Chapter 1. Preamble

Copyright 2014-2021 The Khronos Group Inc.

This Specification is protected by copyright laws and contains material proprietary to Khronos. Except as described by these terms, it or any components may not be reproduced, republished, distributed, transmitted, displayed, broadcast or otherwise exploited in any manner without the express prior written permission of Khronos. Khronos grants a conditional copyright license to use and reproduce the unmodified Specification for any purpose, without fee or royalty, EXCEPT no licenses to any patent, trademark or other intellectual property rights are granted under these terms.

Khronos makes no, and expressly disclaims any, representations or warranties, express or implied, regarding this Specification, including, without limitation: merchantability, fitness for a particular purpose, non-infringement of any intellectual property, correctness, accuracy, completeness, timeliness, and reliability. Under no circumstances will Khronos, or any of its Promoters, Contributors or Members, or their respective partners, officers, directors, employees, agents or representatives be liable for any damages, whether direct, indirect, special or consequential damages for lost revenues, lost profits, or otherwise, arising from or in connection with these materials.

This Specification has been created under the Khronos Intellectual Property Rights Policy, which is Attachment A of the Khronos Group Membership Agreement available at https://www.khronos.org/files/member_agreement.pdf, and which defines the terms 'Scope', 'Compliant Portion', and 'Necessary Patent Claims'. Parties desiring to implement the Specification and make use of Khronos trademarks in relation to that implementation, and receive reciprocal patent license protection under the Khronos Intellectual Property Rights Policy must become Adopters and confirm the implementation as conformant under the process defined by Khronos for this Specification; see https://www.khronos.org/adopters.

This Specification contains substantially unmodified functionality from, and is a successor to, Khronos specifications including OpenGL, OpenGL ES and OpenCL.

Some parts of this Specification are purely informative and so are EXCLUDED from the Scope of this Specification. The Document Conventions section of the Introduction defines how these parts of the Specification are identified.

Where this Specification uses technical terminology, defined in the Glossary or otherwise, that refer to enabling technologies that are not expressly set forth in this Specification, those enabling technologies are EXCLUDED from the Scope of this Specification. For clarity, enabling technologies not disclosed with particularity in this Specification (e.g. semiconductor manufacturing technology, hardware architecture, processor architecture or microarchitecture, memory architecture, compiler technology, object oriented technology, basic operating system technology, compression technology, algorithms, and so on) are NOT to be considered expressly set forth; only those application program interfaces and data structures disclosed with particularity are included in the Scope of this Specification.

For purposes of the Khronos Intellectual Property Rights Policy as it relates to the definition of Necessary Patent Claims, all recommended or optional features, behaviors and functionality set
forth in this Specification, if implemented, are considered to be included as Compliant Portions.

Where this Specification includes normative references to external documents, only the specifically identified sections of those external documents are INCLUDED in the Scope of this Specification. If not created by Khronos, those external documents may contain contributions from non-members of Khronos not covered by the Khronos Intellectual Property Rights Policy.

This document contains extensions which are not ratified by Khronos, and as such is not a ratified Specification, though it contains text from (and is a superset of) the ratified Vulkan Specification. The ratified versions of the Vulkan Specification can be found at https://www.khronos.org/registry/vulkan/specs/1.2/html/vkspec.html (core only) and https://www.khronos.org/registry/vulkan/specs/1.2-khr-extensions/html/vkspec.html (core with KHR extensions).

Vulkan and Khronos are registered trademarks of The Khronos Group Inc. ASTC is a trademark of ARM Holdings PLC; OpenCL is a trademark of Apple Inc.; and OpenGL and OpenGL ES are registered trademarks of Hewlett Packard Enterprise, all used under license by Khronos. All other product names, trademarks, and/or company names are used solely for identification and belong to their respective owners.
Chapter 2. Introduction

This document, referred to as the “Vulkan Specification” or just the “Specification” hereafter, describes the Vulkan Application Programming Interface (API). Vulkan is a C99 API designed for explicit control of low-level graphics and compute functionality.

The canonical version of the Specification is available in the official Vulkan Registry (https://www.khronos.org/registry/vulkan/). The source files used to generate the Vulkan specification are stored in the Vulkan Documentation Repository (https://github.com/KhronosGroup/Vulkan-Docs). The source repository additionally has a public issue tracker and allows the submission of pull requests that improve the specification.

2.1. Document Conventions

The Vulkan specification is intended for use by both implementors of the API and application developers seeking to make use of the API, forming a contract between these parties. Specification text may address either party; typically the intended audience can be inferred from context, though some sections are defined to address only one of these parties. (For example, Valid Usage sections only address application developers). Any requirements, prohibitions, recommendations or options defined by normative terminology are imposed only on the audience of that text.

Note

Structure and enumerated types defined in extensions that were promoted to core in a later version of Vulkan are now defined in terms of the equivalent Vulkan core interfaces. This affects the Vulkan Specification, the Vulkan header files, and the corresponding XML Registry.

2.1.1. Informative Language

Some language in the specification is purely informative, intended to give background or suggestions to implementors or developers.

If an entire chapter or section contains only informative language, its title will be suffixed with “(Informative)”.

All NOTEs are implicitly informative.

2.1.2. Normative Terminology

Within this specification, the key words must, required, should, recommended, may, and optional are to be interpreted as described in RFC 2119 - Key words for use in RFCs to Indicate Requirement Levels (https://www.ietf.org/rfc/rfc2119.txt). These key words are highlighted in the specification for clarity. In text addressing application developers, their use expresses requirements that apply to application behavior. In text addressing implementors, their use expresses requirements that apply to implementations.

In text addressing application developers, the additional key words can and cannot are to be
interpreted as describing the capabilities of an application, as follows:

**can**
This word means that the application is able to perform the action described.

**cannot**
This word means that the API and/or the execution environment provide no mechanism through which the application can express or accomplish the action described.

These key words are never used in text addressing implementors.

*Note*
There is an important distinction between **cannot** and **must not**, as used in this Specification. **Cannot** means something the application literally is unable to express or accomplish through the API, while **must not** means something that the application is capable of expressing through the API, but that the consequences of doing so are undefined and potentially unrecoverable for the implementation (see Errors).

Unless otherwise noted in the section heading, all sections and appendices in this document are normative.

### 2.1.3. Technical Terminology

The Vulkan Specification makes use of common engineering and graphics terms such as **Pipeline**, **Shader**, and **Host** to identify and describe Vulkan API constructs and their attributes, states, and behaviors. The **Glossary** defines the basic meanings of these terms in the context of the Specification. The Specification text provides fuller definitions of the terms and may elaborate, extend, or clarify the **Glossary** definitions. When a term defined in the **Glossary** is used in normative language within the Specification, the definitions within the Specification govern and supersede any meanings the terms may have in other technical contexts (i.e. outside the Specification).

### 2.1.4. Normative References

References to external documents are considered normative references if the Specification uses any of the normative terms defined in **Normative Terminology** to refer to them or their requirements, either as a whole or in part.

The following documents are referenced by normative sections of the specification:

Chapter 3. Fundamentals

This chapter introduces fundamental concepts including the Vulkan architecture and execution model, API syntax, queues, pipeline configurations, numeric representation, state and state queries, and the different types of objects and shaders. It provides a framework for interpreting more specific descriptions of commands and behavior in the remainder of the Specification.

3.1. Host and Device Environment

The Vulkan Specification assumes and requires: the following properties of the host environment with respect to Vulkan implementations:

- The host must have runtime support for 8, 16, 32 and 64-bit signed and unsigned two's-complement integers, all addressable at the granularity of their size in bytes.
- The host must have runtime support for 32- and 64-bit floating-point types satisfying the range and precision constraints in the Floating Point Computation section.
- The representation and endianness of these types on the host must match the representation and endianness of the same types on every physical device supported.

Note

Since a variety of data types and structures in Vulkan may be accessible by both host and physical device operations, the implementation should be able to access such data efficiently in both paths in order to facilitate writing portable and performant applications.

3.2. Execution Model

This section outlines the execution model of a Vulkan system.

Vulkan exposes one or more devices, each of which exposes one or more queues which may process work asynchronously to one another. The set of queues supported by a device is partitioned into families. Each family supports one or more types of functionality and may contain multiple queues with similar characteristics. Queues within a single family are considered compatible with one another, and work produced for a family of queues can be executed on any queue within that family. This specification defines the following types of functionality that queues may support: video decode, video encode, graphics, compute, transfer and sparse memory management.

Note

A single device may report multiple similar queue families rather than, or as well as, reporting multiple members of one or more of those families. This indicates that while members of those families have similar capabilities, they are not directly compatible with one another.

Device memory is explicitly managed by the application. Each device may advertise one or more heaps, representing different areas of memory. Memory heaps are either device local or host local,
but are always visible to the device. Further detail about memory heaps is exposed via memory types available on that heap. Examples of memory areas that may be available on an implementation include:

- **device local** is memory that is physically connected to the device.
- **device local, host visible** is device local memory that is visible to the host.
- **host local, host visible** is memory that is local to the host and visible to the device and host.

On other architectures, there may only be a single heap that can be used for any purpose.

A Vulkan application controls a set of devices through the submission of command buffers which have recorded device commands issued via Vulkan library calls. The content of command buffers is specific to the underlying implementation and is opaque to the application. Once constructed, a command buffer can be submitted once or many times to a queue for execution. Multiple command buffers can be built in parallel by employing multiple threads within the application.

Command buffers submitted to different queues may execute in parallel or even out of order with respect to one another. Command buffers submitted to a single queue respect submission order, as described further in synchronization chapter. Command buffer execution by the device is also asynchronous to host execution. Once a command buffer is submitted to a queue, control may return to the application immediately. Synchronization between the device and host, and between different queues is the responsibility of the application.

### 3.2.1. Queue Operation

Vulkan queues provide an interface to the execution engines of a device. Commands for these execution engines are recorded into command buffers ahead of execution time. These command buffers are then submitted to queues with a queue submission command for execution in a number of batches. Once submitted to a queue, these commands will begin and complete execution without further application intervention, though the order of this execution is dependent on a number of implicit and explicit ordering constraints.

Work is submitted to queues using queue submission commands that typically take the form `vkQueue*` (e.g. `vkQueueSubmit`, `vkQueueBindSparse`), and optionally take a list of semaphores upon which to wait before work begins and a list of semaphores to signal once work has completed. The work itself, as well as signaling and waiting on the semaphores are all queue operations.

Queue operations on different queues have no implicit ordering constraints, and may execute in any order. Explicit ordering constraints between queues can be expressed with semaphores and fences.

Command buffer submissions to a single queue respect submission order and other implicit ordering guarantees, but otherwise may overlap or execute out of order. Other types of batches and queue submissions against a single queue (e.g. sparse memory binding) have no implicit ordering constraints with any other queue submission or batch. Additional explicit ordering constraints between queue submissions and individual batches can be expressed with semaphores and fences.

Before a fence or semaphore is signaled, it is guaranteed that any previously submitted queue operations have completed execution, and that memory writes from those queue operations are...
available to future queue operations. Waiting on a signaled semaphore or fence guarantees that previous writes that are available are also visible to subsequent commands.

Command buffer boundaries, both between primary command buffers of the same or different batches or submissions as well as between primary and secondary command buffers, do not introduce any additional ordering constraints. In other words, submitting the set of command buffers (which can include executing secondary command buffers) between any semaphore or fence operations execute the recorded commands as if they had all been recorded into a single primary command buffer, except that the current state is reset on each boundary. Explicit ordering constraints can be expressed with explicit synchronization primitives.

There are a few implicit ordering guarantees between commands within a command buffer, but only covering a subset of execution. Additional explicit ordering constraints can be expressed with the various explicit synchronization primitives.

Note
Implementations have significant freedom to overlap execution of work submitted to a queue, and this is common due to deep pipelining and parallelism in Vulkan devices.

Commands recorded in command buffers either perform actions (draw, dispatch, clear, copy, query/timestamp operations, begin/end subpass operations), set state (bind pipelines, descriptor sets, and buffers, set dynamic state, push constants, set render pass/subpass state), or perform synchronization (set/wait events, pipeline barrier, render pass/subpass dependencies). Some commands perform more than one of these tasks. State setting commands update the current state of the command buffer. Some commands that perform actions (e.g. draw/dispatch) do so based on the current state set cumulatively since the start of the command buffer. The work involved in performing action commands is often allowed to overlap or to be reordered, but doing so must not alter the state to be used by each action command. In general, action commands are those commands that alter framebuffer attachments, read/write buffer or image memory, or write to query pools.

Synchronization commands introduce explicit execution and memory dependencies between two sets of action commands, where the second set of commands depends on the first set of commands. These dependencies enforce that both the execution of certain pipeline stages in the later set occur after the execution of certain stages in the source set, and that the effects of memory accesses performed by certain pipeline stages occur in order and are visible to each other. When not enforced by an explicit dependency or implicit ordering guarantees, action commands may overlap execution or execute out of order, and may not see the side effects of each other’s memory accesses.

The device executes queue operations asynchronously with respect to the host. Control is returned to an application immediately following command buffer submission to a queue. The application must synchronize work between the host and device as needed.

3.3. Object Model

The devices, queues, and other entities in Vulkan are represented by Vulkan objects. At the API
level, all objects are referred to by handles. There are two classes of handles, dispatchable and non-
dispatchable. Dispatchable handle types are a pointer to an opaque type. This pointer may be used
by layers as part of intercepting API commands, and thus each API command takes a dispatchable
type as its first parameter. Each object of a dispatchable type must have a unique handle value
during its lifetime.

Non-dispatchable handle types are a 64-bit integer type whose meaning is implementation-
dependent. If the privateData feature is enabled for a VkDevice, each object of a non-dispatchable
type created on that device must have a handle value that is unique among objects created on that
device, for the duration of the object’s lifetime. Otherwise, non-dispatchable handles may encode
object information directly in the handle rather than acting as a reference to an underlying object,
and thus may not have unique handle values. If handle values are not unique, then destroying one
such handle must not cause identical handles of other types to become invalid, and must not cause
identical handles of the same type to become invalid if that handle value has been created more
times than it has been destroyed.

All objects created or allocated from a VkDevice (i.e. with a VkDevice as the first parameter) are
private to that device, and must not be used on other devices.

3.3.1. Object Lifetime

Objects are created or allocated by vkCreate* and vkAllocate* commands, respectively. Once an
object is created or allocated, its “structure” is considered to be immutable, though the contents of
certain object types is still free to change. Objects are destroyed or freed by vkDestroy* and vkFree*
commands, respectively.

Objects that are allocated (rather than created) take resources from an existing pool object or
memory heap, and when freed return resources to that pool or heap. While object creation and
destruction are generally expected to be low-frequency occurrences during runtime, allocating and
freeing objects can occur at high frequency. Pool objects help accommodate improved performance
of the allocations and frees.

It is an application’s responsibility to track the lifetime of Vulkan objects, and not to destroy them
while they are still in use.

The ownership of application-owned memory is immediately acquired by any Vulkan command it
is passed into. Ownership of such memory must be released back to the application at the end of
the duration of the command, so that the application can alter or free this memory as soon as all
the commands that acquired it have returned.

The following object types are consumed when they are passed into a Vulkan command and not
further accessed by the objects they are used to create. They must not be destroyed in the duration
of any API command they are passed into:

- VkShaderModule
- VkPipelineCache
- VkValidationCacheEXT

A VkRenderPass object passed as a parameter to create another object is not further accessed by that
object after the duration of the command it is passed into. A *VkRenderPass* used in a command buffer follows the rules described below.

A *VkPipelineLayout* object **must** not be destroyed while any command buffer that uses it is in the recording state.

*VkDescriptorSetLayout* objects **may** be accessed by commands that operate on descriptor sets allocated using that layout, and those descriptor sets **must** not be updated with *vkUpdateDescriptorSets* after the descriptor set layout has been destroyed. Otherwise, a *VkDescriptorSetLayout* object passed as a parameter to create another object is not further accessed by that object after the duration of the command it is passed into.

The application **must** not destroy any other type of Vulkan object until all uses of that object by the device (such as via command buffer execution) have completed.

The following Vulkan objects **must** not be destroyed while any command buffers using the object are in the **pending state**:

- *VkEvent*
- *VkQueryPool*
- *VkBuffer*
- *VkBufferView*
- *VkImage*
- *VkImageView*
- *VkPipeline*
- *VkSampler*
- *VkSamplerYcbcrConversion*
- *VkDescriptorPool*
- *VkFramebuffer*
- *VkRenderPass*
- *VkCommandBuffer*
- *VkCommandPool*
- *VkDeviceMemory*
- *VkDescriptorSet*
- *VkIndirectCommandsLayoutNV*
  - *VkAccelerationStructureNV*
  - *VkAccelerationStructureKHR*

Destroying these objects will move any command buffers that are in the **recording or executable state**, and are using those objects, to the **invalid state**.

The following Vulkan objects **must** not be destroyed while any queue is executing commands that
In general, objects can be destroyed or freed in any order, even if the object being freed is involved in the use of another object (e.g. use of a resource in a view, use of a view in a descriptor set, use of a pipeline library in another pipeline, use of a referenced pipeline for additional graphics shader groups in another pipeline, use of a bottom level acceleration structure in an instance referenced by a top level acceleration structure, use of an object in a command buffer, binding of a memory allocation to a resource), as long as any object that uses the freed object is not further used in any way except to be destroyed or to be reset in such a way that it no longer uses the other object (such as resetting a command buffer). If the object has been reset, then it can be used as if it never used the freed object. An exception to this is when there is a parent/child relationship between objects. In this case, the application must not destroy a parent object before its children, except when the parent is explicitly defined to free its children when it is destroyed (e.g. for pool objects, as defined below).

VkCommandPool objects are parents of VkCommandBuffer objects. VkDescriptorPool objects are parents of VkDescriptorSet objects. VkDevice objects are parents of many object types (all that take a VkDevice as a parameter to their creation).

The following Vulkan objects have specific restrictions for when they can be destroyed:

- VkQueue objects cannot be explicitly destroyed. Instead, they are implicitly destroyed when the VkDevice object they are retrieved from is destroyed.
- Destroying a pool object implicitly frees all objects allocated from that pool. Specifically, destroying VkCommandPool frees all VkCommandBuffer objects that were allocated from it, and destroying VkDescriptorPool frees all VkDescriptorSet objects that were allocated from it.
- VkDevice objects can be destroyed when all VkQueue objects retrieved from them are idle, and all objects created from them have been destroyed. This includes the following objects:
  - VkFence
  - VkSemaphore
  - VkEvent
  - VkQueryPool
  - VkBuffer
  - VkBufferView
  - VkImage
  - VkImageView
  - VkShaderModule
  - VkPipelineCache
• **VkPhysicalDevice** objects cannot be explicitly destroyed. Instead, they are implicitly destroyed when the **VkInstance** object they are retrieved from is destroyed.

• **VkInstance** objects can be destroyed once all **VkDevice** objects created from any of its **VkPhysicalDevice** objects have been destroyed.

### 3.3.2. External Object Handles

As defined above, the scope of object handles created or allocated from a **VkDevice** is limited to that logical device. Objects which are not in scope are said to be external. To bring an external object into scope, an external handle must be exported from the object in the source scope and imported into the destination scope.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>The scope of external handles and their associated resources may vary according to their type, but they can generally be shared across process and API boundaries.</td>
</tr>
</tbody>
</table>

### 3.4. Application Binary Interface

The mechanism by which Vulkan is made available to applications is platform- or implementation-defined. On many platforms the C interface described in this Specification is provided by a shared library. Since shared libraries can be changed independently of the applications that use them, they present particular compatibility challenges, and this Specification places some requirements on them.

Shared library implementations must use the default Application Binary Interface (ABI) of the standard C compiler for the platform, or provide customized API headers that cause application code to use the implementation’s non-default ABI. An ABI in this context means the size, alignment,
and layout of C data types; the procedure calling convention; and the naming convention for shared library symbols corresponding to C functions. Customizing the calling convention for a platform is usually accomplished by defining calling convention macros appropriately in `vk_platform.h`.

On platforms where Vulkan is provided as a shared library, library symbols beginning with “vk” and followed by a digit or uppercase letter are reserved for use by the implementation. Applications which use Vulkan must not provide definitions of these symbols. This allows the Vulkan shared library to be updated with additional symbols for new API versions or extensions without causing symbol conflicts with existing applications.

Shared library implementations should provide library symbols for commands in the highest version of this Specification they support, and for Window System Integration extensions relevant to the platform. They may also provide library symbols for commands defined by additional extensions.

Note

These requirements and recommendations are intended to allow implementors to take advantage of platform-specific conventions for SDKs, ABIs, library versioning mechanisms, etc. while still minimizing the code changes necessary to port applications or libraries between platforms. Platform vendors, or providers of the de facto standard Vulkan shared library for a platform, are encouraged to document what symbols the shared library provides and how it will be versioned when new symbols are added.

Applications should only rely on shared library symbols for commands in the minimum core version required by the application. `vkGetInstanceProcAddr` and `vkGetDeviceProcAddr` should be used to obtain function pointers for commands in core versions beyond the application's minimum required version.

3.5. Command Syntax and Duration

The Specification describes Vulkan commands as functions or procedures using C99 syntax. Language bindings for other languages such as C++ and JavaScript may allow for stricter parameter passing, or object-oriented interfaces.

Vulkan uses the standard C types for the base type of scalar parameters (e.g. types from `<stdint.h>`), with exceptions described below, or elsewhere in the text when appropriate:

`VkBool32` represents boolean `True` and `False` values, since C does not have a sufficiently portable built-in boolean type:

```c
// Provided by VK_VERSION_1_0
typedef uint32_t VkBool32;
```

`VK_TRUE` represents a boolean `True` (unsigned integer 1) value, and `VK_FALSE` a boolean `False` (unsigned integer 0) value.
All values returned from a Vulkan implementation in a `VkBool32` will be either `VK_TRUE` or `VK_FALSE`.

Applications **must** not pass any other values than `VK_TRUE` or `VK_FALSE` into a Vulkan implementation where a `VkBool32` is expected.

`VkDeviceSize` represents device memory size and offset values:

```c
// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceSize;
```

`VkDeviceAddress` represents device buffer address values:

```c
// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceAddress;
```

Commands that create Vulkan objects are of the form `vkCreate*` and take `Vk*CreateInfo` structures with the parameters needed to create the object. These Vulkan objects are destroyed with commands of the form `vkDestroy*`.

The last in-parameter to each command that creates or destroys a Vulkan object is `pAllocator`. The `pAllocator` parameter *can* be set to a non-NULL value such that allocations for the given object are delegated to an application provided callback; refer to the Memory Allocation chapter for further details.

Commands that allocate Vulkan objects owned by pool objects are of the form `vkAllocate*`, and take `Vk*AllocateInfo` structures. These Vulkan objects are freed with commands of the form `vkFree*`. These objects do not take allocators; if host memory is needed, they will use the allocator that was specified when their parent pool was created.

Commands are recorded into a command buffer by calling API commands of the form `vkCmd*`. Each such command *may* have different restrictions on where it *can* be used: in a primary and/or secondary command buffer, inside and/or outside a render pass, and in one or more of the supported queue types. These restrictions are documented together with the definition of each such command.

The *duration* of a Vulkan command refers to the interval between calling the command and its return to the caller.

### 3.5.1. Lifetime of Retrieved Results

Information is retrieved from the implementation with commands of the form `vkGet*` and `vkEnumerate*`.

Unless otherwise specified for an individual command, the results are *invariant*; that is, they will remain unchanged when retrieved again by calling the same command with the same parameters, so long as those parameters themselves all remain valid.
3.6. Threading Behavior

Vulkan is intended to provide scalable performance when used on multiple host threads. All commands support being called concurrently from multiple threads, but certain parameters, or components of parameters are defined to be externally synchronized. This means that the caller must guarantee that no more than one thread is using such a parameter at a given time.

More precisely, Vulkan commands use simple stores to update the state of Vulkan objects. A parameter declared as externally synchronized may have its contents updated at any time during the host execution of the command. If two commands operate on the same object and at least one of the commands declares the object to be externally synchronized, then the caller must guarantee not only that the commands do not execute simultaneously, but also that the two commands are separated by an appropriate memory barrier (if needed).

Note

Memory barriers are particularly relevant for hosts based on the ARM CPU architecture, which is more weakly ordered than many developers are accustomed to from x86/x64 programming. Fortunately, most higher-level synchronization primitives (like the pthread library) perform memory barriers as a part of mutual exclusion, so muting Vulkan objects via these primitives will have the desired effect.

Similarly the application must avoid any potential data hazard of application-owned memory that has its ownership temporarily acquired by a Vulkan command. While the ownership of application-owned memory remains acquired by a command the implementation may read the memory at any point, and it may write non-const qualified memory at any point. Parameters referring to non-const qualified application-owned memory are not marked explicitly as externally synchronized in the Specification.

If an application is using deferred host operations in a command, and that operation is successfully deferred, object parameters and application-owned memory passed to that command may be accessed at any time until the deferred operation is complete.

Many object types are immutable, meaning the objects cannot change once they have been created. These types of objects never need external synchronization, except that they must not be destroyed while they are in use on another thread. In certain special cases mutable object parameters are internally synchronized, making external synchronization unnecessary. Any command parameters that are not labeled as externally synchronized are either not mutated by the command or are internally synchronized. Additionally, certain objects related to a command’s parameters (e.g. command pools and descriptor pools) may be affected by a command, and must also be externally synchronized. These implicit parameters are documented as described below.

Parameters of commands that are externally synchronized are listed below.
Externally Synchronized Parameters

