VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of
`VK_ACCESS_SHADER_READ_BIT`.
Valid Usage

- VUID-vkCmdBuildAccelerationStructuresKHR-mode-04628
  The `mode` member of each element of `pInfos` must be a valid
  `VkBuildAccelerationStructureModeKHR` value.

- VUID-vkCmdBuildAccelerationStructuresKHR-srcAccelerationStructure-04629
  If the `srcAccelerationStructure` member of any element of `pInfos` is not
  `VK_NULL_HANDLE`, the `srcAccelerationStructure` member must be a valid
  `VkAccelerationStructureKHR` handle.

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-04630
  For each element of `pInfos`, if its `mode` member is
  `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member
  must not be `VK_NULL_HANDLE`.

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03403
  The `srcAccelerationStructure` member of any element of `pInfos` must not be the same
  acceleration structure as the `dstAccelerationStructure` member of any other element of
  `pInfos`.

- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03698
  The `dstAccelerationStructure` member of any element of `pInfos` must not be the same
  acceleration structure as the `dstAccelerationStructure` member of any other element of
  `pInfos`.

- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03800
  The `dstAccelerationStructure` member of any element of `pInfos` must be a valid
  `VkAccelerationStructureKHR` handle.

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03699
  For each element of `pInfos`, if its `type` member is
  `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member
  must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type`
  equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or
  `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03700
  For each element of `pInfos`, if its `type` member is
  `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member
  must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type`
  equal to either `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` or
  `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03663
  For each element of `pInfos`, if its `mode` member is
  `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, inactive primitives in its
  `srcAccelerationStructure` member must not be made active.

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03664
  For each element of `pInfos`, if its `mode` member is
  `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, active primitives in its
  `srcAccelerationStructure` member must not be made inactive.
The `dstAccelerationStructure` member of any element of `pInfos` must not be referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `srcAccelerationStructure` member of any other element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, which is accessed by this command.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command.

For each element of `pInfos`, if its `mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must have been built before with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` set in `VkAccelerationStructureBuildGeometryInfoKHR.flags`.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` and `dstAccelerationStructure` members must either be the same `VkAccelerationStructureKHR`, or not have any memory aliasing.
For each element of pInfos, if its mode member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its geometryCount member must have the same value which was specified when srcAccelerationStructure was last built.

For each element of pInfos, if its mode member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its flags member must have the same value which was specified when srcAccelerationStructure was last built.

For each element of pInfos, if its mode member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its type member must have the same value which was specified when srcAccelerationStructure was last built.

For each element of pInfos, if its mode member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its geometryType member must have the same value which was specified when srcAccelerationStructure was last built.

For each element of pInfos, if its mode member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its flags member must have the same value which was specified when srcAccelerationStructure was last built.

For each element of pInfos, if its mode member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its geometry.triangles.vertexFormat member must have the same value which was specified when srcAccelerationStructure was last built.

For each element of pInfos, if its mode member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its geometry.triangles.maxVertex member must have the same value which was specified when srcAccelerationStructure was last built.

For each element of pInfos, if its mode member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its geometry.triangles.indexType member must have the same value which was specified when srcAccelerationStructure was last built.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` member was NULL when `srcAccelerationStructure` was last built, then it must be NULL.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` member was not NULL when `srcAccelerationStructure` was last built, then it may not be NULL.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, then the value of each index referenced must be the same as the corresponding index value when `srcAccelerationStructure` was last built.

For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, its `primitiveCount` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, if the corresponding geometry uses indices, its `firstVertex` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the corresponding `ppBuildRangeInfos[i][j].primitiveCount` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`.

For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member must be bound to device memory.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member must be bound to device memory.

For each element of `pInfos`, the buffer used to create each acceleration structure...
referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` must be bound to device memory

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03671
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where `N` is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03672
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03673
  The buffers from which the buffer device addresses for all of the `geometry.triangles.vertexData`, `geometry.triangles.indexData`, `geometry.triangles.transformData`, `geometry.aabbs.data`, and `geometry.instances.data` members of all `pInfos[i].pGeometries` and `pInfos[i].ppGeometries` are queried must have been created with the `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` usage flag

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03674
  The buffer from which the buffer device address `pInfos[i].scratchData.deviceAddress` is queried must have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03675
  For each element of `pInfos`, its `scratchData.deviceAddress` member must be a valid device address obtained from `vkGetBufferDeviceAddress`

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03676
  For each element of `pInfos`, if `scratchData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03677

  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is not 0, it must be aligned to 16 bytes

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03810
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.deviceAddress must be a valid device address obtained from <code>vkGetBufferDeviceAddress</code>

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03811
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, if geometry.aabbs.data.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single
For any element of \( p\text{Infos}[i].p\text{Geometries} \) or \( p\text{Infos}[i].pp\text{Geometries} \) with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.deviceAddress` must be aligned to 8 bytes.

For any element of \( p\text{Infos}[i].p\text{Geometries} \) or \( p\text{Infos}[i].pp\text{Geometries} \) with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_FALSE`, `geometry.instances.data.deviceAddress` must be aligned to 16 bytes.

For any element of \( p\text{Infos}[i].p\text{Geometries} \) or \( p\text{Infos}[i].pp\text{Geometries} \) with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_TRUE`, each element of `geometry.instances.data.deviceAddress` in device memory must be aligned to 8 bytes.

For any element of \( p\text{Infos}[i].p\text{Geometries} \) or \( p\text{Infos}[i].pp\text{Geometries} \) with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each \( \text{VkAccelerationStructureInstanceKHR} :: \text{accelerationStructureReference} \) value in `geometry.instances.data.deviceAddress` must be a valid device address containing a value obtained from `vkGetAccelerationStructureDeviceAddressKHR`.

For each \( p\text{Infos}[i] \), `dst\text{AccelerationStructure}` must have been created with a value of `VkAccelerationStructureCreateInfoKHR::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetAccelerationStructureBuildSizesKHR` with `pBuildInfo = p\text{Infos}[i]` and with each element of the `pMaxPrimitiveCounts` array greater than or equal to the equivalent `ppBuildRangeInfos[i][j].primitiveCount` values for \( j \) in \( [0, p\text{Infos}[i].\text{geometryCount}) \).

Each element of `ppBuildRangeInfos[i]` must be a valid pointer to an array of `p\text{Infos}[i].\text{geometryCount} \text{VkAccelerationStructureBuildRangeInfoKHR}` structures.
Valid Usage (Implicit)

- **VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-parameter**
  
  `pInfos` must be a valid pointer to an array of `infoCount` valid `VkAccelerationStructureBuildGeometryInfoKHR` structures

- **VUID-vkCmdBuildAccelerationStructuresKHR-ppBuildRangeInfos-parameter**
  
  `ppBuildRangeInfos` must be a valid pointer to an array of `infoCount` `VkAccelerationStructureBuildRangeInfoKHR` structures

- **VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- **VUID-vkCmdBuildAccelerationStructuresKHR-renderpass**
  
  This command must only be called outside of a render pass instance

- **VUID-vkCmdBuildAccelerationStructuresKHR-infoCount-arraylength**
  
  `infoCount` must be greater than 0

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

To build acceleration structures with some parameters sourced on the device call:
void vkCmdBuildAccelerationStructuresIndirectKHR(
    VkCommandBuffer commandBuffer,  
    uint32_t infoCount,          
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,  
    const VkDeviceAddress* pIndirectDeviceAddresses,  
    const uint32_t* pIndirectStrides,  
    const uint32_t* const ppMaxPrimitiveCounts);

- commandBuffer is the command buffer into which the command will be recorded.
- infoCount is the number of acceleration structures to build.
- pInfos is an array of infoCount VkAccelerationStructureBuildGeometryInfoKHR structures defining the geometry used to build each acceleration structure.
- pIndirectDeviceAddresses is an array of infoCount buffer device addresses which point to pInfos[i].geometryCount VkAccelerationStructureBuildRangeInfoKHR structures defining dynamic offsets to the addresses where geometry data is stored, as defined by pInfos[i].
- pIndirectStrides is an array of infoCount byte strides between elements of pIndirectDeviceAddresses.
- ppMaxPrimitiveCounts is an array of infoCount arrays of pInfos[i].geometryCount values indicating the maximum number of primitives that will be built by this command for each geometry.

Accesses to acceleration structures, scratch buffers, vertex buffers, index buffers, and instance buffers must be synchronized as with vkCmdBuildAccelerationStructuresKHR.

Accesses to any element of pIndirectDeviceAddresses must be synchronized with the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of VK_ACCESS_INDIRECT_COMMAND_READ_BIT.
Valid Usage

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-mode-04628**
  
  The `mode` member of each element of `pInfos` must be a valid `VkBuildAccelerationStructureModeKHR` value.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-srcAccelerationStructure-04629**
  
  If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-04630**
  
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must not be `VK_NULL_HANDLE`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03403**
  
  The `srcAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03698**
  
  The `dstAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03800**
  
  The `dstAccelerationStructure` member of any element of `pInfos` must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03699**
  
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03700**
  
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03663**
  
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, inactive primitives in its `srcAccelerationStructure` member must not be made active.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03664**
  
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, active primitives in its `srcAccelerationStructure` member must not be made inactive.
The \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} \textbf{must} not be referenced by the \texttt{geometry.instances.data} member of any element of \texttt{pGeometries} or \texttt{ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR} in any other element of \texttt{pInfos}.

The range of memory backing the \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} that is accessed by this command \textbf{must} not overlap the memory backing the \texttt{dstAccelerationStructure} member of any other element of \texttt{pInfos}, which is accessed by this command.

The range of memory backing the \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} that is accessed by this command \textbf{must} not overlap the memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} (including the same element), which is accessed by this command.

The range of memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} that is accessed by this command \textbf{must} not overlap the memory backing the \texttt{scratchData} member of any other element of \texttt{pInfos}, which is accessed by this command.

The range of memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} that is accessed by this command \textbf{must} not overlap the memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} with a \texttt{mode} equal to \texttt{VK\_BUILD\_ACCELERATION\_STRUCTURE\_MODE\_UPDATE\_KHR} (including the same element), which is accessed by this command.

The range of memory backing the \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} that is accessed by this command \textbf{must} not overlap the memory backing any acceleration structure referenced by the \texttt{geometry.instances.data} member of any element of \texttt{pGeometries} or \texttt{ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR} in any other element of \texttt{pInfos}, which is accessed by this command.

For each element of \texttt{pInfos}, if its \texttt{mode} member is \texttt{VK\_BUILD\_ACCELERATION\_STRUCTURE\_MODE\_UPDATE\_KHR}, its \texttt{srcAccelerationStructure} member \textbf{must} have been built before with \texttt{VK\_BUILD\_ACCELERATION\_STRUCTURE\_ALLOW\_UPDATE\_BIT\_KHR} set in \texttt{VkAccelerationStructureBuildGeometryInfoKHR::flags}.

For each element of \texttt{pInfos}, if its \texttt{mode} member is \texttt{VK\_BUILD\_ACCELERATION\_STRUCTURE\_MODE\_UPDATE\_KHR}, its \texttt{srcAccelerationStructure} and \texttt{dstAccelerationStructure} members \textbf{must} either be the same \texttt{VkAccelerationStructureKHR}, or not have any memory aliasing.
For each element of `pInfos`, if its `mode` member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its `geometryCount` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its `flags` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its `type` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `geometryType` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `flags` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its `geometry.triangles.vertexFormat` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its `geometry.triangles.maxVertex` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its `geometry.triangles.indexType` member must have the same value which was specified when `srcAccelerationStructure` was last built.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` member was NULL when `srcAccelerationStructure` was last built, then it must be NULL.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` member was not NULL when `srcAccelerationStructure` was last built, then it may not be NULL.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, then the value of each index referenced must be the same as the corresponding index value when `srcAccelerationStructure` was last built.

For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, its `primitiveCount` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, if the corresponding geometry uses indices, its `firstVertex` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the corresponding `ppMaxPrimitiveCounts[i][j]` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`.

For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member must be bound to device memory.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member must be bound to device memory.