- The `instance` parameter in `vkDestroyInstance`
- The `device` parameter in `vkDestroyDevice`
- The `queue` parameter in `vkQueueSubmit`
- The `fence` parameter in `vkQueueSubmit`
- The `queue` parameter in `vkQueueWaitIdle`
- The `memory` parameter in `vkFreeMemory`
- The `memory` parameter in `vkMapMemory`
- The `memory` parameter in `vkUnmapMemory`
- The `buffer` parameter in `vkBindBufferMemory`
- The `image` parameter in `vkBindImageMemory`
- The `queue` parameter in `vkQueueBindSparse`
- The `fence` parameter in `vkQueueBindSparse`
- The `fence` parameter in `vkDestroyFence`
- The `semaphore` parameter in `vkDestroySemaphore`
- The `event` parameter in `vkDestroyEvent`
- The `event` parameter in `vkSetEvent`
- The `event` parameter in `vkResetEvent`
- The `queryPool` parameter in `vkDestroyQueryPool`
- The `buffer` parameter in `vkDestroyBuffer`
- The `bufferView` parameter in `vkDestroyBufferView`
- The `image` parameter in `vkDestroyImage`
- The `imageView` parameter in `vkDestroyImageView`
- The `shaderModule` parameter in `vkDestroyShaderModule`
- The `pipelineCache` parameter in `vkDestroyPipelineCache`
- The `dstCache` parameter in `vkMergePipelineCaches`
- The `pipeline` parameter in `vkDestroyPipeline`
- The `pipelineLayout` parameter in `vkDestroyPipelineLayout`
- The `sampler` parameter in `vkDestroySampler`
- The `descriptorSetLayout` parameter in `vkDestroyDescriptorSetLayout`
- The `descriptorPool` parameter in `vkDestroyDescriptorPool`
- The `descriptorPool` parameter in `vkResetDescriptorPool`
- The `descriptorPool` member of the `pAllocateInfo` parameter in `vkAllocateDescriptorSets`
- The `descriptorPool` parameter in `vkFreeDescriptorSets`
• The `framebuffer` parameter in `vkDestroyFramebuffer`
• The `renderPass` parameter in `vkDestroyRenderPass`
• The `commandPool` parameter in `vkDestroyCommandPool`
• The `commandPool` parameter in `vkResetCommandPool`
• The `commandPool` member of the `pAllocateInfo` parameter in `vkAllocateCommandBuffers`
• The `commandPool` parameter in `vkFreeCommandBuffers`
• The `commandBuffer` parameter in `vkBeginCommandBuffer`
• The `commandBuffer` parameter in `vkEndCommandBuffer`
• The `commandBuffer` parameter in `vkResetCommandBuffer`
• The `commandBuffer` parameter in `vkCmdBindPipeline`
• The `commandBuffer` parameter in `vkCmdSetViewport`
• The `commandBuffer` parameter in `vkCmdSetScissor`
• The `commandBuffer` parameter in `vkCmdSetLineWidth`
• The `commandBuffer` parameter in `vkCmdSetDepthBias`
• The `commandBuffer` parameter in `vkCmdSetBlendConstants`
• The `commandBuffer` parameter in `vkCmdSetDepthBounds`
• The `commandBuffer` parameter in `vkCmdSetStencilCompareMask`
• The `commandBuffer` parameter in `vkCmdSetStencilWriteMask`
• The `commandBuffer` parameter in `vkCmdSetStencilReference`
• The `commandBuffer` parameter in `vkCmdBindDescriptorSets`
• The `commandBuffer` parameter in `vkCmdBindIndexBuffer`
• The `commandBuffer` parameter in `vkCmdBindVertexBuffers`
• The `commandBuffer` parameter in `vkCmdDraw`
• The `commandBuffer` parameter in `vkCmdDrawIndexed`
• The `commandBuffer` parameter in `vkCmdDrawIndirect`
• The `commandBuffer` parameter in `vkCmdDispatch`
• The `commandBuffer` parameter in `vkCmdDispatchIndirect`
• The `commandBuffer` parameter in `vkCmdCopyBuffer`
• The `commandBuffer` parameter in `vkCmdCopyImage`
• The `commandBuffer` parameter in `vkCmdBlitImage`
• The `commandBuffer` parameter in `vkCmdCopyBufferToImage`
• The `commandBuffer` parameter in `vkCmdCopyImageToBuffer`
• The `commandBuffer` parameter in `vkCmdUpdateBuffer`
• The `commandBuffer` parameter in `vkCmdFillBuffer`
• The `commandBuffer` parameter in `vkCmdClearColorImage`
• The `commandBuffer` parameter in `vkCmdClearDepthStencilImage`
• The `commandBuffer` parameter in `vkCmdClearAttachments`
• The `commandBuffer` parameter in `vkCmdResolveImage`
• The `commandBuffer` parameter in `vkCmdSetEvent`
• The `commandBuffer` parameter in `vkCmdResetEvent`
• The `commandBuffer` parameter in `vkCmdWaitEvents`
• The `commandBuffer` parameter in `vkCmdPipelineBarrier`
• The `commandBuffer` parameter in `vkCmdBeginQuery`
• The `commandBuffer` parameter in `vkCmdEndQuery`
• The `commandBuffer` parameter in `vkCmdResetQueryPool`
• The `commandBuffer` parameter in `vkCmdWriteTimestamp`
• The `commandBuffer` parameter in `vkCmdCopyQueryPoolResults`
• The `commandBuffer` parameter in `vkCmdPushConstants`
• The `commandBuffer` parameter in `vkCmdBeginRenderPass`
• The `commandBuffer` parameter in `vkCmdNextSubpass`
• The `commandBuffer` parameter in `vkCmdEndRenderPass`
• The `commandBuffer` parameter in `vkCmdExecuteCommands`
• The `commandBuffer` parameter in `vkCmdSetDeviceMask`
• The `commandPool` parameter in `vkTrimDispatchBase`
• The `ycbcrConversion` parameter in `vkDestroySamplerYcbcrConversion`
• The `descriptorUpdateTemplate` parameter in `vkDestroyDescriptorUpdateTemplate`
• The `descriptorSet` parameter in `vkUpdateDescriptorSetWithTemplate`
• The `surface` parameter in `vkDestroySurfaceKHR`
• The `surface` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`
• The `oldSwapchain` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`
• The `swapchain` parameter in `vkDestroySwapchainKHR`
• The `swapchain` parameter in `vkAcquireNextImageKHR`
• The `semaphore` parameter in `vkAcquireNextImageKHR`
• The `fence` parameter in `vkAcquireNextImageKHR`
• The `queue` parameter in `vkQueuePresentKHR`
• The `surface` parameter in `vkGetDeviceGroupSurfacePresentModesKHR`
• The `surface` parameter in `vkGetPhysicalDevicePresentRectanglesKHR`
• The `display` parameter in `vkCreateDisplayModeKHR`
• The `mode` parameter in `vkGetDisplayPlaneCapabilitiesKHR`
• The `commandBuffer` parameter in `vkCmdSetDeviceMaskKHR`
• The `commandBuffer` parameter in `vkCmdDispatchBaseKHR`
• The `commandPool` parameter in `vkTrimCommandPoolKHR`
• The `commandBuffer` parameter in `vkCmdPushDescriptorSetKHR`
• The `commandBuffer` parameter in `vkCmdPushDescriptorSetWithTemplateKHR`
• The `descriptorUpdateTemplate` parameter in `vkDestroyDescriptorUpdateTemplateKHR`
• The `descriptorSet` parameter in `vkUpdateDescriptorSetWithTemplateKHR`
• The `commandBuffer` parameter in `vkCmdBeginRenderPass2`
• The `commandBuffer` parameter in `vkCmdBeginRenderPass2KHR`
• The `commandBuffer` parameter in `vkCmdNextSubpass2`
• The `commandBuffer` parameter in `vkCmdNextSubpass2KHR`
• The `commandBuffer` parameter in `vkCmdEndRenderPass2`
• The `commandBuffer` parameter in `vkCmdEndRenderPass2KHR`
• The `swapchain` parameter in `vkGetSwapchainStatusKHR`
• The `ycbcrConversion` parameter in `vkDestroySamplerYcbcrConversionKHR`
• The `commandBuffer` parameter in `vkCmdDrawIndirectCount`
• The `commandBuffer` parameter in `vkCmdDrawIndirectCountKHR`
• The `commandBuffer` parameter in `vkCmdDrawIndexedIndirectCount`
• The `commandBuffer` parameter in `vkCmdDrawIndexedIndirectCountKHR`
• The `operation` parameter in `vkDestroyDeferredOperationKHR`
• The `commandBuffer` parameter in `vkCmdSetEvent2KHR`
• The `commandBuffer` parameter in `vkCmdResetEvent2KHR`
• The `commandBuffer` parameter in `vkCmdWaitEvents2KHR`
• The `commandBuffer` parameter in `vkCmdPipelineBarrier2KHR`
• The `commandBuffer` parameter in `vkCmdWriteTimestamp2KHR`
• The `queue` parameter in `vkQueueSubmit2KHR`
• The `fence` parameter in `vkQueueSubmit2KHR`
• The `commandBuffer` parameter in `vkCmdWriteBufferMarker2AMD`
• The `commandBuffer` parameter in `vkCmdCopyBuffer2KHR`
• The `commandBuffer` parameter in `vkCmdCopyImage2KHR`
• The `commandBuffer` parameter in `vkCmdCopyBufferToImage2KHR`
• The `commandBuffer` parameter in `vkCmdCopyImageToBuffer2KHR`
• The `commandBuffer` parameter in `vkCmdBlitImage2KHR`
• The `commandBuffer` parameter in `vkCmdResolveImage2KHR`
• The `callback` parameter in `vkDestroyDebugReportCallbackEXT`
• The `object` member of the `pTagInfo` parameter in `vkDebugMarkerSetObjectTagEXT`
• The `object` member of the `pNameInfo` parameter in `vkDebugMarkerSetObjectNameEXT`
• The `commandBuffer` parameter in `vkCmdDebugMarkerBeginEXT`
• The `commandBuffer` parameter in `vkCmdDebugMarkerEndEXT`
• The `commandBuffer` parameter in `vkCmdDebugMarkerInsertEXT`
• The `commandBuffer` parameter in `vkCmdBindTransformFeedbackBuffersEXT`
• The `commandBuffer` parameter in `vkCmdBeginTransformFeedbackEXT`
• The `commandBuffer` parameter in `vkCmdEndTransformFeedbackEXT`
• The `commandBuffer` parameter in `vkCmdBeginQueryIndexedEXT`
• The `commandBuffer` parameter in `vkCmdEndQueryIndexedEXT`
• The `commandBuffer` parameter in `vkCmdDrawIndirectByteCountEXT`
• The `commandBuffer` parameter in `vkCmdDrawIndirectCountAMD`
• The `commandBuffer` parameter in `vkCmdDrawIndexedIndirectCountAMD`
• The `commandBuffer` parameter in `vkCmdBeginConditionalRenderingEXT`
• The `commandBuffer` parameter in `vkCmdEndConditionalRenderingEXT`
• The `commandBuffer` parameter in `vkCmdSetViewportWScalingNV`
• The `swapchain` parameter in `vkGetRefreshCycleDurationGOOGLE`
• The `swapchain` parameter in `vkGetPastPresentationTimingGOOGLE`
• The `commandBuffer` parameter in `vkCmdSetDiscardRectangleEXT`
• The `objectHandle` member of the `pNameInfo` parameter in `vkSetDebugUtilsObjectNameEXT`
• The `objectHandle` member of the `pTagInfo` parameter in `vkSetDebugUtilsObjectTagEXT`
• The `commandBuffer` parameter in `vkCmdBeginDebugUtilsLabelEXT`
• The `commandBuffer` parameter in `vkCmdEndDebugUtilsLabelEXT`
• The `commandBuffer` parameter in `vkCmdInsertDebugUtilsLabelEXT`
• The `messenger` parameter in `vkDestroyDebugUtilsMessengerEXT`
• The `commandBuffer` parameter in `vkCmdSetSampleLocationsEXT`
• The `validationCache` parameter in `vkDestroyValidationCacheEXT`
• The `dstCache` parameter in `vkMergeValidationCachesEXT`
• The `commandBuffer` parameter in `vkCmdBindShadingRateImageNV`
• The `commandBuffer` parameter in `vkCmdSetViewportShadingRatePaletteNV`
• The `commandBuffer` parameter in `vkCmdSetCoarseSampleOrderNV`
• The `accelerationStructure` parameter in `vkDestroyAccelerationStructureNV`
• The `commandBuffer` parameter in `vkCmdBuildAccelerationStructureNV`
• The `commandBuffer` parameter in `vkCmdCopyAccelerationStructureNV`
• The `commandBuffer` parameter in `vkCmdTraceRaysNV`
• The `commandBuffer` parameter in `vkCmdWriteAccelerationStructuresPropertiesNV`
• The `commandBuffer` parameter in `vkCmdWriteBufferMarkerAMD`
• The `commandBuffer` parameter in `vkCmdDrawMeshTasksNV`
• The `commandBuffer` parameter in `vkCmdDrawMeshTasksIndirectNV`
• The `commandBuffer` parameter in `vkCmdDrawMeshTasksIndirectCountNV`
• The `commandBuffer` parameter in `vkCmdSetExclusiveScissorNV`
• The `commandBuffer` parameter in `vkCmdSetCheckpointNV`
• The `commandBuffer` parameter in `vkCmdSetPerformanceMarkerINTEL`
• The `commandBuffer` parameter in `vkCmdSetPerformanceStreamMarkerINTEL`
• The `commandBuffer` parameter in `vkCmdSetPerformanceOverrideINTEL`
• The `configuration` parameter in `vkReleasePerformanceConfigurationINTEL`
• The `commandBuffer` parameter in `vkCmdSetLineStippleEXT`
• The `commandBuffer` parameter in `vkCmdSetCullModeEXT`
• The `commandBuffer` parameter in `vkCmdSetFrontFaceEXT`
• The `commandBuffer` parameter in `vkCmdSetPrimitiveTopologyEXT`
• The `commandBuffer` parameter in `vkCmdSetViewportWithCountEXT`
• The `commandBuffer` parameter in `vkCmdSetScissorWithCountEXT`
• The `commandBuffer` parameter in `vkCmdBindVertexBuffers2EXT`
• The `commandBuffer` parameter in `vkCmdSetDepthTestEnableEXT`
• The `commandBuffer` parameter in `vkCmdSetDepthWriteEnableEXT`
• The `commandBuffer` parameter in `vkCmdSetDepthCompareOpEXT`
• The `commandBuffer` parameter in `vkCmdSetDepthBoundsTestEnableEXT`
• The `commandBuffer` parameter in `vkCmdSetStencilTestEnableEXT`
• The `commandBuffer` parameter in `vkCmdSetStencilOpEXT`
• The `commandBuffer` parameter in `vkCmdPreprocessGeneratedCommandsNV`
• The `commandBuffer` parameter in `vkCmdExecuteGeneratedCommandsNV`
• The `commandBuffer` parameter in `vkCmdBindPipelineShaderGroupNV`
• The `indirectCommandsLayout` parameter in `vkDestroyIndirectCommandsLayoutNV`
• The `privateDataSlot` parameter in `vkDestroyPrivateDataSlotEXT`
• The `commandBuffer` parameter in `vkCmdSetFragmentShadingRateEnumNV`
• The `commandBuffer` parameter in `vkCmdSetVertexInputEXT`
• The `commandBuffer` parameter in `vkCmdSetPatchControlPointsEXT`
• The `commandBuffer` parameter in `vkCmdSetRasterizerDiscardEnableEXT`
• The `commandBuffer` parameter in `vkCmdSetDepthBiasEnableEXT`  
• The `commandBuffer` parameter in `vkCmdSetLogicOpEXT`  
• The `commandBuffer` parameter in `vkCmdSetPrimitiveRestartEnableEXT`  
• The `commandBuffer` parameter in `vkCmdSetColorWriteEnableEXT`  
• The `accelerationStructure` parameter in `vkDestroyAccelerationStructureKHR`  
• The `commandBuffer` parameter in `vkCmdBuildAccelerationStructuresKHR`  
• The `commandBuffer` parameter in `vkCmdBuildAccelerationStructuresIndirectKHR`  
• The `commandBuffer` parameter in `vkCmdCopyAccelerationStructureToMemoryKHR`  
• The `commandBuffer` parameter in `vkCmdCopyMemoryToAccelerationStructureKHR`  
• The `commandBuffer` parameter in `vkCmdWriteAccelerationStructuresPropertiesKHR`  
• The `commandBuffer` parameter in `vkCmdTraceRaysKHR`  
• The `commandBuffer` parameter in `vkCmdTraceRaysIndirectKHR`  
• The `commandBuffer` parameter in `vkCmdSetRayTracingPipelineStackSizeKHR`  

For `VkPipelineCache` objects created with `flags` containing `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT`, the above table is extended with the `pipelineCache` parameter to `vkCreate*Pipelines` being externally synchronized.

There are also a few instances where a command can take in a user allocated list whose contents are externally synchronized parameters. In these cases, the caller must guarantee that at most one thread is using a given element within the list at a given time. These parameters are listed below.
Externally Synchronized Parameter Lists

- The buffer member of each element of the pBufferBinds member of each element of the pBindInfo parameter in vkQueueBindSparse
- The image member of each element of the pImageOpaqueBinds member of each element of the pBindInfo parameter in vkQueueBindSparse
- The image member of each element of the pImageBinds member of each element of the pBindInfo parameter in vkQueueBindSparse
- Each element of the pFences parameter in vkResetFences
- Each element of the pDescriptorSets parameter in vkFreeDescriptorSets
- The dstSet member of each element of the pDescriptorWrites parameter in vkUpdateDescriptorSets
- The dstSet member of each element of the pDescriptorCopies parameter in vkUpdateDescriptorSets
- Each element of the pCommandBuffers parameter in vkFreeCommandBuffers
- Each element of the pWaitSemaphores member of the pPresentInfo parameter in vkQueuePresentKHR
- Each element of the pSwapchains member of the pPresentInfo parameter in vkQueuePresentKHR
- The surface member of each element of the pCreateInfos parameter in vkCreateSharedSwapchainsKHR
- The oldSwapchain member of each element of the pCreateInfos parameter in vkCreateSharedSwapchainsKHR

In addition, there are some implicit parameters that need to be externally synchronized. For example, all commandBuffer parameters that need to be externally synchronized imply that the commandPool that was passed in when creating that command buffer also needs to be externally synchronized. The implicit parameters and their associated object are listed below.
Implicit Externally Synchronized Parameters

- All `VkPhysicalDevice` objects enumerated from `instance` in `vkDestroyInstance`.
- All `VkQueue` objects received from `device` in `vkDestroyDevice`.
- All `VkQueue` objects created from `device` in `vkDeviceWaitIdle`.
- Any `VkDescriptorSet` objects allocated from `descriptorPool` in `vkResetDescriptorPool`.
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkBeginCommandBuffer`.
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkEndCommandBuffer`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindPipeline`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetViewport`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetScissor`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetLineWidth`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBias`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetBlendConstants`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBounds`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilCompareMask`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilWriteMask`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindDescriptorSets`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindIndexBuffer`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindVertexBuffers`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDraw`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexed`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndirect`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatch`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatchIndirect`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBuffer`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImage`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBlitImage`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBufferToImage`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImageToBuffer`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdUpdateBuffer`.
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdFillBuffer`.
• The VkCommandPool that commandBuffer was allocated from, in vkCmdClearColorImage
• The VkCommandPool that commandBuffer was allocated from, in vkCmdClearDepthStencilImage
• The VkCommandPool that commandBuffer was allocated from, in vkCmdClearAttachments
• The VkCommandPool that commandBuffer was allocated from, in vkCmdResolveImage
• The VkCommandPool that commandBuffer was allocated from, in vkCmdSetEvent
• The VkCommandPool that commandBuffer was allocated from, in vkCmdResetEvent
• The VkCommandPool that commandBuffer was allocated from, in vkCmdPipelineBarrier
• The VkCommandPool that commandBuffer was allocated from, in vkCmdBeginQuery
• The VkCommandPool that commandBuffer was allocated from, in vkCmdEndQuery
• The VkCommandPool that commandBuffer was allocated from, in vkCmdResetQueryPool

3.7. Errors

Vulkan is a layered API. The lowest layer is the core Vulkan layer, as defined by this Specification. The application can use additional layers above the core for debugging, validation, and other purposes.

One of the core principles of Vulkan is that building and submitting command buffers should be
highly efficient. Thus error checking and validation of state in the core layer is minimal, although more rigorous validation can be enabled through the use of layers.

The core layer assumes applications are using the API correctly. Except as documented elsewhere in the Specification, the behavior of the core layer to an application using the API incorrectly is undefined, and may include program termination. However, implementations must ensure that incorrect usage by an application does not affect the integrity of the operating system, the Vulkan implementation, or other Vulkan client applications in the system. In particular, any guarantees made by an operating system about whether memory from one process can be visible to another process or not must not be violated by a Vulkan implementation for any memory allocation. Vulkan implementations are not required to make additional security or integrity guarantees beyond those provided by the OS unless explicitly directed by the application's use of a particular feature or extension.

Note
For instance, if an operating system guarantees that data in all its memory allocations are set to zero when newly allocated, the Vulkan implementation must make the same guarantees for any allocations it controls (e.g. VkDeviceMemory).

Similarly, if an operating system guarantees that use-after-free of host allocations will not result in values written by another process becoming visible, the same guarantees must be made by the Vulkan implementation for device memory.

If the protected memory feature is supported, the implementation provides additional guarantees when invalid usage occurs to prevent values in protected memory from being accessed or inferred outside of protected operations, as described in Protected Memory Access Rules.

Validation of correct API usage is left to validation layers. Applications should be developed with validation layers enabled, to help catch and eliminate errors. Once validated, released applications should not enable validation layers by default.

3.7.1. Valid Usage

Valid usage defines a set of conditions which must be met in order to achieve well-defined runtime behavior in an application. These conditions depend only on Vulkan state, and the parameters or objects whose usage is constrained by the condition.

Some valid usage conditions have dependencies on runtime limits or feature availability. It is possible to validate these conditions against Vulkan's minimum supported values for these limits and features, or some subset of other known values.

Valid usage conditions do not cover conditions where well-defined behavior (including returning an error code) exists.

Valid usage conditions should apply to the command or structure where complete information about the condition would be known during execution of an application. This is such that a validation layer or linter can be written directly against these statements at the point they are specified.
Valid usage conditions are described in a block labelled “Valid Usage” following each command or structure they apply to.

### 3.7.2. Implicit Valid Usage

Some valid usage conditions apply to all commands and structures in the API, unless explicitly denoted otherwise for a specific command or structure. These conditions are considered *implicit*, and are described in a block labelled “Valid Usage (Implicit)” following each command or structure they apply to. Implicit valid usage conditions are described in detail below.

#### Valid Usage for Object Handles

Any input parameter to a command that is an object handle *must* be a valid object handle, unless otherwise specified. An object handle is valid if:

- It has been created or allocated by a previous, successful call to the API. Such calls are noted in the Specification.
- It has not been deleted or freed by a previous call to the API. Such calls are noted in the Specification.
- Any objects used by that object, either as part of creation or execution, *must* also be valid.

The reserved values `VK_NULL_HANDLE` and `NULL` can be used in place of valid non-dispatchable handles and dispatchable handles, respectively, when *explicitly called out in the Specification*. Any command that creates an object successfully *must* not return these values. It is valid to pass these values to `vkDestroy*` or `vkFree*` commands, which will silently ignore these values.

#### Valid Usage for Pointers

Any parameter that is a pointer *must* be a *valid pointer* only if it is explicitly called out by a Valid Usage statement.

A pointer is “valid” if it points at memory containing values of the number and type(s) expected by the command, and all fundamental types accessed through the pointer (e.g. as elements of an array or as members of a structure) satisfy the alignment requirements of the host processor.
Valid Usage for Strings

Any parameter that is a pointer to char must be a finite sequence of values terminated by a null character, or if explicitly called out in the Specification, can be NULL.

Valid Usage for Enumerated Types

Any parameter of an enumerated type must be a valid enumerant for that type. A enumerant is valid if:

- The enumerant is defined as part of the enumerated type.
- The enumerant is not the special value (suffixed with \_MAX\_ENUM) defined for the enumerated type.

1

This special value exists only to ensure that C enum types are 32 bits in size. It is not part of the API, and should not be used by applications.

Any enumerated type returned from a query command or otherwise output from Vulkan to the application must not have a reserved value. Reserved values are values not defined by any extension for that enumerated type.

Note

This language is intended to accommodate cases such as “hidden” extensions known only to driver internals, or layers enabling extensions without knowledge of the application, without allowing return of values not defined by any extension.

Note

Application developers are encouraged to be careful when using switch statements with Vulkan API enums. This is because new extensions can add new values to existing enums. The use of a default: statement, within a switch, may avoid future compilation issues. Particularly for enums like e.g. VkDriverId that may change at any time.

Valid Usage for Flags

A collection of flags is represented by a bitmask using the type VkFlags:

```
// Provided by VK_VERSION_1_0
typedef uint32_t VkFlags;
```

Bitmasks are passed to many commands and structures to compactly represent options, but VkFlags is not used directly in the API. Instead, a Vk*Flags type which is an alias of VkFlags, and whose name matches the corresponding Vk*FlagBits that are valid for that type, is used.

Any Vk*Flags member or parameter used in the API as an input must be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags. A bit flag is valid if:
• The bit flag is defined as part of the `Vk*FlagBits` type, where the bits type is obtained by taking the flag type and replacing the trailing `Flags` with `FlagBits`. For example, a flag value of type `VkColorComponentFlags` must contain only bit flags defined by `VkColorComponentFlagBits`.

• The flag is allowed in the context in which it is being used. For example, in some cases, certain bit flags or combinations of bit flags are mutually exclusive.

Any `Vk*Flags` member or parameter returned from a query command or otherwise output from Vulkan to the application may contain bit flags undefined in its corresponding `Vk*FlagBits` type. An application cannot rely on the state of these unspecified bits.

Only the low-order 31 bits (bit positions zero through 30) are available for use as flag bits.

**Note**

This restriction is due to poorly defined behavior by C compilers given a C enumerant value of `0x80000000`. In some cases adding this enumerant value may increase the size of the underlying `Vk*FlagBits` type, breaking the ABI.

**Valid Usage for Structure Types**

Any parameter that is a structure containing a `sType` member must have a value of `sType` which is a valid `VkStructureType` value matching the type of the structure.

Structure types supported by the Vulkan API include:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStructureType {
    VK_STRUCTURE_TYPE_APPLICATION_INFO = 0,
    VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO = 1,

Each value corresponds to a particular structure with a sType member with a matching name. As a general rule, the name of each VkStructureType value is obtained by taking the name of the structure, stripping the leading Vk, prefixing each capital letter with _, converting the entire resulting string to upper case, and prefixing it with VK_STRUCTURE_TYPE_. For example, structures of type VkImageCreateInfo correspond to a VkStructureType of VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO, and thus its sType member must equal that when it is passed to the API.

The values VK_STRUCTURE_TYPE_LOADER_INSTANCE_CREATE_INFO and VK_STRUCTURE_TYPE_LOADER_DEVICE_CREATE_INFO are reserved for internal use by the loader, and do not have corresponding Vulkan structures in this Specification.
Valid Usage for Structure Pointer Chains

Any parameter that is a structure containing a `void* pNext` member must have a value of `pNext` that is either `NULL`, or is a pointer to a valid extending structure, containing `sType` and `pNext` members as described in the Vulkan Documentation and Extensions document in the section “Extension Interactions”. The set of structures connected by `pNext` pointers is referred to as a `pNext chain`.

Each structure present in the `pNext` chain must be defined at runtime by either:

- a core version which is supported
- an extension which is enabled
- a supported device extension in the case of physical-device-level functionality added by the device extension

Each type of extending structure must not appear more than once in a `pNext` chain, including any aliases. This general rule may be explicitly overridden for specific structures.

Any component of the implementation (the loader, any enabled layers, and drivers) must skip over, without processing (other than reading the `sType` and `pNext` members) any extending structures in the chain not defined by core versions or extensions supported by that component.

As a convenience to implementations and layers needing to iterate through a structure pointer chain, the Vulkan API provides two base structures. These structures allow for some type safety, and can be used by Vulkan API functions that operate on generic inputs and outputs.

The `VkBaseInStructure` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBaseInStructure {
    VkStructureType                    sType;
    const struct VkBaseInStructure*    pNext;
} VkBaseInStructure;
```

- `sType` is the structure type of the structure being iterated through.
- `pNext` is `NULL` or a pointer to the next structure in a structure chain.

`VkBaseInStructure` can be used to facilitate iterating through a read-only structure pointer chain.

The `VkBaseOutStructure` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBaseOutStructure {
    VkStructureType               sType;
    struct VkBaseOutStructure*    pNext;
} VkBaseOutStructure;
```

- `sType` is the structure type of the structure being iterated through.
• `pNext` is `NULL` or a pointer to the next structure in a structure chain.

`VkBaseOutStructure` can be used to facilitate iterating through a structure pointer chain that returns data back to the application.

### Valid Usage for Nested Structures

The above conditions also apply recursively to members of structures provided as input to a command, either as a direct argument to the command, or themselves a member of another structure.

Specifics on valid usage of each command are covered in their individual sections.

### Valid Usage for Extensions

Instance-level functionality or behavior added by an instance extension to the API must not be used unless that extension is supported by the instance as determined by `vkEnumerateInstanceExtensionProperties`, and that extension is enabled in `VkInstanceCreateInfo`.

Physical-device-level functionality or behavior added by an instance extension to the API must not be used unless that extension is supported by the instance as determined by `vkEnumerateInstanceExtensionProperties`, and that extension is enabled in `VkInstanceCreateInfo`.

Physical-device-level functionality or behavior added by a device extension to the API must not be used unless the conditions described in Extending Physical Device Core Functionality are met.

Device functionality or behavior added by a device extension to the API must not be used unless that extension is supported by the device as determined by `vkEnumerateDeviceExtensionProperties`, and that extension is enabled in `VkDeviceCreateInfo`.

### Valid Usage for Newer Core Versions

Instance-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the instance as determined by `vkEnumerateInstanceVersion` and the specified version of `VkApplicationInfo::apiVersion`.

Physical-device-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the physical device as determined by `VkPhysicalDeviceProperties::apiVersion` and the specified version of `VkApplicationInfo::apiVersion`.

Device-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the device as determined by `VkPhysicalDeviceProperties::apiVersion` and the specified version of `VkApplicationInfo::apiVersion`.

### 3.7.3. Return Codes

While the core Vulkan API is not designed to capture incorrect usage, some circumstances still require return codes. Commands in Vulkan return their status via return codes that are in one of two categories:

• Successful completion codes are returned when a command needs to communicate success or
status information. All successful completion codes are non-negative values.

- Run time error codes are returned when a command needs to communicate a failure that could only be detected at runtime. All runtime error codes are negative values.

All return codes in Vulkan are reported via `VkResult` return values. The possible codes are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkResult {
    VK_SUCCESS = 0,
    VK_NOT_READY = 1,
    VK_TIMEOUT = 2,
    VK_EVENT_SET = 3,
    VK_EVENT_RESET = 4,
    VK_INCOMPLETE = 5,
    VK_ERROR_OUT_OF_HOST_MEMORY = -1,
    VK_ERROR_OUT_OF_DEVICE_MEMORY = -2,
    VK_ERROR_INITIALIZATION_FAILED = -3,
    VK_ERROR_DEVICE_LOST = -4,
    VK_ERROR_MEMORY_MAP_FAILED = -5,
    VK_ERROR_LAYER_NOT_PRESENT = -6,
    VK_ERROR_EXTENSION_NOT_PRESENT = -7,
    VK_ERROR_FEATURE_NOT_PRESENT = -8,
    VK_ERROR_INCOMPATIBLE_DRIVER = -9,
    VK_ERROR_TOO_MANY_OBJECTS = -10,
    VK_ERROR_FORMAT_NOT_SUPPORTED = -11,
    VK_ERROR_FRAGMENTED_POOL = -12,
    VK_ERROR_UNKNOWN = -13,
    // Provided by VK_VERSION_1_1
    VK_ERROR_OUT_OF_POOL_MEMORY = -1000069000,
    // Provided by VK_VERSION_1_1
    VK_ERROR_INVALID_EXTERNAL_HANDLE = -1000072003,
    VK_ERROR_FRAGMENTATION = -1000161000,
    VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS = -1000257000,
    // Provided by VK_KHR_surface
    VK_ERROR_SURFACE_LOST_KHR = -1000000000,
    // Provided by VK_KHR_surface
    VK_ERROR_NATIVE_WINDOW_IN_USE_KHR = -1000000001,
    // Provided by VK_KHR_swapchain
    VK_SUBOPTIMAL_KHR = 1000001003,
    // Provided by VK_KHR_swapchain
    VK_ERROR_OUT_OF_DATE_KHR = -1000001004,
    // Provided by VK_KHR_display_swapchain
    VK_ERROR_INCOMPATIBLE_DISPLAY_KHR = -1000003001,
    // Provided by VK_EXT_debug_report
    VK_ERROR_VALIDATION_FAILED_EXT = -1000011001,
    // Provided by VK_NV_glsl_shader
    VK_ERROR_INVALID_SHADER_NV = -1000012000,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT = -1000158000,
    // Provided by VK_EXT_global_priority
};
```
VK_ERROR_NOT_PERMITTED_EXT = -1000174001,
// Provided by VK_EXT_full_screen_exclusive
VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT = -1000255000,
// Provided by VK_KHR_deferred_host_operations
VK_THREAD_IDLE_KHR = 1000268000,
// Provided by VK_KHR_deferred_host_operations
VK_THREAD_DONE_KHR = 1000268001,
// Provided by VK_KHR_deferred_host_operations
VK_OPERATION_DEFERRED_KHR = 1000268002,
// Provided by VK_KHR_deferred_host_operations
VK_OPERATION_NOT_DEFERRED_KHR = 1000268003,
// Provided by VK_KHR_maintenance1
VK_PIPELINE_COMPILE_REQUIRED_EXT = 1000297000,
// Provided by VK_KHR_maintenance1
VK_ERROR_OUT_OF_POOL_MEMORY_KHR = VK_ERROR_OUT_OF_POOL_MEMORY,
// Provided by VK_KHR_external_memory
VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR = VK_ERROR_INVALID_EXTERNAL_HANDLE,
// Provided by VK_EXT_descriptor_indexing
VK_ERROR_FRAGMENTATION_EXT = VK_ERROR_FRAGMENTATION,
// Provided by VK_EXT_buffer_device_address
VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR = VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR,
VK_ERROR_PIPELINE_COMPILE_REQUIRED_EXT = VK_PIPELINE_COMPILE_REQUIRED_EXT,
} VkResult;

Success Codes
- **VK_SUCCESS** Command successfully completed
- **VK_NOT_READY** A fence or query has not yet completed
- **VK_TIMEOUT** A wait operation has not completed in the specified time
- **VK_EVENT_SET** An event is signaled
- **VK_EVENT_RESET** An event is unsignaled
- **VK_INCOMPLETE** A return array was too small for the result
- **VK_SUBOPTIMAL_KHR** A swapchain no longer matches the surface properties exactly, but can still be used to present to the surface successfully.
- **VK_THREAD_IDLE_KHR** A deferred operation is not complete but there is currently no work for this thread to do at the time of this call.
- **VK_THREAD_DONE_KHR** A deferred operation is not complete but there is no work remaining to assign to additional threads.
- **VK_OPERATION_DEFERRED_KHR** A deferred operation was requested and at least some of the work was deferred.
- **VK_OPERATION_NOT_DEFERRED_KHR** A deferred operation was requested and no operations were deferred.
- **VK_PIPELINE_COMPILE_REQUIRED_EXT** A requested pipeline creation would have required
compilation, but the application requested compilation to not be performed.

**Error codes**

- **VK_ERROR_OUT_OF_HOST_MEMORY** A host memory allocation has failed.
- **VK_ERROR_OUT_OF_DEVICE_MEMORY** A device memory allocation has failed.
- **VK_ERROR_INITIALIZATION_FAILED** Initialization of an object could not be completed for implementation-specific reasons.
- **VK_ERROR_DEVICE_LOST** The logical or physical device has been lost. See Lost Device
- **VK_ERROR_MEMORY_MAP_FAILED** Mapping of a memory object has failed.
- **VK_ERROR_LAYER_NOT_PRESENT** A requested layer is not present or could not be loaded.
- **VK_ERROR_EXTENSION_NOT_PRESENT** A requested extension is not supported.
- **VK_ERROR_FEATURE_NOT_PRESENT** A requested feature is not supported.
- **VK_ERROR_INCOMPATIBLE_DRIVER** The requested version of Vulkan is not supported by the driver or is otherwise incompatible for implementation-specific reasons.
- **VK_ERROR_TOO_MANY_OBJECTS** Too many objects of the type have already been created.
- **VK_ERROR_FORMAT_NOT_SUPPORTED** A requested format is not supported on this device.
- **VK_ERROR_FRAGMENTED_POOL** A pool allocation has failed due to fragmentation of the pool’s memory. This must only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. This should be returned in preference to **VK_ERROR_OUT_OF_POOL_MEMORY**, but only if the implementation is certain that the pool allocation failure was due to fragmentation.
- **VK_ERROR_SURFACE_LOST_KHR** A surface is no longer available.
- **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** The requested window is already in use by Vulkan or another API in a manner which prevents it from being used again.
- **VK_ERROR_OUT_OF_DATE_KHR** A surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications must query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.
- **VK_ERROR_INCOMPATIBLE_DISPLAY_KHR** The display used by a swapchain does not use the same presentable image layout, or is incompatible in a way that prevents sharing an image.
- **VK_ERROR_INVALID_SHADER_NV** One or more shaders failed to compile or link. More details are reported back to the application via **VK_EXT_debug_report** if enabled.
- **VK_ERROR_OUT_OF_POOL_MEMORY** A pool memory allocation has failed. This must only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. If the failure was definitely due to fragmentation of the pool, **VK_ERROR_FRAGMENTED_POOL** should be returned instead.
- **VK_ERROR_INVALID_EXTERNAL_HANDLE** An external handle is not a valid handle of the specified type.
- **VK_ERROR_FRAGMENTATION** A descriptor pool creation has failed due to fragmentation.
- **VK_ERROR_INVALID_DEVICE_ADDRESS_EXT** A buffer creation failed because the requested address is not available.
• **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS** A buffer creation or memory allocation failed because the requested address is not available. A shader group handle assignment failed because the requested shader group handle information is no longer valid.

• **VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT** An operation on a swapchain created with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` failed as it did not have exclusive full-screen access. This may occur due to implementation-dependent reasons, outside of the application’s control.

• **VK_ERROR_UNKNOWN** An unknown error has occurred; either the application has provided invalid input, or an implementation failure has occurred.

If a command returns a runtime error, unless otherwise specified any output parameters will have undefined contents, except that if the output parameter is a structure with `sType` and `pNext` fields, those fields will be unmodified. Any structures chained from `pNext` will also have undefined contents, except that `sType` and `pNext` will be unmodified.

**VK_ERROR_OUT_OF_*_MEMORY** errors do not modify any currently existing Vulkan objects. Objects that have already been successfully created can still be used by the application.

---

**Note**

As a general rule, `Free`, `Release`, and `Reset` commands do not return `VK_ERROR_OUT_OF_HOST_MEMORY`, while any other command with a return code may return it. Any exceptions from this rule are described for those commands.

**VK_ERROR_UNKNOWN** will be returned by an implementation when an unexpected error occurs that cannot be attributed to valid behavior of the application and implementation. Under these conditions, it may be returned from any command returning a `VkResult`.

---

**Note**

`VK_ERROR_UNKNOWN` is not expected to ever be returned if the application behavior is valid, and if the implementation is bug-free. If `VK_ERROR_UNKNOWN` is received, the application should be checked against the latest validation layers to verify correct behavior as much as possible. If no issues are identified it could be an implementation issue, and the implementor should be contacted for support.

Performance-critical commands generally do not have return codes. If a runtime error occurs in such commands, the implementation will defer reporting the error until a specified point. For commands that record into command buffers (`vkCmd*`) runtime errors are reported by `vkEndCommandBuffer`.

### 3.8. Numeric Representation and Computation

Implementations normally perform computations in floating-point, and must meet the range and precision requirements defined under “Floating-Point Computation” below.

These requirements only apply to computations performed in Vulkan operations outside of shader execution, such as texture image specification and sampling, and per-fragment operations. Range and precision requirements during shader execution differ and are specified by the *Precision and...*
Operation of SPIR-V Instructions section.

In some cases, the representation and/or precision of operations is implicitly limited by the specified format of vertex or texel data consumed by Vulkan. Specific floating-point formats are described later in this section.

### 3.8.1. Floating-Point Computation

Most floating-point computation is performed in SPIR-V shader modules. The properties of computation within shaders are constrained as defined by the Precision and Operation of SPIR-V Instructions section.

Some floating-point computation is performed outside of shaders, such as viewport and depth range calculations. For these computations, we do not specify how floating-point numbers are to be represented, or the details of how operations on them are performed, but only place minimal requirements on representation and precision as described in the remainder of this section.

We require simply that numbers' floating-point parts contain enough bits and that their exponent fields are large enough so that individual results of floating-point operations are accurate to about 1 part in $10^5$. The maximum representable magnitude for all floating-point values must be at least $2^{32}$.

$x \times 0 = 0 \times x = 0$ for any non-infinite and non-NaN $x$.

$1 \times x = x \times 1 = x$.

$x + 0 = 0 + x = x$.

$0^0 = 1$.

Occasionally, further requirements will be specified. Most single-precision floating-point formats meet these requirements.

The special values Inf and -Inf encode values with magnitudes too large to be represented; the special value NaN encodes “Not A Number” values resulting from undefined arithmetic operations such as $0 / 0$. Implementations may support Inf and NaN in their floating-point computations.

### 3.8.2. Floating-Point Format Conversions

When a value is converted to a defined floating-point representation, finite values falling between two representable finite values are rounded to one or the other. The rounding mode is not defined. Finite values whose magnitude is larger than that of any representable finite value may be rounded either to the closest representable finite value or to the appropriately signed infinity. For unsigned destination formats any negative values are converted to zero. Positive infinity is converted to positive infinity; negative infinity is converted to negative infinity in signed formats and to zero in unsigned formats; and any NaN is converted to a NaN.
3.8.3. 16-Bit Floating-Point Numbers

16-bit floating point numbers are defined in the “16-bit floating point numbers” section of the Khronos Data Format Specification.

3.8.4. Unsigned 11-Bit Floating-Point Numbers

Unsigned 11-bit floating point numbers are defined in the “Unsigned 11-bit floating point numbers” section of the Khronos Data Format Specification.

3.8.5. Unsigned 10-Bit Floating-Point Numbers

Unsigned 10-bit floating point numbers are defined in the “Unsigned 10-bit floating point numbers” section of the Khronos Data Format Specification.

3.8.6. General Requirements

Any representable floating-point value in the appropriate format is legal as input to a Vulkan command that requires floating-point data. The result of providing a value that is not a floating-point number to such a command is unspecified, but must not lead to Vulkan interruption or termination. For example, providing a negative zero (where applicable) or a denormalized number to a Vulkan command must yield deterministic results, while providing a NaN or Inf yields unspecified results.

Some calculations require division. In such cases (including implied divisions performed by vector normalization), division by zero produces an unspecified result but must not lead to Vulkan interruption or termination.

3.9. Fixed-Point Data Conversions

When generic vertex attributes and pixel color or depth components are represented as integers, they are often (but not always) considered to be normalized. Normalized integer values are treated specially when being converted to and from floating-point values, and are usually referred to as normalized fixed-point.

In the remainder of this section, b denotes the bit width of the fixed-point integer representation. When the integer is one of the types defined by the API, b is the bit width of that type. When the integer comes from an image containing color or depth component texels, b is the number of bits allocated to that component in its specified image format.

The signed and unsigned fixed-point representations are assumed to be b-bit binary two’s-complement integers and binary unsigned integers, respectively.

3.9.1. Conversion from Normalized Fixed-Point to Floating-Point

Unsigned normalized fixed-point integers represent numbers in the range [0,1]. The conversion from an unsigned normalized fixed-point value c to the corresponding floating-point value f is defined as
Signed normalized fixed-point integers represent numbers in the range \([-1,1]\). The conversion from a signed normalized fixed-point value \(c\) to the corresponding floating-point value \(f\) is performed using

\[
f = \frac{c}{2^b - 1}
\]

Only the range \([-2^{b-1} + 1, 2^{b-1} - 1]\) is used to represent signed fixed-point values in the range \([-1,1]\). For example, if \(b = 8\), then the integer value -127 corresponds to -1.0 and the value 127 corresponds to 1.0. This equation is used everywhere that signed normalized fixed-point values are converted to floating-point.

Note that while zero is exactly expressible in this representation, one value (-128 in the example) is outside the representable range, and implementations must clamp it to -1.0. Where the value is subject to further processing by the implementation, eg. during texture filtering, values less than -1.0 may be used but the result must be clamped before the value is returned to shaders.

### 3.9.2. Conversion from Floating-Point to Normalized Fixed-Point

The conversion from a floating-point value \(f\) to the corresponding unsigned normalized fixed-point value \(c\) is defined by first clamping \(f\) to the range \([0,1]\), then computing

\[
c = \text{convertFloatToUint}(f \times (2^b - 1), b)
\]

where \text{convertFloatToUint}(r,b) returns one of the two unsigned binary integer values with exactly \(b\) bits which are closest to the floating-point value \(r\). Implementations should round to nearest. If \(r\) is equal to an integer, then that integer value must be returned. In particular, if \(f\) is equal to 0.0 or 1.0, then \(c\) must be assigned 0 or \(2^b - 1\), respectively.

The conversion from a floating-point value \(f\) to the corresponding signed normalized fixed-point value \(c\) is performed by clamping \(f\) to the range \([-1,1]\), then computing

\[
c = \text{convertFloatToInt}(f \times (2^{b-1} - 1), b)
\]

where \text{convertFloatToInt}(r,b) returns one of the two signed two’s-complement binary integer values with exactly \(b\) bits which are closest to the floating-point value \(r\). Implementations should round to nearest. If \(r\) is equal to an integer, then that integer value must be returned. In particular, if \(f\) is equal to -1.0, 0.0, or 1.0, then \(c\) must be assigned \(-2^{b-1}\), 0, or \(2^{b-1} - 1\), respectively.

This equation is used everywhere that floating-point values are converted to signed normalized fixed-point.

### 3.10. Common Object Types

Some types of Vulkan objects are used in many different structures and command parameters, and are described here. These types include offsets, extents, and rectangles.
### 3.10.1. Offsets

Offsets are used to describe a pixel location within an image or framebuffer, as an (x,y) location for two-dimensional images, or an (x,y,z) location for three-dimensional images.

A two-dimensional offset is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkOffset2D {
    int32_t    x;
    int32_t    y;
} VkOffset2D;
```