For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or
ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR must be bound to device memory.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03671**
  If pInfos[i].mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR, all addresses between pInfos[i].scratchData.deviceAddress and pInfos[i].scratchData.deviceAddress + N - 1 must be in the buffer device address range of the same buffer, where N is given by the buildScratchSize member of the VkAccelerationStructureBuildSizesInfoKHR structure returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03672**
  If pInfos[i].mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, all addresses between pInfos[i].scratchData.deviceAddress and pInfos[i].scratchData.deviceAddress + N - 1 must be in the buffer device address range of the same buffer, where N is given by the updateScratchSize member of the VkAccelerationStructureBuildSizesInfoKHR structure returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-geometry-03673**
  The buffers from which the buffer device addresses for all of the geometry.triangles.vertexData, geometry.triangles.indexData, geometry.triangles.transformData, geometry.aabbs.data, and geometry.instances.data members of all pInfos[i].pGeometries and pInfos[i].ppGeometries are queried must have been created with the VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR usage flag.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03674**
  The buffer from which the buffer device address pInfos[i].scratchData.deviceAddress is queried must have been created with VK_BUFFER_USAGE_STORAGE_BUFFER_BIT usage flag.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03802**
  For each element of pInfos, its scratchData.deviceAddress member must be a valid device address obtained from vkGetBufferDeviceAddress.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03803**
  For each element of pInfos, if scratchData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03710**
  For each element of pInfos, its scratchData.deviceAddress member must be a multiple of VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03804**
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03805**
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.vertexData.deviceAddress is the...
address of a non-sparse buffer then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03711**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.deviceAddress` must be aligned to the size in bytes of the smallest component of the format in `vertexFormat`

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03806**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.deviceAddress` must be a valid device address obtained from `vkGetBufferDeviceAddress`

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03807**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, if `geometry.triangles.indexData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03810**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not `0`, it **must** be aligned to 16 bytes

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03811**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.deviceAddress` must be a valid device address obtained from `vkGetBufferDeviceAddress`

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03812**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, if `geometry.aabbs.data.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object
• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03714
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.deviceAddress must be aligned to 8 bytes

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03715
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_FALSE, geometry.instances.data.deviceAddress must be aligned to 16 bytes

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03716
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_TRUE, each element of geometry.instances.data.deviceAddress in device memory must be aligned to 16 bytes

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03813
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, geometry.instances.data.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03814
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.instances.data.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03815
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, each VkAccelerationStructureInstanceKHR::accelerationStructureReference value in geometry.instances.data.deviceAddress must be a valid device address containing a value obtained from vkGetAccelerationStructureDeviceAddressKHR

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03645
  For any element of pIndirectDeviceAddresses, if the buffer from which it was queried is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03646
  For any element of pIndirectDeviceAddresses[i], all device addresses between pIndirectDeviceAddresses[i] and pIndirectDeviceAddresses[i] + (pInfos[i].geometryCount × pIndirectStrides[i]) - 1 must be in the buffer device address range of the same buffer

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03647
  For any element of pIndirectDeviceAddresses, the buffer from which it was queried must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03648
  Each element of pIndirectDeviceAddresses must be a multiple of 4
Each element of \texttt{pIndirectStrides} must be a multiple of 4

\begin{itemize}
  \item \texttt{VkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-03787}
  \item \texttt{VkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-03649}
  \item \texttt{VkCmdBuildAccelerationStructuresIndirectKHR-accelerationStructureIndirectBuild-03650}
  \item \texttt{VkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03651}
  \item \texttt{VkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03652}
  \item \texttt{VkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-03653}
\end{itemize}

Each \texttt{VkAccelerationStructureBuildRangeInfoKHR} structure referenced by any element of \texttt{pIndirectDeviceAddresses} must be a valid \texttt{VkAccelerationStructureBuildRangeInfoKHR} structure

The \texttt{VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureIndirectBuild} feature must be enabled

Each \texttt{VkAccelerationStructureBuildRangeInfoKHR} structure referenced by any element of \texttt{pIndirectDeviceAddresses} must be a valid \texttt{VkAccelerationStructureBuildRangeInfoKHR} structure

\begin{itemize}
  \item \texttt{VkAccelerationStructureCreateInfoKHR::size} greater than or equal to the memory size required by the build operation, as returned by \texttt{vkGetAccelerationStructureBuildSizesKHR} with \texttt{pBuildInfo = pInfo[i]} and \texttt{pMaxPrimitiveCounts = ppMaxPrimitiveCounts[i]}
  \item \texttt{ppMaxPrimitiveCounts[i][j]} must be greater than or equal to the the \texttt{primitiveCount} value specified by the \texttt{VkAccelerationStructureBuildRangeInfoKHR} structure located at \texttt{pIndirectDeviceAddresses[i] + (j \times pIndirectStrides[i])}
Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-parameter
  pInfos must be a valid pointer to an array of infoCount valid
  VkAccelerationStructureBuildGeometryInfoKHR structures

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-parameter
  pIndirectDeviceAddresses must be a valid pointer to an array of infoCount VkDeviceAddress values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-parameter
  pIndirectStrides must be a valid pointer to an array of infoCount uint32_t values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-parameter
  ppMaxPrimitiveCounts must be a valid pointer to an array of infoCount uint32_t values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-infoCount-arraylength
  infoCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The VkAccelerationStructureBuildGeometryInfoKHR structure is defined as:
typedef struct VkAccelerationStructureBuildGeometryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureTypeKHR type;
    VkBuildAccelerationStructureFlagsKHR flags;
    VkBuildAccelerationStructureModeKHR mode;
    VkAccelerationStructureKHR srcAccelerationStructure;
    VkAccelerationStructureKHR dstAccelerationStructure;
    uint32_t geometryCount;
    const VkAccelerationStructureGeometryKHR* pGeometries;
    const VkAccelerationStructureGeometryKHR* const* ppGeometries;
    VkDeviceOrHostAddressKHR scratchData;
} VkAccelerationStructureBuildGeometryInfoKHR;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• type is a VkAccelerationStructureTypeKHR value specifying the type of acceleration structure being built.
• flags is a bitmask of VkBuildAccelerationStructureFlagBitsKHR specifying additional parameters of the acceleration structure.
• mode is a VkBuildAccelerationStructureModeKHR value specifying the type of operation to perform.
• srcAccelerationStructure is a pointer to an existing acceleration structure that is to be used to update the dst acceleration structure when mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR.
• dstAccelerationStructure is a pointer to the target acceleration structure for the build.
• geometryCount specifies the number of geometries that will be built into dstAccelerationStructure.
• pGeometries is a pointer to an array of VkAccelerationStructureGeometryKHR structures.
• ppGeometries is a pointer to an array of pointers to VkAccelerationStructureGeometryKHR structures.
• scratchData is the device or host address to memory that will be used as scratch memory for the build.

Only one of pGeometries or ppGeometries can be a valid pointer, the other must be NULL. Each element of the non-NULL array describes the data used to build each acceleration structure geometry.

The index of each element of the pGeometries or ppGeometries members of VkAccelerationStructureBuildGeometryInfoKHR is used as the geometry index during ray traversal. The geometry index is available in ray shaders via the RayGeometryIndexKHR built-in, and is used to determine hit and intersection shaders executed during traversal. The geometry index is available to ray queries via the OpRayQueryGetIntersectionGeometryIndexKHR instruction.
Valid Usage

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03654
  type **must not** be VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-03788
  Only one of pGeometries or ppGeometries **can be** a valid pointer, the other **must be** NULL

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03789
  If type **is** VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, the geometryType member of elements of either pGeometries or ppGeometries **must be** VK_GEOMETRY_TYPE_INSTANCES_KHR

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03790
  If type **is** VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, geometryCount **must be** 1

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03791
  If type **is** VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR the geometryType member of elements of either pGeometries or ppGeometries **must not** be VK_GEOMETRY_TYPE_INSTANCES_KHR

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03792
  If type **is** VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR then the geometryType member of each geometry in either pGeometries or ppGeometries **must be** the same

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03793
  If type **is** VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR then geometryCount **must be** less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxGeometryCount

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03794
  If type **is** VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR and the geometryType member of either pGeometries or ppGeometries is VK_GEOMETRY_TYPE_AABBS_KHR, the total number of AABBs in all geometries **must be** less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03795
  If type **is** VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR and the geometryType member of either pGeometries or ppGeometries is VK_GEOMETRY_TYPE_TRIANGLES_KHR, the total number of triangles in all geometries **must be** less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-03796
  If flags **has** the VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR bit set, then it **must not** have the VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR bit set
Valid Usage (Implicit)

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_GEOMETRY_INFO_KHR`.

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-pNext-pNext**
  
  `pNext` **must** be `NULL`.

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-parameter**
  
  `type` **must** be a valid `VkAccelerationStructureTypeKHR` value.

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-parameter**
  
  `flags` **must** be a valid combination of `VkBuildAccelerationStructureFlagBitsKHR` values.

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-parameter**
  
  If `geometryCount` is not 0, and `pGeometries` is not `NULL`, `pGeometries` **must** be a valid pointer to an array of `geometryCount` valid `VkAccelerationStructureGeometryKHR` structures.

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-ppGeometries-parameter**
  
  If `geometryCount` is not 0, and `ppGeometries` is not `NULL`, `ppGeometries` **must** be a valid pointer to an array of `geometryCount` valid pointers to valid `VkAccelerationStructureGeometryKHR` structures.

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-commonparent**
  
  Both of `dstAccelerationStructure`, and `srcAccelerationStructure` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`.

The `VkBuildAccelerationStructureModeKHR` enumeration is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureModeKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR = 0,
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR = 1,
} VkBuildAccelerationStructureModeKHR;
```

- **`VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`** specifies that the destination acceleration structure will be built using the specified geometries.

- **`VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`** specifies that the destination acceleration structure will be built using data in a source acceleration structure, updated by the specified geometries.

The `VkDeviceOrHostAddressKHR` union is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressKHR {
    VkDeviceAddress    deviceAddress;
    void*              hostAddress;
} VkDeviceOrHostAddressKHR;
```
• **deviceAddress** is a buffer device address as returned by the `vkGetBufferDeviceAddressKHR` command.

• **hostAddress** is a host memory address.

The **VkDeviceOrHostAddressConstKHR** union is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressConstKHR {
    VkDeviceAddress    deviceAddress;
    const void*        hostAddress;
} VkDeviceOrHostAddressConstKHR;
```

• **deviceAddress** is a buffer device address as returned by the `vkGetBufferDeviceAddressKHR` command.

• **hostAddress** is a const host memory address.

The **VkAccelerationStructureGeometryKHR** structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryKHR {
    VkStructureType                           sType;
    const void*                               pNext;
    VkGeometryTypeKHR                         geometryType;
    VkAccelerationStructureGeometryDataKHR    geometry;
    VkGeometryFlagsKHR                        flags;
} VkAccelerationStructureGeometryKHR;
```

• **sType** is the type of this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **geometryType** describes which type of geometry this `VkAccelerationStructureGeometryKHR` refers to.

• **geometry** is a `VkAccelerationStructureGeometryDataKHR` union describing the geometry data for the relevant geometry type.

• **flags** is a bitmask of `VkGeometryFlagBitsKHR` values describing additional properties of how the geometry should be built.
Valid Usage (Implicit)

- **VUID-VkAccelerationStructureGeometryKHR-sType-sType**
  
  *sType* must be **VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_KHR**

- **VUID-VkAccelerationStructureGeometryKHR-pNext-pNext**
  
  *pNext* must be **NULL**

- **VUID-VkAccelerationStructureGeometryKHR-geometryType-parameter**
  
  *geometryType* must be a valid **VkGeometryTypeKHR** value

- **VUID-VkAccelerationStructureGeometryKHR-triangles-parameter**
  
  If *geometryType* is **VK_GEOMETRY_TYPE_TRIANGLES_KHR**, the *triangles* member of *geometry* must be a valid **VkAccelerationStructureGeometryTrianglesDataKHR** structure

- **VUID-VkAccelerationStructureGeometryKHR-aabbs-parameter**
  
  If *geometryType* is **VK_GEOMETRY_TYPE_AABBS_KHR**, the *aabbs* member of *geometry* must be a valid **VkAccelerationStructureGeometryAabbsDataKHR** structure

- **VUID-VkAccelerationStructureGeometry_KHR-instances-parameter**
  
  If *geometryType* is **VK_GEOMETRY_TYPE_INSTANCES_KHR**, the *instances* member of *geometry* must be a valid **VkAccelerationStructureGeometryInstancesDataKHR** structure

- **VUID-VkAccelerationStructureGeometry_KHR-flags-parameter**
  
  *flags* must be a valid combination of **VkGeometryFlagBitsKHR** values

The **VkAccelerationStructureGeometryDataKHR** union is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef union VkAccelerationStructureGeometryDataKHR {
    VkAccelerationStructureGeometryTrianglesDataKHR    triangles;
    VkAccelerationStructureGeometryAabbsDataKHR        aabbs;
    VkAccelerationStructureGeometryInstancesDataKHR    instances;
} VkAccelerationStructureGeometryDataKHR;
```

- **triangles** is a **VkAccelerationStructureGeometryTrianglesDataKHR** structure.
- **aabbs** is a **VkAccelerationStructureGeometryAabbsDataKHR** structure.
- **instances** is a **VkAccelerationStructureGeometryInstancesDataKHR** structure.

The **VkAccelerationStructureGeometryTrianglesDataKHR** structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryTrianglesDataKHR {
    VkStructureType                  sType;
    const void*                      pNext;
    VkFormat                         vertexFormat;
    VkDeviceOrHostAddressConstKHR    vertexData;
    VkDeviceSize                     vertexStride;
    uint32_t                         maxVertex;
    VkIndexType                      indexType;
    VkDeviceOrHostAddressConstKHR    indexData;
    VkDeviceOrHostAddressConstKHR    transformData;
} VkAccelerationStructureGeometryTrianglesDataKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexFormat` is the `VkFormat` of each vertex element.
- `vertexData` is a device or host address to memory containing vertex data for this geometry.
- `maxVertex` is the highest index of a vertex that will be addressed by a build command using this structure.
- `vertexStride` is the stride in bytes between each vertex.
- `indexType` is the `VkIndexType` of each index element.
- `indexData` is a device or host address to memory containing index data for this geometry.
- `transformData` is a device or host address to memory containing an optional reference to a `VkTransformMatrixKHR` structure defining a transformation that should be applied to vertices in this geometry.

**Note**
Unlike the stride for vertex buffers in `VkVertexInputBindingDescription` for graphics pipelines which must not exceed `maxVertexInputBindingStride`, `vertexStride` for acceleration structure geometry is instead restricted to being a 32-bit value.
Valid Usage

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03735
  vertexStride must be a multiple of the size in bytes of the smallest component of vertexFormat

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03819
  vertexStride must be less than or equal to $2^{32} - 1$

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-03797
  vertexFormat must support the VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR in VkFormatProperties::bufferFeatures as returned by vkGetPhysicalDeviceFormatProperties2

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-03798
  indexType must be VK_INDEX_TYPE_UINT16, VK_INDEX_TYPE_UINT32, or VK_INDEX_TYPE_NONE_KHR

Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_TRIANGLES_DATA_KHR

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-pNext-pNext
  pNext must be NULL

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-parameter
  vertexFormat must be a valid VkFormat value

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-parameter
  indexType must be a valid VkIndexType value

The VkTransformMatrixKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkTransformMatrixKHR {
    float matrix[3][4];
} VkTransformMatrixKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkTransformMatrixKHR VkTransformMatrixNV;
```

- matrix is a 3x4 row-major affine transformation matrix.
The `VkAccelerationStructureGeometryAabbsDataKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryAabbsDataKHR {
    VkStructureType                  sType;
    const void*                      pNext;
    VkDeviceOrHostAddressConstKHR    data;
    VkDeviceSize                     stride;
} VkAccelerationStructureGeometryAabbsDataKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `data` is a device or host address to memory containing `VkAabbPositionsKHR` structures containing position data for each axis-aligned bounding box in the geometry.
- `stride` is the stride in bytes between each entry in `data`. The stride must be a multiple of 8.

Valid Usage

- `VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03545` `stride` must be a multiple of 8
- `VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03820` `stride` must be less than or equal to \(2^{32}-1\)

Valid Usage (Implicit)

- `VUID-VkAccelerationStructureGeometryAabbsDataKHR-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_AABBS_DATA_KHR`
- `VUID-VkAccelerationStructureGeometryAabbsDataKHR-pNext-pNext` `pNext` must be `NULL`

The `VkAabbPositionsKHR` structure is defined as:
Provided by VK_KHR_acceleration_structure

typedef struct VkAabbPositionsKHR {
    float minX;
    float minY;
    float minZ;
    float maxX;
    float maxY;
    float maxZ;
} VkAabbPositionsKHR;

or the equivalent

Provided by VK_NV_ray_tracing

typedef VkAabbPositionsKHR VkAabbPositionsNV;

- minX is the x position of one opposing corner of a bounding box.
- minY is the y position of one opposing corner of a bounding box.
- minZ is the z position of one opposing corner of a bounding box.
- maxX is the x position of the other opposing corner of a bounding box.
- maxY is the y position of the other opposing corner of a bounding box.
- maxZ is the z position of the other opposing corner of a bounding box.

**Valid Usage**

- VUID-VkAabbPositionsKHR-minX-03546
  minX must be less than or equal to maxX

- VUID-VkAabbPositionsKHR-minY-03547
  minY must be less than or equal to maxY

- VUID-VkAabbPositionsKHR-minZ-03548
  minZ must be less than or equal to maxZ

The VkAccelerationStructureGeometryInstancesDataKHR structure is defined as:

Provided by VK_KHR_acceleration_structure

typedef struct VkAccelerationStructureGeometryInstancesDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 arrayOfPointers;
    VkDeviceOrHostAddressConstKHR data;
} VkAccelerationStructureGeometryInstancesDataKHR;

- sType is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **arrayOfPointers** specifies whether **data** is used as an array of addresses or just an array.

• **data** is either the address of an array of device or host addresses referencing individual **VkAccelerationStructureInstanceKHR** structures if **arrayOfPointers** is **VK_TRUE**, or the address of an array of **VkAccelerationStructureInstanceKHR** structures.

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureGeometryInstancesDataKHR-sType-sType**

  - **sType** must be **VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_INSTANCES_DATA_KHR**

- **VUID-VkAccelerationStructureGeometryInstancesDataKHR-pNext-pNext**

  - **pNext** must be **NULL**

**Acceleration structure instances** can be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location. Multiple instances can point to the same bottom level acceleration structure.

An acceleration structure instance is defined by the structure:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureInstanceKHR {
    VkTransformMatrixKHR        transform;
    uint32_t                    instanceCustomIndex:24;
    uint32_t                    mask:8;
    uint32_t                    instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t                    accelerationStructureReference;
} VkAccelerationStructureInstanceKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkAccelerationStructureInstanceKHR VkAccelerationStructureInstanceNV;
```

- **transform** is a **VkTransformMatrixKHR** structure describing a transformation to be applied to the acceleration structure.

- **instanceCustomIndex** is a 24-bit user-specified index value accessible to ray shaders in the **InstanceCustomIndexKHR** built-in.

- **mask** is an 8-bit visibility mask for the geometry. The instance may only be hit if **rayMask & instance.mask != 0**

- **instanceShaderBindingTableRecordOffset** is a 24-bit offset used in calculating the hit shader binding table index.
• **flags** is an 8-bit mask of **VkGeometryInstanceFlagBitsKHR** values to apply to this instance.

• **accelerationStructureReference** is either:
  ◦ a device address containing the value obtained from **vkGetAccelerationStructureDeviceAddressKHR** or **vkGetAccelerationStructureHandleNV** (used by device operations which reference acceleration structures) or,
  ◦ a **VkAccelerationStructureKHR** object (used by host operations which reference acceleration structures).

The C language spec does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

• **instanceCustomIndex** and **mask** occupy the same memory as if a single **uint32_t** was specified in their place
  ◦ **instanceCustomIndex** occupies the 24 least significant bits of that memory
  ◦ **mask** occupies the 8 most significant bits of that memory

• **instanceShaderBindingTableRecordOffset** and **flags** occupy the same memory as if a single **uint32_t** was specified in their place
  ◦ **instanceShaderBindingTableRecordOffset** occupies the 24 least significant bits of that memory
  ◦ **flags** occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values according to the correct bit pattern.

**Valid Usage (Implicit)**

• VUID-VkAccelerationStructureInstanceKHR-flags-parameter
  
  **flags** must be a valid combination of **VkGeometryInstanceFlagBitsKHR** values

Possible values of **flags** in the instance modifying the behavior of that instance are:
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryInstanceFlagBitsKHR {
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR = 0x00000002,
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR = 0x00000004,
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR = 0x00000008,
} VkGeometryInstanceFlagBitsKHR;

or the equivalent

// Provided by VK_NV_ray_tracing
typedef VkGeometryInstanceFlagBitsKHR VkGeometryInstanceFlagBitsNV;

• VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR disables face culling for this instance.

• VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR indicates that the front face of the triangle for culling purposes is the face that is counter clockwise in object space relative to the ray origin. Because the facing is determined in object space, an instance transform matrix does not change the winding, but a geometry transform does.

• VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR causes this instance to act as though VK_GEOMETRY_OPAQUE_BIT_KHR were specified on all geometries referenced by this instance. This behavior can be overridden by the SPIR-V NoOpaqueKHR ray flag.

• VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR causes this instance to act as though VK_GEOMETRY_OPAQUE_BIT_KHR were not specified on all geometries referenced by this instance. This behavior can be overridden by the SPIR-V OpaqueKHR ray flag.

VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR and VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR must not be used in the same flag.

// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkGeometryInstanceFlagsKHR;

or the equivalent
typedef VkGeometryInstanceFlagsKHR VkGeometryInstanceFlagsNV;

VkGeometryInstanceFlagsKHR is a bitmask type for setting a mask of zero or more VkGeometryInstanceFlagBitsKHR.

VkAccelerationStructureBuildRangeInfoKHR is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildRangeInfoKHR {
    uint32_t    primitiveCount;
    uint32_t    primitiveOffset;
    uint32_t    firstVertex;
    uint32_t    transformOffset;
} VkAccelerationStructureBuildRangeInfoKHR;
```

- **primitiveCount** defines the number of primitives for a corresponding acceleration structure geometry.
- **primitiveOffset** defines an offset in bytes into the memory where primitive data is defined.
- **firstVertex** is the index of the first vertex to build from for triangle geometry.
- **transformOffset** defines an offset in bytes into the memory where a transform matrix is defined.

The primitive count and primitive offset are interpreted differently depending on the VkGeometryTypeKHR used:

- For geometries of type VK_GEOMETRY_TYPE_TRIANGLES_KHR, **primitiveCount** is the number of triangles to be built, where each triangle is treated as 3 vertices.
  - If the geometry uses indices, **primitiveCount × 3** indices are consumed from VkAccelerationStructureGeometryTrianglesDataKHR::indexData, starting at an offset of **primitiveOffset**. The value of **firstVertex** is added to the index values before fetching vertices.
  - If the geometry does not use indices, **primitiveCount × 3** vertices are consumed from VkAccelerationStructureGeometryTrianglesDataKHR::vertexData, starting at an offset of **primitiveOffset + VkAccelerationStructureGeometryTrianglesDataKHR::vertexStride × firstVertex**.
  - A single VkTransformMatrixKHR structure is consumed from VkAccelerationStructureGeometryTrianglesDataKHR::transformData, at an offset of **transformOffset**. This transformation matrix is used by all triangles.

- For geometries of type VK_GEOMETRY_TYPE_AABBS_KHR, **primitiveCount** is the number of axis-aligned bounding boxes. **primitiveCount × VkAabbPositionsKHR** structures are consumed from VkAccelerationStructureGeometryAabbsDataKHR::data, starting at an offset of **primitiveOffset**.