- x is the x offset.
- y is the y offset.

A three-dimensional offset is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkOffset3D {
    int32_t    x;
    int32_t    y;
    int32_t    z;
} VkOffset3D;
```

- x is the x offset.
- y is the y offset.
- z is the z offset.

### 3.10.2. Extents

Extents are used to describe the size of a rectangular region of pixels within an image or framebuffer, as (width,height) for two-dimensional images, or as (width,height,depth) for three-dimensional images.

A two-dimensional extent is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtent2D {
    uint32_t    width;
    uint32_t    height;
} VkExtent2D;
```

- width is the width of the extent.
- height is the height of the extent.
A three-dimensional extent is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtent3D {
    uint32_t    width;
    uint32_t    height;
    uint32_t    depth;
} VkExtent3D;
```

- `width` is the width of the extent.
- `height` is the height of the extent.
- `depth` is the depth of the extent.

### 3.10.3. Rectangles

Rectangles are used to describe a specified rectangular region of pixels within an image or framebuffer. Rectangles include both an offset and an extent of the same dimensionality, as described above. Two-dimensional rectangles are defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkRect2D {
    VkOffset2D    offset;
    VkExtent2D    extent;
} VkRect2D;
```

- `offset` is a `VkOffset2D` specifying the rectangle offset.
- `extent` is a `VkExtent2D` specifying the rectangle extent.
Chapter 4. Initialization

Before using Vulkan, an application must initialize it by loading the Vulkan commands, and creating a `VkInstance` object.

### 4.1. Command Function Pointers

Vulkan commands are not necessarily exposed by static linking on a platform. Commands to query function pointers for Vulkan commands are described below.

**Note**

When extensions are promoted or otherwise incorporated into another extension or Vulkan core version, command aliases may be included. Whilst the behavior of each command alias is identical, the behavior of retrieving each alias's function pointer is not. A function pointer for a given alias can only be retrieved if the extension or version that introduced that alias is supported and enabled, irrespective of whether any other alias is available.

Function pointers for all Vulkan commands can be obtained with the command:

```c
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetInstanceProcAddr(
    VkInstance instance,
    const char* pName);
```

- `instance` is the instance that the function pointer will be compatible with, or `NULL` for commands not dependent on any instance.
- `pName` is the name of the command to obtain.

`vkGetInstanceProcAddr` itself is obtained in a platform- and loader- specific manner. Typically, the loader library will export this command as a function symbol, so applications can link against the loader library, or load it dynamically and look up the symbol using platform-specific APIs.

The table below defines the various use cases for `vkGetInstanceProcAddr` and expected return value (“fp” is “function pointer”) for each case.

The returned function pointer is of type `PFN_vkVoidFunction`, and must be cast to the type of the command being queried before use.

**Table 1. `vkGetInstanceProcAddr` behavior**

<table>
<thead>
<tr>
<th>instance</th>
<th>pName</th>
<th>return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>*1 NULL</td>
<td>undefined</td>
<td>undefined</td>
</tr>
<tr>
<td>invalid non-NULL</td>
<td>*1</td>
<td>undefined</td>
</tr>
<tr>
<td>instance</td>
<td>NULL</td>
<td>undefined</td>
</tr>
<tr>
<td>NULL</td>
<td>vkEnumerateInstanceVersion</td>
<td>fp</td>
</tr>
</tbody>
</table>
### Table

<table>
<thead>
<tr>
<th>instance</th>
<th>pName</th>
<th>return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>vkEnumerateInstanceExtensionProperties</td>
<td>fp</td>
</tr>
<tr>
<td>NULL</td>
<td>vkEnumerateInstanceLayerProperties</td>
<td>fp</td>
</tr>
<tr>
<td>NULL</td>
<td>vkCreateInstance</td>
<td>fp</td>
</tr>
<tr>
<td>instance</td>
<td>core Vulkan command</td>
<td>fp(^2)</td>

<td>available device extension(^3) commands for instance</td>
<td>fp(^2)</td>
</tr>
<tr>
<td>any other case, not covered above</td>
<td>NULL</td>
<td></td>
</tr>
</tbody>
</table>

1

"*" means any representable value for the parameter (including valid values, invalid values, and NULL).

2

The returned function pointer **must** only be called with a dispatchable object (the first parameter) that is `instance` or a child of `instance`, e.g. `VkInstance`, `VkPhysicalDevice`, `VkDevice`, `VkQueue`, or `VkCommandBuffer`.

3

An “available device extension” is a device extension supported by any physical device enumerated by `instance`.

### Valid Usage (Implicit)

- **VUID-vkGetInstanceProcAddr-instance-parameter**
  If `instance` is not NULL, `instance` must be a valid `VkInstance` handle

- **VUID-vkGetInstanceProcAddr-pName-parameter**
  `pName` must be a null-terminated UTF-8 string

In order to support systems with multiple Vulkan implementations, the function pointers returned by `vkGetInstanceProcAddr` may point to dispatch code that calls a different real implementation for different `VkDevice` objects or their child objects. The overhead of the internal dispatch for `VkDevice` objects can be avoided by obtaining device-specific function pointers for any commands that use a device or device-child object as their dispatchable object. Such function pointers **can** be obtained with the command:
The table below defines the various use cases for `vkGetDeviceProcAddr` and expected return value for each case.

The returned function pointer is of type `PFN_vkVoidFunction`, and **must** be cast to the type of the command being queried before use. The function pointer **must** only be called with a dispatchable object (the first parameter) that is `device` or a child of `device`.

<table>
<thead>
<tr>
<th>device</th>
<th>pName</th>
<th>return value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>NULL</code></td>
<td><code>*</code>1</td>
<td>undefined</td>
</tr>
<tr>

</tr>
<tr>
<td>device</td>
<td>enabled extension device-level commands²</td>
<td>fp³</td>
</tr>
<tr>
<td>any other case, not covered above</td>
<td><code>NULL</code></td>
<td></td>
</tr>
</tbody>
</table>

1

"*" means any representable value for the parameter (including valid values, invalid values, and `NULL`).

2

In this function, device-level excludes all physical-device-level commands.

3

The returned function pointer **must** only be called with a dispatchable object (the first parameter) that is `device` or a child of `device` e.g. `VkDevice`, `VkQueue`, or `VkCommandBuffer`.

---

**Valid Usage (Implicit)**

- `VUID-vkGetDeviceProcAddr-device-parameter`
  - `device` **must** be a valid `VkDevice` handle

- `VUID-vkGetDeviceProcAddr-pName-parameter`
  - `pName` **must** be a null-terminated UTF-8 string

The definition of `PFN_vkVoidFunction` is:
4.1.1. Extending Physical Device Core Functionality

New core physical-device-level functionality can be used when the physical-device version is greater than or equal to the version of Vulkan that added the new functionality. The Vulkan version supported by a physical device can be obtained by calling `vkGetPhysicalDeviceProperties`.

4.1.2. Extending Physical Device From Device Extensions

When the `VK_KHR_get_physical_device_properties2` extension is enabled, or when both the instance and the physical-device versions are at least 1.1, physical-device-level functionality of a device extension can be used with a physical device if the corresponding extension is enumerated by `vkEnumerateDeviceExtensionProperties` for that physical device, even before a logical device has been created.

To obtain a function pointer for a physical-device-level command from a device extension, an application can use `vkGetInstanceProcAddr`. This function pointer may point to dispatch code, which calls a different real implementation for different `VkPhysicalDevice` objects. Applications must not use a `VkPhysicalDevice` in any command added by an extension or core version that is not supported by that physical device.

Device extensions may define structures that can be added to the `pNext` chain of physical-device-level commands.

4.2. Instances

There is no global state in Vulkan and all per-application state is stored in a `VkInstance` object. Creating a `VkInstance` object initializes the Vulkan library and allows the application to pass information about itself to the implementation.

Instances are represented by `VkInstance` handles:

```c
// Provided by VK_VERSION_1_0
typedef void (VKAPI_PTR *PFN_vkVoidFunction)(void);
```

To query the version of instance-level functionality supported by the implementation, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkEnumerateInstanceVersion(
    uint32_t* pApiVersion);
```

- `pApiVersion` is a pointer to a `uint32_t`, which is the version of Vulkan supported by instance-level functionality, encoded as described in Version Numbers.
Note
The intended behaviour of `vkEnumerateInstanceVersion` is that an implementation should not need to perform memory allocations and should unconditionally return `VK_SUCCESS`. The loader, and any enabled layers, may return `VK_ERROR_OUT_OF_HOST_MEMORY` in the case of a failed memory allocation.

Valid Usage (Implicit)

- VUID-vkEnumerateInstanceVersion-pApiVersion-parameter
  
  `pApiVersion` must be a valid pointer to a `uint32_t` value

Return Codes

Success
- `VK_SUCCESS`

Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`

To create an instance object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateInstance(
    const VkInstanceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkInstance* pInstance);
```

- `pCreateInfo` is a pointer to a `VkInstanceCreateInfo` structure controlling creation of the instance.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pInstance` points a `VkInstance` handle in which the resulting instance is returned.

`vkCreateInstance` verifies that the requested layers exist. If not, `vkCreateInstance` will return `VK_ERROR_LAYER_NOT_PRESENT`. Next `vkCreateInstance` verifies that the requested extensions are supported (e.g. in the implementation or in any enabled instance layer) and if any requested extension is not supported, `vkCreateInstance` must return `VK_ERROR_EXTENSION_NOT_PRESENT`. After verifying and enabling the instance layers and extensions the `VkInstance` object is created and returned to the application. If a requested extension is only supported by a layer, both the layer and the extension need to be specified at `vkCreateInstance` time for the creation to succeed.
Valid Usage

- VUID-vkCreateInstance-ppEnabledExtensionNames-01388
  All required extensions for each extension in the VkInstanceCreateInfo::ppEnabledExtensionNames list must also be present in that list

Valid Usage (Implicit)

- VUID-vkCreateInstance-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkInstanceCreateInfo structure

- VUID-vkCreateInstance-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateInstance-pInstance-parameter
  pInstance must be a valid pointer to a VkInstance handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_LAYER_NOT_PRESENT
- VK_ERROR_EXTENSION_NOT_PRESENT
- VK_ERROR_INCOMPATIBLE_DRIVER

The VkInstanceCreateInfo structure is defined as:
// Provided by VK_VERSION_1_0

typedef struct VkInstanceCreateInfo {
    VkStructureType             sType;
    const void*                 pNext;
    VkInstanceCreateFlags       flags;
    const VkApplicationInfo*    pApplicationInfo;
    uint32_t                    enabledLayerCount;
    const char* const*          ppEnabledLayerNames;
    uint32_t                    enabledExtensionCount;
    const char* const*          ppEnabledExtensionNames;
} VkInstanceCreateInfo;

• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is reserved for future use.

• **pApplicationInfo** is NULL or a pointer to a VkApplicationInfo structure. If not NULL, this information helps implementations recognize behavior inherent to classes of applications. VkApplicationInfo is defined in detail below.

• **enabledLayerCount** is the number of global layers to enable.

• **ppEnabledLayerNames** is a pointer to an array of enabledLayerCount null-terminated UTF-8 strings containing the names of layers to enable for the created instance. The layers are loaded in the order they are listed in this array, with the first array element being the closest to the application, and the last array element being the closest to the driver. See the Layers section for further details.

• **enabledExtensionCount** is the number of global extensions to enable.

• **ppEnabledExtensionNames** is a pointer to an array of enabledExtensionCount null-terminated UTF-8 strings containing the names of extensions to enable.
Valid Usage (Implicit)

- **VUID-VkInstanceCreateInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO`

- **VUID-VkInstanceCreateInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDebugReportCallbackCreateInfoEXT`, `VkDebugUtilsMessengerCreateInfoEXT`, `VkValidationFeaturesEXT`, or `VkValidationFlagsEXT`

- **VUID-VkInstanceCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkDebugUtilsMessengerCreateInfoEXT`

- **VUID-VkInstanceCreateInfo-flags-zerobitmask**
  
  `flags` must be 0

- **VUID-VkInstanceCreateInfo-pApplicationInfo-parameter**
  
  If `pApplicationInfo` is not `NULL`, `pApplicationInfo` must be a valid pointer to a valid `VkApplicationInfo` structure

- **VUID-VkInstanceCreateInfo-ppEnabledLayerNames-parameter**
  
  If `enabledLayerCount` is not 0, `ppEnabledLayerNames` must be a valid pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings

- **VUID-VkInstanceCreateInfo-ppEnabledExtensionNames-parameter**
  
  If `enabledExtensionCount` is not 0, `ppEnabledExtensionNames` must be a valid pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings

---

`// Provided by VK_VERSION_1_0`

typedef VkFlags VkInstanceCreateFlags;

`VkInstanceCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

When creating a Vulkan instance for which you wish to disable validation checks, add a `VkValidationFlagsEXT` structure to the `pNext` chain of the ` VkInstanceCreateInfo` structure, specifying the checks to be disabled.

---

`// Provided by VK_EXT_validation_flags`

typedef struct VkValidationFlagsEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t disabledValidationCheckCount;
    const VkValidationCheckEXT* pDisabledValidationChecks;
} VkValidationFlagsEXT;

- `sType` is the type of this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
• `disabledValidationCheckCount` is the number of checks to disable.

• `pDisabledValidationChecks` is a pointer to an array of `VkValidationCheckEXT` values specifying the validation checks to be disabled.

---

**Valid Usage (Implicit)**

- **VUID-VkValidationFlagsEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_VALIDATION_FLAGS_EXT`

- **VUID-VkValidationFlagsEXT-pDisabledValidationChecks-parameter**
  
  `pDisabledValidationChecks` must be a valid pointer to an array of `disabledValidationCheckCount` valid `VkValidationCheckEXT` values

- **VUID-VkValidationFlagsEXT-disabledValidationCheckCount-arraylength**
  
  `disabledValidationCheckCount` must be greater than 0

Possible values of elements of the `VkValidationFlagsEXT::pDisabledValidationChecks` array, specifying validation checks to be disabled, are:

```c
// Provided by VK_EXT_validation_flags
typedef enum VkValidationCheckEXT {
    VK_VALIDATION_CHECK_ALL_EXT = 0,
    VK_VALIDATION_CHECK_SHADERS_EXT = 1,
} VkValidationCheckEXT;
```

- `VK_VALIDATION_CHECK_ALL_EXT` specifies that all validation checks are disabled.
- `VK_VALIDATION_CHECK_SHADERS_EXT` specifies that shader validation is disabled.

When creating a Vulkan instance for which you wish to enable or disable specific validation features, add a `VkValidationFeaturesEXT` structure to the `pNext` chain of the `VkInstanceCreateInfo` structure, specifying the features to be enabled or disabled.

```c
// Provided by VK_EXT_validation_features
typedef struct VkValidationFeaturesEXT {
    VkStructureType                         sType;
    const void*                             pNext;
    uint32_t                                enabledValidationFeatureCount;
    const VkValidationFeatureEnableEXT*     pEnabledValidationFeatures;
    uint32_t                                disabledValidationFeatureCount;
    const VkValidationFeatureDisableEXT*    pDisabledValidationFeatures;
} VkValidationFeaturesEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `enabledValidationFeatureCount` is the number of features to enable.
• **pEnabledValidationFeatures** is a pointer to an array of `VkValidationFeatureEnableEXT` values specifying the validation features to be enabled.

• **disabledValidationFeatureCount** is the number of features to disable.

• **pDisabledValidationFeatures** is a pointer to an array of `VkValidationFeatureDisableEXT` values specifying the validation features to be disabled.

---

### Valid Usage

• VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-02967
  If the `pEnabledValidationFeatures` array contains `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT`, then it must also contain `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT`.

• VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-02968
  If the `pEnabledValidationFeatures` array contains `VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT`, then it must not contain `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT`.

---

### Valid Usage (Implicit)

• VUID-VkValidationFeaturesEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VALIDATION_FEATURES_EXT`.

• VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-parameter
  If `enabledValidationFeatureCount` is not 0, `pEnabledValidationFeatures` must be a valid pointer to an array of `enabledValidationFeatureCount` valid `VkValidationFeatureEnableEXT` values.

• VUID-VkValidationFeaturesEXT-pDisabledValidationFeatures-parameter
  If `disabledValidationFeatureCount` is not 0, `pDisabledValidationFeatures` must be a valid pointer to an array of `disabledValidationFeatureCount` valid `VkValidationFeatureDisableEXT` values.

---

Possible values of elements of the `VkValidationFeaturesEXT::pEnabledValidationFeatures` array, specifying validation features to be enabled, are:

```c
// Provided by VK_EXT_validation_features
typedef enum VkValidationFeatureEnableEXT {
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT = 0,
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT = 1,
    VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT = 2,
    VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT = 3,
    VK_VALIDATION_FEATURE_ENABLE_SYNCHRONIZATION_VALIDATION_EXT = 4,
} VkValidationFeatureEnableEXT;
```

• **VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT** specifies that GPU-assisted validation is enabled. Activating this feature instruments shader programs to generate additional diagnostic data. This
feature is disabled by default.

- **VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT** specifies that the validation layers reserve a descriptor set binding slot for their own use. The layer reports a value for `VkPhysicalDeviceLimits::maxBoundDescriptorSets` that is one less than the value reported by the device. If the device supports the binding of only one descriptor set, the validation layer does not perform GPU-assisted validation. This feature is disabled by default.

- **VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT** specifies that Vulkan best-practices validation is enabled. Activating this feature enables the output of warnings related to common misuse of the API, but which are not explicitly prohibited by the specification. This feature is disabled by default.

- **VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT** specifies that the layers will process `debugPrintfEXT` operations in shaders and send the resulting output to the debug callback. This feature is disabled by default.

- **VK_VALIDATION_FEATURE_ENABLE_SYNCHRONIZATION_VALIDATION_EXT** specifies that Vulkan synchronization validation is enabled. This feature reports resource access conflicts due to missing or incorrect synchronization operations between actions (Draw, Copy, Dispatch, Blit) reading or writing the same regions of memory. This feature is disabled by default.

Possible values of elements of the `VkValidationFeaturesEXT::pDisabledValidationFeatures` array, specifying validation features to be disabled, are:

```c
// Provided by VK_EXT_validation_features
typedef enum VkValidationFeatureDisableEXT {
    VK_VALIDATION_FEATURE_DISABLE_ALL_EXT = 0,
    VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT = 1,
    VK_VALIDATION_FEATURE_DISABLE_THREAD_SAFETY_EXT = 2,
    VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT = 3,
    VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT = 4,
    VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT = 5,
    VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT = 6,
} VkValidationFeatureDisableEXT;
```

- **VK_VALIDATION_FEATURE_DISABLE_ALL_EXT** specifies that all validation checks are disabled.

- **VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT** specifies that shader validation is disabled. This feature is enabled by default.

- **VK_VALIDATION_FEATURE_DISABLE_THREAD_SAFETY_EXT** specifies that thread safety validation is disabled. This feature is enabled by default.

- **VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT** specifies that stateless parameter validation is disabled. This feature is enabled by default.

- **VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT** specifies that object lifetime validation is disabled. This feature is enabled by default.

- **VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT** specifies that core validation checks are disabled. This feature is enabled by default. If this feature is disabled, the shader validation and GPU-assisted validation features are also disabled.
• **VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT** specifies that protection against duplicate non-dispatchable object handles is disabled. This feature is enabled by default.

**Note**
Disabling checks such as parameter validation and object lifetime validation prevents the reporting of error conditions that can cause other validation checks to behave incorrectly or crash. Some validation checks assume that their inputs are already valid and do not always revalidate them.

**Note**
The **VK_EXT_validation_features** extension subsumes all the functionality provided in the **VK_EXT_validation_flags** extension.

The **VkApplicationInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkApplicationInfo {
    VkStructureType    sType;
    const void*        pNext;
    const char*        pApplicationName;
    uint32_t           applicationVersion;
    const char*        pEngineName;
    uint32_t           engineVersion;
    uint32_t           apiVersion;
} VkApplicationInfo;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **pApplicationName** is **NULL** or is a pointer to a null-terminated UTF-8 string containing the name of the application.
- **applicationVersion** is an unsigned integer variable containing the developer-supplied version number of the application.
- **pEngineName** is **NULL** or is a pointer to a null-terminated UTF-8 string containing the name of the engine (if any) used to create the application.
- **engineVersion** is an unsigned integer variable containing the developer-supplied version number of the engine used to create the application.
- **apiVersion** must be the highest version of Vulkan that the application is designed to use, encoded as described in **Version Numbers**. The patch version number specified in **apiVersion** is ignored when creating an instance object. Only the major and minor versions of the instance **must** match those requested in **apiVersion**.

Vulkan 1.0 implementations were required to return **VK_ERROR_INCOMPATIBLE_DRIVER** if **apiVersion** was larger than 1.0. Implementations that support Vulkan 1.1 or later must not return **VK_ERROR_INCOMPATIBLE_DRIVER** for any value of **apiVersion**.
Note
Because Vulkan 1.0 implementations may fail with VK_ERROR_INCOMPATIBLE_DRIVER, applications should determine the version of Vulkan available before calling vkCreateInstance. If the vkGetInstanceProcAddr returns NULL for vkEnumerateInstanceVersion, it is a Vulkan 1.0 implementation. Otherwise, the application can call vkEnumerateInstanceVersion to determine the version of Vulkan.

As long as the instance supports at least Vulkan 1.1, an application can use different versions of Vulkan with an instance than it does with a device or physical device.

Note
The Khronos validation layers will treat apiVersion as the highest API version the application targets, and will validate API usage against the minimum of that version and the implementation version (instance or device, depending on context). If an application tries to use functionality from a greater version than this, a validation error will be triggered.

For example, if the instance supports Vulkan 1.1 and three physical devices support Vulkan 1.0, Vulkan 1.1, and Vulkan 1.2, respectively, and if the application sets apiVersion to 1.2, the application can use the following versions of Vulkan:

- Vulkan 1.0 can be used with the instance and with all physical devices.
- Vulkan 1.1 can be used with the instance and with the physical devices that support Vulkan 1.1 and Vulkan 1.2.
- Vulkan 1.2 can be used with the physical device that supports Vulkan 1.2.

If we modify the above example so that the application sets apiVersion to 1.1, then the application must not use Vulkan 1.2 functionality on the physical device that supports Vulkan 1.2.

Implicit layers must be disabled if they do not support a version at least as high as apiVersion. See the Vulkan Loader Specification and Architecture Overview document for additional information.

Note
Providing a NULL VkInstanceCreateInfo::pApplicationInfo or providing an apiVersion of 0 is equivalent to providing an apiVersion of VK_MAKE_API_VERSION(0,1,0,0).

Valid Usage

- VUID-VkApplicationInfo-apiVersion-04010
  If apiVersion is not 0, then it must be greater or equal to VK_API_VERSION_1_0
Valid Usage (Implicit)

- VUID-VkApplicationInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_APPLICATION_INFO

- VUID-VkApplicationInfo-pNext-pNext
  pNext must be NULL

- VUID-VkApplicationInfo-pApplicationName-parameter
  If pApplicationName is not NULL, pApplicationName must be a null-terminated UTF-8 string

- VUID-VkApplicationInfo-pEngineName-parameter
  If pEngineName is not NULL, pEngineName must be a null-terminated UTF-8 string

To destroy an instance, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyInstance(
    VkInstance instance,
    const VkAllocationCallbacks* pAllocator);
```

- instance is the handle of the instance to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyInstance-instance-00629
  All child objects created using instance must have been destroyed prior to destroying instance

- VUID-vkDestroyInstance-instance-00630
  If VkAllocationCallbacks were provided when instance was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyInstance-instance-00631
  If no VkAllocationCallbacks were provided when instance was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyInstance-instance-parameter
  If instance is not NULL, instance must be a valid VkInstance handle

- VUID-vkDestroyInstance-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
Host Synchronization

- Host access to instance must be externally synchronized
- Host access to all VkPhysicalDevice objects enumerated from instance must be externally synchronized
Chapter 5. Devices and Queues

Once Vulkan is initialized, devices and queues are the primary objects used to interact with a Vulkan implementation.

Vulkan separates the concept of physical and logical devices. A physical device usually represents a single complete implementation of Vulkan (excluding instance-level functionality) available to the host, of which there are a finite number. A logical device represents an instance of that implementation with its own state and resources independent of other logical devices.

Physical devices are represented by VkPhysicalDevice handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkPhysicalDevice)
```

### 5.1. Physical Devices

To retrieve a list of physical device objects representing the physical devices installed in the system, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumeratePhysicalDevices(
    VkInstance instance,                  
    uint32_t* pPhysicalDeviceCount,      
    VkPhysicalDevice* pPhysicalDevices); 
```

- `instance` is a handle to a Vulkan instance previously created with `vkCreateInstance`.
- `pPhysicalDeviceCount` is a pointer to an integer related to the number of physical devices available or queried, as described below.
- `pPhysicalDevices` is either `NULL` or a pointer to an array of `VkPhysicalDevice` handles.