- For geometries of type VK_GEOMETRY_TYPE_INSTANCES_KHR, **primitiveCount** is the number of acceleration structures. **primitiveCount × VkAccelerationStructureInstanceKHR** structures are consumed from VkAccelerationStructureGeometryInstancesDataKHR::data, starting at an offset
Valid Usage

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03656
  For geometries of type VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the geometry uses indices, the offset primitiveOffset from VkAccelerationStructureGeometryTrianglesDataKHR::indexData must be a multiple of the element size of VkAccelerationStructureGeometryTrianglesDataKHR::indexType.

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03657
  For geometries of type VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the geometry does not use indices, the offset primitiveOffset from VkAccelerationStructureGeometryTrianglesDataKHR::vertexData must be a multiple of the component size of VkAccelerationStructureGeometryTrianglesDataKHR::vertexFormat.

- VUID-VkAccelerationStructureBuildRangeInfoKHR-transformOffset-03658
  For geometries of type VK_GEOMETRY_TYPE_TRIANGLES_KHR, the offset transformOffset from VkAccelerationStructureGeometryTrianglesDataKHR::transformData must be a multiple of 16.

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03659
  For geometries of type VK_GEOMETRY_TYPE_AABBS_KHR, the offset primitiveOffset from VkAccelerationStructureGeometryAabbsDataKHR::data must be a multiple of 8.

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03659
  For geometries of type VK_GEOMETRY_TYPE_INSTANCES_KHR, the offset primitiveOffset from VkAccelerationStructureGeometryInstancesDataKHR::data must be a multiple of 16.

36.1.7. Copying Acceleration Structures

An additional command exists for copying acceleration structures without updating their contents. The acceleration structure object can be compacted in order to improve performance. Before copying, an application must query the size of the resulting acceleration structure.

To query acceleration structure size parameters call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdWriteAccelerationStructuresPropertiesKHR(
    VkCommandBuffer commandBuffer,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureKHR* pAccelerationStructures,
    VkQueryType queryType,
    VkQueryPool queryPool,
    uint32_t firstQuery);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `accelerationStructureCount` is the count of acceleration structures for which to query the property.
- `pAccelerationStructures` is a pointer to an array of existing previously built acceleration structures.
- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
- `queryPool` is the query pool that will manage the results of the query.
- `firstQuery` is the first query index within the query pool that will contain the `accelerationStructureCount` number of results.

Accesses to any of the acceleration structures listed in `pAccelerationStructures` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`.

### Valid Usage

- **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02493**
  queryPool must have been created with a `queryType` matching `queryType`

- **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02494**
  The queries identified by `queryPool` and `firstQuery` must be unavailable

- **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-buffer-03736**
  The buffer used to create each acceleration structure in `pAccelerationStructures` must be bound to device memory

- **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-query-04880**
  The sum of `query` plus `accelerationStructureCount` must be less than or equal to the number of queries in `queryPool`

- **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructures-03431**
  All acceleration structures in `pAccelerationStructures` must have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`

- **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryType-03432**
  `queryType` must be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE.Serialization_SIZE_KHR`
Valid Usage (Implicit)

- **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parameter**
  - `pAccelerationStructures` must be a valid pointer to an array of `accelerationStructureCount` valid `VkAccelerationStructureKHR` handles

- **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryType-parameter**
  - `queryType` must be a valid `VkQueryType` value

- **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-parameter**
  - `queryPool` must be a valid `VkQueryPool` handle

- **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-renderpass**
  - This command must only be called outside of a render pass instance

- **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructureCount-arraylength**
  - `accelerationStructureCount` must be greater than 0

- **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commonparent**
  - Each of `commandBuffer`, `queryPool`, and the elements of `pAccelerationStructures` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary, Secondary</td>
<td>Outside</td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

To query acceleration structure size parameters call:
```c
void vkCmdWriteAccelerationStructuresPropertiesNV(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    accelerationStructureCount,
    const VkAccelerationStructureNV*           pAccelerationStructures,
    VkQueryType                                 queryType,
    VkQueryPool                                 queryPool,
    uint32_t                                    firstQuery);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `accelerationStructureCount` is the count of acceleration structures for which to query the property.
- `pAccelerationStructures` is a pointer to an array of existing previously built acceleration structures.
- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
- `queryPool` is the query pool that will manage the results of the query.
- `firstQuery` is the first query index within the query pool that will contain the `accelerationStructureCount` number of results.

Accesses to any of the acceleration structures listed in `pAccelerationStructures` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`.

**Valid Usage**

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-03755
  - `queryPool` must have been created with a `queryType` matching `queryType`

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-03756
  - The queries identified by `queryPool` and `firstQuery` must be unavailable

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-accelerationStructure-03757
  - `accelerationStructure` must be bound completely and contiguously to a single `VkDeviceMemory` object via `vkBindAccelerationStructureMemoryNV`

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-accelerationStructures-03431
  - All acceleration structures in `pAccelerationStructures` must have been built with
    - `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`
    - `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryType-03432
  - `queryType` must be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`
Valid Usage (Implicit)

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-pAccelerationStructures-parameter
  pAccelerationStructures must be a valid pointer to an array of accelerationStructureCount
  valid VkAccelerationStructureNV handles

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryType-parameter
  queryType must be a valid VkQueryType value

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-accelerationStructureCount-arraylength
  accelerationStructureCount must be greater than 0

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commonparent
  Each of commandBuffer, queryPool, and the elements of pAccelerationStructures must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>

</tbody>
</table>

To copy an acceleration structure call:
void vkCmdCopyAccelerationStructureNV(
    VkCommandBuffer commandBuffer, 
    VkAccelerationStructureNV dst, 
    VkAccelerationStructureNV src, 
    VkCopyAccelerationStructureModeKHR mode);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `dst` is the target acceleration structure for the copy.
- `src` is the source acceleration structure for the copy.
- `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

Accesses to `src` and `dst` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR` as appropriate.

---

**Valid Usage**

- VUID-vkCmdCopyAccelerationStructureNV-mode-03410
  mode must be `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR` or `VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR`

- VUID-vkCmdCopyAccelerationStructureNV-src-03411
  If mode is `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR`, `src` must have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR`

- VUID-vkCmdCopyAccelerationStructureNV-buffer-03718
  The buffer used to create `src` must be bound to device memory

- VUID-vkCmdCopyAccelerationStructureNV-buffer-03719
  The buffer used to create `dst` must be bound to device memory
Valid Usage (Implicit)

- **VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyAccelerationStructureNV-dst-parameter**
  
  `dst` must be a valid `VkAccelerationStructureNV` handle

- **VUID-vkCmdCopyAccelerationStructureNV-src-parameter**
  
  `src` must be a valid `VkAccelerationStructureNV` handle

- **VUID-vkCmdCopyAccelerationStructureNV-mode-parameter**
  
  `mode` must be a valid `VkCopyAccelerationStructureModeKHR` value

- **VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- **VUID-vkCmdCopyAccelerationStructureNV-renderpass**
  
  This command must only be called outside of a render pass instance

- **VUID-vkCmdCopyAccelerationStructureNV-commonparent**
  
  Each of `commandBuffer`, `dst`, and `src` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</table>

To copy an acceleration structure call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyAccelerationStructureKHR(
    VkCommandBuffer commandBuffer,
    const VkCopyAccelerationStructureInfoKHR* pInfo);
```
• `commandBuffer` is the command buffer into which the command will be recorded.

• `pInfo` is a pointer to a `VkCopyAccelerationStructureInfoKHR` structure defining the copy operation.

Accesses to `pInfo->src` and `pInfo->dst` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR` as appropriate.

### Valid Usage

- VUID-vkCmdCopyAccelerationStructureKHR-buffer-03737
  
  The buffer used to create `pInfo->src` must be bound to device memory

- VUID-vkCmdCopyAccelerationStructureKHR-buffer-03738
  
  The buffer used to create `pInfo->dst` must be bound to device memory

### Valid Usage (Implicit)

- VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyAccelerationStructureKHR-pInfo-parameter
  
  `pInfo` must be a valid pointer to a valid `VkCopyAccelerationStructureInfoKHR` structure

- VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdCopyAccelerationStructureKHR-renderpass
  
  This command must only be called outside of a render pass instance

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Compute</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkCopyAccelerationStructureInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyAccelerationStructureInfoKHR {
    VkStructureType                      sType;
    const void*                           pNext;
    VkAccelerationStructureKHR            src;
    VkAccelerationStructureKHR            dst;
    VkCopyAccelerationStructureModeKHR    mode;
} VkCopyAccelerationStructureInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source acceleration structure for the copy.
- `dst` is the target acceleration structure for the copy.
- `mode` is a `VkCopyAccelerationStructureModeKHR` value that specifies additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyAccelerationStructureInfoKHR-mode-03410**
  
  `mode` must be `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR` or `VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR`

- **VUID-VkCopyAccelerationStructureInfoKHR-src-03411**
  
  If `mode` is `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR`, `src` must have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR`

- **VUID-VkCopyAccelerationStructureInfoKHR-buffer-03718**
  
  The buffer used to create `src` must be bound to device memory

- **VUID-VkCopyAccelerationStructureInfoKHR-buffer-03719**
  
  The buffer used to create `dst` must be bound to device memory
Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_COPY ACCELERATION_STRUCTURE_INFO_KHR`
- **pNext** must be `NULL`
- **src** must be a valid `VkAccelerationStructureKHR` handle
- **dst** must be a valid `VkAccelerationStructureKHR` handle
- **mode** must be a valid `VkCopyAccelerationStructureModeKHR` value
- Both of **dst**, and **src** must have been created, allocated, or retrieved from the same **VkDevice**

Possible values of **mode** specifying additional operations to perform during the copy, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkCopyAccelerationStructureModeKHR {
    VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR = 0,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR = 1,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR = 2,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR = 3,
} VkCopyAccelerationStructureModeKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkCopyAccelerationStructureModeKHR VkCopyAccelerationStructureModeNV;
```

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR** creates a direct copy of the acceleration structure specified in **src** into the one specified by **dst**. The **dst** acceleration structure must have been created with the same parameters as **src**.
- **VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR** creates a more compact version of an acceleration structure **src** into **dst**. The acceleration structure **dst** must have been created with a size at least as large as that returned by `vkCmdWriteAccelerationStructuresPropertiesKHR` or
The corresponding handles matching the values returned by 

\texttt{vkGetAccelerationStructureDeviceAddressKHR} or \texttt{vkGetAccelerationStructureHandleNV} are tightly
packed in the buffer following the count. The application is expected to store a mapping between 
those handles and the original application-generated bottom-level acceleration structures to 
provide when deserializing. The serialized data is written to the buffer (or read from the buffer) 
according to the host endianness.

Valid Usage

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03739
  pInfo->dst.deviceAddress must be a valid device address for a buffer bound to device 
  memory.

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03740
  pInfo->dst.deviceAddress must be aligned to 256 bytes

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03741
  If the buffer pointed to by pInfo->dst.deviceAddress is non-sparse then it must be bound 
  completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-None-03559
  The buffer used to create pInfo->src must be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyAccelerationStructureToMemoryInfoKHR 
  structure

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-recording 
  commandBuffer must be in the recording state

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute 
  operations

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-renderpass
  This command must only be called outside of a render pass instance

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally 
  synchronized
## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Compute</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

---

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyAccelerationStructureToMemoryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR src;
    VkDeviceOrHostAddressKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyAccelerationStructureToMemoryInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **src** is the source acceleration structure for the copy.
- **dst** is the device or host address to memory which is the target for the copy.
- **mode** is a `VkCopyAccelerationStructureModeKHR` value that specifies additional operations to perform during the copy.

---

### Valid Usage

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-dst-03561**
  The memory pointed to by **dst** **must** be at least as large as the serialization size of **src**, as reported by `vkWriteAccelerationStructuresPropertiesKHR` or `vkCmdWriteAccelerationStructuresPropertiesKHR` with a query type of `VK_QUERY_TYPE_ACCELERATION_STRUCTURE.Serialization_SIZE_KHR`.

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-03412**
  **mode** **must** be `VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR`
Valid Usage (Implicit)

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_TO_MEMORY_INFO_KHR`

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-pNext-pNext**
  - `pNext` **must** be `NULL`

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-parameter**
  - `src` **must** be a valid `VkAccelerationStructureKHR` handle

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-parameter**
  - `mode` **must** be a valid `VkCopyAccelerationStructureModeKHR` value

To copy device memory to an acceleration structure call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyMemoryToAccelerationStructureKHR(
    VkCommandBuffer                             commandBuffer,
    const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

- `pInfo` is a pointer to a `VkCopyMemoryToAccelerationStructureInfoKHR` structure defining the copy operation.

Accesses to `pInfo->dst` **must** be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`. Accesses to the buffer indicated by `pInfo->src.deviceAddress` **must** be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_TRANSFER_READ_BIT`.

This command can accept acceleration structures produced by either `vkCmdCopyAccelerationStructureToMemoryKHR` or `vkCopyAccelerationStructureToMemoryKHR`.

The structure provided as input to deserialize is as described in `vkCmdCopyAccelerationStructureToMemoryKHR`, with any acceleration structure handles filled in with the newly-queried handles to bottom level acceleration structures created before deserialization. These do not need to be built at deserialize time, but **must** be created.
Valid Usage

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03742
  pInfo->src.deviceAddress must be a valid device address for a buffer bound to device memory.

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03743
  pInfo->src.deviceAddress must be aligned to 256 bytes

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03744
  If the buffer pointed to by pInfo->src.deviceAddress is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-buffer-03745
  The buffer used to create pInfo->dst must be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyMemoryToAccelerationStructureInfoKHR structure

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-renderpass
  This command must only be called outside of a render pass instance

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkCopyMemoryToAccelerationStructureInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyMemoryToAccelerationStructureInfoKHR {
    VkStructureType               sType;
    const void*                   pNext;
    VkDeviceOrHostAddressConstKHR src;
    VkAccelerationStructureKHR    dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyMemoryToAccelerationStructureInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the device or host address to memory containing the source data for the copy.
- `dst` is the target acceleration structure for the copy.
- `mode` is a `VkCopyAccelerationStructureModeKHR` value that specifies additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-03413**
  - `mode` must be `VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR`

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pInfo-03414**
  - The data in `src` must have a format compatible with the destination physical device as returned by `vkGetDeviceAccelerationStructureCompatibilityKHR`

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-03746**
  - `dst` must have been created with a size greater than or equal to that used to serialize the data in `src`
Valid Usage (Implicit)

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_COPY_MEMORY_TO_ACCELERATION_STRUCTURE_INFO_KHR`.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pNext-pNext**
  
  `pNext` must be `NULL`.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-parameter**
  
  `dst` must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-parameter**
  
  `mode` must be a valid `VkCopyAccelerationStructureModeKHR` value.

To check if a serialized acceleration structure is compatible with the current device call:

```c
// Provided by VK_KHR_acceleration_structure
void vkGetDeviceAccelerationStructureCompatibilityKHR(
    VkDevice                                    device,
    const VkAccelerationStructureVersionInfoKHR* pVersionInfo,
    VkAccelerationStructureCompatibilityKHR*    pCompatibility);
```

- **device** is the device to check the version against.

- **pVersionInfo** is a pointer to a `VkAccelerationStructureVersionInfoKHR` structure specifying version information to check against the device.

- **pCompatibility** is a pointer to a `VkAccelerationStructureCompatibilityKHR` value in which compatibility information is returned.

Valid Usage

- **VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-rayTracingPipeline-03661**
  
  The `rayTracingPipeline` or `rayQuery` feature must be enabled.

Valid Usage (Implicit)

- **VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-device-parameter**
  
  `device` must be a valid `VkDevice` handle.

- **VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pVersionInfo-parameter**
  
  `pVersionInfo` must be a valid pointer to a valid `VkAccelerationStructureVersionInfoKHR` structure.

- **VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pCompatibility-parameter**
  
  `pCompatibility` must be a valid pointer to a `VkAccelerationStructureCompatibilityKHR` value.
The `VkAccelerationStructureVersionInfoKHR` structure is defined as:

```c
typedef struct VkAccelerationStructureVersionInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    const uint8_t*     pVersionData;
} VkAccelerationStructureVersionInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pVersionData` is a pointer to the version header of an acceleration structure as defined in `vkCmdCopyAccelerationStructureToMemoryKHR`

**Note**

`pVersionData` is a pointer to an array of `2*VK_UUID_SIZE` uint8_t values instead of two `VK_UUID_SIZE` arrays as the expected use case for this member is to be pointed at the header of an previously serialized acceleration structure (via `vkCmdCopyAccelerationStructureToMemoryKHR` or `vkCopyAccelerationStructureToMemoryKHR`) that is loaded in memory. Using arrays would necessitate extra memory copies of the UUIDs.

**Valid Usage (Implicit)**

- **VUID-VkAccelerationStructureVersionInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_INFO_KHR`

- **VUID-VkAccelerationStructureVersionInfoKHR-pNext-pNext**
  
  `pNext` must be NULL

- **VUID-VkAccelerationStructureVersionInfoKHR-pVersionData-parameter**
  
  `pVersionData` must be a valid pointer to an array of `2*VK_UUID_SIZE` uint8_t values

Possible values of `pCompatibility` returned by `vkGetDeviceAccelerationStructureCompatibilityKHR` are:

```c
typedef enum VkAccelerationStructureCompatibilityKHR {
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR = 0,
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR = 1,
} VkAccelerationStructureCompatibilityKHR;
```

- `VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR` if the `pVersionData` version acceleration structure is compatible with device.
- `VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR` if the `pVersionData` version
acceleration structure is not compatible with device.

### 36.2. Host Acceleration Structure Operations

Implementations are also required to provide host implementations of the acceleration structure operations if the `accelerationStructureHostCommands` feature is enabled:

- `vkBuildAccelerationStructuresKHR` corresponding to `vkCmdBuildAccelerationStructuresKHR`
- `vkCopyAccelerationStructureKHR` corresponding to `vkCmdCopyAccelerationStructureKHR`
- `vkCopyAccelerationStructureToMemoryKHR` corresponding to `vkCmdCopyAccelerationStructureToMemoryKHR`
- `vkCopyMemoryToAccelerationStructureKHR` corresponding to `vkCmdCopyMemoryToAccelerationStructureKHR`
- `vkWriteAccelerationStructuresPropertiesKHR` corresponding to `vkCmdWriteAccelerationStructuresPropertiesKHR`

These commands are functionally equivalent to their device counterparts, except that they are executed on the host timeline, rather than being enqueued into command buffers.

All acceleration structures used by the host commands must be bound to host-visible memory, and all input data for acceleration structure builds must be referenced using host addresses instead of device addresses. Applications are not required to map acceleration structure memory when using the host commands.

**Note**

The `vkBuildAccelerationStructuresKHR` and `vkCmdBuildAccelerationStructuresKHR` may use different algorithms, and thus are not required to produce identical structures. The structures produced by these two commands may exhibit different memory footprints or traversal performance, but should strive to be similar where possible.

Apart from these details, the host and device operations are interchangable. For example, an application can use `vkBuildAccelerationStructuresKHR` to build a structure, compact it on the device using `vkCmdCopyAccelerationStructureKHR`, and serialize the result using `vkCopyAccelerationStructureToMemoryKHR`.

To build acceleration structures on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkBuildAccelerationStructuresKHR(
    VkDevice                                    device,
    VkDeferredOperationKHR                      deferredOperation,
    uint32_t                                    infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkAccelerationStructureBuildRangeInfoKHR*  const* ppBuildRangeInfos);
```
- device is the VkDevice for which the acceleration structures are being built.
- deferredOperation is an optional VkDeferredOperationKHR to request deferral for this command.
- infoCount is the number of acceleration structures to build. It specifies the number of the pInfo structures and ppBuildRangeInfos pointers that must be provided.
- pInfo is a pointer to an array of infoCount VkAccelerationStructureBuildGeometryInfoKHR structures defining the geometry used to build each acceleration structure.
- ppBuildRangeInfos is an array of infoCount pointers to arrays of VkAccelerationStructureBuildRangeInfoKHR structures. Each ppBuildRangeInfos[i] is an array of pInfo[i].geometryCount VkAccelerationStructureBuildRangeInfoKHR structures defining dynamic offsets to the addresses where geometry data is stored, as defined by pInfo[i].

This command fulfills the same task as vkCmdBuildAccelerationStructuresKHR but is executed by the host.

The vkBuildAccelerationStructuresKHR command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

**Note**

This means that an application cannot build a top-level acceleration structure in the same vkBuildAccelerationStructuresKHR call as the associated bottom-level or instance acceleration structures are being built. There also cannot be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.
Valid Usage

- VUID-vkBuildAccelerationStructuresKHR-mode-04628
  The `mode` member of each element of `pInfos` must be a valid `VkBuildAccelerationStructureModeKHR` value.

- VUID-vkBuildAccelerationStructuresKHR-srcAccelerationStructure-04629
  If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member must be a valid `VkAccelerationStructureKHR` handle.

- VUID-vkBuildAccelerationStructuresKHR-pInfos-04630
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must not be `VK_NULL_HANDLE`.

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03403
  The `srcAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03698
  The `dstAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03800
  The `dstAccelerationStructure` member of any element of `pInfos` must be a valid `VkAccelerationStructureKHR` handle.

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03699
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03700
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03663
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, inactive primitives in its `srcAccelerationStructure` member must not be made active.

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03664
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, active primitives in its `srcAccelerationStructure` member must not be made inactive.
The `dstAccelerationStructure` member of any element of `pInfos` must not be referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `srcAccelerationStructure` member of any other element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, which is accessed by this command.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `srcAccelerationStructure` member of any element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` (including the same element), which is accessed by this command.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must have been built before with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` set in `VkAccelerationStructureBuildGeometryInfoKHR::flags`.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` and `dstAccelerationStructure` members must either be the same `VkAccelerationStructureKHR`, or not have any memory aliasing.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `geometryCount` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `flags` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `type` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `geometryType` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `flags` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.vertexFormat` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.maxVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.indexType` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.
For each element of \texttt{pInfos}, if its \texttt{mode} member is \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, then for each \texttt{VkAccelerationStructureGeometryKHR} structure referred to by its \texttt{pGeometries} or \texttt{ppGeometries} members, if \texttt{geometryType} is \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, if its \texttt{geometry.triangles.transformData} member was NULL when \texttt{srcAccelerationStructure} was last built, then it must be NULL.

For each element of \texttt{pInfos}, if its \texttt{mode} member is \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, then for each \texttt{VkAccelerationStructureGeometryKHR} structure referred to by its \texttt{pGeometries} or \texttt{ppGeometries} members, if \texttt{geometryType} is \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, if its \texttt{geometry.triangles.transformData} member was not NULL when \texttt{srcAccelerationStructure} was last built, then it may not be NULL.

For each element of \texttt{pInfos}, if its \texttt{mode} member is \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, then for each \texttt{VkAccelerationStructureGeometryKHR} structure referred to by its \texttt{pGeometries} or \texttt{ppGeometries} members, if \texttt{geometryType} is \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, and \texttt{geometry.triangles.indexType} is not \texttt{VK_INDEX_TYPE_NONE_KHR}, then the value of each index referenced must be the same as the corresponding index value when \texttt{srcAccelerationStructure} was last built.

For each \texttt{VkAccelerationStructureBuildRangeInfoKHR} referenced by this command, its \texttt{primitiveCount} member must have the same value which was specified when \texttt{srcAccelerationStructure} was last built.

For each \texttt{VkAccelerationStructureBuildRangeInfoKHR} referenced by this command, if the corresponding geometry uses indices, its \texttt{firstVertex} member must have the same value which was specified when \texttt{srcAccelerationStructure} was last built.

For each element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK_GEOMETRY_TYPE_INSTANCES_KHR}, the corresponding \texttt{ppBuildRangeInfos[i][j].primitiveCount} must be less than or equal to \texttt{VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount}.

For each \texttt{pInfos[i]}, \texttt{dstAccelerationStructure} must have been created with a value of \texttt{VkAccelerationStructureCreateInfoKHR::size} greater than or equal to the memory size required by the build operation, as returned by \texttt{vkGetAccelerationStructureBuildSizesKHR} with \texttt{pBuildInfo = pInfos[i]} and with each element of the \texttt{pMaxPrimitiveCounts} array greater than or equal to the equivalent \texttt{ppBuildRangeInfos[i][j].primitiveCount} values for \texttt{j} in \texttt{[0, pInfos[i].geometryCount)}.

Each element of \texttt{ppBuildRangeInfos[i]} must be a valid pointer to an array of \texttt{pInfos[i].geometryCount} \texttt{VkAccelerationStructureBuildRangeInfoKHR} structures.
If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object.

Any previous deferred operation that was associated with `deferredOperation` must be complete.

For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member must be bound to host-visible device memory.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, the buffer used to create its `srcAccelerationStructure` member must be bound to host-visible device memory.

For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` must be bound to host-visible device memory.

The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature must be enabled.

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` must be valid host memory, where `N` is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` must be valid host memory, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.hostAddress` must be a valid host address.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.hostAddress` must be a valid host address.
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.hostAddress` is not 0, it **must** be a valid host address.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.hostAddress` **must** be a valid host address.

For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member **must** be bound to memory that was not allocated with multiple instances.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member **must** be bound to memory that was not allocated with multiple instances.

For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` **must** be bound to memory that was not allocated with multiple instances.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `geometry.instances.data.hostAddress` **must** be a valid `VkAccelerationStructureKHR` object.
Valid Usage (Implicit)

- **VUID-vkBuildAccelerationStructuresKHR-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkBuildAccelerationStructuresKHR-deferredOperation-parameter**
  - If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-parameter**
  - `pInfos` must be a valid pointer to an array of `infoCount` valid `VkAccelerationStructureBuildGeometryInfoKHR` structures

- **VUID-vkBuildAccelerationStructuresKHR-ppBuildRangeInfos-parameter**
  - `ppBuildRangeInfos` must be a valid pointer to an array of `infoCount` `VkAccelerationStructureBuildRangeInfoKHR` structures

- **VUID-vkBuildAccelerationStructuresKHR-infoCount-arraylength**
  - `infoCount` must be greater than 0

- **VUID-vkBuildAccelerationStructuresKHR-deferredOperation-parent**
  - If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`

Return Codes

**Success**

- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To copy or compact an acceleration structure on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureKHR(  
  VkDevice                                    device,  
  VkDeferredOperationKHR                      deferredOperation,  
  const VkCopyAccelerationStructureInfoKHR*   pInfo);
```