If `pPhysicalDevices` is `NULL`, then the number of physical devices available is returned in `pPhysicalDeviceCount`. Otherwise, `pPhysicalDeviceCount` must point to a variable set by the user to the number of elements in the `pPhysicalDevices` array, and on return the variable is overwritten with the number of handles actually written to `pPhysicalDevices`. If `pPhysicalDeviceCount` is less than the number of physical devices available, at most `pPhysicalDeviceCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available physical devices were returned.
Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDevices-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkEnumeratePhysicalDevices-pPhysicalDeviceCount-parameter
  pPhysicalDeviceCount must be a valid pointer to a uint32_t value

- VUID-vkEnumeratePhysicalDevices-pPhysicalDevices-parameter
  If the value referenced by pPhysicalDeviceCount is not 0, and pPhysicalDevices is not NULL, pPhysicalDevices must be a valid pointer to an array of pPhysicalDeviceCount VkPhysicalDevice handles

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED

To query general properties of physical devices once enumerated, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceProperties(
    VkPhysicalDevice                            physicalDevice,
    VkPhysicalDeviceProperties*                 pProperties);
```

- physicalDevice is the handle to the physical device whose properties will be queried.
- pProperties is a pointer to a VkPhysicalDeviceProperties structure in which properties are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceProperties-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceProperties-pProperties-parameter
  pProperties must be a valid pointer to a VkPhysicalDeviceProperties structure

The VkPhysicalDeviceProperties structure is defined as:
typedef struct VkPhysicalDeviceProperties {
    uint32_t apiVersion;
    uint32_t driverVersion;
    uint32_t vendorID;
    uint32_t deviceID;
    VkPhysicalDeviceType deviceType;
    char deviceName[VK_MAX_PHYSICAL_DEVICE_NAME_SIZE];
    uint8_t pipelineCacheUUID[VK_UUID_SIZE];
    VkPhysicalDeviceLimits limits;
    VkPhysicalDeviceSparseProperties sparseProperties;
} VkPhysicalDeviceProperties;

- **apiVersion** is the version of Vulkan supported by the device, encoded as described in Version Numbers.
- **driverVersion** is the vendor-specified version of the driver.
- **vendorID** is a unique identifier for the vendor (see below) of the physical device.
- **deviceID** is a unique identifier for the physical device among devices available from the vendor.
- **deviceType** is a `VkPhysicalDeviceType` specifying the type of device.
- **deviceName** is an array of `VK_MAX_PHYSICAL_DEVICE_NAME_SIZE` char containing a null-terminated UTF-8 string which is the name of the device.
- **pipelineCacheUUID** is an array of `VK_UUID_SIZE` uint8_t values representing a universally unique identifier for the device.
- **limits** is the `VkPhysicalDeviceLimits` structure specifying device-specific limits of the physical device. See Limits for details.
- **sparseProperties** is the `VkPhysicalDeviceSparseProperties` structure specifying various sparse related properties of the physical device. See Sparse Properties for details.

**Note**
The value of **apiVersion** may be different than the version returned by `vkEnumerateInstanceVersion`; either higher or lower. In such cases, the application must not use functionality that exceeds the version of Vulkan associated with a given object. The `pApiVersion` parameter returned by `vkEnumerateInstanceVersion` is the version associated with a `VkInstance` and its children, except for a `VkPhysicalDevice` and its children. `VkPhysicalDeviceProperties::apiVersion` is the version associated with a `VkPhysicalDevice` and its children.

**Note**
The encoding of **driverVersion** is implementation-defined. It may not use the same encoding as **apiVersion**. Applications should follow information from the vendor on how to extract the version information from **driverVersion**.
The `vendorID` and `deviceID` fields are provided to allow applications to adapt to device characteristics that are not adequately exposed by other Vulkan queries.

**Note**

These may include performance profiles, hardware errata, or other characteristics.

The `vendor` identified by `vendorID` is the entity responsible for the most salient characteristics of the underlying implementation of the `VkPhysicalDevice` being queried.

**Note**

For example, in the case of a discrete GPU implementation, this should be the GPU chipset vendor. In the case of a hardware accelerator integrated into a system-on-chip (SoC), this should be the supplier of the silicon IP used to create the accelerator.

If the vendor has a PCI vendor ID, the low 16 bits of `vendorID` must contain that PCI vendor ID, and the remaining bits must be set to zero. Otherwise, the value returned must be a valid Khronos vendor ID, obtained as described in the Vulkan Documentation and Extensions: Procedures and Conventions document in the section “Registering a Vendor ID with Khronos”. Khronos vendor IDs are allocated starting at 0x10000, to distinguish them from the PCI vendor ID namespace. Khronos vendor IDs are symbolically defined in the `VkVendorId` type.

The vendor is also responsible for the value returned in `deviceID`. If the implementation is driven primarily by a PCI device with a PCI device ID, the low 16 bits of `deviceID` must contain that PCI device ID, and the remaining bits must be set to zero. Otherwise, the choice of what values to return may be dictated by operating system or platform policies - but should uniquely identify both the device version and any major configuration options (for example, core count in the case of multicore devices).

**Note**

The same device ID should be used for all physical implementations of that device version and configuration. For example, all uses of a specific silicon IP GPU version and configuration should use the same device ID, even if those uses occur in different SoCs.

Khronos vendor IDs which may be returned in `VkPhysicalDeviceProperties::vendorID` are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkVendorId {
    VK_VENDOR_ID_VIV = 0x10001,
    VK_VENDOR_ID_VSI = 0x10002,
    VK_VENDOR_ID_KAZAN = 0x10003,
    VK_VENDOR_ID_CODEPLAY = 0x10004,
    VK_VENDOR_ID_MESA = 0x10005,
    VK_VENDOR_ID_POCL = 0x10006,
} VkVendorId;
```
Khronos vendor IDs may be allocated by vendors at any time. Only the latest canonical versions of this Specification, of the corresponding \texttt{vk.xml} API Registry, and of the corresponding \texttt{vulkan_core.h} header file \textbf{must} contain all reserved Khronos vendor IDs.

Only Khronos vendor IDs are given symbolic names at present. PCI vendor IDs returned by the implementation can be looked up in the PCI-SIG database.

The physical device types which \textbf{may} be returned in \texttt{VkPhysicalDeviceProperties::devicetype} are:

\begin{verbatim}
// Provided by VK_VERSION_1_0
typedef enum VkPhysicalDeviceType {
    VK_PHYSICAL_DEVICE_TYPE_OTHER = 0,
    VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU = 1,
    VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU = 2,
    VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU = 3,
    VK_PHYSICAL_DEVICE_TYPE_CPU = 4,
} VkPhysicalDeviceType;
\end{verbatim}

- \texttt{VK_PHYSICAL_DEVICE_TYPE_OTHER} - the device does not match any other available types.
- \texttt{VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU} - the device is typically one embedded in or tightly coupled with the host.
- \texttt{VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU} - the device is typically a separate processor connected to the host via an interlink.
- \texttt{VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU} - the device is typically a virtual node in a virtualization environment.
- \texttt{VK_PHYSICALDEVICE_TYPE_CPU} - the device is typically running on the same processors as the host.

The physical device type is advertised for informational purposes only, and does not directly affect the operation of the system. However, the device type \textbf{may} correlate with other advertised properties or capabilities of the system, such as how many memory heaps there are.

To query general properties of physical devices once enumerated, call:

\begin{verbatim}
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceProperties2(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);
\end{verbatim}

or the equivalent command
void vkGetPhysicalDeviceProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);

- **physicalDevice** is the handle to the physical device whose properties will be queried.
- **pProperties** is a pointer to a `VkPhysicalDeviceProperties2` structure in which properties are returned.

Each structure in `pProperties` and its `pNext` chain contains members corresponding to implementation-dependent properties, behaviors, or limits. `vkGetPhysicalDeviceProperties2` fills in each member to specify the corresponding value for the implementation.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceProperties2-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- **VUID-vkGetPhysicalDeviceProperties2-pProperties-parameter**
  - `pProperties` must be a valid pointer to a `VkPhysicalDeviceProperties2` structure

The `VkPhysicalDeviceProperties2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProperties2 {
    VkStructureType sType;
    void* pNext;
    VkPhysicalDeviceProperties properties;
} VkPhysicalDeviceProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceProperties2 VkPhysicalDeviceProperties2KHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **properties** is a `VkPhysicalDeviceProperties` structure describing properties of the physical device. This structure is written with the same values as if it were written by `vkGetPhysicalDeviceProperties`.

The `pNext` chain of this structure is used to extend the structure with properties defined by extensions.
Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceProperties2-sType-sType**
  
  sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROPERTIES_2**

- **VUID-VkPhysicalDeviceProperties2-pNext-pNext**
  
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of

  - VkPhysicalDeviceAccelerationStructurePropertiesKHR,
  - VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT,
  - VkPhysicalDeviceConservativeRasterizationPropertiesEXT,
  - VkPhysicalDeviceCooperativeMatrixPropertiesNV,
  - VkPhysicalDeviceCustomBorderColorPropertiesEXT,
  - VkPhysicalDeviceDepthStencilResolveProperties,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT, VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExternalMemoryHostPropertiesEXT,
  - VkPhysicalDeviceFloatControlsProperties,
  - VkPhysicalDeviceFragmentDensityMap2PropertiesEXT,
  - VkPhysicalDeviceFragmentDensityMapPropertiesEXT,
  - VkPhysicalDeviceFragmentShadingRateEnumsPropertiesNV,
  - VkPhysicalDeviceFragmentShadingRatePropertiesKHR, VkPhysicalDeviceIDProperties,
  - VkPhysicalDeviceInlineUniformBlockPropertiesEXT,
  - VkPhysicalDeviceLineRasterizationPropertiesEXT,
  - VkPhysicalDeviceMaintenance3Properties,
  - VkPhysicalDeviceMeshShaderPropertiesNV,
  - VkPhysicalDeviceMultiviewPerViewAttributesPropertiesNVX,
  - VkPhysicalDeviceMultiviewProperties, VkPhysicalDevicePCIBusInfoPropertiesEXT,
  - VkPhysicalDevicePerformanceQueryPropertiesKHR,
  - VkPhysicalDevicePointClippingProperties,
  - VkPhysicalDevicePortabilitySubsetPropertiesKHR,
  - VkPhysicalDeviceProtectedMemoryProperties,
  - VkPhysicalDeviceProvokingVertexPropertiesEXT,
  - VkPhysicalDevicePushDescriptorPropertiesKHR,
  - VkPhysicalDeviceRayTracingPipelinePropertiesKHR,
  - VkPhysicalDeviceRayTracingPropertiesNV, VkPhysicalDeviceRobustness2PropertiesEXT,
  - VkPhysicalDeviceSampleLocationsPropertiesEXT,
  - VkPhysicalDeviceSamplerFilterMinmaxProperties,
  - VkPhysicalDeviceShaderCoreProperties2AMD,
  - VkPhysicalDeviceShaderCorePropertiesAMD,
  - VkPhysicalDeviceShaderSMBuiltinsPropertiesNV,
  - VkPhysicalDeviceShadingRateImagePropertiesNV, VkPhysicalDeviceSubgroupProperties,
  - VkPhysicalDeviceSubgroupSizeControlPropertiesEXT,
  - VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT,
  - VkPhysicalDeviceTimelineSemaphoreProperties,
  - VkPhysicalDeviceTransformFeedbackPropertiesEXT,
  - VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT.

or
The `sType` value of each struct in the `pNext` chain must be unique.

The `VkPhysicalDeviceIDProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceIDProperties {
    VkStructureType    sType;
    void*              pNext;
    uint8_t            deviceUUID[VK_UUID_SIZE];
    uint8_t            driverUUID[VK_UUID_SIZE];
    uint8_t            deviceLUID[VK_LUID_SIZE];
    uint32_t           deviceNodeMask;
    VkBool32           deviceLUIDValid;
} VkPhysicalDeviceIDProperties;
```

or the equivalent:

```c
// Provided by VK_KHR_external_memory_capabilities, VK_KHR_external_semaphore_capabilities, VK_KHR_external_fence_capabilities
typedef VkPhysicalDeviceIDProperties VkPhysicalDeviceIDPropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the device.
- `driverUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the driver build in use by the device.
- `deviceLUID` is an array of `VK_LUID_SIZE` `uint8_t` values representing a locally unique identifier for the device.
- `deviceNodeMask` is a `uint32_t` bitfield identifying the node within a linked device adapter corresponding to the device.
- `deviceLUIDValid` is a boolean value that will be `VK_TRUE` if `deviceLUID` contains a valid LUID and `deviceNodeMask` contains a valid node mask, and `VK_FALSE` if they do not.

If the `VkPhysicalDeviceIDProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

`deviceUUID` must be immutable for a given device across instances, processes, driver APIs, driver versions, and system reboots.

Applications can compare the `driverUUID` value across instance and process boundaries, and can make similar queries in external APIs to determine whether they are capable of sharing memory.
objects and resources using them with the device.

deviceUUID and/or driverUUID must be used to determine whether a particular external object can be shared between driver components, where such a restriction exists as defined in the compatibility table for the particular object type:

- External memory handle types compatibility
- External semaphore handle types compatibility
- External fence handle types compatibility

If deviceLUIDValid is VK_FALSE, the values of deviceLUID and deviceNodeMask are undefined. If deviceLUIDValid is VK_TRUE and Vulkan is running on the Windows operating system, the contents of deviceLUID can be cast to an LUID object and must be equal to the locally unique identifier of a IDXGIAdapter1 object that corresponds to physicalDevice. If deviceLUIDValid is VK_TRUE, deviceNodeMask must contain exactly one bit. If Vulkan is running on an operating system that supports the Direct3D 12 API and physicalDevice corresponds to an individual device in a linked device adapter, deviceNodeMask identifies the Direct3D 12 node corresponding to physicalDevice. Otherwise, deviceNodeMask must be 1.

Note

Although they have identical descriptions, VkPhysicalDeviceIDProperties::deviceUUID may differ from VkPhysicalDeviceProperties2::pipelineCacheUUID. The former is intended to identify and correlate devices across API and driver boundaries, while the latter is used to identify a compatible device and driver combination to use when serializing and de-serializing pipeline state.

Implementations should return deviceUUID values which are likely to be unique even in the presence of multiple Vulkan implementations (such as a GPU driver and a software renderer; two drivers for different GPUs; or the same Vulkan driver running on two logically different devices).

Khronos' conformance testing can not guarantee that deviceUUID values are actually unique, so implementors should make their own best efforts to ensure this. In particular, hard-coded deviceUUID values, especially all-0 bits, should never be used.

A combination of values unique to the vendor, the driver, and the hardware environment can be used to provide a deviceUUID which is unique to a high degree of certainty. Some possible inputs to such a computation are:

- Information reported by vkGetPhysicalDeviceProperties
- PCI device ID (if defined)
- PCI bus ID, or similar system configuration information.
- Driver binary checksums.
While `VkPhysicalDeviceIDProperties::deviceUUID` is specified to remain consistent across driver versions and system reboots, it is not intended to be usable as a serializable persistent identifier for a device. It may change when a device is physically added to, removed from, or moved to a different connector in a system while that system is powered down. Further, there is no reasonable way to verify with conformance testing that a given device retains the same UUID in a given system across all driver versions supported in that system. While implementations should make every effort to report consistent device UUIDs across driver versions, applications should avoid relying on the persistence of this value for uses other than identifying compatible devices for external object sharing purposes.

### Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ID_PROPERTIES`

The `VkPhysicalDeviceDriverProperties` structure is defined as:

```c
typedef struct VkPhysicalDeviceDriverProperties {
    VkStructureType         sType;
    void*                   pNext;
    VkDriverId              driverID;
    char                    driverName[VK_MAX_DRIVER_NAME_SIZE];
    char                    driverInfo[VK_MAX_DRIVER_INFO_SIZE];
    VkConformanceVersion    conformanceVersion;
} VkPhysicalDeviceDriverProperties;
```

or the equivalent

```c
// Provided by VK_KHR_driver_properties
typedef VkPhysicalDeviceDriverProperties VkPhysicalDeviceDriverPropertiesKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **driverID** is a unique identifier for the driver of the physical device.
- **driverName** is an array of `VK_MAX_DRIVER_NAME_SIZE` char containing a null-terminated UTF-8 string which is the name of the driver.
- **driverInfo** is an array of `VK_MAX_DRIVER_INFO_SIZE` char containing a null-terminated UTF-8 string with additional information about the driver.
- **conformanceVersion** is the version of the Vulkan conformance test this driver is conformant against (see `VkConformanceVersion`).
If the `VkPhysicalDeviceDriverProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the driver corresponding to a physical device.

driverID must be immutable for a given driver across instances, processes, driver versions, and system reboots.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceDriverProperties-sType-sType
  
  sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DRIVER_PROPERTIES`

Khronos driver IDs which may be returned in `VkPhysicalDeviceDriverProperties::driverID` are:
typedef enum VkDriverId {
    VK_DRIVER_ID_AMD_PROPRIETARY = 1,
    VK_DRIVER_ID_AMD_OPEN_SOURCE = 2,
    VK_DRIVER_ID_MESA_RADV = 3,
    VK_DRIVER_ID_NVIDIA_PROPRIETARY = 4,
    VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS = 5,
    VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA = 6,
    VK_DRIVER_ID_IMAGINATION_PROPRIETARY = 7,
    VK_DRIVER_ID_QUALCOMM_PROPRIETARY = 8,
    VK_DRIVER_ID_ARM_PROPRIETARY = 9,
    VK_DRIVER_ID_GOOGLE_SWIFTSHADER = 10,
    VK_DRIVER_ID_GGP_PROPRIETARY = 11,
    VK_DRIVER_ID_BROADCOM_PROPRIETARY = 12,
    VK_DRIVER_ID_MESA_LLVMPIPE = 13,
    VK_DRIVER_ID_MOLTENVK = 14,
    VK_DRIVER_ID_COREAVI_PROPRIETARY = 15,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_AMD_PROPRIETARY_KHR = VK_DRIVER_ID_AMD_PROPRIETARY,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_AMD_OPEN_SOURCE_KHR = VK_DRIVER_ID_AMD_OPEN_SOURCE,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_MESA_RADV_KHR = VK_DRIVER_ID_MESA_RADV,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_NVIDIA_PROPRIETARY_KHR = VK_DRIVER_ID_NVIDIA_PROPRIETARY,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS_KHR = VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA_KHR = VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_IMAGINATION_PROPRIETARY_KHR = VK_DRIVER_ID_IMAGINATION_PROPRIETARY,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_QUALCOMM_PROPRIETARY_KHR = VK_DRIVER_ID_QUALCOMM_PROPRIETARY,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_ARM_PROPRIETARY_KHR = VK_DRIVER_ID_ARM_PROPRIETARY,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_GOOGLE_SWIFTSHADER_KHR = VK_DRIVER_ID_GOOGLE_SWIFTSHADER,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_GGP_PROPRIETARY_KHR = VK_DRIVER_ID_GGP_PROPRIETARY,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_BROADCOM_PROPRIETARY_KHR = VK_DRIVER_ID_BROADCOM_PROPRIETARY,
} VkDriverId;

or the equivalent

// Provided by VK_KHR_driver_properties
typedef VkDriverId VkDriverIdKHR;
Khronos driver IDs may be allocated by vendors at any time. There may be multiple driver IDs for the same vendor, representing different drivers (for e.g. different platforms, proprietary or open source, etc.). Only the latest canonical versions of this Specification, of the corresponding *vk.xml* API Registry, and of the corresponding *vulkan_core.h* header file **must** contain all reserved Khronos driver IDs.

Only driver IDs registered with Khronos are given symbolic names. There **may be** unregistered driver IDs returned.

The conformance test suite version an implementation is compliant with is described with the *VkConformanceVersion* structure:

```c
typedef struct VkConformanceVersion {
  uint8_t    major;
  uint8_t    minor;
  uint8_t    subminor;
  uint8_t    patch;
} VkConformanceVersion;
```

or the equivalent

```c
// Provided by VK_KHR_driver_properties
typedef VkConformanceVersion VkConformanceVersionKHR;
```

- major is the major version number of the conformance test suite.
- minor is the minor version number of the conformance test suite.
- subminor is the subminor version number of the conformance test suite.
- patch is the patch version number of the conformance test suite.

The *VkPhysicalDevicePCIBusInfoPropertiesEXT* structure is defined as:

```c
// Provided by VK_EXT_pci_bus_info
typedef struct VkPhysicalDevicePCIBusInfoPropertiesEXT {
  VkStructureType    sType;
  void*              pNext;
  uint32_t           pciDomain;
  uint32_t           pciBus;
  uint32_t           pciDevice;
  uint32_t           pcifunction;
} VkPhysicalDevicePCIBusInfoPropertiesEXT;
```

- sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• pciDomain is the PCI bus domain.
• pciBus is the PCI bus identifier.
• pciDevice is the PCI device identifier.
• pciFunction is the PCI device function identifier.

If the VkPhysicalDevicePCIBusInfoPropertiesEXT structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

These are properties of the PCI bus information of a physical device.

Valid Usage (Implicit)

• VUID-VkPhysicalDevicePCIBusInfoPropertiesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PCI_BUS_INFO_PROPERTIES_EXT

To query properties of queues available on a physical device, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceQueueFamilyProperties(
  VkPhysicalDevice                      physicalDevice,
  uint32_t*                              pQueueFamilyPropertyCount,
  VkQueueFamilyProperties*               pQueueFamilyProperties);
```

• physicalDevice is the handle to the physical device whose properties will be queried.
• pQueueFamilyPropertyCount is a pointer to an integer related to the number of queue families available or queried, as described below.
• pQueueFamilyProperties is either NULL or a pointer to an array of VkQueueFamilyProperties structures.

If pQueueFamilyProperties is NULL, then the number of queue families available is returned in pQueueFamilyPropertyCount. Implementations must support at least one queue family. Otherwise, pQueueFamilyPropertyCount must point to a variable set by the user to the number of elements in the pQueueFamilyProperties array, and on return the variable is overwritten with the number of structures actually written to pQueueFamilyProperties. If pQueueFamilyPropertyCount is less than the number of queue families available, at most pQueueFamilyPropertyCount structures will be written.
Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceQueueFamilyProperties-physicalDevice-parameter**
  
  *physicalDevice* must be a valid *VkPhysicalDevice* handle

- **VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyPropertyCount-parameter**
  
  *pQueueFamilyPropertyCount* must be a valid pointer to a *uint32_t* value

- **VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyProperties-parameter**
  
  If the value referenced by *pQueueFamilyPropertyCount* is not 0, and *pQueueFamilyProperties* is not NULL, *pQueueFamilyProperties* must be a valid pointer to an array of *pQueueFamilyPropertyCount* *VkQueueFamilyProperties* structures

The *VkQueueFamilyProperties* structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkQueueFamilyProperties {
    VkQueueFlags    queueFlags;
    uint32_t        queueCount;
    uint32_t        timestampValidBits;
    VkExtent3D      minImageTransferGranularity;
} VkQueueFamilyProperties;
```

- *queueFlags* is a bitmask of *VkQueueFlagBits* indicating capabilities of the queues in this queue family.

- *queueCount* is the unsigned integer count of queues in this queue family. Each queue family must support at least one queue.

- *timestampValidBits* is the unsigned integer count of meaningful bits in the timestamps written via *vkCmdWriteTimestamp2KHR* or *vkCmdWriteTimestamp*. The valid range for the count is 36..64 bits, or a value of 0, indicating no support for timestamps. Bits outside the valid range are guaranteed to be zeros.

- *minImageTransferGranularity* is the minimum granularity supported for image transfer operations on the queues in this queue family.

The value returned in *minImageTransferGranularity* has a unit of compressed texel blocks for images having a block-compressed format, and a unit of texels otherwise.

Possible values of *minImageTransferGranularity* are:

- (0,0,0) which indicates that only whole mip levels must be transferred using the image transfer operations on the corresponding queues. In this case, the following restrictions apply to all offset and extent parameters of image transfer operations:
  - The *x*, *y*, and *z* members of a *VkOffset3D* parameter must always be zero.
  - The *width*, *height*, and *depth* members of a *VkExtent3D* parameter must always match the width, height, and depth of the image subresource corresponding to the parameter, respectively.
• \((A_x, A_y, A_z)\) where \(A_x, A_y,\) and \(A_z\) are all integer powers of two. In this case the following restrictions apply to all image transfer operations:
  ◦ \(x, y, \) and \(z\) of a \texttt{VkOffset3D} parameter \textbf{must} be integer multiples of \(A_x, A_y,\) and \(A_z,\) respectively.
  ◦ \texttt{width} of a \texttt{VkExtent3D} parameter \textbf{must} be an integer multiple of \(A_x,\) or else \(x + \texttt{width}\) \textbf{must} equal the width of the image subresource corresponding to the parameter.
  ◦ \texttt{height} of a \texttt{VkExtent3D} parameter \textbf{must} be an integer multiple of \(A_y,\) or else \(y + \texttt{height}\) \textbf{must} equal the height of the image subresource corresponding to the parameter.
  ◦ \texttt{depth} of a \texttt{VkExtent3D} parameter \textbf{must} be an integer multiple of \(A_z,\) or else \(z + \texttt{depth}\) \textbf{must} equal the depth of the image subresource corresponding to the parameter.
  ◦ If the format of the image corresponding to the parameters is one of the block-compressed formats then for the purposes of the above calculations the granularity \textbf{must} be scaled up by the compressed texel block dimensions.

Queues supporting graphics and/or compute operations \textbf{must} report \((1,1,1)\) in \texttt{minImageTransferGranularity}, meaning that there are no additional restrictions on the granularity of image transfer operations for these queues. Other queues supporting image transfer operations are only \textbf{required} to support whole mip level transfers, thus \texttt{minImageTransferGranularity} for queues belonging to such queue families \textbf{may} be \((0,0,0)\).

The \textbf{Device Memory} section describes memory properties queried from the physical device.

For physical device feature queries see the \textbf{Features} chapter.

Bits which \textbf{may} be set in \texttt{VkQueueFamilyProperties::queueFlags} indicating capabilities of queues in a queue family are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueueFlagBits {
    VK_QUEUE_GRAPHICS_BIT = 0x00000001,
    VK_QUEUE_COMPUTE_BIT = 0x00000002,
    VK_QUEUE_TRANSFER_BIT = 0x00000004,
    VK_QUEUE_SPARSE_BINDING_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_QUEUE_PROTECTED_BIT = 0x00000010,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_decode_queue
    VK_QUEUE_VIDEO_DECODE_BIT_KHR = 0x00000020,
    #endif
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_encode_queue
    VK_QUEUE_VIDEO_ENCODE_BIT_KHR = 0x00000040,
    #endif
} VkQueueFlagBits;
```

• \texttt{VK_QUEUE_GRAPHICS_BIT} \textbf{specifies} that queues in this queue family support graphics operations.
• **VK_QUEUE_COMPUTE_BIT** specifies that queues in this queue family support compute operations.

• **VK_QUEUE_TRANSFER_BIT** specifies that queues in this queue family support transfer operations.

• **VK_QUEUE_SPARSE_BINDING_BIT** specifies that queues in this queue family support sparse memory management operations (see Sparse Resources). If any of the sparse resource features are enabled, then at least one queue family must support this bit.

• **VK_QUEUE_VIDEO_DECODE_BIT_KHR** indicates that queues in this queue family support Video Decode operations.

• **VK_QUEUE_VIDEO_ENCODE_BIT_KHR** indicates that queues in this queue family support Video Encode operations.

• if **VK_QUEUE_PROTECTED_BIT** is set, then the queues in this queue family support the **VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT** bit. (see Protected Memory). If the physical device supports the protectedMemory feature, at least one of its queue families must support this bit.

If an implementation exposes any queue family that supports graphics operations, at least one queue family of at least one physical device exposed by the implementation must support both graphics and compute operations.

Furthermore, if the protected memory physical device feature is supported, then at least one queue family of at least one physical device exposed by the implementation must support graphics operations, compute operations, and protected memory operations.

> **Note**

All commands that are allowed on a queue that supports transfer operations are also allowed on a queue that supports either graphics or compute operations. Thus, if the capabilities of a queue family include **VK_QUEUE_GRAPHICS_BIT** or **VK_QUEUE_COMPUTE_BIT**, then reporting the **VK_QUEUE_TRANSFER_BIT** capability separately for that queue family is optional.

For further details see Queues.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueueFlags;
```

**VkQueueFlags** is a bitmask type for setting a mask of zero or more **VkQueueFlagBits**.

To query properties of queues available on a physical device, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceQueueFamilyProperties2(  
    VkPhysicalDevice physicalDevice,  
    uint32_t* pQueueFamilyPropertyCount,  
    VkQueueFamilyProperties2* pQueueFamilyProperties);
```

or the equivalent command
void vkGetPhysicalDeviceQueueFamilyProperties2KHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2*                   pQueueFamilyProperties);

- physicalDevice is the handle to the physical device whose properties will be queried.
- pQueueFamilyPropertyCount is a pointer to an integer related to the number of queue families available or queried, as described in `vkGetPhysicalDeviceQueueFamilyProperties`.
- pQueueFamilyProperties is either NULL or a pointer to an array of `VkQueueFamilyProperties2` structures.

`vkGetPhysicalDeviceQueueFamilyProperties2` behaves similarly to `vkGetPhysicalDeviceQueueFamilyProperties`, with the ability to return extended information in a `pNext` chain of output structures.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-physicalDevice-parameter physicalDevice must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyPropertyCount-parameter pQueueFamilyPropertyCount must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyProperties-parameter If the value referenced by `pQueueFamilyPropertyCount` is not 0, and `pQueueFamilyProperties` is not NULL, `pQueueFamilyProperties` must be a valid pointer to an array of `VkQueueFamilyProperties2` structures

The `VkQueueFamilyProperties2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkQueueFamilyProperties2 {
    VkStructureType            sType;
    void*                      pNext;
    VkQueueFamilyProperties    queueFamilyProperties;
} VkQueueFamilyProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkQueueFamilyProperties2 VkQueueFamilyProperties2KHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
• queueFamilyProperties is a VkQueueFamilyProperties structure which is populated with the same values as in vkGetPhysicalDeviceQueueFamilyProperties.

Valid Usage (Implicit)

• VUID-VkQueueFamilyProperties2-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUEUE_FAMILY_PROPERTIES_2

• VUID-VkQueueFamilyProperties2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkQueueFamilyCheckpointProperties2NV, VkQueueFamilyCheckpointPropertiesNV, or VkVideoQueueFamilyProperties2KHR

• VUID-VkQueueFamilyProperties2-sType-unique
  The sType value of each struct in the pNext chain must be unique

The VkQueueFamilyCheckpointProperties2NV structure is defined as:

```c
// Provided by VK_KHR_synchronization2 with VK_NV_device_diagnostic_checkpoints
typedef struct VkQueueFamilyCheckpointProperties2NV {
  VkStructureType             sType;
  void*                       pNext;
  VkPipelineStageFlags2KHR    checkpointExecutionStageMask;
} VkQueueFamilyCheckpointProperties2NV;
```

• sType is the type of this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• checkpointExecutionStageMask is a mask indicating which pipeline stages the implementation can execute checkpoint markers in.

Additional queue family information can be queried by setting VkQueueFamilyProperties2::pNext to point to a VkQueueFamilyCheckpointProperties2NV structure.

Valid Usage (Implicit)

• VUID-VkQueueFamilyCheckpointProperties2NV-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUEUE_FAMILY_CHECKPOINT_PROPERTIES_2_NV

The VkQueueFamilyCheckpointPropertiesNV structure is defined as:

Chapter 5. Devices and Queues | 107
typedef struct VkQueueFamilyCheckpointPropertiesNV {
    VkStructureType sType;
    void* pNext;
    VkPipelineStageFlags checkpointExecutionStageMask;
} VkQueueFamilyCheckpointPropertiesNV;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **checkpointExecutionStageMask** is a mask indicating which pipeline stages the implementation can execute checkpoint markers in.

Additional queue family information can be queried by setting `VkQueueFamilyProperties2::pNext` to point to a `VkQueueFamilyCheckpointPropertiesNV` structure.

**Valid Usage (Implicit)**

- VUID-VkQueueFamilyCheckpointPropertiesNV-sType-sType
  
sType must be VK_STRUCTURE_TYPE_QUEUE_FAMILY_CHECKPOINT_PROPERTIES_NV

To enumerate the performance query counters available on a queue family of a physical device, call:

```c
// Provided by VK_KHR_performance_query
VkResult vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    uint32_t* pCounterCount,
    VkPerformanceCounterKHR* pCounters,
    VkPerformanceCounterDescriptionKHR* pCounterDescriptions);
```

- **physicalDevice** is the handle to the physical device whose queue family performance query counter properties will be queried.
- **queueFamilyIndex** is the index into the queue family of the physical device we want to get properties for.
- **pCounterCount** is a pointer to an integer related to the number of counters available or queried, as described below.
- **pCounters** is either NULL or a pointer to an array of `VkPerformanceCounterKHR` structures.
- **pCounterDescriptions** is either NULL or a pointer to an array of `VkPerformanceCounterDescriptionKHR` structures.

If **pCounters** is NULL and **pCounterDescriptions** is NULL, then the number of counters available is returned in **pCounterCount**. Otherwise, **pCounterCount** must point to a variable set by the user to the number of elements in the **pCounters**, **pCounterDescriptions**, or both arrays and on return the
variable is overwritten with the number of structures actually written out. If \( p\text{CounterCount} \) is less than the number of counters available, at most \( p\text{CounterCount} \) structures will be written, and \( \text{VK_INCOMPLETE} \) will be returned instead of \( \text{VK_SUCCESS} \), to indicate that not all the available counters were returned.

### Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-physicalDevice-parameter
  - \( \text{physicalDevice} \) must be a valid \( \text{VkPhysicalDevice} \) handle
- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterCount-parameter
  - \( p\text{CounterCount} \) must be a valid pointer to a \( \text{uint32_t} \) value
- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounters-parameter
  - If the value referenced by \( p\text{CounterCount} \) is not 0, and \( p\text{Counters} \) is not NULL, \( p\text{Counters} \) must be a valid pointer to an array of \( p\text{CounterCount} \) \( \text{VkPerformanceCounterKHR} \) structures
- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterDescriptions-parameter
  - If the value referenced by \( p\text{CounterCount} \) is not 0, and \( p\text{CounterDescriptions} \) is not NULL, \( p\text{CounterDescriptions} \) must be a valid pointer to an array of \( p\text{CounterCount} \) \( \text{VkPerformanceCounterDescriptionKHR} \) structures

### Return Codes

**Success**
- \( \text{VK_SUCCESS} \)
- \( \text{VK_INCOMPLETE} \)

**Failure**
- \( \text{VK_ERROR_OUT_OF_HOST_MEMORY} \)
- \( \text{VK_ERROR_OUT_OF_DEVICE_MEMORY} \)
- \( \text{VK_ERROR_INITIALIZATION_FAILED} \)

The \( \text{VkPerformanceCounterKHR} \) structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterKHR {
    VkStructureType                   sType;
    const void*                       pNext;
    VkPerformanceCounterUnitKHR       unit;
    VkPerformanceCounterScopeKHR      scope;
    VkPerformanceCounterStorageKHR    storage;
    uint8_t                           uuid[VK_UUID_SIZE];
} VkPerformanceCounterKHR;
```

- \( s\text{Type} \) is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `unit` is a `VkPerformanceCounterUnitKHR` specifying the unit that the counter data will record.
• `scope` is a `VkPerformanceCounterScopeKHR` specifying the scope that the counter belongs to.
• `storage` is a `VkPerformanceCounterStorageKHR` specifying the storage type that the counter’s data uses.
• `uuid` is an array of size `VK_UUID_SIZE`, containing 8-bit values that represent a universally unique identifier for the counter of the physical device.

### Valid Usage (Implicit)

- `VUID-VkPerformanceCounterKHR-sType-sType`
  - `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_KHR`
- `VUID-VkPerformanceCounterKHR-pNext-pNext`
  - `pNext` must be `NULL`

Performance counters have an associated unit. This unit describes how to interpret the performance counter result.

The performance counter unit types which **may** be returned in `VkPerformanceCounterKHR::unit` are:

```c
typedef enum VkPerformanceCounterUnitKHR {
    VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR = 0,
    VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR = 1,
    VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR = 2,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR = 3,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR = 4,
    VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR = 5,
    VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR = 6,
    VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR = 7,
    VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR = 8,
    VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR = 9,
    VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR = 10,
} VkPerformanceCounterUnitKHR;
```

- `VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR` - the performance counter unit is a generic data point.
- `VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR` - the performance counter unit is a percentage (%).
- `VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR` - the performance counter unit is a value of nanoseconds (ns).
- `VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR` - the performance counter unit is a value of bytes.
- `VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR` - the performance counter unit is a value of bytes/s.
- **VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR** - the performance counter unit is a temperature reported in Kelvin.
- **VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR** - the performance counter unit is a value of watts (W).
- **VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR** - the performance counter unit is a value of volts (V).
- **VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR** - the performance counter unit is a value of amps (A).
- **VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR** - the performance counter unit is a value of hertz (Hz).
- **VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR** - the performance counter unit is a value of cycles.

Performance counters have an associated scope. This scope describes the granularity of a performance counter.

The performance counter scope types which **may** be returned in `VkPerformanceCounterKHR::scope` are:

```c
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterScopeKHR {
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR = 0,
    VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR = 1,
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR = 2,
    VK_QUERY_SCOPE_COMMAND_BUFFER_KHR = VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR,
    VK_QUERY_SCOPE_RENDER_PASS_KHR = VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR,
    VK_QUERY_SCOPE_COMMAND_KHR = VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR,
} VkPerformanceCounterScopeKHR;
```

- **VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR** - the performance counter scope is a single complete command buffer.
- **VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR** - the performance counter scope is zero or more complete render passes. The performance query containing the performance counter **must** begin and end outside a render pass instance.
- **VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR** - the performance counter scope is zero or more commands.

Performance counters have an associated storage. This storage describes the payload of a counter result.

The performance counter storage types which **may** be returned in `VkPerformanceCounterKHR::storage` are:
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterStorageKHR {
    VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR = 0,
    VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR = 1,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR = 2,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR = 3,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR = 4,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR = 5,
} VkPerformanceCounterStorageKHR;

- **VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR** - the performance counter storage is a 32-bit signed integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR** - the performance counter storage is a 64-bit signed integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR** - the performance counter storage is a 32-bit unsigned integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR** - the performance counter storage is a 64-bit unsigned integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR** - the performance counter storage is a 32-bit floating-point.
- **VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR** - the performance counter storage is a 64-bit floating-point.

The VkPerformanceCounterDescriptionKHR structure is defined as:

// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterDescriptionKHR {
    VkStructureType sType;
    const void* pNext;
    VkPerformanceCounterDescriptionFlagsKHR flags;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char category[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
} VkPerformanceCounterDescriptionKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkPerformanceCounterDescriptionFlagBitsKHR indicating the usage behavior for the counter.
- **name** is an array of size VK_MAX_DESCRIPTION_SIZE, containing a null-terminated UTF-8 string specifying the name of the counter.
- **category** is an array of size VK_MAX_DESCRIPTION_SIZE, containing a null-terminated UTF-8 string specifying the category of the counter.
• description is an array of size VK_MAX_DESCRIPTION_SIZE, containing a null-terminated UTF-8 string specifying the description of the counter.

```
Valid Usage (Implicit)
```

- VUID-VkPerformanceCounterDescriptionKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR

- VUID-VkPerformanceCounterDescriptionKHR-pNext-pNext
  pNext must be NULL

Bits which can be set in VkPerformanceCounterDescriptionKHR::flags to specify usage behavior for a command pool are:

```c
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterDescriptionFlagBitsKHR {
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR = 0x00000001,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR = 0x00000002,
} VkPerformanceCounterDescriptionFlagBitsKHR;
```

- VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR specifies that recording the counter may have a noticeable performance impact.

- VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR specifies that concurrently recording the counter while other submitted command buffers are running may impact the accuracy of the recording.

```c
// Provided by VK_KHR_performance_query
typedef VkFlags VkPerformanceCounterDescriptionFlagsKHR;
```

VkPerformanceCounterDescriptionFlagsKHR is a bitmask type for setting a mask of zero or more VkPerformanceCounterDescriptionFlagBitsKHR.

5.2. Devices

Device objects represent logical connections to physical devices. Each device exposes a number of queue families each having one or more queues. All queues in a queue family support the same operations.

As described in Physical Devices, a Vulkan application will first query for all physical devices in a system. Each physical device can then be queried for its capabilities, including its queue and queue family properties. Once an acceptable physical device is identified, an application will create a corresponding logical device. The created logical device is then the primary interface to the
physical device.

How to enumerate the physical devices in a system and query those physical devices for their queue family properties is described in the Physical Device Enumeration section above.

A single logical device can be created from multiple physical devices, if those physical devices belong to the same device group. A device group is a set of physical devices that support accessing each other’s memory and recording a single command buffer that can be executed on all the physical devices. Device groups are enumerated by calling vkEnumeratePhysicalDeviceGroups, and a logical device is created from a subset of the physical devices in a device group by passing the physical devices through VkDeviceGroupDeviceCreateInfo. For two physical devices to be in the same device group, they must support identical extensions, features, and properties.

Note
Physical devices in the same device group must be so similar because there are no rules for how different features/properties would interact. They must return the same values for nearly every invariant vkGetPhysicalDevice* feature, property, capability, etc., but could potentially differ for certain queries based on things like having a different display connected, or different compositor, etc.. The specification does not attempt to enumerate which state is in each category, because such a list would quickly become out of date.

To retrieve a list of the device groups present in the system, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkEnumeratePhysicalDeviceGroups(
    VkInstance instance,
    uint32_t* pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

or the equivalent command

```c
// Provided by VK_KHR_device_group_creation
VkResult vkEnumeratePhysicalDeviceGroupsKHR(
    VkInstance instance,
    uint32_t* pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

- instance is a handle to a Vulkan instance previously created with vkCreateInstance.
- pPhysicalDeviceGroupCount is a pointer to an integer related to the number of device groups available or queried, as described below.
- pPhysicalDeviceGroupProperties is either NULL or a pointer to an array of VkPhysicalDeviceGroupProperties structures.

If pPhysicalDeviceGroupProperties is NULL, then the number of device groups available is returned in pPhysicalDeviceGroupCount. Otherwise, pPhysicalDeviceGroupCount must point to a variable set by the
user to the number of elements in the `pPhysicalDeviceGroupProperties` array, and on return the variable is overwritten with the number of structures actually written to `pPhysicalDeviceGroupProperties`. If `pPhysicalDeviceGroupCount` is less than the number of device groups available, at most `pPhysicalDeviceGroupCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available device groups were returned.

Every physical device **must** be in exactly one device group.

### Valid Usage (Implicit)

- **instance** must be a valid `VkInstance` handle
- **pPhysicalDeviceGroupCount** must be a valid pointer to a `uint32_t` value
- If the value referenced by `pPhysicalDeviceGroupCount` is not 0, and `pPhysicalDeviceGroupProperties` is not NULL, `pPhysicalDeviceGroupProperties` must be a valid pointer to an array of `pPhysicalDeviceGroupCount` `VkPhysicalDeviceGroupProperties` structures

### Return Codes

#### Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

#### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkPhysicalDeviceGroupProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceGroupProperties {
    VkStructureType     sType;
    void*               pNext;
    uint32_t            physicalDeviceCount;
    VkPhysicalDevice    physicalDevices[VK_MAX_DEVICE_GROUP_SIZE];
    VkBool32            subsetAllocation;
} VkPhysicalDeviceGroupProperties;
```
or the equivalent

```c
// Provided by VK_KHR_device_group_creation
typedef VkPhysicalDeviceGroupProperties VkPhysicalDeviceGroupPropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `physicalDeviceCount` is the number of physical devices in the group.
- `physicalDevices` is an array of `VK_MAX_DEVICE_GROUP_SIZE` `VkPhysicalDevice` handles representing all physical devices in the group. The first `physicalDeviceCount` elements of the array will be valid.
- `subsetAllocation` specifies whether logical devices created from the group support allocating device memory on a subset of devices, via the `deviceMask` member of the `VkMemoryAllocateFlagsInfo`. If this is `VK_FALSE`, then all device memory allocations are made across all physical devices in the group. If `physicalDeviceCount` is 1, then `subsetAllocation` must be `VK_FALSE`.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceGroupProperties-sType-sType
  sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES`
- `VUID-VkPhysicalDeviceGroupProperties-pNext-pNext
  pNext` must be `NULL`

### 5.2.1. Device Creation

Logical devices are represented by `VkDevice` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkDevice)
```

A logical device is created as a connection to a physical device. To create a logical device, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateDevice(
    VkPhysicalDevice                            physicalDevice,
    const VkDeviceCreateInfo*                   pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkDevice*                                   pDevice);
```

- `physicalDevice` must be one of the device handles returned from a call to `vkEnumeratePhysicalDevices` (see Physical Device Enumeration).
• **pCreateInfo** is a pointer to a `VkDeviceCreateInfo` structure containing information about how to create the device.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

• **pDevice** is a pointer to a handle in which the created `VkDevice` is returned.

`vkCreateDevice` verifies that extensions and features requested in the `ppEnabledExtensionNames` and `pEnabledFeatures` members of `pCreateInfo`, respectively, are supported by the implementation. If any requested extension is not supported, `vkCreateDevice` must return `VK_ERROR_EXTENSION_NOT_PRESENT`. If any requested feature is not supported, `vkCreateDevice` must return `VK_ERROR_FEATURE_NOT_PRESENT`. Support for extensions can be checked before creating a device by querying `vkEnumerateDeviceExtensionProperties`. Support for features can similarly be checked by querying `vkGetPhysicalDeviceFeatures`.

After verifying and enabling the extensions the `VkDevice` object is created and returned to the application.

Multiple logical devices can be created from the same physical device. Logical device creation may fail due to lack of device-specific resources (in addition to the other errors). If that occurs, `vkCreateDevice` will return `VK_ERROR_TOO_MANY_OBJECTS`.

---

### Valid Usage

- VUID-vkCreateDevice-ppEnabledExtensionNames-01387
  All required extensions for each extension in the `VkDeviceCreateInfo ::ppEnabledExtensionNames` list must also be present in that list

---

### Valid Usage (Implicit)

- VUID-vkCreateDevice-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkCreateDevice-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkDeviceCreateInfo` structure

- VUID-vkCreateDevice-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateDevice-pDevice-parameter
  `pDevice` must be a valid pointer to a `VkDevice` handle
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INITIALIZATION_FAILED
• VK_ERROR_EXTENSION_NOT_PRESENT
• VK_ERROR_FEATURE_NOT_PRESENT
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_DEVICE_LOST

The VkDeviceCreateInfo structure is defined as:

```c
typedef struct VkDeviceCreateInfo {
    VkStructureType                    sType;
    const void*                        pNext;
    VkDeviceCreateFlags                flags;
    uint32_t                           queueCreateInfoCount;
    const VkDeviceQueueCreateInfo*     pQueueCreateInfos;
    uint32_t                           enabledLayerCount;
    const char* const*                 ppEnabledLayerNames;
    uint32_t                           enabledExtensionCount;
    const char* const*                 ppEnabledExtensionNames;
    const VkPhysicalDeviceFeatures*    pEnabledFeatures;
} VkDeviceCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **queueCreateInfoCount** is the unsigned integer size of the **pQueueCreateInfos** array. Refer to the Queue Creation section below for further details.
- **pQueueCreateInfos** is a pointer to an array of VkDeviceQueueCreateInfo structures describing the queues that are requested to be created along with the logical device. Refer to the Queue Creation section below for further details.
- **enabledLayerCount** is deprecated and ignored.
- **ppEnabledLayerNames** is deprecated and ignored. See Device Layer Deprecation.
- **enabledExtensionCount** is the number of device extensions to enable.
• **ppEnabledExtensionNames** is a pointer to an array of enabledExtensionCount null-terminated UTF-8 strings containing the names of extensions to enable for the created device. See the Extensions section for further details.

• **pEnabledFeatures** is NULL or a pointer to a VkPhysicalDeviceFeatures structure containing boolean indicators of all the features to be enabled. Refer to the Features section for further details.

**Valid Usage**

- **VUID-VkDeviceCreateInfo-queueFamilyIndex-02802**
  The queueFamilyIndex member of each element of pQueueCreateInfos must be unique within pQueueCreateInfos, except that two members can share the same queueFamilyIndex if one is a protected-capable queue and one is not a protected-capable queue.

- **VUID-VkDeviceCreateInfo-pNext-00373**
  If the pNext chain includes a VkPhysicalDeviceFeatures2 structure, then pEnabledFeatures must be NULL.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-01840**
  ppEnabledExtensionNames must not contain VK_AMD_negative_viewport_height.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-03328**
  ppEnabledExtensionNames must not contain both VK_KHR_buffer_device_address and VK_EXT_buffer_device_address.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-04451**
  If the VK_KHR_portability_subset extension is included in pProperties of vkEnumerateDeviceExtensionProperties, ppEnabledExtensions must include "VK_KHR_portability_subset".

- **VUID-VkDeviceCreateInfo-shadingRateImage-04478**
  If shadingRateImage is enabled, pipelineFragmentShadingRate must not be enabled.

- **VUID-VkDeviceCreateInfo-shadingRateImage-04479**
  If shadingRateImage is enabled, primitiveFragmentShadingRate must not be enabled.

- **VUID-VkDeviceCreateInfo-shadingRateImage-04480**
  If shadingRateImage is enabled, attachmentFragmentShadingRate must not be enabled.

- **VUID-VkDeviceCreateInfo-fragmentDensityMap-04481**
  If fragmentDensityMap is enabled, pipelineFragmentShadingRate must not be enabled.

- **VUID-VkDeviceCreateInfo-fragmentDensityMap-04482**
  If fragmentDensityMap is enabled, primitiveFragmentShadingRate must not be enabled.

- **VUID-VkDeviceCreateInfo-fragmentDensityMap-04483**
  If fragmentDensityMap is enabled, attachmentFragmentShadingRate must not be enabled.
Valid Usage (Implicit)

- VUID-VkDeviceCreateInfo-sType-sType
  
  **sType must be** `VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO`

- VUID-VkDeviceCreateInfo-pNext-pNext
  

• VUID-VkDeviceCreateInfo-sType-unique

The sType value of each struct in the pNext chain must be unique, with the exception of structures of type VkDeviceDeviceMemoryReportCreateInfoEXT or VkDevicePrivateDataCreateInfoEXT

• VUID-VkDeviceCreateInfo-flags-zerobitmask

flags must be 0
• **VUID-VkDeviceCreateInfo-pQueueCreateInfos-parameter**
  
  `pQueueCreateInfos` **must** be a valid pointer to an array of `queueCreateInfoCount` valid `VkDeviceQueueCreateInfo` structures.

• **VUID-VkDeviceCreateInfo-ppEnabledLayerNames-parameter**
  
  If `enabledLayerCount` is not 0, `ppEnabledLayerNames` **must** be a valid pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings.

• **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-parameter**
  
  If `enabledExtensionCount` is not 0, `ppEnabledExtensionNames` **must** be a valid pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings.

• **VUID-VkDeviceCreateInfo-pEnabledFeatures-parameter**
  
  If `pEnabledFeatures` is not NULL, `pEnabledFeatures` **must** be a valid pointer to a valid `VkPhysicalDeviceFeatures` structure.

• **VUID-VkDeviceCreateInfo-queueCreateInfoCount-arraylength**
  
  `queueCreateInfoCount` **must** be greater than 0.

// Provided by VK_VERSION_1_0

typedef VkFlags VkDeviceCreateFlags;

**VkDeviceCreateFlags** is a bitmask type for setting a mask, but is currently reserved for future use.

A logical device **can** be created that connects to one or more physical devices by adding a `VkDeviceGroupDeviceCreateInfo` structure to the `pNext` chain of `VkDeviceCreateInfo`. The `VkDeviceGroupDeviceCreateInfo` structure is defined as:

// Provided by VK_VERSION_1_1

typedef struct VkDeviceGroupDeviceCreateInfo {
  VkStructureType sType;
  const void* pNext;
  uint32_t physicalDeviceCount;
  const VkPhysicalDevice* pPhysicalDevices;
} VkDeviceGroupDeviceCreateInfo;

or the equivalent

// Provided by VK_KHR_device_group_creation

typedef VkDeviceGroupDeviceCreateInfo VkDeviceGroupDeviceCreateInfoKHR;

• `sType` is the type of this structure.

• `pNext` is NULL or a pointer to a structure extending this structure.

• `physicalDeviceCount` is the number of elements in the `pPhysicalDevices` array.

• `pPhysicalDevices` is a pointer to an array of physical device handles belonging to the same device group.
The elements of the `pPhysicalDevices` array are an ordered list of the physical devices that the logical device represents. These must be a subset of a single device group, and need not be in the same order as they were enumerated. The order of the physical devices in the `pPhysicalDevices` array determines the `device index` of each physical device, with element i being assigned a device index of i. Certain commands and structures refer to one or more physical devices by using device indices or `device masks` formed using device indices.

A logical device created without using `VkDeviceGroupDeviceCreateInfo`, or with `physicalDeviceCount` equal to zero, is equivalent to a `physicalDeviceCount` of one and `pPhysicalDevices` pointing to the `physicalDevice` parameter to `vkCreateDevice`. In particular, the device index of that physical device is zero.

### Valid Usage

- **VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00375**
  Each element of `pPhysicalDevices` must be unique

- **VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00376**
  All elements of `pPhysicalDevices` must be in the same device group as enumerated by `vkEnumeratePhysicalDeviceGroups`

- **VUID-VkDeviceGroupDeviceCreateInfo-physicalDeviceCount-00377**
  If `physicalDeviceCount` is not 0, the `physicalDevice` parameter of `vkCreateDevice` must be an element of `pPhysicalDevices`

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupDeviceCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO`

- **VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-parameter**
  If `physicalDeviceCount` is not 0, `pPhysicalDevices` must be a valid pointer to an array of `physicalDeviceCount` valid `VkPhysicalDevice` handles

To specify whether device memory allocation is allowed beyond the size reported by `VkPhysicalDeviceMemoryProperties`, add a `VkDeviceMemoryOverallocationCreateInfoAMD` structure to the `pNext` chain of the `VkDeviceCreateInfo` structure. If this structure is not specified, it is as if the `VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD` value is used.

```c
// Provided by VK_AMD_memory_overallocation_behavior
typedef struct VkDeviceMemoryOverallocationCreateInfoAMD {
    VkStructureType                      sType;
    const void*                          pNext;
    VkMemoryOverallocationBehaviorAMD    overallocationBehavior;
} VkDeviceMemoryOverallocationCreateInfoAMD;
```

- `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `overallocationBehavior` is the desired overallocation behavior.

Valid Usage (Implicit)

• `VUID-VkDeviceMemoryOverallocationCreateInfoAMD-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_MEMORY_OVERALLOCATION_CREATE_INFO_AMD`

• `VUID-VkDeviceMemoryOverallocationCreateInfoAMD-overallocationBehavior-parameter`
  `overallocationBehavior` must be a valid `VkMemoryOverallocationBehaviorAMD` value

Possible values for `VkDeviceMemoryOverallocationCreateInfoAMD::overallocationBehavior` include:

```c
// Provided by VK_AMD_memory_overallocation_behavior
typedef enum VkMemoryOverallocationBehaviorAMD {
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD = 0,
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_ALLOWED_AMD = 1,
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_DISALLOWED_AMD = 2,
} VkMemoryOverallocationBehaviorAMD;
```

• `VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD` lets the implementation decide if overallocation is allowed.

• `VK_MEMORY_OVERALLOCATION_BEHAVIOR_ALLOWED_AMD` specifies overallocation is allowed if platform permits.

• `VK_MEMORY_OVERALLOCATION_BEHAVIOR_DISALLOWED_AMD` specifies the application is not allowed to allocate device memory beyond the heap sizes reported by `VkPhysicalDeviceMemoryProperties`. Allocations that are not explicitly made by the application within the scope of the Vulkan instance are not accounted for.

When using the Nsight™ Aftermath SDK, to configure how device crash dumps are created, add a `VkDeviceDiagnosticsConfigCreateInfoNV` structure to the `pNext` chain of the `VkDeviceCreateInfo` structure.

```c
// Provided by VK_NV_device_diagnostics_config
typedef struct VkDeviceDiagnosticsConfigCreateInfoNV {
    VkStructureType                     sType;
    const void*                         pNext;
    VkDeviceDiagnosticsConfigFlagsNV    flags;
} VkDeviceDiagnosticsConfigCreateInfoNV;
```

• `sType` is the type of this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `flags` is a bitmask of `VkDeviceDiagnosticsConfigFlagBitsNV` specifying additional parameters for configuring diagnostic tools.
Valid Usage (Implicit)

- **VUID-VkDeviceDiagnosticsConfigCreateInfoNV-sType-sType** 
  *sType must be* \texttt{VK_STRUCTURE_TYPE_DEVICE_DIAGNOSTICS_CONFIG_CREATE_INFO_NV} 

- **VUID-VkDeviceDiagnosticsConfigCreateInfoNV-flags-parameter** 
  *flags must be a valid combination of* \texttt{VkDeviceDiagnosticsConfigFlagBitsNV} values

Bits which 	extbf{can} be set in \texttt{VkDeviceDiagnosticsConfigCreateInfoNV::flags} include:

```c
typedef enum by VK_NV_device_diagnostics_config
VkDeviceDiagnosticsConfigFlagBitsNV {
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_DEBUG_INFO_BIT_NV = 0x00000001,
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_RESOURCE_TRACKING_BIT_NV = 0x00000002,
    VKDEVICE_DIAGNOSTICS_CONFIG_ENABLE_AUTOMATIC_CHECKPOINTS_BIT_NV = 0x00000004,
} VkDeviceDiagnosticsConfigFlagBitsNV;
```

- **VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_DEBUG_INFO_BIT_NV** enables the generation of debug information for shaders.

- **VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_RESOURCE_TRACKING_BIT_NV** enables driver side tracking of resources (images, buffers, etc.) used to augment the device fault information.

- **VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_AUTOMATIC_CHECKPOINTS_BIT_NV** enables automatic insertion of diagnostic checkpoints for draw calls, dispatches, trace rays, and copies. The CPU call stack at the time of the command will be associated as the marker data for the automatically inserted checkpoints.

```c
typedef by VK_NV_device_diagnostics_config
VkFlags VkDeviceDiagnosticsConfigFlagsNV;
```

\texttt{VkDeviceDiagnosticsConfigFlagsNV} is a bitmask type for setting a mask of zero or more \texttt{VkDeviceDiagnosticsConfigFlagBitsNV}.

To register callbacks for underlying device memory events of type \texttt{VkDeviceMemoryReportEventTypeEXT}, add one or multiple \texttt{VkDeviceDeviceMemoryReportCreateInfoEXT} structures to the \texttt{pNext} chain of the \texttt{VkDeviceCreateInfo} structure.

```c
typedef struct by VK_EXT_device_memory_report
VkDeviceDeviceMemoryReportCreateInfoEXT {
    VkStructureType                        sType;
    const void*                            pNext;
    VkDeviceMemoryReportFlagsEXT           flags;
    PFN_vkDeviceMemoryReportCallbackEXT    pfnUserCallback;
    void*                                  pUserData;
} VkDeviceDeviceMemoryReportCreateInfoEXT;
```
• **sType** is the type of this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **flags** is 0 and reserved for future use.
• **PFN_vkDeviceMemoryReportCallbackEXT** is the application callback function to call.
• **pUserData** is user data to be passed to the callback.

The callback **may** be called from multiple threads simultaneously.

The callback **must** be called only once by the implementation when a `VkDeviceMemoryReportEventTypeEXT` event occurs.

**Note**
The callback could be called from a background thread other than the thread calling the Vulkan commands.

**Valid Usage (Implicit)**

- **VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_DEVICE_MEMORY_REPORT_CREATE_INFO_EXT`
- **VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-flags-zerobitmask**
  - `flags` **must** be `0`
- **VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-pfnUserCallback-parameter**
  - `PFN_vkDeviceMemoryReportCallbackEXT` **must** be a valid `PFN_vkDeviceMemoryReportCallbackEXT` value
- **VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-pUserData-parameter**
  - `pUserData` **must** be a pointer value

The prototype for the `VkDeviceDeviceMemoryReportCreateInfoEXT::PFN_vkDeviceMemoryReportCallbackEXT` function implemented by the application is:

```c
// Provided by VK_EXT_device_memory_report
typedef void (VKAPI_PTR *PFN_vkDeviceMemoryReportCallbackEXT)(
    const VkDeviceMemoryReportCallbackDataEXT* pCallbackData,
    void* pUserData);
```

- **pCallbackData** contains all the callback related data in the `VkDeviceMemoryReportCallbackDataEXT` structure.
- **pUserData** is the user data provided when the `VkDeviceDeviceMemoryReportCreateInfoEXT` was created.

The callback **must** not make calls to any Vulkan commands.

The definition of `VkDeviceMemoryReportCallbackDataEXT` is:
// Provided by VK_EXT_device_memory_report
typedef struct VkDeviceMemoryReportCallbackDataEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemoryReportFlagsEXT flags;
    VkDeviceMemoryReportEventTypeEXT type;
    uint64_t memoryObjectId;
    VkDeviceSize size;
    VkObjectType objectType;
    uint64_t objectHandle;
    uint32_t heapIndex;
} VkDeviceMemoryReportCallbackDataEXT;

• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is 0 and reserved for future use.

• **type** is a VkDeviceMemoryReportEventTypeEXT type specifying the type of event reported in this VkDeviceMemoryReportCallbackDataEXT structure.

• **memoryObjectId** is the unique id for the underlying memory object as described below.

• **size** is the size of the memory object in bytes. If **type** is VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT, VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT or VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT, **size** is a valid VkDeviceSize value. Otherwise, **size** is undefined.

• **objectType** is a VkObjectType value specifying the type of the object associated with this device memory report event. If **type** is VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT, VKDEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT, VKDEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT, VKDEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT or VKDEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT, **objectType** is a valid VkObjectType enum. Otherwise, **objectType** is undefined.

• **objectHandle** is the object this device memory report event is attributed to. If **type** is VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT, VKDEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT, VKDEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT or VKDEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT, **objectHandle** is a valid Vulkan handle of the type associated with **objectType** as defined in the VkObjectType and Vulkan Handle Relationship table. Otherwise, **objectHandle** is undefined.

• **heapIndex** describes which memory heap this device memory allocation is made from. If **type** is VKDEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT or VKDEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT, **heapIndex** corresponds to one of the valid heaps from the VkPhysicalDeviceMemoryProperties structure. Otherwise, **heapIndex** is undefined.

**memoryObjectId** is used to avoid double-counting on the same memory object.

If an internally-allocated device memory object or a VkDeviceMemory cannot be exported,
memoryObjectId must be unique in the VkDevice.

If an internally-allocated device memory object or a VkDeviceMemory supports being exported, memoryObjectId must be unique system wide.

If an internal device memory object or a VkDeviceMemory is backed by an imported external memory object, memoryObjectId must be unique system wide.

Implementor’s Note

If the heap backing an internally-allocated device memory cannot be used to back VkDeviceMemory, implementations can advertise that heap with no types.

Note

This structure should only be considered valid during the lifetime of the triggered callback.

For VKDEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT and VKDEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT events, objectHandle usually will not yet exist when the application or tool receives the callback. objectHandle will only exist when the create or allocate call that triggered the event returns, and if the allocation or import ends up failing objectHandle won’t ever exist.

Valid Usage (Implicit)

- VUID-VkDeviceMemoryReportCallbackDataEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_MEMORY_REPORT_CALLBACK_DATA_EXT

- VUID-VkDeviceMemoryReportCallbackDataEXT-pNext-pNext
  pNext must be NULL

Possible values of VkDeviceMemoryReportCallbackDataEXT::type, specifying event types which cause the device driver to call the callback, are:

// Provided by VK_EXT_device_memory_report
typedef enum VK_EXT_device_memory_report
    VkDeviceMemoryReportEventTypeEXT {
        VKDEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT = 0,
        VKDEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT = 1,
        VKDEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT = 2,
        VKDEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT = 3,
        VKDEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT = 4,
} VkDeviceMemoryReportEventTypeEXT;

- VKDEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT specifies this event corresponds to the allocation of an internal device memory object or a VkDeviceMemory.

- VKDEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT specifies this event corresponds to the
deallocation of an internally-allocated device memory object or a \texttt{VkDeviceMemory}.

- \texttt{VK\_DEVICE\_MEMORY\_REPORT\_EVENT\_TYPE\_IMPORT\_EXT} specifies this event corresponds to the import of an external memory object.

- \texttt{VK\_DEVICE\_MEMORY\_REPORT\_EVENT\_TYPE\_UNIMPORT\_EXT} specifies this event is the release of an imported external memory object.

- \texttt{VK\_DEVICE\_MEMORY\_REPORT\_EVENT\_TYPE\_ALLOCATION\_FAILED\_EXT} specifies this event corresponds to the failed allocation of an internal device memory object or a \texttt{VkDeviceMemory}.

To reserve private data storage slots, add a \texttt{VkDevicePrivateDataCreateInfoEXT} structure to the \texttt{pNext} chain of the \texttt{VkDeviceCreateInfo} structure. Reserving slots in this manner is not strictly necessary, but doing so may improve performance.