- `device` is the device which owns the acceleration structures.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
• pInfo is a pointer to a VkCopyAccelerationStructureInfoKHR structure defining the copy operation.

This command fulfills the same task as vkCmdCopyAccelerationStructureKHR but is executed by the host.

Valid Usage

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-03677
  If deferredOperation is not VK_NULL_HANDLE, it must be a valid VkDeferredOperationKHR object

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-03678
  Any previous deferred operation that was associated with deferredOperation must be complete

• VUID-vkCopyAccelerationStructureKHR-buffer-03727
  The buffer used to create pInfo->src must be bound to host-visible device memory

• VUID-vkCopyAccelerationStructureKHR-buffer-03728
  The buffer used to create pInfo->dst must be bound to host-visible device memory

• VUID-vkCopyAccelerationStructureKHR-accelerationStructureHostCommands-03582
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands feature must be enabled

• VUID-vkCopyAccelerationStructureKHR-buffer-03780
  The buffer used to create pInfo->src must be bound to memory that was not allocated with multiple instances

• VUID-vkCopyAccelerationStructureKHR-buffer-03781
  The buffer used to create pInfo->dst must be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

• VUID-vkCopyAccelerationStructureKHR-device-parameter
  device must be a valid VkDevice handle

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

• VUID-vkCopyAccelerationStructureKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyAccelerationStructureInfoKHR structure

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device
Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy host accessible memory to an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyMemoryToAccelerationStructureKHR(
    VkDevice                                    device,
    VkDeferredOperationKHR                      deferredOperation,
    const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);
```

- `device` is the device which owns `pInfo->dst`.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `pInfo` is a pointer to a `VkCopyMemoryToAccelerationStructureInfoKHR` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMemoryToAccelerationStructureKHR` but is executed by the host.

This command can accept acceleration structures produced by either `vkCmdCopyAccelerationStructureToMemoryKHR` or `vkCopyAccelerationStructureToMemoryKHR`. 
Valid Usage

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-03677
  If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid
  `VkDeferredOperationKHR` object

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` must be complete

- VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03729
  `pInfo->src.hostAddress` must be a valid host pointer

- VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03750
  `pInfo->src.hostAddress` must be aligned to 16 bytes

- VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03730
  The buffer used to create `pInfo->dst` must be bound to host-visible device memory

- VUID-vkCopyMemoryToAccelerationStructureKHR-accelerationStructureHostCommands-03583
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR`::`accelerationStructureHostCommands` feature must be enabled

- VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03782
  The buffer used to create `pInfo->dst` must be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkCopyMemoryToAccelerationStructureKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parameter
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle

- VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkCopyMemoryToAccelerationStructureInfoKHR` structure

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parent
  If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`
To copy an acceleration structure to host accessible memory, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureToMemoryKHR(
    VkDevice                                    device,
    VkDeferredOperationKHR                      deferredOperation,
    const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

- **device** is the device which owns `pInfo->src`.
- **deferredOperation** is an optional `VkDeferredOperationKHR` to request deferral for this command.
- **pInfo** is a pointer to a `VkCopyAccelerationStructureToMemoryInfoKHR` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyAccelerationStructureToMemoryKHR` but is executed by the host.

This command produces the same results as `vkCmdCopyAccelerationStructureToMemoryKHR`, but writes its result directly to a host pointer, and is executed on the host rather than the device. The output may not necessarily be bit-for-bit identical, but it can be equally used by either `vkCmdCopyMemoryToAccelerationStructureKHR` or `vkCopyMemoryToAccelerationStructureKHR`.

---

**Return Codes**

**Success**
- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
Valid Usage

- VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-03677
  If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object.

- VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` must be complete.

- VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03731
  The buffer used to create `pInfo->src` must be bound to host-visible device memory.

- VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03732
  `pInfo->dst.hostAddress` must be a valid host pointer.

- VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03751
  `pInfo->dst.hostAddress` must be aligned to 16 bytes.

- VUID-vkCopyAccelerationStructureToMemoryKHR-accelerationStructureHostCommands-03584
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature must be enabled.

- VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03783
  The buffer used to create `pInfo->src` must be bound to memory that was not allocated with multiple instances.

Valid Usage (Implicit)

- VUID-vkCopyAccelerationStructureToMemoryKHR-device-parameter
  `device` must be a valid `VkDevice` handle.

- VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-parameter
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle.

- VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkCopyAccelerationStructureToMemoryInfoKHR` structure.

- VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-parent
  If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`.

Chapter 36. Acceleration Structures | 1927
Return Codes

**Success**
- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query acceleration structure size parameters on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkWriteAccelerationStructuresPropertiesKHR(
    VkDevice device,                     // Device which owns the acceleration structures in pAccelerationStructures.
    uint32_t accelerationStructureCount, // Count of acceleration structures for which to query the property.
    const VkAccelerationStructureKHR* pAccelerationStructures, // Pointer to an array of existing previously built acceleration structures.
    VkQueryType queryType,               // Query type.
    size_t dataSize,                     // Size in bytes of the buffer pointed to by pData.
    void* pData,                         // Pointer to a user-allocated buffer where the results will be written.
    size_t stride)                       //Stride in bytes between results for individual queries within pData.
);
```

- `device` is the device which owns the acceleration structures in `pAccelerationStructures`.
- `accelerationStructureCount` is the count of acceleration structures for which to query the property.
- `pAccelerationStructures` is a pointer to an array of existing previously built acceleration structures.
- `queryType` is a `VkQueryType` value specifying the property to be queried.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to a user-allocated buffer where the results will be written.
- `stride` is the stride in bytes between results for individual queries within `pData`.

This command fulfills the same task as `vkCmdWriteAccelerationStructuresPropertiesKHR` but is executed by the host.
Valid Usage

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructures-03431**
  All acceleration structures in \texttt{pAccelerationStructures} must have been built with \texttt{VK_BUILD ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR} if \texttt{queryType} is \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR}.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03432**
  \texttt{queryType} must be \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR} or \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR}.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03448**
  If \texttt{queryType} is \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR}, then \texttt{stride} must be a multiple of the size of \texttt{VkDeviceSize}.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03449**
  If \texttt{queryType} is \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR}, then \texttt{data} must point to a \texttt{VkDeviceSize}.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03450**
  If \texttt{queryType} is \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR}, then \texttt{stride} must be a multiple of the size of \texttt{VkDeviceSize}.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03451**
  If \texttt{queryType} is \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR}, then \texttt{data} must point to a \texttt{VkDeviceSize}.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-dataSize-03452**
  \texttt{dataSize} must be greater than or equal to \texttt{accelerationStructureCount*stride}.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-buffer-03733**
  The buffer used to create each acceleration structure in \texttt{pAccelerationStructures} must be bound to host-visible device memory.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructureHostCommands-03585**
  The \texttt{VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands} feature must be enabled.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-buffer-03784**
  The buffer used to create each acceleration structure in \texttt{pAccelerationStructures} must be bound to memory that was not allocated with multiple instances.
Valid Usage (Implicit)

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-device-parameter**
  
  device must be a valid VkDevice handle

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parameter**

  pAccelerationStructures must be a valid pointer to an array of accelerationStructureCount valid VkAccelerationStructureKHR handles

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-parameter**

  queryType must be a valid VkQueryType value

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-pData-parameter**

  pData must be a valid pointer to an array of dataSize bytes

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructureCount-arraylength**

  accelerationStructureCount must be greater than 0

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-dataSize-arraylength**

  dataSize must be greater than 0

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parent**

  Each element of pAccelerationStructures must have been created, allocated, or retrieved from device

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
Chapter 37. Ray Traversal

Ray traversal is the process which handles intersections between a traced ray and geometry in an acceleration structure.

Ray traversal cannot be started by a Vulkan API command directly - a shader must execute `OpRayQueryProceedKHR` or `OpTraceRayKHR`. When the `rayTracingPipeline` feature is enabled, `OpTraceRayKHR` can be used for ray tracing in a ray tracing pipeline. When the `rayQuery` feature is enabled, `OpRayQueryProceedKHR` can be used in any shader stage.

37.1. Ray Intersection Candidate Determination

Once tracing begins, rays will be tested against geometries in an acceleration structure to determine if a hit occurred between them, initially based only on their geometric properties (i.e. their vertices). The implementation performs similar operations to that of rasterization, but with the effective viewport determined by the parameters of the ray, and the geometry transformed into a space determined by that viewport.

The acceleration structure space coordinates of each primitive are transformed according to the origin and direction of the ray as follows:

\[
\begin{pmatrix}
  x_r \\
  y_r \\
  z_r 
\end{pmatrix} = \begin{pmatrix}
  a_x^2(1-c) + c & a_ya_z(1-c) - sa_z & a_ya_z(1-c) + sa_y \\
  a_xa_y(1-c) - sa_y & a_y^2(1-c) + c & a_ya_z(1-c) - sa_x \\
  a_xa_z(1-c) + sa_x & a_ya_z(1-c) - sa_y & a_z^2(1-c) + c
\end{pmatrix} \begin{pmatrix}
  x_{as} - o_x \\
  y_{as} - o_y \\
  z_{as} - o_z
\end{pmatrix}
\]

\(a\) is the axis of rotation from the unnormalized ray direction vector \(d\) to the axis vector \(k\):

\[
a = \begin{pmatrix}
  d \times k \\
  ||d \times k|| \\
  0 \\
  1 \\
\end{pmatrix}
\]

if \(||d \times k|| \neq 0\)

\[
a = \begin{pmatrix}
  0 \\
  0 \\
  -1
\end{pmatrix}
\]

if \(||d \times k|| = 0\)

\(s\) and \(c\) are the sine and cosine of the angle of rotation about \(a\) from \(d\) to \(k\):

\[
c = \frac{d \cdot k}{||d||}
\]

\[
s = \sqrt{1 - c^2}
\]

\(k\) is the unit vector:

\[
k = \begin{pmatrix}
  0 \\
  0 \\
  -1
\end{pmatrix}
\]

\(o\) and \(d\) are the ray origin and unnormalized direction, respectively; the vector described by \(x_{as}, y_{as}\), and \(z_{as}\) is any position in acceleration structure space; and the vector described by \(x_r, y_r,\) and \(z_r\) is the same position in ray space.

An intersection candidate is a unique point of intersection between a ray and a geometric primitive. For any primitive that has within its bounds a position \(xyz_{as}\) such that
Triangle primitive bounds consist of all points on the plane formed by the three vertices and within the bounds of the edges between the vertices, subject to the watertightness constraints below. AABB primitive bounds consist of all points within an implementation-defined bound which includes the specified box.

Note

The bounds of the AABB including all points internal to the bound implies that a ray started within the AABB will hit that AABB.

The determination of this condition is performed in an implementation specific manner, and may be performed with floating point operations. Due to the complexity and number of operations involved, inaccuracies are expected, particularly as the scale of values involved begins to diverge. Implementations should take efforts to maintain as much precision as possible.

Note

One very common case is when geometries are close to each other at some distance from the origin in acceleration structure space, where an effect similar to “z-fighting” is likely to be observed. Applications can mitigate this by ensuring their detailed geometries remain close to the origin.

Another likely case is when the origin of a ray is set to a position on a previously intersected surface, and its \( t_{\text{min}} \) is zero or near zero; an intersection may be detected on the emitting surface. This case can usually be mitigated by offsetting \( t_{\text{min}} \) slightly.

In the case of AABB geometries, implementations may increase their size in an acceleration structure in order to mitigate precision issues. This may result in false positives being reported to the application.

For triangle intersection candidates, the \( b \) and \( c \) barycentric coordinates on the triangle where the above condition is met are made available to future shading. If the ray was traced with \texttt{OpTraceRayKHR}, these values are available as a vector of 2 32-bit floating point values in the \texttt{HitAttributeKHR} storage class.

\[
\begin{align*}
x_r &= 0 \\
y_r &= 0 \\
t_{\text{min}} &\leq \frac{z_r}{\|d\|} \leq t_{\text{max}}
\end{align*}
\]
Once an intersection candidate is determined, it proceeds through the following operations, in order:

1. Ray Intersection Culling
2. Ray Intersection Confirmation
3. Ray Closest Hit Determination
4. Ray Result Determination

The sections below describe the exact details of these tests. There is no ordering guarantee between operations performed on different intersection candidates.

### 37.1.1. Watertightness

For a set of triangles with identical transforms, within a single instance:

- Any set of two or more triangles where all triangles have one vertex with an identical position value, that vertex is a *shared vertex*.
- Any set of two triangles with two shared vertices that were specified in the same *winding order* in each triangle have a *shared edge* defined by those vertices.

A *closed fan* is a set of three or more triangles where:

- All triangles in the set have the same shared vertex as one of their vertices.
- All edges that include the above vertex are shared edges.
- All above shared edges are shared by exactly two triangles from the set.
- No two triangles in the set intersect, except at shared edges.
- Every triangle in the set is joined to every other triangle in the set by a series of the above shared edges.

Implementations should not double-hit or miss when a ray intersects a shared edge, or a shared vertex of a closed fan.

### 37.2. Ray Intersection Culling

Candidate intersections go through several phases of culling before confirmation as an actual hit. There is no particular ordering dependency between the different culling operations.

#### 37.2.1. Ray Primitive Culling

If the `rayTraversalPrimitiveCulling` or `rayQuery` features are enabled, the `SkipTrianglesKHR` and `SkipAABBsKHR` ray flags can be specified when tracing a ray.

If `SkipTrianglesKHR` was included in the `Ray Flags` operand of the ray trace instruction, and the intersection is with a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs. If `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR` was included in the pipeline, traversal with `OpTraceRayKHR` calls will all behave as if `SkipTrianglesKHR` was included in
its Ray Flags operand.

If SkipAABBsKHR was included in the Ray Flags operand of the ray trace instruction, and the intersection is with an AABB primitive, the intersection is dropped, and no further processing of this intersection occurs. If VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR was included in the pipeline, traversal with OpTraceRayKHR calls will all behave as if SkipAABBsKHR was included in its Ray Flags operand.

37.2.2. Ray Mask Culling

Instances can be made invisible to particular rays based on the value of VkAccelerationStructureInstanceKHR::mask used to add that instance to a top-level acceleration structure, and the Cull Mask parameter used to trace the ray.

For the instance which is intersected, if mask & Cull Mask == 0, the intersection is dropped, and no further processing occurs.

37.2.3. Ray Face Culling

As in polygon rasterization, one of the stages of ray traversal is to determine if a triangle primitive is back- or front-facing, and primitives can be culled based on that facing.

If the intersection candidate is with an AABB primitive, this operation is skipped.

**Determination**

When a ray intersects a triangle primitive, the order that vertices are specified for the polygon affects whether the ray intersects the front or back face. Front or back facing is determined in the same way as they are for rasterization, based on the sign of the polygon’s area but using the ray space coordinates instead of framebuffer coordinates. One way to compute this area is:

\[
    a = -\frac{1}{2} \sum_{i=0}^{n-1} x_iy_{i+1} - x_{i+1}y_i
\]

where \( x_i \) and \( y_i \) are the x and y ray space coordinates of the ith vertex of the n-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and i ⊕ 1 is (i + 1) mod n.

If VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR is included in VkAccelerationStructureInstanceKHR::flags for the instance containing the intersected triangle, if a is positive then the intersection is with the front face of the triangle, otherwise it is with the back face. If VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR was not included, this determination is reversed. Additionally, if a is 0, the intersection candidate is treated as not intersecting with any face, irrespective of the sign.

If the ray was traced with OpTraceRayKHR, the HitKindKHR built-in is set to HitKindFrontFacingTriangleKHR if the intersection is with front-facing geometry, and HitKindBackFacingTriangleKHR if the intersection is with back-facing geometry, for shader stages considering this intersection.

If the ray was traced with OpRayQueryProceedKHR, OpRayQueryGetIntersectionFrontFaceKHR will return
true for intersection candidates with front faces, or false for back faces.

**Culling**

If `CullBackFacingTrianglesKHR` was included in the `Ray Flags` parameter of the ray trace instruction, and the intersection is determined as with the back face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

If `CullFrontFacingTrianglesKHR` was included in the `Ray Flags` parameter of the ray trace instruction, and the intersection is determined as with the front face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

This culling is disabled if `VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR` was included in `VkAccelerationStructureInstanceKHR::flags` for the instance which the intersected geometry belongs to.

Intersection candidates that have not intersected with any face (`a == 0`) are unconditionally culled, irrespective of ray flags and geometry instance flags.

### 37.2.4. Ray Opacity Culling

Each geometry in the acceleration structure may be considered either opaque or not. Opaque geometries continue through traversal as normal, whereas non-opaque geometries need to be either confirmed or discarded by shader code. Intersection candidates can also be culled based on their opacity.

**Determination**

Each individual intersection candidate is initially determined as opaque if `VK_GEOMETRY_OPAQUE_BIT_KHR` was included in the `VkAccelerationStructureGeometryKHR::flags` when the geometry it intersected with was built, otherwise it is considered non-opaque.

If the intersection candidate was generated by an intersection shader, the intersection is initially considered to have opacity matching the AABB candidate that it was generated from.

However, this opacity can be overridden when it is built into an instance. Setting `VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR` in `VkAccelerationStructureInstanceKHR::flags` will force all geometries in the instance to be considered opaque. Similarly, setting `VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR` will force all geometries in the instance to be considered non-opaque.

This can again be overridden by including `OpaqueKHR` or `NoOpaqueKHR` in the `Ray Flags` parameter when tracing a ray. `OpaqueKHR` forces all geometries to behave as if they are opaque, regardless of their build parameters. Similarly, `NoOpaqueKHR` forces all geometries to behave as if they are non-opaque.

If the ray was traced with `OpRayQueryProceedKHR`, to determine the opacity of AABB intersection candidates, `OpRayQueryGetIntersectionCandidateAABBOpaqueKHR` can be used. This instruction will return `true` for opaque intersection candidates, and `false` for non-opaque intersection candidates.

**Culling**

If `CullOpaqueKHR` is included in the `Ray Flags` parameter when tracing a ray, an intersection with a
geometry that is considered opaque is dropped, and no further processing occurs.

If `CullNoOpaqueKHR` is included in the Ray Flags parameter when tracing a ray, an intersection with a geometry that is considered non-opaque is dropped, and no further processing occurs.

### 37.3. Ray Intersection Confirmation

Depending on the opacity of intersected geometry and whether it is a triangle or an AABB, candidate intersections are further processed to determine the eventual hit result. Candidates generated from AABB intersections run through the same confirmation process as triangle hits.

#### 37.3.1. AABB Intersection Candidates

For intersection candidates with an AABB geometry generated by Ray Intersection Candidate Determination, shader code is executed to determine whether any hits should be reported to the traversal infrastructure; no further processing of this intersection candidate occurs.

If the ray was traced with `OpTraceRayKHR`, an intersection shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. If this shader calls `OpReportIntersectionKHR`, a new intersection candidate is generated as described below. If the intersection shader is `VK_SHADER_UNUSED_KHR` (which is only allowed for a zero hit group) then no intersection is generated.

Each new candidate generated as a result of this processing is a generated intersection candidate that intersects the AABB geometry, with a t value equal to the Hit parameter of the `OpReportIntersectionKHR` instruction. The new generated candidate is then independently run through Ray Intersection Confirmation as a generated intersection.

If the ray was traced with `OpRayQueryProceedKHR`, control is returned to the shader which executed `OpRayQueryProceedKHR`, returning true. The resulting ray query has a candidate intersection type of `RayQueryCandidateIntersectionAABBKHR`. `OpRayQueryGenerateIntersectionKHR` can be called to commit a new intersection candidate with committed intersection type of `RayQueryCommittedIntersectionGeneratedKHR`. Further ray query processing can be continued by executing `OpRayQueryProceedKHR` with the same ray query, or intersection can be terminated with `OpRayQueryTerminateKHR`. Unlike rays traced with `OpTraceRayKHR`, candidates generated in this way skip generated intersection candidate confirmation; applications should make this determination before generating the intersection.

This operation may be executed multiple times for the same intersection candidate.

#### 37.3.2. Triangle and Generated Intersection Candidates

For triangle and generated intersection candidates, additional shader code may be executed based on the intersection’s opacity.

If the intersection is opaque, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

For non-opaque intersection candidates, shader code is executed to determine whether a hit
occurred or not.

If the ray was traced with \texttt{OpTraceRayKHR}, an \textit{any-hit shader} is invoked from the \textit{Shader Binding Table} according to the specified indexing. If this shader calls \texttt{OpIgnoreIntersectionKHR}, the candidate is dropped and no further processing of the candidate occurs. If the \textit{any-hit shader} identified is \texttt{VK_SHADER_UNUSED_KHR}, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

If the ray was traced with \texttt{OpRayQueryProceedKHR}, control is returned to the shader which executed \texttt{OpRayQueryProceedKHR}, returning \texttt{true}. As only triangle candidates participate in this operation with \textit{ray queries}, the resulting candidate intersection type is always \texttt{RayQueryCandidateIntersectionTriangleKHR}. \texttt{OpRayQueryConfirmIntersectionKHR} \textbf{can} be called on the \textit{ray query} to confirm the candidate as a hit with committed intersection type of \texttt{RayQueryCommittedIntersectionTriangleKHR}. Further ray query processing \textbf{can} be continued by executing \texttt{OpRayQueryProceedKHR} with the same \textit{ray query}, or intersection \textbf{can} be terminated with \texttt{OpRayQueryTerminateKHR}. If \texttt{OpRayQueryConfirmIntersectionKHR} has not been executed, the candidate is dropped and no further processing of the candidate occurs.

This operation \textbf{may} be executed multiple times for the same intersection candidate unless \texttt{VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR} was specified for the intersected geometry.