```c
// Provided by VK\_EXT\_private\_data
typedef struct VkDevicePrivateDataCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t privateDataSlotRequestCount;
} VkDevicePrivateDataCreateInfoEXT;
```

- \texttt{sType} is the type of this structure.

- \texttt{pNext} is NULL or a pointer to a structure extending this structure.

- \texttt{privateDataSlotRequestCount} is the amount of slots to reserve.

**Valid Usage (Implicit)**

- \texttt{VUID-VkDevicePrivateDataCreateInfoEXT-sType-sType} \texttt{sType} must be \texttt{VK\_STRUCTURE\_TYPE\_DEVICE\_PRIVATE\_DATA\_CREATE\_INFO\_EXT}

### 5.2.2. Device Use

The following is a high-level list of \texttt{VkDevice} uses along with references on where to find more information:

- Creation of queues. See the Queues section below for further details.

- Creation and tracking of various synchronization constructs. See Synchronization and Cache Control for further details.

- Allocating, freeing, and managing memory. See Memory Allocation and Resource Creation for further details.

- Creation and destruction of command buffers and command buffer pools. See Command Buffers for further details.

- Creation, destruction, and management of graphics state. See Pipelines and Resource Descriptors, among others, for further details.
5.2.3. Lost Device

A logical device may become lost for a number of implementation-specific reasons, indicating that pending and future command execution may fail and cause resources and backing memory to become undefined.

*Note*

Typical reasons for device loss will include things like execution timing out (to prevent denial of service), power management events, platform resource management, implementation errors.

Applications not adhering to valid usage may also result in device loss being reported, however this is not guaranteed. Even if device loss is reported, the system may be in an unrecoverable state, and further usage of the API is still considered invalid.

When this happens, certain commands will return VK_ERROR_DEVICE_LOST. After any such event, the logical device is considered lost. It is not possible to reset the logical device to a non-lost state, however the lost state is specific to a logical device (VkDevice), and the corresponding physical device (VkPhysicalDevice) may be otherwise unaffected.

In some cases, the physical device may also be lost, and attempting to create a new logical device will fail, returning VK_ERROR_DEVICE_LOST. This is usually indicative of a problem with the underlying implementation, or its connection to the host. If the physical device has not been lost, and a new logical device is successfully created from that physical device, it must be in the non-lost state.

*Note*

Whilst logical device loss may be recoverable, in the case of physical device loss, it is unlikely that an application will be able to recover unless additional, unaffected physical devices exist on the system. The error is largely informational and intended only to inform the user that a platform issue has occurred, and should be investigated further. For example, underlying hardware may have developed a fault or become physically disconnected from the rest of the system. In many cases, physical device loss may cause other more serious issues such as the operating system crashing; in which case it may not be reported via the Vulkan API.

When a device is lost, its child objects are not implicitly destroyed and their handles are still valid. Those objects must still be destroyed before their parents or the device can be destroyed (see the Object Lifetime section). The host address space corresponding to device memory mapped using vkMapMemory is still valid, and host memory accesses to these mapped regions are still valid, but the contents are undefined. It is still legal to call any API command on the device and child objects.

Once a device is lost, command execution may fail, and commands that return a VkResult may return VK_ERROR_DEVICE_LOST. Commands that do not allow runtime errors must still operate correctly for valid usage and, if applicable, return valid data.

Commands that wait indefinitely for device execution (namely vkDeviceWaitIdle, vkQueueWaitIdle,
vkWaitForFences or vkAcquireNextImageKHR with a maximum `timeout`, and `vkGetQueryPoolResults` with the `VK_QUERY_RESULT_WAIT_BIT` bit set in `flags`) must return in finite time even in the case of a lost device, and return either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`. For any command that may return `VK_ERROR_DEVICE_LOST`, for the purpose of determining whether a command buffer is in the `pending state`, or whether resources are considered in-use by the device, a return value of `VK_ERROR_DEVICE_LOST` is equivalent to `VK_SUCCESS`.

The content of any external memory objects that have been exported from or imported to a lost device become undefined. Objects on other logical devices or in other APIs which are associated with the same underlying memory resource as the external memory objects on the lost device are unaffected other than their content becoming undefined. The layout of subresources of images on other logical devices that are bound to `VkDeviceMemory` objects associated with the same underlying memory resources as external memory objects on the lost device becomes `VK_IMAGE_LAYOUT_UNDEFINED`.

The state of `VkSemaphore` objects on other logical devices created by importing a semaphore payload with temporary permanence which was exported from the lost device is undefined. The state of `VkSemaphore` objects on other logical devices that permanently share a semaphore payload with a `VkSemaphore` object on the lost device is undefined, and remains undefined following any subsequent signal operations. Implementations must ensure pending and subsequently submitted wait operations on such semaphores behave as defined in Semaphore State Requirements For Wait Operations for external semaphores not in a valid state for a wait operation.

### 5.2.4. Device Destruction

To destroy a device, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyDevice(
    VkDevice device,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

To ensure that no work is active on the device, `vkDeviceWaitIdle` can be used to gate the destruction of the device. Prior to destroying a device, an application is responsible for destroying/freeing any Vulkan objects that were created using that device as the first parameter of the corresponding `vkCreate*` or `vkAllocate*` command.

**Note**

The lifetime of each of these objects is bound by the lifetime of the `VkDevice` object. Therefore, to avoid resource leaks, it is critical that an application explicitly free all of these resources prior to calling `vkDestroyDevice`.
Valid Usage

- VUID-vkDestroyDevice-device-00378
  All child objects created on device must have been destroyed prior to destroying device.

- VUID-vkDestroyDevice-device-00379
  If VkAllocationCallbacks were provided when device was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyDevice-device-00380
  If no VkAllocationCallbacks were provided when device was created, pAllocator must be NULL.

Valid Usage (Implicit)

- VUID-vkDestroyDevice-device-parameter
  If device is not NULL, device must be a valid VkDevice handle.

- VUID-vkDestroyDevice-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure.

Host Synchronization

- Host access to device must be externally synchronized.
- Host access to all VkQueue objects received from device must be externally synchronized.

5.3. Queues

5.3.1. Queue Family Properties

As discussed in the Physical Device Enumeration section above, the vkGetPhysicalDeviceQueueFamilyProperties command is used to retrieve details about the queue families and queues supported by a device.

Each index in the pQueueFamilyProperties array returned by vkGetPhysicalDeviceQueueFamilyProperties describes a unique queue family on that physical device. These indices are used when creating queues, and they correspond directly with the queueFamilyIndex that is passed to the vkCreateDevice command via the VkDeviceQueueCreateInfo structure as described in the Queue Creation section below.

Grouping of queue families within a physical device is implementation-dependent.
The general expectation is that a physical device groups all queues of matching capabilities into a single family. However, while implementations should do this, it is possible that a physical device may return two separate queue families with the same capabilities.

Once an application has identified a physical device with the queue(s) that it desires to use, it will create those queues in conjunction with a logical device. This is described in the following section.

5.3.2. Queue Creation

Creating a logical device also creates the queues associated with that device. The queues to create are described by a set of VkDeviceQueueCreateInfo structures that are passed to vkCreateDevice in pQueueCreateInfos.

Queues are represented by VkQueue handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkQueue)
```

The VkDeviceQueueCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDeviceQueueCreateInfo {  
    VkStructureType sType;  
    const void* pNext;  
    VkDeviceQueueCreateFlags flags;  
    uint32_t queueFamilyIndex;  
    uint32_t queueCount;  
    const float* pQueuePriorities;
} VkDeviceQueueCreateInfo;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask indicating behavior of the queue.
- queueFamilyIndex is an unsigned integer indicating the index of the queue family to create on this device. This index corresponds to the index of an element of the pQueueFamilyProperties array that was returned by vkGetPhysicalDeviceQueueFamilyProperties.
- queueCount is an unsigned integer specifying the number of queues to create in the queue family indicated by queueFamilyIndex.
- pQueuePriorities is a pointer to an array of queueCount normalized floating point values, specifying priorities of work that will be submitted to each created queue. See Queue Priority for more information.
Valid Usage

- VUID-VkDeviceQueueCreateInfo-queueFamilyIndex-00381
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by 
  vkGetPhysicalDeviceQueueFamilyProperties

- VUID-VkDeviceQueueCreateInfo-queueCount-00382
  queueCount must be less than or equal to the queueCount member of the 
  VkQueueFamilyProperties structure, as returned by 
  vkGetPhysicalDeviceQueueFamilyProperties in the 
  pQueueFamilyProperties[queueFamilyIndex]

- VUID-VkDeviceQueueCreateInfo-pQueuePriorities-00383
  Each element of pQueuePriorities must be between 0.0 and 1.0 inclusive

- VUID-VkDeviceQueueCreateInfo-flags-02861
  If the protected memory feature is not enabled, the 
  VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT bit of flags must not be set

Valid Usage (Implicit)

- VUID-VkDeviceQueueCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO

- VUID-VkDeviceQueueCreateInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of 
  VkDeviceQueueGlobalPriorityCreateInfoEXT

- VUID-VkDeviceQueueCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkDeviceQueueCreateInfo-flags-parameter
  flags must be a valid combination of VkDeviceQueueCreateFlagBits values

- VUID-VkDeviceQueueCreateInfo-pQueuePriorities-parameter
  pQueuePriorities must be a valid pointer to an array of queueCount float values

- VUID-VkDeviceQueueCreateInfo-queueCount-arraylength
  queueCount must be greater than 0

Bits which can be set in VkDeviceQueueCreateInfo::flags to specify usage behavior of the queue are:

// Provided by VK_VERSION_1_0
typedef enum VkDeviceQueueCreateFlagBits {
    // Provided by VK_VERSION_1_1
    VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT = 0x00000001,
} VkDeviceQueueCreateFlagBits;

- VK DEVICE QUEUE CREATE PROTECTED BIT specifies that the device queue is a protected-capable
queue.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceQueueCreateFlags;
```

`VkDeviceQueueCreateFlags` is a bitmask type for setting a mask of zero or more `VkDeviceQueueCreateFlagBits`.

A queue can be created with a system-wide priority by adding a `VkDeviceQueueGlobalPriorityCreateInfoEXT` structure to the `pNext` chain of `VkDeviceQueueCreateInfo`.

The `VkDeviceQueueGlobalPriorityCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_global_priority
typedef struct VkDeviceQueueGlobalPriorityCreateInfoEXT {
    VkStructureType             sType;
    const void*                 pNext;
    VkQueueGlobalPriorityEXT    globalPriority;
} VkDeviceQueueGlobalPriorityCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `globalPriority` is the system-wide priority associated to this queue as specified by `VkQueueGlobalPriorityEXT`.

A queue created without specifying `VkDeviceQueueGlobalPriorityCreateInfoEXT` will default to `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`.

**Valid Usage (Implicit)**

- `VUID-VkDeviceQueueGlobalPriorityCreateInfoEXT-sType-sType`
  - `sType` must be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_GLOBAL_PRIORITY_CREATE_INFO_EXT`

- `VUID-VkDeviceQueueGlobalPriorityCreateInfoEXT-globalPriority-parameter`
  - `globalPriority` must be a valid `VkQueueGlobalPriorityEXT` value

Possible values of `VkDeviceQueueGlobalPriorityCreateInfoEXT::globalPriority`, specifying a system-wide priority level are:
Priority values are sorted in ascending order. A comparison operation on the enum values can be used to determine the priority order.

- **VK_QUEUE_GLOBAL_PRIORITY_LOW_EXT** is below the system default. Useful for non-interactive tasks.
- **VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT** is the system default priority.
- **VK_QUEUE_GLOBAL_PRIORITY_HIGH_EXT** is above the system default.
- **VK_QUEUE_GLOBAL_PRIORITY_REALTIME_EXT** is the highest priority. Useful for critical tasks.

Queues with higher system priority may be allotted more processing time than queues with lower priority. An implementation may allow a higher-priority queue to starve a lower-priority queue until the higher-priority queue has no further commands to execute.

Priorities imply no ordering or scheduling constraints.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

The global priority level of a queue takes precedence over the per-process queue priority (VkDeviceQueueCreateInfo::pQueuePriorities).

Abuse of this feature may result in starving the rest of the system of implementation resources. Therefore, the driver implementation may deny requests to acquire a priority above the default priority (VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT) if the caller does not have sufficient privileges. In this scenario VK_ERROR_NOT_PERMITTED_EXT is returned.

The driver implementation may fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this scenario VK_ERROR_INITIALIZATION_FAILED is returned.

To retrieve a handle to a VkQueue object, call:

```c
// Provided by VK_VERSION_1_0
void vkGetDeviceQueue(
    VkDevice device,
    uint32_t queueFamilyIndex,
    uint32_t queueIndex,
    VkQueue* pQueue);
```

- **device** is the logical device that owns the queue.
• queueFamilyIndex is the index of the queue family to which the queue belongs.

• queueIndex is the index within this queue family of the queue to retrieve.

• pQueue is a pointer to a VkQueue object that will be filled with the handle for the requested queue.

vkGetDeviceQueue must only be used to get queues that were created with the flags parameter of VkDeviceQueueCreateInfo set to zero. To get queues that were created with a non-zero flags parameter use vkGetDeviceQueue2.

### Valid Usage

- VUID-vkGetDeviceQueue-queueFamilyIndex-00384
  queueFamilyIndex must be one of the queue family indices specified when device was created, via the VkDeviceQueueCreateInfo structure

- VUID-vkGetDeviceQueue-queueIndex-00385
  queueIndex must be less than the number of queues created for the specified queue family index when device was created, via the queueCount member of the VkDeviceQueueCreateInfo structure

- VUID-vkGetDeviceQueue-flags-01841
  VkDeviceQueueCreateInfo::flags must have been set to zero when device was created

### Valid Usage (Implicit)

- VUID-vkGetDeviceQueue-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetDeviceQueue-pQueue-parameter
  pQueue must be a valid pointer to a VkQueue handle

To retrieve a handle to a VkQueue object with specific VkDeviceQueueCreateFlags creation flags, call:

```c
// Provided by VK_VERSION_1_1
void vkGetDeviceQueue2(
    VkDevice                                    device,
    const VkDeviceQueueInfo2*                   pQueueInfo,
    VkQueue*                                    pQueue);
```

• device is the logical device that owns the queue.

• pQueueInfo is a pointer to a VkDeviceQueueInfo2 structure, describing the parameters used to create the device queue.

• pQueue is a pointer to a VkQueue object that will be filled with the handle for the requested queue.
Valid Usage (Implicit)

- VUID-vkGetDeviceQueue2-device-parameter
  
  **device** must be a valid **VkDevice** handle

- VUID-vkGetDeviceQueue2-pQueueInfo-parameter
  
  **pQueueInfo** must be a valid pointer to a valid **VkDeviceQueueInfo2** structure

- VUID-vkGetDeviceQueue2-pQueue-parameter
  
  **pQueue** must be a valid pointer to a **VkQueue** handle

The **VkDeviceQueueInfo2** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceQueueInfo2 {
    VkStructureType             sType;
    const void*                 pNext;
    VkDeviceQueueCreateFlags    flags;
    uint32_t                    queueFamilyIndex;
    uint32_t                    queueIndex;
} VkDeviceQueueInfo2;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure. The **pNext** chain of **VkDeviceQueueInfo2** is used to provide additional image parameters to **vkGetDeviceQueue2**.
- **flags** is a **VkDeviceQueueCreateFlags** value indicating the flags used to create the device queue.
- **queueFamilyIndex** is the index of the queue family to which the queue belongs.
- **queueIndex** is the index within this queue family of the queue to retrieve.

The queue returned by **vkGetDeviceQueue2** must have the same **flags** value from this structure as that used at device creation time in a **VkDeviceQueueCreateInfo** instance. If no matching **flags** were specified at device creation time, then the handle returned in **pQueue** must be **NULL**.

Valid Usage

- VUID-VkDeviceQueueInfo2-queueFamilyIndex-01842
  
  **queueFamilyIndex** must be one of the queue family indices specified when **device** was created, via the **VkDeviceQueueCreateInfo** structure

- VUID-VkDeviceQueueInfo2-queueIndex-01843
  
  **queueIndex** must be less than the number of queues created for the specified queue family index and **VkDeviceQueueCreateFlags** member **flags** equal to this **flags** value when **device** was created, via the **queueCount** member of the **VkDeviceQueueCreateInfo** structure
5.3.3. Queue Family Index

The queue family index is used in multiple places in Vulkan in order to tie operations to a specific family of queues.

When retrieving a handle to the queue via `vkGetDeviceQueue`, the queue family index is used to select which queue family to retrieve the `VkQueue` handle from as described in the previous section.

When creating a `VkCommandPool` object (see Command Pools), a queue family index is specified in the `VkCommandPoolCreateInfo` structure. Command buffers from this pool can only be submitted on queues corresponding to this queue family.

When creating `VkImage` (see Images) and `VkBuffer` (see Buffers) resources, a set of queue families is included in the `VkImageCreateInfo` and `VkBufferCreateInfo` structures to specify the queue families that can access the resource.

When inserting a `VkBufferMemoryBarrier` or `VkImageMemoryBarrier` (see Pipeline Barriers), a source and destination queue family index is specified to allow the ownership of a buffer or image to be transferred from one queue family to another. See the Resource Sharing section for details.

5.3.4. Queue Priority

Each queue is assigned a priority, as set in the `VkDeviceQueueCreateInfo` structures when creating the device. The priority of each queue is a normalized floating point value between 0.0 and 1.0, which is then translated to a discrete priority level by the implementation. Higher values indicate a higher priority, with 0.0 being the lowest priority and 1.0 being the highest.

Within the same device, queues with higher priority may be allotted more processing time than queues with lower priority. The implementation makes no guarantees with regards to ordering or scheduling among queues with the same priority, other than the constraints defined by any explicit synchronization primitives. The implementation makes no guarantees with regards to queues across different devices.

An implementation may allow a higher-priority queue to starve a lower-priority queue on the same `VkDevice` until the higher-priority queue has no further commands to execute. The relationship of queue priorities must not cause queues on one `VkDevice` to starve queues on another `VkDevice`.

No specific guarantees are made about higher priority queues receiving more processing time or
better quality of service than lower priority queues.

5.3.5. Queue Submission

Work is submitted to a queue via *queue submission* commands such as *vkQueueSubmit2KHR* or *vkQueueSubmit*. Queue submission commands define a set of *queue operations* to be executed by the underlying physical device, including synchronization with semaphores and fences.

Submission commands take as parameters a target queue, zero or more *batches* of work, and an *optional* fence to signal upon completion. Each batch consists of three distinct parts:

1. Zero or more semaphores to wait on before execution of the rest of the batch.
   - If present, these describe a *semaphore wait operation*.
2. Zero or more work items to execute.
   - If present, these describe a *queue operation* matching the work described.
3. Zero or more semaphores to signal upon completion of the work items.
   - If present, these describe a *semaphore signal operation*.

If a fence is present in a queue submission, it describes a *fence signal operation*.

All work described by a queue submission command *must* be submitted to the queue before the command returns.

**Sparse Memory Binding**

In Vulkan it is possible to sparsely bind memory to buffers and images as described in the *Sparse Resource* chapter. Sparse memory binding is a queue operation. A queue whose flags include the *VK_QUEUE_SPARSE_BINDING_BIT* *must* be able to support the mapping of a virtual address to a physical address on the device. This causes an update to the page table mappings on the device. This update *must* be synchronized on a queue to avoid corrupting page table mappings during execution of graphics commands. By binding the sparse memory resources on queues, all commands that are dependent on the updated bindings are synchronized to only execute after the binding is updated. See the *Synchronization and Cache Control* chapter for how this synchronization is accomplished.

5.3.6. Queue Destruction

Queues are created along with a logical device during *vkCreateDevice*. All queues associated with a logical device are destroyed when *vkDestroyDevice* is called on that device.
Chapter 6. Command Buffers

Command buffers are objects used to record commands which can be subsequently submitted to a device queue for execution. There are two levels of command buffers - primary command buffers, which can execute secondary command buffers, and which are submitted to queues, and secondary command buffers, which can be executed by primary command buffers, and which are not directly submitted to queues.

Command buffers are represented by `VkCommandBuffer` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkCommandBuffer)
```

Recorded commands include commands to bind pipelines and descriptor sets to the command buffer, commands to modify dynamic state, commands to draw (for graphics rendering), commands to dispatch (for compute), commands to execute secondary command buffers (for primary command buffers only), commands to copy buffers and images, and other commands.

Each command buffer manages state independently of other command buffers. There is no inheritance of state across primary and secondary command buffers, or between secondary command buffers. When a command buffer begins recording, all state in that command buffer is undefined. When secondary command buffer(s) are recorded to execute on a primary command buffer, the secondary command buffer inherits no state from the primary command buffer, and all state of the primary command buffer is undefined after an execute secondary command buffer command is recorded. There is one exception to this rule - if the primary command buffer is inside a render pass instance, then the render pass and subpass state is not disturbed by executing secondary command buffers. For state dependent commands (such as draws and dispatches), any state consumed by those commands must not be undefined.

`VkCommandBufferInheritanceViewportScissorInfoNV` defines an exception allowing limited inheritance of dynamic viewport and scissor state.

Unless otherwise specified, and without explicit synchronization, the various commands submitted to a queue via command buffers may execute in arbitrary order relative to each other, and/or concurrently. Also, the memory side effects of those commands may not be directly visible to other commands without explicit memory dependencies. This is true within a command buffer, and across command buffers submitted to a given queue. See the synchronization chapter for information on implicit and explicit synchronization between commands.

6.1. Command Buffer Lifecycle

Each command buffer is always in one of the following states:

**Initial**

When a command buffer is allocated, it is in the initial state. Some commands are able to reset a command buffer (or a set of command buffers) back to this state from any of the executable, recording or invalid state. Command buffers in the initial state can only be moved to the
recording state, or freed.

**Recording**

vkBeginCommandBuffer changes the state of a command buffer from the initial state to the *recording state*. Once a command buffer is in the recording state, vkCmd* commands can be used to record to the command buffer.

**Executable**

vkEndCommandBuffer ends the recording of a command buffer, and moves it from the recording state to the *executable state*. Executable command buffers can be submitted, reset, or recorded to another command buffer.

**Pending**

Queue submission of a command buffer changes the state of a command buffer from the executable state to the *pending state*. Whilst in the pending state, applications must not attempt to modify the command buffer in any way - as the device may be processing the commands recorded to it. Once execution of a command buffer completes, the command buffer either reverts back to the executable state, or if it was recorded with **VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT**, it moves to the invalid state. A synchronization command should be used to detect when this occurs.

**Invalid**

Some operations, such as modifying or deleting a resource that was used in a command recorded to a command buffer, will transition the state of that command buffer into the *invalid state*. Command buffers in the invalid state can only be reset or freed.

![Figure 1. Lifecycle of a command buffer](image)

Any given command that operates on a command buffer has its own requirements on what state a command buffer must be in, which are detailed in the valid usage constraints for that command.

Resetting a command buffer is an operation that discards any previously recorded commands and puts a command buffer in the initial state. Resetting occurs as a result of vkResetCommandBuffer or vkResetCommandPool, or as part of vkBeginCommandBuffer (which additionally puts the command buffer in the recording state).
Secondary command buffers can be recorded to a primary command buffer via `vkCmdExecuteCommands`. This partially ties the lifecycle of the two command buffers together - if the primary is submitted to a queue, both the primary and any secondaries recorded to it move to the pending state. Once execution of the primary completes, so it does for any secondary recorded within it. After all executions of each command buffer complete, they each move to their appropriate completion state (either to the execution state or the invalid state, as specified above).

If a secondary moves to the invalid state or the initial state, then all primary buffers it is recorded in move to the invalid state. A primary moving to any other state does not affect the state of a secondary recorded in it.

```
Note
Resetting or freeing a primary command buffer removes the lifecycle linkage to all secondary command buffers that were recorded into it.
```

### 6.2. Command Pools

Command pools are opaque objects that command buffer memory is allocated from, and which allow the implementation to amortize the cost of resource creation across multiple command buffers. Command pools are externally synchronized, meaning that a command pool must not be used concurrently in multiple threads. That includes use via recording commands on any command buffers allocated from the pool, as well as operations that allocate, free, and reset command buffers or the pool itself.

Command pools are represented by `VkCommandPool` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCommandPool)
```

To create a command pool, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateCommandPool(  
VkDevice device,  
const VkCommandPoolCreateInfo* pCreateInfo,  
const VkAllocationCallbacks* pAllocator,  
VkCommandPool* pCommandPool);
```

- `device` is the logical device that creates the command pool.
- `pCreateInfo` is a pointer to a `VkCommandPoolCreateInfo` structure specifying the state of the command pool object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pCommandPool` is a pointer to a `VkCommandPool` handle in which the created pool is returned.
Valid Usage

- VUID-vkCreateCommandPool-queueFamilyIndex-01937
  `pCreateInfo->queueFamilyIndex` **must** be the index of a queue family available in the logical device `device`

Valid Usage (Implicit)

- VUID-vkCreateCommandPool-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkCreateCommandPool-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid `VkCommandPoolCreateInfo` structure

- VUID-vkCreateCommandPool-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateCommandPool-pCommandPool-parameter
  `pCommandPool` **must** be a valid pointer to a `VkCommandPool` handle

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCommandPoolCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandPoolCreateInfo {
    VkStructureType             sType;  // Type of this structure.
    const void*                 pNext;  // NULL or a pointer to a structure extending this structure.
    VkCommandPoolCreateFlags    flags;  // A bitmask of `VkCommandPoolCreateFlagBits` indicating usage behavior for the pool and command buffers allocated from it.
    uint32_t                     queueFamilyIndex;  // Queue family index.
} VkCommandPoolCreateInfo;
```
• queueFamilyIndex designates a queue family as described in section Queue Family Properties. All command buffers allocated from this command pool must be submitted on queues from the same queue family.

Valid Usage

• VUID-VkCommandPoolCreateInfo-flags-02860
  If the protected memory feature is not enabled, the VK_COMMAND_POOL_CREATE_PROTECTED_BIT bit of flags must not be set.

Valid Usage (Implicit)

• VUID-VkCommandPoolCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_COMMAND_POOL_CREATE_INFO.

• VUID-VkCommandPoolCreateInfo-pNext-pNext
  pNext must be NULL.

• VUID-VkCommandPoolCreateInfo-flags-parameter
  flags must be a valid combination of VkCommandPoolCreateFlagBits values.

Bits which can be set in VkCommandPoolCreateInfo::flags to specify usage behavior for a command pool are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolCreateFlagBits {
    VK_COMMAND_POOL_CREATE_TRANSIENT_BIT = 0x00000001,
    VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT = 0x00000002,
// Provided by VK_VERSION_1_1
    VK_COMMAND_POOL_CREATE_PROTECTED_BIT = 0x00000004,
} VkCommandPoolCreateFlagBits;
```

• VK_COMMAND_POOL_CREATE_TRANSIENT_BIT specifies that command buffers allocated from the pool will be short-lived, meaning that they will be reset or freed in a relatively short timeframe. This flag may be used by the implementation to control memory allocation behavior within the pool.

• VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT allows any command buffer allocated from a pool to be individually reset to the initial state; either by calling vkResetCommandBuffer, or via the implicit reset when calling vkBeginCommandBuffer. If this flag is not set on a pool, then vkResetCommandBuffer must not be called for any command buffer allocated from that pool.

• VK_COMMAND_POOL_CREATE_PROTECTED_BIT specifies that command buffers allocated from the pool are protected command buffers.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolCreateFlags;
```
VkCommandPoolCreateFlags is a bitmask type for setting a mask of zero or more VkCommandPoolCreateFlagBits.

To trim a command pool, call:

```c
// Provided by VK_VERSION_1_1
void vkTrimCommandPool(
    VkDevice device,
    VkCommandPool commandPool,
    VkCommandPoolTrimFlags flags);
```
or the equivalent command

```c
// Provided by VK_KHR_maintenance1
void vkTrimCommandPoolKHR(
    VkDevice device,
    VkCommandPool commandPool,
    VkCommandPoolTrimFlags flags);
```

- **device** is the logical device that owns the command pool.
- **commandPool** is the command pool to trim.
- **flags** is reserved for future use.

Trimming a command pool recycles unused memory from the command pool back to the system. Command buffers allocated from the pool are not affected by the command.
Note

This command provides applications with some control over the internal memory allocations used by command pools.

Unused memory normally arises from command buffers that have been recorded and later reset, such that they are no longer using the memory. On reset, a command buffer can return memory to its command pool, but the only way to release memory from a command pool to the system requires calling `vkResetCommandPool`, which cannot be executed while any command buffers from that pool are still in use. Subsequent recording operations into command buffers will re-use this memory but since total memory requirements fluctuate over time, unused memory can accumulate.

In this situation, trimming a command pool may be useful to return unused memory back to the system, returning the total outstanding memory allocated by the pool back to a more “average” value.

Implementations utilize many internal allocation strategies that make it impossible to guarantee that all unused memory is released back to the system. For instance, an implementation of a command pool may involve allocating memory in bulk from the system and sub-allocating from that memory. In such an implementation any live command buffer that holds a reference to a bulk allocation would prevent that allocation from being freed, even if only a small proportion of the bulk allocation is in use.

In most cases trimming will result in a reduction in allocated but unused memory, but it does not guarantee the “ideal” behavior.

Trimming may be an expensive operation, and should not be called frequently. Trimming should be treated as a way to relieve memory pressure after application-known points when there exists enough unused memory that the cost of trimming is “worth” it.

Valid Usage (Implicit)

- `VK_KHR_pipeline_executed_directly` must be a valid `VkDevice` handle
- `commandPool` must be a valid `VkCommandPool` handle
- `flags` must be 0
- `commandPool` must have been created, allocated, or retrieved from `device`
Host Synchronization

- Host access to `commandPool` must be externally synchronized

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkCommandPoolTrimFlags;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance1
typedef VkCommandPoolTrimFlags VkCommandPoolTrimFlagsKHR;
```

`VkCommandPoolTrimFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To reset a command pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetCommandPool(
    VkDevice                                    device,
    VkCommandPool                               commandPool,
    VkCommandPoolResetFlags                     flags);
```

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool to reset.
- `flags` is a bitmask of `VkCommandPoolResetFlagBits` controlling the reset operation.

Resetting a command pool recycles all of the resources from all of the command buffers allocated from the command pool back to the command pool. All command buffers that have been allocated from the command pool are put in the initial state.

Any primary command buffer allocated from another `VkCommandPool` that is in the recording or executable state and has a secondary command buffer allocated from `commandPool` recorded into it, becomes invalid.

Valid Usage

- `VUID-vkResetCommandPool-commandPool-00040`
  All `VkCommandBuffer` objects allocated from `commandPool` must not be in the pending state
Valid Usage (Implicit)

- VUID-vkResetCommandPool-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkResetCommandPool-commandPool-parameter
  
  `commandPool` must be a valid `VkCommandPool` handle

- VUID-vkResetCommandPool-flags-parameter
  
  `flags` must be a valid combination of `VkCommandPoolResetFlagBits` values

- VUID-vkResetCommandPool-commandPool-parent
  
  `commandPool` must have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `commandPool` must be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Bits which can be set in `vkResetCommandPool::flags` to control the reset operation are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolResetFlagBits {
    VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandPoolResetFlagBits;
```

- `VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT` specifies that resetting a command pool recycles all of the resources from the command pool back to the system.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolResetFlags;
```

`VkCommandPoolResetFlags` is a bitmask type for setting a mask of zero or more `VkCommandPoolResetFlagBits`.

To destroy a command pool, call:
void vkDestroyCommandPool(
  VkDevice device,  
  VkCommandPool commandPool,  
  const VkAllocationCallbacks* pAllocator);

- **device** is the logical device that destroys the command pool.
- **commandPool** is the handle of the command pool to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

When a pool is destroyed, all command buffers allocated from the pool are **freed**.

Any primary command buffer allocated from another **VkCommandPool** that is in the recording or executable state and has a secondary command buffer allocated from **commandPool** recorded into it, becomes **invalid**.

### Valid Usage

- **VUID-vkDestroyCommandPool-commandPool-00041**
  All **VkCommandBuffer** objects allocated from **commandPool** must not be in the pending state

- **VUID-vkDestroyCommandPool-commandPool-00042**
  If **VkAllocationCallbacks** were provided when **commandPool** was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyCommandPool-commandPool-00043**
  If no **VkAllocationCallbacks** were provided when **commandPool** was created, **pAllocator** must be **NULL**

### Valid Usage (Implicit)

- **VUID-vkDestroyCommandPool-device-parameter**
  **device** must be a valid **VkDevice** handle

- **VUID-vkDestroyCommandPool-commandPool-parameter**
  If **commandPool** is not **VK_NULL_HANDLE**, **commandPool** must be a valid **VkCommandPool** handle

- **VUID-vkDestroyCommandPool-pAllocator-parameter**
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- **VUID-vkDestroyCommandPool-commandPool-parent**
  If **commandPool** is a valid handle, it must have been created, allocated, or retrieved from **device**
6.3. Command Buffer Allocation and Management

To allocate command buffers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateCommandBuffers(
    VkDevice                                    device,
    const VkCommandBufferAllocateInfo*          pAllocateInfo,
    VkCommandBuffer*                            pCommandBuffers);
```

- `device` is the logical device that owns the command pool.
- `pAllocateInfo` is a pointer to a `VkCommandBufferAllocateInfo` structure describing parameters of the allocation.
- `pCommandBuffers` is a pointer to an array of `VkCommandBuffer` handles in which the resulting command buffer objects are returned. The array must be at least the length specified by the `commandBufferCount` member of `pAllocateInfo`. Each allocated command buffer begins in the initial state.

`vkAllocateCommandBuffers` can be used to create multiple command buffers. If the creation of any of those command buffers fails, the implementation must destroy all successfully created command buffer objects from this command, set all entries of the `pCommandBuffers` array to `NULL` and return the error.

When command buffers are first allocated, they are in the initial state.

Valid Usage (Implicit)

- VUID-vkAllocateCommandBuffers-device-parameter
  device must be a valid `VkDevice` handle

- VUID-vkAllocateCommandBuffers-pAllocateInfo-parameter
  `pAllocateInfo` must be a valid pointer to a valid `VkCommandBufferAllocateInfo` structure

- VUID-vkAllocateCommandBuffers-pCommandBuffers-parameter
  `pCommandBuffers` must be a valid pointer to an array of `pAllocateInfo->commandBufferCount` `VkCommandBuffer` handles

- VUID-vkAllocateCommandBuffers-pAllocateInfo::commandBufferCount-arraylength
  `pAllocateInfo->commandBufferCount` must be greater than 0
Host Synchronization

- Host access to `pAllocateInfo->commandPool` must be externally synchronized.

Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkCommandBufferAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferAllocateInfo {
    VkStructureType         sType;
    const void*             pNext;
    VkCommandPool           commandPool;
    VkCommandBufferLevel    level;
    uint32_t                commandBufferCount;
} VkCommandBufferAllocateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `commandPool` is the command pool from which the command buffers are allocated.
- `level` is a `VkCommandBufferLevel` value specifying the command buffer level.
- `commandBufferCount` is the number of command buffers to allocate from the pool.

Valid Usage (Implicit)

- **VUID-VkCommandBufferAllocateInfo-sType-sType**
  `sType` must be **VK_STRUCTURE_TYPE_COMMAND_BUFFER_ALLOCATE_INFO**

- **VUID-VkCommandBufferAllocateInfo-pNext-pNext**
  `pNext` must be `NULL`

- **VUID-VkCommandBufferAllocateInfo-commandPool-parameter**
  `commandPool` must be a valid `VkCommandPool` handle

- **VUID-VkCommandBufferAllocateInfo-level-parameter**
  `level` must be a valid `VkCommandBufferLevel` value
Possible values of `VkCommandBufferAllocateInfo::level`, specifying the command buffer level, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferLevel {
    VK_COMMAND_BUFFER_LEVEL_PRIMARY = 0,
    VK_COMMAND_BUFFER_LEVEL_SECONDARY = 1,
} VkCommandBufferLevel;
```

- `VK_COMMAND_BUFFER_LEVEL_PRIMARY` specifies a primary command buffer.
- `VK_COMMAND_BUFFER_LEVEL_SECONDARY` specifies a secondary command buffer.

To reset command buffers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetCommandBuffer(
    VkCommandBuffer commandBuffer,
    VkCommandBufferResetFlags flags);
```

- `commandBuffer` is the command buffer to reset. The command buffer can be in any state other than pending, and is moved into the initial state.
- `flags` is a bitmask of `VkCommandBufferResetFlagBits` controlling the reset operation.

Any primary command buffer that is in the recording or executable state and has `commandBuffer` recorded into it, becomes invalid.

**Valid Usage**

- `VUID-vkResetCommandBuffer-commandBuffer-00045`
  - `commandBuffer` must not be in the pending state
- `VUID-vkResetCommandBuffer-commandBuffer-00046`
  - `commandBuffer` must have been allocated from a pool that was created with the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT`

**Valid Usage (Implicit)**

- `VUID-vkResetCommandBuffer-commandBuffer-parameter`
  - `commandBuffer` must be a valid `VkCommandBuffer` handle
- `VUID-vkResetCommandBuffer-flags-parameter`
  - `flags` must be a valid combination of `VkCommandBufferResetFlagBits` values
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Bits which can be set in `vkResetCommandBuffer::flags` to control the reset operation are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferResetFlagBits {
    VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandBufferResetFlagBits;
```

- `VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT` specifies that most or all memory resources currently owned by the command buffer should be returned to the parent command pool. If this flag is not set, then the command buffer may hold onto memory resources and reuse them when recording commands. `commandBuffer` is moved to the initial state.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandBufferResetFlags;
```

`VkCommandBufferResetFlags` is a bitmask type for setting a mask of zero or more `VkCommandBufferResetFlagBits`.

To free command buffers, call:

```c
// Provided by VK_VERSION_1_0
void vkFreeCommandBuffers(
    VkDevice device,
    VkCommandPool commandPool,
    uint32_t commandBufferCount,
    const VkCommandBuffer* pCommandBuffers);
```

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool from which the command buffers were allocated.
- `commandBufferCount` is the length of the `pCommandBuffers` array.
• *pCommandBuffers* is a pointer to an array of handles of command buffers to free.

Any primary command buffer that is in the recording or executable state and has any element of *pCommandBuffers* recorded into it, becomes invalid.

### Valid Usage

- VUID-vkFreeCommandBuffers-pCommandBuffers-00047
  All elements of *pCommandBuffers* must not be in the pending state

- VUID-vkFreeCommandBuffers-pCommandBuffers-00048
  *pCommandBuffers* must be a valid pointer to an array of `commandBufferCount` `VkCommandBuffer` handles, each element of which must either be a valid handle or NULL

### Valid Usage (Implicit)

- VUID-vkFreeCommandBuffers-device-parameter
  *device* must be a valid `VkDevice` handle

- VUID-vkFreeCommandBuffers-commandPool-parameter
  *commandPool* must be a valid `VkCommandPool` handle

- VUID-vkFreeCommandBuffers-commandBufferCount-arraylength
  *commandBufferCount* must be greater than 0

- VUID-vkFreeCommandBuffers-commandPool-parent
  *commandPool* must have been created, allocated, or retrieved from *device*

- VUID-vkFreeCommandBuffers-pCommandBuffers-parent
  Each element of *pCommandBuffers* that is a valid handle must have been created, allocated, or retrieved from *commandPool*

### Host Synchronization

- Host access to *commandPool* must be externally synchronized

- Host access to each member of *pCommandBuffers* must be externally synchronized

### 6.4. Command Buffer Recording

To begin recording a command buffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBeginCommandBuffer(
    VkCommandBuffer                          commandBuffer,
    const VkCommandBufferBeginInfo*         pBeginInfo);
```
• **commandBuffer** is the handle of the command buffer which is to be put in the recording state.

• **pBeginInfo** points to a VkCommandBufferBeginInfo structure defining additional information about how the command buffer begins recording.

---

### Valid Usage

- **VUID-vkBeginCommandBuffer-commandBuffer-00049**
  
  **commandBuffer must not be in the recording or pending state**

- **VUID-vkBeginCommandBuffer-commandBuffer-00050**
  
  If commandBuffer was allocated from a VkCommandPool which did not have the VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT flag set, commandBuffer must be in the initial state.

- **VUID-vkBeginCommandBuffer-commandBuffer-00051**
  
  If commandBuffer is a secondary command buffer, the pInheritanceInfo member of pBeginInfo must be a valid VkCommandBufferInheritanceInfo structure.

- **VUID-vkBeginCommandBuffer-commandBuffer-00052**
  
  If commandBuffer is a secondary command buffer and either the occlusionQueryEnable member of the pInheritanceInfo member of pBeginInfo is VK_FALSE, or the precise occlusion queries feature is not enabled, the queryFlags member of the pInheritanceInfo member pBeginInfo must not contain VK_QUERY_CONTROL_PRECISE_BIT.

- **VUID-vkBeginCommandBuffer-commandBuffer-02840**
  
  If commandBuffer is a primary command buffer, then pBeginInfo->flags must not set both the VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT and the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT flags.

---

### Valid Usage (Implicit)

- **VUID-vkBeginCommandBuffer-commandBuffer-parameter**
  
  commandBuffer must be a valid VkCommandBuffer handle.

- **VUID-vkBeginCommandBuffer-pBeginInfo-parameter**
  
  pBeginInfo must be a valid pointer to a valid VkCommandBufferBeginInfo structure.

---

### Host Synchronization

- Host access to commandBuffer must be externally synchronized.

- Host access to theVkCommandPool that commandBuffer was allocated from must be externally synchronized.
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkCommandBufferBeginInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandBufferUsageFlags flags;
    const VkCommandBufferInheritanceInfo* pInheritanceInfo;
} VkCommandBufferBeginInfo;
```

• `sType` is the type of this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `flags` is a bitmask of `VkCommandBufferUsageFlagBits` specifying usage behavior for the command buffer.

• `pInheritanceInfo` is a pointer to a `VkCommandBufferInheritanceInfo` structure, used if `commandBuffer` is a secondary command buffer. If this is a primary command buffer, then this value is ignored.

Valid Usage

• VUID-VkCommandBufferBeginInfo-flags-00053

  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `renderPass` member of `pInheritanceInfo` must be a valid `VkRenderPass`

• VUID-VkCommandBufferBeginInfo-flags-00054

  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `subpass` member of `pInheritanceInfo` must be a valid subpass index within the `renderPass` member of `pInheritanceInfo`

• VUID-VkCommandBufferBeginInfo-flags-00055

  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `framebuffer` member of `pInheritanceInfo` must be either `VK_NULL_HANDLE`, or a valid `VkFramebuffer` that is compatible with the `renderPass` member of `pInheritanceInfo`
Valid Usage (Implicit)

- **VUID-VkCommandBufferBeginInfo-sType-sType**
  *sType must be* `VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO`

- **VUID-VkCommandBufferBeginInfo-pNext-pNext**
  *pNext must be* `NULL` *or a pointer to a valid instance of* `VkDeviceGroupCommandBufferBeginInfo`

- **VUID-VkCommandBufferBeginInfo-sType-unique**
  The *sType* value of each struct in the *pNext* chain must be unique

- **VUID-VkCommandBufferBeginInfo-flags-parameter**
  *flags must be a valid combination of* `VkCommandBufferUsageFlagBits` *values*

Bits which can be set in `VkCommandBufferBeginInfo::flags` to specify usage behavior for a command buffer are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferUsageFlagBits {
    VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT = 0x00000001,
    VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT = 0x00000002,
    VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT = 0x00000004,
} VkCommandBufferUsageFlagBits;
```

- **VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT** specifies that each recording of the command buffer will only be submitted once, and the command buffer will be reset and recorded again between each submission.

- **VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT** specifies that a secondary command buffer is considered to be entirely inside a render pass. If this is a primary command buffer, then this bit is ignored.

- **VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT** specifies that a command buffer can be resubmitted to a queue while it is in the *pending state*, and recorded into multiple primary command buffers.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandBufferUsageFlags;
```

*VkCommandBufferUsageFlags* is a bitmask type for setting a mask of zero or more `VkCommandBufferUsageFlagBits`.

If the command buffer is a secondary command buffer, then the `VkCommandBufferInheritanceInfo` structure defines any state that will be inherited from the primary command buffer:
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferInheritanceInfo {
    VkStructureType                  sType;
    const void*                      pNext;
    VkRenderPass                     renderPass;
    uint32_t                         subpass;
    VkFramebuffer                    framebuffer;
    VkBool32                         occlusionQueryEnable;
    VkQueryControlFlags              queryFlags;
    VkQueryPipelineStatisticFlags    pipelineStatistics;
} VkCommandBufferInheritanceInfo;

- **sType** is the type of this structure.

- **pNext** is NULL or a pointer to a structure extending this structure.

- **renderPass** is a VkRenderPass object defining which render passes the VkCommandBuffer will be compatible with and can be executed within. If the VkCommandBuffer will not be executed within a render pass instance, renderPass is ignored.

- **subpass** is the index of the subpass within the render pass instance that the VkCommandBuffer will be executed within. If the VkCommandBuffer will not be executed within a render pass instance, subpass is ignored.

- **framebuffer** optionally refers to the VkFramebuffer object that the VkCommandBuffer will be rendering to if it is executed within a render pass instance. It can be VK_NULL_HANDLE if the framebuffer is not known, or if the VkCommandBuffer will not be executed within a render pass instance.

  **Note**
  Specifying the exact framebuffer that the secondary command buffer will be executed with may result in better performance at command buffer execution time.

- **occlusionQueryEnable** specifies whether the command buffer can be executed while an occlusion query is active in the primary command buffer. If this is VK_TRUE, then this command buffer can be executed whether the primary command buffer has an occlusion query active or not. If this is VK_FALSE, then the primary command buffer must not have an occlusion query active.

- **queryFlags** specifies the query flags that can be used by an active occlusion query in the primary command buffer when this secondary command buffer is executed. If this value includes the VK_QUERY_CONTROL_PRECISE_BIT bit, then the active query can return boolean results or actual sample counts. If this bit is not set, then the active query must not use the VK_QUERY_CONTROL_PRECISE_BIT bit.

- **pipelineStatistics** is a bitmask of VkQueryPipelineStatisticFlagBits specifying the set of pipeline statistics that can be counted by an active query in the primary command buffer when this secondary command buffer is executed. If this value includes a given bit, then this command buffer can be executed whether the primary command buffer has a pipeline statistics query active that includes this bit or not. If this value excludes a given bit, then the
active pipeline statistics query must not be from a query pool that counts that statistic.

Valid Usage

- VUID-VkCommandBufferInheritanceInfo-occlusionQueryEnable-00056
  If the inherited queries feature is not enabled, occlusionQueryEnable must be VK_FALSE

- VUID-VkCommandBufferInheritanceInfo-queryFlags-00057
  If the inherited queries feature is enabled, queryFlags must be a valid combination of VkQueryControlFlagBits values

- VUID-VkCommandBufferInheritanceInfo-queryFlags-02788
  If the inherited queries feature is not enabled, queryFlags must be 0

- VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-02789
  If the pipeline statistics queries feature is enabled, pipelineStatistics must be a valid combination of VkQueryPipelineStatisticFlagBits values

- VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-00058
  If the pipeline statistics queries feature is not enabled, pipelineStatistics must be 0

Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_INFO

- VUID-VkCommandBufferInheritanceInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkCommandBufferInheritanceConditionalRenderingInfoEXT, VkCommandBufferInheritanceRenderPassTransformInfoQCOM, or VkCommandBufferInheritanceViewportScissorInfoNV

- VUID-VkCommandBufferInheritanceInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkCommandBufferInheritanceInfo-commonparent
  Both of framebuffer, and renderPass that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Note

On some implementations, not using the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT bit enables command buffers to be patched in-place if needed, rather than creating a copy of the command buffer.

If a command buffer is in the invalid, or executable state, and the command buffer was allocated from a command pool with the VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT flag set, then vkBeginCommandBuffer implicitly resets the command buffer, behaving as if vkResetCommandBuffer had been called with VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT not set. After the implicit reset, commandBuffer is moved to the recording state.
If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceConditionalRenderingInfoEXT` structure, then that structure controls whether a command buffer can be executed while conditional rendering is active in the primary command buffer.

The `VkCommandBufferInheritanceConditionalRenderingInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_conditional_rendering
typedef struct VkCommandBufferInheritanceConditionalRenderingInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 conditionalRenderingEnable;
} VkCommandBufferInheritanceConditionalRenderingInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `conditionalRenderingEnable` specifies whether the command buffer can be executed while conditional rendering is active in the primary command buffer. If this is `VK_TRUE`, then this command buffer can be executed whether the primary command buffer has active conditional rendering or not. If this is `VK_FALSE`, then the primary command buffer must not have conditional rendering active.

If this structure is not present, the behavior is as if `conditionalRenderingEnable` is `VK_FALSE`.

### Valid Usage

- VUID-VkCommandBufferInheritanceConditionalRenderingInfoEXT-conditionalRenderingEnable-01977
  - If the inherited conditional rendering feature is not enabled, `conditionalRenderingEnable` must be `VK_FALSE`

### Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceConditionalRenderingInfoEXT-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_CONDITIONAL_RENDERING_INFO_EXT`

To begin recording a secondary command buffer compatible with execution inside a render pass using render pass transform, add the `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` to the `pNext` chain of `VkCommandBufferInheritanceInfo` structure passed to the `vkBeginCommandBuffer` command specifying the parameters for transformed rasterization.

The `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` structure is defined as:
typedef struct VkCommandBufferInheritanceRenderPassTransformInfoQCOM {
    VkStructureType sType;
    void* pNext;
    VkSurfaceTransformFlagBitsKHR transform;
    VkRect2D renderArea;
} VkCommandBufferInheritanceRenderPassTransformInfoQCOM;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **transform** is a VkSurfaceTransformFlagBitsKHR value describing the transform to be applied to the render pass.
- **renderArea** is the render area that is affected by the command buffer.

When the secondary is recorded to execute within a render pass instance using `vkCmdExecuteCommands`, the render pass transform parameters of the secondary command buffer must be consistent with the render pass transform parameters specified for the render pass instance. In particular, the **transform** and **renderArea** for command buffer must be identical to the **transform** and **renderArea** of the render pass instance.

### Valid Usage

- VUID-VkCommandBufferInheritanceRenderPassTransformInfoQCOM-transform-02864
  - **transform** must be: VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR, VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR, VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR, or VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR

### Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceRenderPassTransformInfoQCOM-sType-sType
  - **sType** must be VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDER_PASS_TRANSFORM_INFO_QCOM

The **VkCommandBufferInheritanceViewportScissorInfoNV** structure is defined as:

// Provided by VK_NV_inherited_viewport_scissor
typedef struct VkCommandBufferInheritanceViewportScissorInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 viewportScissor2D;
    uint32_t viewportDepthCount;
    const VkViewport* pViewportDepths;
} VkCommandBufferInheritanceViewportScissorInfoNV;
• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• viewportScissor2D specifies whether the listed dynamic state is inherited.
• viewportDepthCount specifies the maximum number of viewports to inherit. When viewportScissor2D is VK_FALSE, the behavior is as if this value is zero.
• pViewportDepths specifies the expected depth range for each inherited viewport.

If the pNext chain of VkCommandBufferInheritanceInfo includes a VkCommandBufferInheritanceViewportScissorInfoNV structure, then that structure controls whether a command buffer can inherit the following state from other command buffers:

• VK_DYNAMIC_STATE_SCISSOR
• VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT
• VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT

as well as the following state, with restrictions on inherited depth values and viewport count:

• VK_DYNAMIC_STATE_VIEWPORT
• VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT

If viewportScissor2D is VK_FALSE, then the command buffer does not inherit the listed dynamic state, and should set this state itself. If this structure is not present, the behavior is as if viewportScissor2D is VK_FALSE.

If viewportScissor2D is VK_TRUE, then the listed dynamic state is inherited, and the command buffer must not set this state, except that the viewport and scissor count may be set by binding a graphics pipeline that does not specify this state as dynamic.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Due to this restriction, applications should ensure either all or none of the graphics pipelines bound in this secondary command buffer use dynamic viewport/scissor counts.</td>
</tr>
</tbody>
</table>

When the command buffer is executed as part of the execution of a vkCmdExecuteCommands command, the inherited state (if enabled) is determined by the following procedure, performed separately for each dynamic state, and separately for each value for dynamic state that consists of multiple values (e.g. multiple viewports).

• With \( i \) being the index of the executed command buffer in the pCommandBuffers array of vkCmdExecuteCommands, if \( i > 0 \) and any secondary command buffer from index 0 to \( i - 1 \) modifies the state, the inherited state is provisionally set to the final value set by the last such secondary command buffer. Binding a graphics pipeline that defines the state statically is equivalent to setting the state to an undefined value.

• Otherwise, the tentatative inherited state is that of the primary command buffer at the point the vkCmdExecuteCommands command was recorded; if the state is undefined, then so is the provisional inherited state.
• If the provisional inherited state is an undefined value, then the state is not inherited.
• If the provisional inherited state is a viewport, with \( n \) being its viewport index, then if \( n \geq \text{viewportDepthCount} \), or if either \( \text{VkViewport::minDepth} \) or \( \text{VkViewport::maxDepth} \) are not equal to the respective values of the \( n \)th element of \( p\text{ViewDepths} \), then the state is not inherited.
• If the provisional inherited state passes both checks, then it becomes the actual inherited state.

Note
There is no support for inheriting dynamic state from a secondary command buffer executed as part of a different \( \text{vkCmdExecuteCommands} \) command.

Valid Usage

- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04782
  If the inherited viewport scissor feature is not enabled, \text{viewportScissor2D} must be \text{VK_FALSE}.

- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04783
  If the multiple viewports feature is not enabled and \text{viewportScissor2D} is \text{VK_TRUE}, then \text{viewportDepthCount} must be \text{1}.

- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04784
  If \text{viewportScissor2D} is \text{VK_TRUE}, then \text{viewportDepthCount} must be greater than \text{0}.

- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04785
  If \text{viewportScissor2D} is \text{VK_TRUE}, then \( p\text{ViewportDepths} \) must be a valid pointer to an array of \text{viewportDepthCount} valid \text{VkViewport} structures, except any requirements on \( x \), \( y \), \( width \), and \( height \) do not apply.

- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04786
  If \text{viewportScissor2D} is \text{VK_TRUE}, then the command buffer must be recorded with the \text{VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT}.

Valid Usage (Implicit)
- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-sType-sType
  \text{sType} must be \text{VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_VIEWPORT_SCISSOR_INFO_NV}.

Once recording starts, an application records a sequence of commands (\( \text{vkCmd*} \)) to set state in the command buffer, draw, dispatch, and other commands.

Several commands can also be recorded indirectly from \text{VkBuffer} content, see Device-Generated Commands.

To complete recording of a command buffer, call:
// Provided by VK_VERSION_1_0
VkResult vkEndCommandBuffer(
    VkCommandBuffer commandBuffer);

- `commandBuffer` is the command buffer to complete recording.

If there was an error during recording, the application will be notified by an unsuccessful return code returned by `vkEndCommandBuffer`. If the application wishes to further use the command buffer, the command buffer **must** be reset.

The command buffer **must** have been in the **recording state**, and is moved to the **executable state**.

### Valid Usage

- VUID-vkEndCommandBuffer-commandBuffer-00059
  ```
  commandBuffer must be in the recording state
  ```

- VUID-vkEndCommandBuffer-commandBuffer-00060
  ```
  If commandBuffer is a primary command buffer, there must not be an active render pass instance
  ```

- VUID-vkEndCommandBuffer-commandBuffer-00061
  ```
  All queries made active during the recording of commandBuffer must have been made inactive
  ```

- VUID-vkEndCommandBuffer-None-01978
  ```
  Conditional rendering must not be active
  ```

- VUID-vkEndCommandBuffer-commandBuffer-01815
  ```
  If commandBuffer is a secondary command buffer, there must not be an outstanding vkCmdBeginDebugUtilsLabelEXT command recorded to commandBuffer that has not previously been ended by a call to vkCmdEndDebugUtilsLabelEXT
  ```

- VUID-vkEndCommandBuffer-commandBuffer-00062
  ```
  If commandBuffer is a secondary command buffer, there must not be an outstanding vkCmdDebugMarkerBeginEXT command recorded to commandBuffer that has not previously been ended by a call to vkCmdDebugMarkerEndEXT
  ```

### Valid Usage (Implicit)

- VUID-vkEndCommandBuffer-commandBuffer-parameter
  ```
  commandBuffer must be a valid VkCommandBuffer handle
  ```
Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

When a command buffer is in the executable state, it can be submitted to a queue for execution.

6.5. Command Buffer Submission

Note
Submission can be a high overhead operation, and applications should attempt to batch work together into as few calls to vkQueueSubmit or vkQueueSubmit2KHR as possible.

To submit command buffers to a queue, call:

```c
// Provided by VK_KHR_synchronization2
VkResult vkQueueSubmit2KHR(
    VkQueue queue,
    uint32_t submitCount,
    const VkSubmitInfo2KHR* pSubmits,
    VkFence fence);
```

• queue is the queue that the command buffers will be submitted to.
• submitCount is the number of elements in the pSubmits array.
• pSubmits is a pointer to an array of VkSubmitInfo2KHR structures, each specifying a command buffer submission batch.
• fence is an optional handle to a fence to be signaled once all submitted command buffers have completed execution. If fence is not VK_NULL_HANDLE, it defines a fence signal operation.

vkQueueSubmit2KHR is a queue submission command, with each batch defined by an element of pSubmits as an instance of the VkSubmitInfo2KHR structure.
Semaphore operations submitted with `vkQueueSubmit2KHR` have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the semaphore section of the synchronization chapter.

If any command buffer submitted to this queue is in the executable state, it is moved to the pending state. Once execution of all submissions of a command buffer complete, it moves from the pending state, back to the executable state. If a command buffer was recorded with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` flag, it instead moves back to the invalid state.

If `vkQueueSubmit2KHR` fails, it may return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by `pSubmits` is unaffected by the call or its failure. If `vkQueueSubmit2KHR` fails in such a way that the implementation is unable to make that guarantee, the implementation must return `VK_ERROR_DEVICE_LOST`. See Lost Device.
Valid Usage

- **VUID-vkQueueSubmit2KHR-synchronization2-03866**
  The synchronization2 feature must be enabled

- **VUID-vkQueueSubmit2KHR-commandBuffer-03867**
  If a command recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits referenced an VkEvent, that event must not be referenced by a command that has been submitted to another queue and is still in the pending state

- **VUID-vkQueueSubmit2KHR-semaphore-03868**
  The semaphore member of any element of the pSignalSemaphoreInfos member of any element of pSubmits must be unsignaled when the semaphore signal operation it defines is executed on the device

- **VUID-vkQueueSubmit2KHR-stageMask-03869**
  The stageMask member of any element of the pSignalSemaphoreInfos member of any element of pSubmits must only include pipeline stages that are supported by the queue family which queue belongs to

- **VUID-vkQueueSubmit2KHR-stageMask-03870**
  The stageMask member of any element of the pWaitSemaphoreInfos member of any element of pSubmits must only include pipeline stages that are supported by the queue family which queue belongs to

- **VUID-vkQueueSubmit2KHR-semaphore-03871**
  When a semaphore wait operation for a binary semaphore is executed, as defined by the semaphore member of any element of the pWaitSemaphoreInfos member of any element of pSubmits, there must be no other queues waiting on the same semaphore

- **VUID-vkQueueSubmit2KHR-semaphore-03872**
  The semaphore member of any element of the pWaitSemaphoreInfos member of any element of pSubmits must be semaphores that are signaled, or have semaphore signal operations previously submitted for execution

- **VUID-vkQueueSubmit2KHR-semaphore-03873**
  Any semaphore member of any element of the pWaitSemaphoreInfos member of any element of pSubmits that was created with a VkSemaphoreTypeKHR of VK_SEMAPHORE_TYPE_BINARY_KHR must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) must have also been submitted for execution

- **VUID-vkQueueSubmit2KHR-commandBuffer-03874**
  The commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits must be in the pending or executable state

- **VUID-vkQueueSubmit2KHR-commandBuffer-03875**
  If a command recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits was not recorded with the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT, it must not be in the pending state

- **VUID-vkQueueSubmit2KHR-commandBuffer-03876**
Any secondary command buffers recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits must be in the pending or executable state

- VUID-vkQueueSubmit2KHR-commandBuffer-03877
  If any secondary command buffers recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits was not recorded with the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT, it must not be in the pending state

- VUID-vkQueueSubmit2KHR-commandBuffer-03878
  The commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits must have been allocated from a VkCommandPool that was created for the same queue family queue belongs to

- VUID-vkQueueSubmit2KHR-commandBuffer-03879
  If a command recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits includes a Queue Family Transfer Acquire Operation, there must exist a previously submitted Queue Family Transfer Release Operation on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such acquire operations, and which happens before the acquire operation

- VUID-vkQueueSubmit2KHR-commandBuffer-03880
  If a command recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits was a vkCmdBeginQuery whose queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the profiling lock must have been held continuously on the VkDevice that queue was retrieved from, throughout recording of those command buffers

---

**Valid Usage (Implicit)**

- VUID-vkQueueSubmit2KHR-queue-parameter
  queue must be a valid VkQueue handle

- VUID-vkQueueSubmit2KHR-pSubmits-parameter
  If submitCount is not 0, pSubmits must be a valid pointer to an array of submitCount valid VkSubmitInfo2KHR structures

- VUID-vkQueueSubmit2KHR-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

- VUID-vkQueueSubmit2KHR-commonparent
  Both of fence, and queue that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to queue must be externally synchronized
- Host access to fence must be externally synchronized

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The VkSubmitInfo2KHR structure is defined as:

```c
// Provided by VK_KHR_synchronization2
typedef struct VkSubmitInfo2KHR {
    VkStructureType                        sType;
    const void *                            pNext;
    VkSubmitFlagsKHR                       flags;
    uint32_t                               waitSemaphoreInfoCount;
    const VkSemaphoreSubmitInfoKHR*        pWaitSemaphoreInfos;
    uint32_t                               commandBufferInfoCount;
    const VkCommandBufferSubmitInfoKHR*    pCommandBufferInfos;
    uint32_t                               signalSemaphoreInfoCount;
    const VkSemaphoreSubmitInfoKHR*        pSignalSemaphoreInfos;
} VkSubmitInfo2KHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkSubmitFlagBitsKHR.
- waitSemaphoreInfoCount is the number of elements in pWaitSemaphoreInfos.
- pWaitSemaphoreInfos is a pointer to an array of VkSemaphoreSubmitInfoKHR structures defining
semaphore wait operations.

- `commandBufferInfoCount` is the number of elements in `pCommandBufferInfos` and the number of command buffers to execute in the batch.
- `pCommandBufferInfos` is a pointer to an array of `VkCommandBufferSubmitInfoKHR` structures describing command buffers to execute in the batch.
- `signalSemaphoreInfoCount` is the number of elements in `pSignalSemaphoreInfos`.
- `pSignalSemaphoreInfos` is a pointer to an array of `VkSemaphoreSubmitInfoKHR` describing semaphore signal operations.

### Valid Usage

- **VUID-VkSubmitInfo2KHR-semaphore-03881**
  
  If the same semaphore is used as the `semaphore` member of both an element of `pSignalSemaphoreInfos` and `pWaitSemaphoreInfos`, and that semaphore is a timeline semaphore, the `value` member of the `pSignalSemaphoreInfos` element **must** be greater than the `value` member of the `pWaitSemaphoreInfos` element.

- **VUID-VkSubmitInfo2KHR-semaphore-03882**
  
  If the `semaphore` member of any element of `pSignalSemaphoreInfos` is a timeline semaphore, the `value` member of that element **must** have a value greater than the current value of the semaphore when the semaphore signal operation is executed.

- **VUID-VkSubmitInfo2KHR-semaphore-03883**
  
  If the `semaphore` member of any element of `pSignalSemaphoreInfos` is a timeline semaphore, the `value` member of that element **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.

- **VUID-VkSubmitInfo2KHR-semaphore-03884**
  
  If the `semaphore` member of any element of `pWaitSemaphoreInfos` is a timeline semaphore, the `value` member of that element **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.

- **VUID-VkSubmitInfo2KHR-flags-03885**
  
  If the protected memory feature is not enabled, `flags` **must** not include `VK_SUBMIT_PROTECTED_BIT_KHR`.

- **VUID-VkSubmitInfo2KHR-flags-03886**
  
  If `flags` includes `VK_SUBMIT_PROTECTED_BIT_KHR`, all elements of `pCommandBuffers` **must** be protected command buffers.

- **VUID-VkSubmitInfo2KHR-flags-03887**
  
  If `flags` does not include `VK_SUBMIT_PROTECTED_BIT_KHR`, each element of `pCommandBuffers` **must** not be a protected command buffer.
Valid Usage (Implicit)

- VUID-VkSubmitInfo2KHR-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_SUBMIT_INFO_2_KHR`.

- VUID-VkSubmitInfo2KHR-pNext-pNext
  
  Each **pNext** member of any structure (including this one) in the **pNext** chain must be either NULL or a pointer to a valid instance of `VkPerformanceQuerySubmitInfoKHR`, `VkWin32KeyedMutexAcquireReleaseInfoKHR`, or `VkWin32KeyedMutexAcquireReleaseInfoNV`.

- VUID-VkSubmitInfo2KHR-sType-unique
  
  The **sType** value of each struct in the **pNext** chain must be unique.

- VUID-VkSubmitInfo2KHR-flags-parameter
  
  **flags** must be a valid combination of `VkSubmitFlagBitsKHR` values.

- VUID-VkSubmitInfo2KHR-pWaitSemaphoreInfos-parameter
  
  If `waitSemaphoreInfoCount` is not 0, *pWaitSemaphoreInfos* must be a valid pointer to an array of `waitSemaphoreInfoCount` valid `VkSemaphoreSubmitInfoKHR` structures.

- VUID-VkSubmitInfo2KHR-pCommandBufferInfos-parameter
  
  If `commandBufferInfoCount` is not 0, *pCommandBufferInfos* must be a valid pointer to an array of `commandBufferInfoCount` valid `VkCommandBufferSubmitInfoKHR` structures.

- VUID-VkSubmitInfo2KHR-pSignalSemaphoreInfos-parameter
  
  If `signalSemaphoreInfoCount` is not 0, *pSignalSemaphoreInfos* must be a valid pointer to an array of `signalSemaphoreInfoCount` valid `VkSemaphoreSubmitInfoKHR` structures.

Bits which can be set in `VkSubmitInfo2KHR::flags` to specify submission behavior are:

```c
// Provided by VK_KHR_synchronization2
typedef enum VkSubmitFlagBitsKHR {
  VK_SUBMIT_PROTECTED_BIT_KHR = 0x00000001,
} VkSubmitFlagBitsKHR;
```

- **VK_SUBMIT_PROTECTED_BIT_KHR** specifies that this batch is a protected submission.