### 37.4. Ray Closest Hit Determination

Unless the ray was traced with the \texttt{TerminateOnFirstHitKHR} \textit{ray flag}, the implementation \textbf{must} track the closest confirmed hit until all geometries have been tested and either confirmed or dropped.

After an intersection candidate is confirmed, its \( t \) value is compared to \( t_{\text{max}} \) to determine which intersection is closer, where \( t \) is the parametric distance along the ray at which the intersection occurred.

- If \( t < t_{\text{max}} \), \( t_{\text{max}} \) is set to \( t \) and the candidate is set as the current closest hit.
- If \( t > t_{\text{max}} \), the candidate is dropped and no further processing of that candidate occurs.
- If \( t = t_{\text{max}} \), the candidate \textbf{may} be set as the current closest hit or dropped.

If \texttt{TerminateOnFirstHitKHR} was included in the \textit{Ray Flags} used to trace the ray, once the first hit is confirmed, the ray trace is terminated.

### 37.5. Ray Result Determination

Once all candidates have finished processing the prior stages, or if the ray is forcibly terminated, the final result of the ray trace is determined.

If a closest hit result was identified by \textit{Ray Closest Hit Determination}, a closest hit has occurred, otherwise the final result is a miss.

For rays traced with \texttt{OpTraceRayKHR}, if a closest hit result was identified, a \textit{closest hit shader} is invoked from the \textit{Shader Binding Table} according to the \textit{specified indexing} for the intersected geometry. Control returns to the shader that executed \texttt{OpTraceRayKHR} once this shader returns. This
shader is skipped if either the ray flags included `SkipClosestHitShaderKHR`, or if the closest hit shader identified is `VK_SHADER_UNUSED_KHR`.

For rays traced with `OpTraceRayKHR` where no hit result was identified, the miss shader identified by the Miss Index parameter of `OpTraceRayKHR` is invoked. Control returns to the shader that executed `OpTraceRayKHR` once this shader returns.

If the ray was traced with `OpRayQueryProceedKHR`, control is returned to the shader which executed `OpRayQueryProceedKHR`, returning false. If a closest hit was identified by Ray Closest Hit Determination, the ray query will now have a committed intersection type of `RayQueryCommittedIntersectionGeneratedKHR` or `RayQueryCommittedIntersectionTriangleKHR`. If no closest hit was identified, the committed intersection type will be `RayQueryCommittedIntersectionNoneKHR`.

No further processing of a ray query occurs after this result is determined.
Chapter 38. Ray Tracing

Ray tracing uses a separate rendering pipeline from both the graphics and compute pipelines (see Ray Tracing Pipeline).

![Ray Tracing Pipeline](image)

**Figure 26. Ray tracing pipeline execution**

**Caption**

Interaction between the different shader stages in the ray tracing pipeline

Within the ray tracing pipeline, `OpTraceRayKHR` can be called to perform a **ray traversal** that invokes the various ray tracing shader stages during its execution. The relationship between the ray tracing pipeline object and the geometries present in the acceleration structure traversed is passed into the ray tracing command in a `VkBuffer` object known as a **shader binding table**. `OpExecuteCallableKHR` can also be used in ray tracing pipelines to invoke a **callable shader**.

During execution, control alternates between scheduling and other operations. The scheduling functionality is implementation-specific and is responsible for workload execution. The shader stages are programmable. **Traversal**, which refers to the process of traversing acceleration structures to find potential intersections of rays with geometry, is fixed function.

The programmable portions of the pipeline are exposed in a single-ray programming model, with each invocation handling one ray at a time. Memory operations can be synchronized using standard memory barriers. The **Workgroup** scope and variables with a storage class of **Workgroup** must not be used in the ray tracing pipeline.

### 38.1. Shader Call Instructions

A **shader call** is an instruction which may cause execution to continue elsewhere by creating one or more invocations that execute a different shader stage.

The shader call instructions are:

- `OpTraceRayKHR` which may invoke intersection, any-hit, closest hit, or miss shaders,
- `OpReportIntersectionKHR` which may invoke any-hit shaders, and
- `OpExecuteCallableKHR` which will invoke a callable shader.
Trace ray instructions **can** be used recursively; invoked shaders **can** themselves execute trace ray instructions, to a maximum depth defined by the `maxRecursionDepth` or `maxRayRecursionDepth` limit.

Shaders directly invoked from the API always have a recursion depth of 0; each shader executed by a trace ray instruction has a recursion depth one higher than the recursion depth of the shader which invoked it. Applications **must** not invoke a shader with a recursion depth greater than the value of `maxRecursionDepth` or `maxPipelineRayRecursionDepth` specified in the pipeline.

An **invocation repack instruction** is a ray tracing shader call instruction where the implementation **may** change the set of invocations that are executing. When a repack instruction is encountered, the invocation is suspended and a new invocation begins and executes the instruction. After executing the repack instruction (which **may** result in other ray tracing shader stages executing) the new invocation ends and the original invocation is resumed, but it **may** be resumed in a different subgroup or at a different `SubgroupLocalInvocationId` within the same subgroup. When a subset of invocations in a subgroup execute the invocation repack instruction, those that do not execute it remain in the same subgroup at the same `SubgroupLocalInvocationId`.

The `OpTraceRayKHR`, `OpReportIntersectionKHR`, and `OpExecuteCallableKHR` instructions are invocation repack instructions.

When a ray tracing shader executes a dynamic instance of an invocation repack instruction which results in another ray tracing shader being invoked, their instructions are related by **shader-call-order**.

For ray tracing invocations that are **shader-call-related**:

- **memory operations** on `StorageBuffer`, `Image`, and `ShaderRecordBufferKHR` storage classes **can** be synchronized using the `ShaderCallKHR` scope.
- the `CallableDataKHR`, `IncomingCallableDataKHR`, `RayPayloadKHR`, `HitAttributeKHR`, and `IncomingRayPayloadKHR` storage classes are **system-synchronized** and no application availability and visibility operations are required.
- memory operations within a single invocation before and after the invocation repack instruction are ordered by **program-order** and do not require explicit synchronization.

### 38.2. Ray Tracing Commands

*Ray tracing commands* provoke work in the ray tracing pipeline. Ray tracing commands are recorded into a command buffer and when executed by a queue will produce work that executes according to the currently bound ray tracing pipeline. A ray tracing pipeline **must** be bound to a command buffer before any ray tracing commands are recorded in that command buffer.

To dispatch ray tracing use:
void vkCmdTraceRaysNV(
    VkCommandBuffer commandBuffer,
    VkBuffer raygenShaderBindingTableBuffer,  // Provided by VK_NV_ray_tracing
    VkDeviceSize raygenShaderBindingOffset,
    VkBuffer missShaderBindingTableBuffer,  // Provided by VK_NV_ray_tracing
    VkDeviceSize missShaderBindingOffset,
    VkDeviceSize missShaderBindingStride,
    VkBuffer hitShaderBindingTableBuffer,  // Provided by VK_NV_ray_tracing
    VkDeviceSize hitShaderBindingOffset,
    VkDeviceSize hitShaderBindingStride,
    VkBuffer callableShaderBindingTableBuffer,  // Provided by VK_NV_ray_tracing
    VkDeviceSize callableShaderBindingOffset,
    VkDeviceSize callableShaderBindingStride,
    uint32_t width,
    uint32_t height,
    uint32_t depth);

• **commandBuffer** is the command buffer into which the command will be recorded.

• **raygenShaderBindingTableBuffer** is the buffer object that holds the shader binding table data for the ray generation shader stage.

• **raygenShaderBindingOffset** is the offset in bytes (relative to **raygenShaderBindingTableBuffer**) of the ray generation shader being used for the trace.

• **missShaderBindingTableBuffer** is the buffer object that holds the shader binding table data for the miss shader stage.

• **missShaderBindingOffset** is the offset in bytes (relative to **missShaderBindingTableBuffer**) of the miss shader being used for the trace.

• **missShaderBindingStride** is the size in bytes of each shader binding table record in **missShaderBindingTableBuffer**.

• **hitShaderBindingTableBuffer** is the buffer object that holds the shader binding table data for the hit shader stages.

• **hitShaderBindingOffset** is the offset in bytes (relative to **hitShaderBindingTableBuffer**) of the hit shader group being used for the trace.

• **hitShaderBindingStride** is the size in bytes of each shader binding table record in **hitShaderBindingTableBuffer**.

• **callableShaderBindingTableBuffer** is the buffer object that holds the shader binding table data for the callable shader stage.

• **callableShaderBindingOffset** is the offset in bytes (relative to **callableShaderBindingTableBuffer**) of the callable shader being used for the trace.

• **callableShaderBindingStride** is the size in bytes of each shader binding table record in **callableShaderBindingTableBuffer**.

• **width** is the width of the ray trace query dimensions.

• **height** is height of the ray trace query dimensions.
• *depth* is depth of the ray trace query dimensions.

When the command is executed, a ray generation group of \( \text{width} \times \text{height} \times \text{depth} \) rays is assembled.
Valid Usage

- **VUID-vkCmdTraceRaysNV-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdTraceRaysNV-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdTraceRaysNV-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdTraceRaysNV-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdTraceRaysNV-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdTraceRaysNV-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdTraceRaysNV-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdTraceRaysNV-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdTraceRaysNV-None-02698**
  For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility
Compatibility

- **VUID-vkCmdTraceRaysNV-None-02699**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- **VUID-vkCmdTraceRaysNV-None-02700**
  A valid pipeline **must** be bound to the pipeline bind point used by this command.

- **VUID-vkCmdTraceRaysNV-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- **VUID-vkCmdTraceRaysNV-None-02859**
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdTraceRaysNV-None-02702**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdTraceRaysNV-None-02703**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdTraceRaysNV-None-02704**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdTraceRaysNV-None-02705**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysNV-None-02706**
  If the robust buffer access feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysNV-None-04115**
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the
Type of the Texel operand of that instruction must have at least as many components as the image view's format.

- VUID-vkCmdTraceRaysNV-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format.

- VUID-vkCmdTraceRaysNV-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdTraceRaysNV-SampledType-04471
  If a VkImageView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdTraceRaysNV-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit channel width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdTraceRaysNV-SampledType-04473
  If a VkBufferView with a VkFormat that has a channel width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdTraceRaysNV-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdTraceRaysNV-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdTraceRaysNV-None-03429
  Any shader group handle referenced by this call must have been queried from the currently bound ray tracing pipeline

- VUID-vkCmdTraceRaysNV-commandBuffer-04624
  commandBuffer must not be a protected command buffer

- VUID-vkCmdTraceRaysNV-maxRecursionDepth-03625
  This command must not cause a trace ray instruction to be executed from a shader invocation with a recursion depth greater than the value of maxRecursionDepth used to create the bound ray tracing pipeline

- VUID-vkCmdTraceRaysNV-raygenShaderBindingTableBuffer-04042
  If raygenShaderBindingTableBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdTraceRaysNV-raygenShaderBindingOffset-02455
  Any shader group handle referenced by this call must have been queried from the currently bound ray tracing pipeline.
raygenShaderBindingOffset must be less than the size of raygenShaderBindingTableBuffer

- VUID-vkCmdTraceRaysNV-raygenShaderBindingOffset-02456
  raygenShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment

- VUID-vkCmdTraceRaysNV-missShaderBindingTableBuffer-04043
  If missShaderBindingTableBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdTraceRaysNV-missShaderBindingOffset-02457
  missShaderBindingOffset must be less than the size of missShaderBindingTableBuffer

- VUID-vkCmdTraceRaysNV-missShaderBindingOffset-02458
  missShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment

- VUID-vkCmdTraceRaysNV-hitShaderBindingTableBuffer-04044
  If hitShaderBindingTableBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdTraceRaysNV-hitShaderBindingOffset-02459
  hitShaderBindingOffset must be less than the size of hitShaderBindingTableBuffer

- VUID-vkCmdTraceRaysNV-hitShaderBindingOffset-02460
  hitShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment

- VUID-vkCmdTraceRaysNV-callableShaderBindingTableBuffer-04045
  If callableShaderBindingTableBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdTraceRaysNV-callableShaderBindingOffset-02461