```c
// Provided by VK_KHR_synchronization2
typedef VkFlags VkSubmitFlagsKHR;
```

`VkSubmitFlagsKHR` is a bitmask type for setting a mask of zero or more `VkSubmitFlagBitsKHR`.

The `VkSemaphoreSubmitInfoKHR` structure is defined as:
typedef struct VkSemaphoreSubmitInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    uint64_t value;
    VkPipelineStageFlags2KHR stageMask;
    uint32_t deviceIndex;
} VkSemaphoreSubmitInfoKHR;

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `semaphore` is a `VkSemaphore` affected by this operation.
- `value` is either the value used to signal `semaphore` or the value waited on by `semaphore`, if `semaphore` is a timeline semaphore. Otherwise it is ignored.
- `stageMask` is a `VkPipelineStageFlags2KHR` mask of pipeline stages at which the semaphore either waits or is signaled.
- `deviceIndex` is the index of the device within a device group that executes the semaphore wait or signal operation.

Whether this structure defines a semaphore wait or signal operation is defined by how it is used.
Valid Usage

- VUID-VkSemaphoreSubmitInfoKHR-stageMask-03929
  If the **geometry shaders** feature is not enabled, **stageMask** **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR`

- VUID-VkSemaphoreSubmitInfoKHR-stageMask-03930
  If the **tessellation shaders** feature is not enabled, **stageMask** **must** not contain `VK_PIPELINE_STAGE_2_TESSellation_CONTROL_SHADER_BIT_KHR` or `VK_PIPELINE_STAGE_2_TESSellation_EVALUATION_SHADER_BIT_KHR`

- VUID-VkSemaphoreSubmitInfoKHR-stageMask-03931
  If the **conditional rendering** feature is not enabled, **stageMask** **must** not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- VUID-VkSemaphoreSubmitInfoKHR-stageMask-03932
  If the **fragment density map** feature is not enabled, **stageMask** **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- VUID-VkSemaphoreSubmitInfoKHR-stageMask-03933
  If the **transform feedback** feature is not enabled, **stageMask** **must** not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-VkSemaphoreSubmitInfoKHR-stageMask-03934
  If the **mesh shaders** feature is not enabled, **stageMask** **must** not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_NV`

- VUID-VkSemaphoreSubmitInfoKHR-stageMask-03935
  If the **task shaders** feature is not enabled, **stageMask** **must** not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_NV`

- VUID-VkSemaphoreSubmitInfoKHR-stageMask-03936
  If the **shading rate image** feature is not enabled, **stageMask** **must** not contain `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV`

- VUID-VkSemaphoreSubmitInfoKHR-device-03888
  If the **device that semaphore was created on** is not a device group, **deviceIndex** **must** be 0

- VUID-VkSemaphoreSubmitInfoKHR-device-03889
  If the **device that semaphore was created on** is a device group, **deviceIndex** **must** be a valid device index

Valid Usage (Implicit)

- VUID-VkSemaphoreSubmitInfoKHR-sType-sType
  **sType** **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_SUBMIT_INFO_KHR`

- VUID-VkSemaphoreSubmitInfoKHR-pNext-pNext
  **pNext** **must** be `NULL`

- VUID-VkSemaphoreSubmitInfoKHR-semaphore-parameter
  **semaphore** **must** be a valid `VkSemaphore` handle

- VUID-VkSemaphoreSubmitInfoKHR-stageMask-parameter
  **stageMask** **must** be a valid combination of `VkPipelineStageFlagBits2KHR` values
The `VkCommandBufferSubmitInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_synchronization2
typedef struct VkCommandBufferSubmitInfoKHR {
    VkStructureType   sType;
    const void*       pNext;
    VkCommandBuffer    commandBuffer;
    uint32_t           deviceMask;
} VkCommandBufferSubmitInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `commandBuffer` is a `VkCommandBuffer` to be submitted for execution.
- `deviceMask` is a bitmask indicating which devices in a device group execute the command buffer. A `deviceMask` of `0` is equivalent to setting all bits corresponding to valid devices in the group to `1`.

## Valid Usage

- VUID-VkCommandBufferSubmitInfoKHR-commandBuffer-03890
  
  `commandBuffer` must not have been allocated with `VK_COMMAND_BUFFER_LEVEL_SECONDARY`

- VUID-VkCommandBufferSubmitInfoKHR-deviceMask-03891
  
  If `deviceMask` is not `0`, it must be a valid device mask

## Valid Usage (Implicit)

- VUID-VkCommandBufferSubmitInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_SUBMIT_INFO_KHR`

- VUID-VkCommandBufferSubmitInfoKHR-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkCommandBufferSubmitInfoKHR-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

To submit command buffers to a queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueSubmit(
    VkQueue                                     queue,
    uint32_t                                    submitCount,
    const VkSubmitInfo*                         pSubmits,
    VkFence                                     fence);
```

- `queue` is the queue that the command buffers will be submitted to.
• **submitCount** is the number of elements in the **pSubmits** array.

• **pSubmits** is a pointer to an array of **VkSubmitInfo** structures, each specifying a command buffer submission batch.

• **fence** is an **optional** handle to a fence to be signaled once all submitted command buffers have completed execution. If **fence** is not **VK_NULL_HANDLE**, it defines a **fence signal operation**.

**vkQueueSubmit** is a **queue submission command**, with each batch defined by an element of **pSubmits**. Batches begin execution in the order they appear in **pSubmits**, but **may** complete out of order.

Fence and semaphore operations submitted with **vkQueueSubmit** have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the **semaphore** and **fence** sections of the synchronization chapter.

Details on the interaction of **pWaitDstStageMask** with synchronization are described in the **semaphore wait operation** section of the synchronization chapter.

The order that batches appear in **pSubmits** is used to determine **submission order**, and thus all the **implicit ordering guarantees** that respect it. Other than these implicit ordering guarantees and any **explicit synchronization primitives**, these batches **may** overlap or otherwise execute out of order.

If any command buffer submitted to this queue is in the **executable state**, it is moved to the **pending state**. Once execution of all submissions of a command buffer complete, it moves from the **pending state**, back to the **executable state**. If a command buffer was recorded with the **VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT** flag, it instead moves to the **invalid state**.

If **vkQueueSubmit** fails, it **may** return **VK_ERROR_OUT_OF_HOST_MEMORY** or **VK_ERROR_OUT_OF_DEVICE_MEMORY**. If it does, the implementation **must** ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by **pSubmits** is unaffected by the call or its failure. If **vkQueueSubmit** fails in such a way that the implementation is unable to make that guarantee, the implementation **must** return **VK_ERROR_DEVICE_LOST**. See **Lost Device**.
Valid Usage

- VUID-vkQueueSubmit-fence-00063
  If fence is not VK_NULL_HANDLE, fence must be unsignaled

- VUID-vkQueueSubmit-fence-00064
  If fence is not VK_NULL_HANDLE, fence must not be associated with any other queue command that has not yet completed execution on that queue

- VUID-vkQueueSubmit-pCommandBuffers-00065
  Any calls to vkCmdSetEvent, vkCmdResetEvent or vkCmdWaitEvents that have been recorded into any of the command buffer elements of the pCommandBuffers member of any element of pSubmits, must not reference any VkEvent that is referenced by any of those commands in a command buffer that has been submitted to another queue and is still in the pending state

- VUID-vkQueueSubmit-pWaitDstStageMask-00066
  Any stage flag included in any element of the pWaitDstStageMask member of any element of pSubmits must be a pipeline stage supported by one of the capabilities of queue, as specified in the table of supported pipeline stages

- VUID-vkQueueSubmit-pSignalSemaphores-00067
  Each element of the pSignalSemaphores member of any element of pSubmits must be unsignaled when the semaphore signal operation it defines is executed on the device

- VUID-vkQueueSubmit-pWaitSemaphores-00068
  When a semaphore wait operation referring to a binary semaphore defined by any element of the pWaitSemaphores member of any element of pSubmits executes on queue, there must be no other queues waiting on the same semaphore

- VUID-vkQueueSubmit-pWaitSemaphores-03238
  All elements of the pWaitSemaphores member of all elements of pSubmits created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) must have also been submitted for execution

- VUID-vkQueueSubmit-pCommandBuffers-00070
  Each element of the pCommandBuffers member of each element of pSubmits must be in the pending or executable state

- VUID-vkQueueSubmit-pCommandBuffers-00071
  If any element of the pCommandBuffers member of any element of pSubmits was not recorded with the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT, it must not be in the pending state

- VUID-vkQueueSubmit-pCommandBuffers-00072
  Any secondary command buffers recorded into any element of the pCommandBuffers member of any element of pSubmits must be in the pending or executable state

- VUID-vkQueueSubmit-pCommandBuffers-00073
  If any secondary command buffers recorded into any element of the pCommandBuffers member of any element of pSubmits was not recorded with the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT, it must not be in the pending state
Each element of the \texttt{pCommandBuffers} member of each element of \texttt{pSubmits} must have been allocated from a \texttt{VkCommandPool} that was created for the same queue family \texttt{queue} belongs to.

If any element of \texttt{pSubmits->pCommandBuffers} includes a Queue Family Transfer Acquire Operation, there must exist a previously submitted Queue Family Transfer Release Operation on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such acquire operations, and which happens-before the acquire operation.

If a command recorded into any element of \texttt{pCommandBuffers} was a \texttt{vkCmdBeginQuery} whose queryPool was created with a queryType of \texttt{VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR}, the profiling lock must have been held continuously on the \texttt{VkDevice} that \texttt{queue} was retrieved from, throughout recording of those command buffers.

Any resource created with \texttt{VK_SHARING_MODE_EXCLUSIVE} that is read by an operation specified by \texttt{pSubmits} must not be owned by any queue family other than the one which \texttt{queue} belongs to, at the time it is executed.

Any resource created with \texttt{VK_SHARING_MODE_CONCURRENT} that is accessed by an operation specified by \texttt{pSubmits} must have included the queue family of \texttt{queue} at resource creation time.

### Valid Usage (Implicit)

- \texttt{VUID-vkQueueSubmit-queue-parameter} \\
  \texttt{queue} must be a valid \texttt{VkQueue} handle

- \texttt{VUID-vkQueueSubmit-pSubmits-parameter} \\
  If \texttt{submitCount} is not 0, \texttt{pSubmits} must be a valid pointer to an array of \texttt{submitCount} valid \texttt{VkSubmitInfo} structures

- \texttt{VUID-vkQueueSubmit-fence-parameter} \\
  If \texttt{fence} is not \texttt{VK_NULL_HANDLE}, \texttt{fence} must be a valid \texttt{VkFence} handle

- \texttt{VUID-vkQueueSubmit-commonparent} \\
  Both of \texttt{fence}, and \texttt{queue} that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same \texttt{VkDevice}

### Host Synchronization

- Host access to \texttt{queue} must be externally synchronized
- Host access to \texttt{fence} must be externally synchronized
Command Properties

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The `VkSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    const VkPipelineStageFlags* pWaitDstStageMask;
    uint32_t commandBufferCount;
    const VkCommandBuffer* pCommandBuffers;
    uint32_t signalSemaphoreCount;
    const VkSemaphore* pSignalSemaphores;
} VkSubmitInfo;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores upon which to wait before executing the command buffers for the batch.
- `pWaitSemaphores` is a pointer to an array of `VkSemaphore` handles upon which to wait before the command buffers for this batch begin execution. If semaphores to wait on are provided, they define a semaphore wait operation.
- `pWaitDstStageMask` is a pointer to an array of pipeline stages at which each corresponding semaphore wait will occur.
- `commandBufferCount` is the number of command buffers to execute in the batch.
• **pCommandBuffers** is a pointer to an array of VkCommandBuffer handles to execute in the batch.

• **signalSemaphoreCount** is the number of semaphores to be signaled once the commands specified in pCommandBuffers have completed execution.

• **pSignalSemaphores** is a pointer to an array of VkSemaphore handles which will be signaled when the command buffers for this batch have completed execution. If semaphores to be signaled are provided, they define a semaphore signal operation.

The order that command buffers appear in **pCommandBuffers** is used to determine submission order, and thus all the implicit ordering guarantees that respect it. Other than these implicit ordering guarantees and any explicit synchronization primitives, these command buffers **may** overlap or otherwise execute out of order.
Valid Usage

- VUID-VkSubmitInfo-pCommandBuffers-00075
  Each element of `pCommandBuffers` must not have been allocated with `VK_COMMAND_BUFFER_LEVEL_SECONDARY`

- VUID-VkSubmitInfo-pWaitDstStageMask-00076
  If the geometry shader feature is not enabled, each element of `pWaitDstStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-VkSubmitInfo-pWaitDstStageMask-00077
  If the tessellation shader feature is not enabled, each element of `pWaitDstStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-VkSubmitInfo-pWaitDstStageMask-00078
  Each element of `pWaitDstStageMask` must not include `VK_PIPELINE_STAGE_HOST_BIT`

- VUID-VkSubmitInfo-pWaitSemaphores-03239
  If any element of `pWaitSemaphores` or `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, then the `pNext` chain must include a `VkTimelineSemaphoreSubmitInfo` structure

- VUID-VkSubmitInfo-pNext-03240
  If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pWaitSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, then its `waitSemaphoreValueCount` member must equal `waitSemaphoreCount`

- VUID-VkSubmitInfo-pNext-03241
  If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, then its `signalSemaphoreValueCount` member must equal `signalSemaphoreCount`

- VUID-VkSubmitInfo-pSignalSemaphores-03242
  For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value greater than the current value of the semaphore when the semaphore signal operation is executed

- VUID-VkSubmitInfo-pWaitSemaphores-03243
  For each element of `pWaitSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues` must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`

- VUID-VkSubmitInfo-pSignalSemaphores-03244
  For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value which does
not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than maxTimelineSemaphoreValueDifference

- VUID-VkSubmitInfo-pWaitDstStageMask-02089
  If the mesh shaders feature is not enabled, each element of pWaitDstStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV

- VUID-VkSubmitInfo-pWaitDstStageMask-02090
  If the task shaders feature is not enabled, each element of pWaitDstStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV

- VUID-VkSubmitInfo-pNext-04120
  If the pNext chain of this structure does not include a VkProtectedSubmitInfo structure with protectedSubmit set to VK_TRUE, then each element of the pCommandBuffers array must be an unprotected command buffer

- VUID-VkSubmitInfo-pNext-04148
  If the pNext chain of this structure includes a VkProtectedSubmitInfo structure with protectedSubmit set to VK_TRUE, then each element of the pCommandBuffers array must be a protected command buffer
Valid Usage (Implicit)

- **VUID-VkSubmitInfo-sType-sType**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkSubmitInfo-sType-unique**
  
  The `sType` must be `VK_STRUCTURE_TYPE_SUBMIT_INFO`.

- **VUID-VkSubmitInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkD3D12FenceSubmitInfoKHR`, `VkDeviceGroupSubmitInfo`, `VkPerformanceQuerySubmitInfoKHR`, `VkProtectedSubmitInfo`, `VkTimelineSemaphoreSubmitInfo`, `VkWin32KeyedMutexAcquireReleaseInfoKHR`, or `VkWin32KeyedMutexAcquireReleaseInfoNV`.

- **VUID-VkSubmitInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkD3D12FenceSubmitInfoKHR`, `VkDeviceGroupSubmitInfo`, `VkPerformanceQuerySubmitInfoKHR`, `VkProtectedSubmitInfo`, `VkTimelineSemaphoreSubmitInfo`, `VkWin32KeyedMutexAcquireReleaseInfoKHR`, or `VkWin32KeyedMutexAcquireReleaseInfoNV`.

To specify the values to use when waiting for and signaling semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, add a `VkTimelineSemaphoreSubmitInfo` structure to the `pNext` chain of the `VkSubmitInfo` structure when using `vkQueueSubmit` or the `VkBindSparseInfo` structure when using `vkQueueBindSparse`. The `VkTimelineSemaphoreSubmitInfo` structure is defined as:
```c
typedef struct VkTimelineSemaphoreSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreValueCount;
    const uint64_t*    pWaitSemaphoreValues;
    uint32_t           signalSemaphoreValueCount;
    const uint64_t*    pSignalSemaphoreValues;
} VkTimelineSemaphoreSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkTimelineSemaphoreSubmitInfo VkTimelineSemaphoreSubmitInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreValueCount` is the number of semaphore wait values specified in `pWaitSemaphoreValues`.
- `pWaitSemaphoreValues` is an array of length `waitSemaphoreValueCount` containing values for the corresponding semaphores in `VkSubmitInfo::pWaitSemaphores` to wait for.
- `signalSemaphoreValueCount` is the number of semaphore signal values specified in `pSignalSemaphoreValues`.
- `pSignalSemaphoreValues` is an array of length `signalSemaphoreValueCount` containing values for the corresponding semaphores in `VkSubmitInfo::pSignalSemaphores` to set when signaled.

If the semaphore in `VkSubmitInfo::pWaitSemaphores` or `VkSubmitInfo::pSignalSemaphores` corresponding to an entry in `pWaitSemaphoreValues` or `pSignalSemaphoreValues` respectively was not created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, the implementation must ignore the value in the `pWaitSemaphoreValues` or `pSignalSemaphoreValues` entry.

**Valid Usage (Implicit)**

- VUID-VkTimelineSemaphoreSubmitInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_TIMELINE_SEMAPHORE_SUBMIT_INFO`
- VUID-VkTimelineSemaphoreSubmitInfo-pWaitSemaphoreValues-parameter
  If `waitSemaphoreValueCount` is not 0, and `pWaitSemaphoreValues` is not `NULL`, `pWaitSemaphoreValues` must be a valid pointer to an array of `waitSemaphoreValueCount` `uint64_t` values
- VUID-VkTimelineSemaphoreSubmitInfo-pSignalSemaphoreValues-parameter
  If `signalSemaphoreValueCount` is not 0, and `pSignalSemaphoreValues` is not `NULL`, `pSignalSemaphoreValues` must be a valid pointer to an array of `signalSemaphoreValueCount` `uint64_t` values
To specify the values to use when waiting for and signaling semaphores whose current payload refers to a Direct3D 12 fence, add a `VkD3D12FenceSubmitInfoKHR` structure to the `pNext` chain of the `VkSubmitInfo` structure. The `VkD3D12FenceSubmitInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkD3D12FenceSubmitInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreValuesCount;
    const uint64_t*    pWaitSemaphoreValues;
    uint32_t           signalSemaphoreValuesCount;
    const uint64_t*    pSignalSemaphoreValues;
} VkD3D12FenceSubmitInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreValuesCount` is the number of semaphore wait values specified in `pWaitSemaphoreValues`.
- `pWaitSemaphoreValues` is a pointer to an array of `waitSemaphoreValuesCount` values for the corresponding semaphores in `VkSubmitInfo::pWaitSemaphores` to wait for.
- `signalSemaphoreValuesCount` is the number of semaphore signal values specified in `pSignalSemaphoreValues`.
- `pSignalSemaphoreValues` is a pointer to an array of `signalSemaphoreValuesCount` values for the corresponding semaphores in `VkSubmitInfo::pSignalSemaphores` to set when signaled.

If the semaphore in `VkSubmitInfo::pWaitSemaphores` or `VkSubmitInfo::pSignalSemaphores` corresponding to an entry in `pWaitSemaphoreValues` or `pSignalSemaphoreValues` respectively does not currently have a payload referring to a Direct3D 12 fence, the implementation must ignore the value in the `pWaitSemaphoreValues` or `pSignalSemaphoreValues` entry.

**Note**
As the introduction of the external semaphore handle type `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` is preserved for backwards compatibility. However, applications should prefer importing such handle types into semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, and use the `VkTimelineSemaphoreSubmitInfo` structure instead of the `VkD3D12FenceSubmitInfoKHR` structure to specify the values to use when waiting for and signaling such semaphores.
Valid Usage

- VUID-VkD3D12FenceSubmitInfoKHR-waitSemaphoreValuesCount-00079
  \textit{waitSemaphoreValuesCount} \textbf{must} be the same value as \texttt{VkSubmitInfo::waitSemaphoreCount}, where \texttt{VkSubmitInfo} is in the \texttt{pNext} chain of this \texttt{VkD3D12FenceSubmitInfoKHR} structure.

- VUID-VkD3D12FenceSubmitInfoKHR-signalSemaphoreValuesCount-00080
  \textit{signalSemaphoreValuesCount} \textbf{must} be the same value as \texttt{VkSubmitInfo::signalSemaphoreCount}, where \texttt{VkSubmitInfo} is in the \texttt{pNext} chain of this \texttt{VkD3D12FenceSubmitInfoKHR} structure.

Valid Usage (Implicit)

- VUID-VkD3D12FenceSubmitInfoKHR-sType-sType
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_D3D12_FENCE_SUBMIT_INFO_KHR}

- VUID-VkD3D12FenceSubmitInfoKHR-pWaitSemaphoreValues-parameter
  If \texttt{waitSemaphoreValuesCount} is not 0, and \texttt{pWaitSemaphoreValues} is not NULL, \texttt{pWaitSemaphoreValues} \textbf{must} be a valid pointer to an array of \texttt{waitSemaphoreValuesCount uint64_t values}

- VUID-VkD3D12FenceSubmitInfoKHR-pSignalSemaphoreValues-parameter
  If \texttt{signalSemaphoreValuesCount} is not 0, and \texttt{pSignalSemaphoreValues} is not NULL, \texttt{pSignalSemaphoreValues} \textbf{must} be a valid pointer to an array of \texttt{signalSemaphoreValuesCount uint64_t values}

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism \textbf{may} be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They \textbf{can} only be used if the imported resource was created with the \texttt{D3D11_RESOURCE_MISC_SHARED_KEYEDMUTEX} flag.

To acquire keyed mutexes before submitted work and/or release them after, add a \texttt{VkWin32KeyedMutexAcquireReleaseInfoKHR} structure to the \texttt{pNext} chain of the \texttt{VkSubmitInfo} structure.

The \texttt{VkWin32KeyedMutexAcquireReleaseInfoKHR} structure is defined as:
typedef struct VkWin32KeyedMutexAcquireReleaseInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 acquireCount;
    const VkDeviceMemory*    pAcquireSyncs;
    const uint64_t*          pAcquireKeys;
    const uint32_t*          pAcquireTimeouts;
    uint32_t                 releaseCount;
    const VkDeviceMemory*    pReleaseSyncs;
    const uint64_t*          pReleaseKeys;
} VkWin32KeyedMutexAcquireReleaseInfoKHR;

• acquireCount is the number of entries in the pAcquireSyncs, pAcquireKeys, and pAcquireTimeoutMilliseconds arrays.

• pAcquireSyncs is a pointer to an array of VkDeviceMemory objects which were imported from Direct3D 11 resources.

• pAcquireKeys is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in pAcquireSyncs.

• pAcquireTimeoutMilliseconds is a pointer to an array of timeout values, in millisecond units, for each acquire specified in pAcquireKeys.

• releaseCount is the number of entries in the pReleaseSyncs and pReleaseKeys arrays.

• pReleaseSyncs is a pointer to an array of VkDeviceMemory objects which were imported from Direct3D 11 resources.

• pReleaseKeys is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in pReleaseSyncs.

Valid Usage

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-00081
  Each member of pAcquireSyncs and pReleaseSyncs must be a device memory object imported by setting VkImportMemoryWin32HandleInfoKHR:HANDLETYPE to VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT
Valid Usage (Implicit)

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_KHR`.

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-parameter**
  
  If `acquireCount` is not 0, `pAcquireSyncs` **must** be a valid pointer to an array of `acquireCount` valid `VkDeviceMemory` handles.

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireKeys-parameter**
  
  If `acquireCount` is not 0, `pAcquireKeys` **must** be a valid pointer to an array of `acquireCount` `uint64_t` values.

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireTimeouts-parameter**
  
  If `acquireCount` is not 0, `pAcquireTimeouts` **must** be a valid pointer to an array of `acquireCount` `uint32_t` values.

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pReleaseSyncs-parameter**
  
  If `releaseCount` is not 0, `pReleaseSyncs` **must** be a valid pointer to an array of `releaseCount` valid `VkDeviceMemory` handles.

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pReleaseKeys-parameter**
  
  If `releaseCount` is not 0, `pReleaseKeys` **must** be a valid pointer to an array of `releaseCount` `uint64_t` values.

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-commonparent**
  
  Both of the elements of `pAcquireSyncs`, and the elements of `pReleaseSyncs` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`.

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism **may** be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They **can** only be used if the imported resource was created with the `D3D11_RESOURCE_MISC_SHARED_KEYEDMUTEX` flag.

To acquire keyed mutexes before submitted work and/or release them after, add a `VkWin32KeyedMutexAcquireReleaseInfoNV` structure to the `pNext` chain of the `VkSubmitInfo` structure.

The `VkWin32KeyedMutexAcquireReleaseInfoNV` structure is defined as:
// Provided by VK_NV_win32_keyed_mutex
typedef struct VkWin32KeyedMutexAcquireReleaseInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t acquireCount;
    const VkDeviceMemory* pAcquireSyncs;
    const uint64_t* pAcquireKeys;
    const uint32_t* pAcquireTimeoutMilliseconds;
    uint32_t releaseCount;
    const VkDeviceMemory* pReleaseSyncs;
    const uint64_t* pReleaseKeys;
} VkWin32KeyedMutexAcquireReleaseInfoNV;

• acquireCount is the number of entries in the pAcquireSyncs, pAcquireKeys, and pAcquireTimeoutMilliseconds arrays.

• pAcquireSyncs is a pointer to an array of VkDeviceMemory objects which were imported from Direct3D 11 resources.

• pAcquireKeys is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in pAcquireSyncs.

• pAcquireTimeoutMilliseconds is a pointer to an array of timeout values, in millisecond units, for each acquire specified in pAcquireKeys.

• releaseCount is the number of entries in the pReleaseSyncs and pReleaseKeys arrays.

• pReleaseSyncs is a pointer to an array of VkDeviceMemory objects which were imported from Direct3D 11 resources.

• pReleaseKeys is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in pReleaseSyncs.
Valid Usage (Implicit)

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_NV`

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireSyncs-parameter**
  - If `acquireCount` is not 0, `pAcquireSyncs` must be a valid pointer to an array of `acquireCount` valid `VkDeviceMemory` handles

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireKeys-parameter**
  - If `acquireCount` is not 0, `pAcquireKeys` must be a valid pointer to an array of `acquireCount` `uint64_t` values

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireTimeoutMilliseconds-parameter**
  - If `acquireCount` is not 0, `pAcquireTimeoutMilliseconds` must be a valid pointer to an array of `acquireCount` `uint32_t` values

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pReleaseSyncs-parameter**
  - If `releaseCount` is not 0, `pReleaseSyncs` must be a valid pointer to an array of `releaseCount` valid `VkDeviceMemory` handles

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pReleaseKeys-parameter**
  - If `releaseCount` is not 0, `pReleaseKeys` must be a valid pointer to an array of `releaseCount` `uint64_t` values

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-commonparent**
  - Both of the elements of `pAcquireSyncs`, and the elements of `pReleaseSyncs` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

If the `pNext` chain of `VkSubmitInfo` includes a `VkProtectedSubmitInfo` structure, then the structure indicates whether the batch is protected. The `VkProtectedSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkProtectedSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           protectedSubmit;
} VkProtectedSubmitInfo;
```

- `protectedSubmit` specifies whether the batch is protected. If `protectedSubmit` is `VK_TRUE`, the batch is protected. If `protectedSubmit` is `VK_FALSE`, the batch is unprotected. If the `VkSubmitInfo::pNext` chain does not include this structure, the batch is unprotected.

Valid Usage

- **VUID-VkProtectedSubmitInfo-protectedSubmit-01816**
  - If the protected memory feature is not enabled, `protectedSubmit` must not be `VK_TRUE`
Valid Usage (Implicit)

- VUID-VkProtectedSubmitInfo-sType-sType
  - **sType** must be `VK_STRUCTURE_TYPE_PROTECTED_SUBMIT_INFO`

If the `pNext` chain of `VkSubmitInfo` includes a `VkDeviceGroupSubmitInfo` structure, then that structure includes device indices and masks specifying which physical devices execute semaphore operations and command buffers.

The `VkDeviceGroupSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreCount;
    const uint32_t*    pWaitSemaphoreDeviceIndices;
    uint32_t           commandBufferCount;
    const uint32_t*    pCommandBufferDeviceMasks;
    uint32_t           signalSemaphoreCount;
    const uint32_t*    pSignalSemaphoreDeviceIndices;
} VkDeviceGroupSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupSubmitInfo VkDeviceGroupSubmitInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **waitSemaphoreCount** is the number of elements in the `pWaitSemaphoreDeviceIndices` array.
- **pWaitSemaphoreDeviceIndices** is a pointer to an array of `waitSemaphoreCount` device indices indicating which physical device executes the semaphore wait operation in the corresponding element of `VkSubmitInfo::pWaitSemaphores`.
- **commandBufferCount** is the number of elements in the `pCommandBufferDeviceMasks` array.
- **pCommandBufferDeviceMasks** is a pointer to an array of `commandBufferCount` device masks indicating which physical devices execute the command buffer in the corresponding element of `VkSubmitInfo::pCommandBuffers`. A physical device executes the command buffer if the corresponding bit is set in the mask.
- **signalSemaphoreCount** is the number of elements in the `pSignalSemaphoreDeviceIndices` array.
- **pSignalSemaphoreDeviceIndices** is a pointer to an array of `signalSemaphoreCount` device indices indicating which physical device executes the semaphore signal operation in the corresponding element of `VkSubmitInfo::pSignalSemaphores`.
If this structure is not present, semaphore operations and command buffers execute on device index zero.

### Valid Usage

- **VUID-VkDeviceGroupSubmitInfo-waitSemaphoreCount-00082**
  
  \( \text{waitSemaphoreCount} \) must equal \( \text{VkSubmitInfo::waitSemaphoreCount} \)

- **VUID-VkDeviceGroupSubmitInfo-commandBufferCount-00083**
  
  \( \text{commandBufferCount} \) must equal \( \text{VkSubmitInfo::commandBufferCount} \)

- **VUID-VkDeviceGroupSubmitInfo-signalSemaphoreCount-00084**
  
  \( \text{signalSemaphoreCount} \) must equal \( \text{VkSubmitInfo::signalSemaphoreCount} \)

- **VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-00085**
  
  All elements of \( \text{pWaitSemaphoreDeviceIndices} \) and \( \text{pSignalSemaphoreDeviceIndices} \) must be valid device indices

- **VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-00086**
  
  All elements of \( \text{pCommandBufferDeviceMasks} \) must be valid device masks

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupSubmitInfo-sType-sType**
  
  \( \text{sType} \) must be \( \text{VK_STRUCTURE_TYPE_DEVICE_GROUP_SUBMIT_INFO} \)

- **VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-parameter**
  
  If \( \text{waitSemaphoreCount} \) is not \( 0 \), \( \text{pWaitSemaphoreDeviceIndices} \) must be a valid pointer to an array of \( \text{waitSemaphoreCount} \) uint32_t values

- **VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-parameter**
  
  If \( \text{commandBufferCount} \) is not \( 0 \), \( \text{pCommandBufferDeviceMasks} \) must be a valid pointer to an array of \( \text{commandBufferCount} \) uint32_t values

- **VUID-VkDeviceGroupSubmitInfo-pSignalSemaphoreDeviceIndices-parameter**
  
  If \( \text{signalSemaphoreCount} \) is not \( 0 \), \( \text{pSignalSemaphoreDeviceIndices} \) must be a valid pointer to an array of \( \text{signalSemaphoreCount} \) uint32_t values

If the \( \text{pNext} \) chain of \( \text{VkSubmitInfo} \) includes a \( \text{VkPerformanceQuerySubmitInfoKHR} \) structure, then the structure indicates which counter pass is active for the batch in that submit.

The \( \text{VkPerformanceQuerySubmitInfoKHR} \) structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceQuerySubmitInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           counterPassIndex;
} VkPerformanceQuerySubmitInfoKHR;
```
• **sType** is the type of this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **counterPassIndex** specifies which counter pass index is active.

If the `VkSubmitInfo::pNext` chain does not include this structure, the batch defaults to use counter pass index 0.

### Valid Usage

- **VUID-VkPerformanceQuerySubmitInfoKHR-counterPassIndex-03221**

  `counterPassIndex` must be less than the number of counter passes required by any queries within the batch. The required number of counter passes for a performance query is obtained by calling `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

### Valid Usage (Implicit)

- **VUID-VkPerformanceQuerySubmitInfoKHR-sType-sType**

  `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR`.

### 6.6. Queue Forward Progress

When using binary semaphores, the application **must** ensure that command buffer submissions will be able to complete without any subsequent operations by the application on any queue. After any call to `vkQueueSubmit` (or other queue operation), for every queued wait on a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` there **must** be a prior signal of that semaphore that will not be consumed by a different wait on the semaphore.

When using timeline semaphores, wait-before-signal behavior is well-defined and applications **can** submit work via `vkQueueSubmit` which defines a timeline semaphore wait operation before submitting a corresponding semaphore signal operation. For each timeline semaphore wait operation defined by a call to `vkQueueSubmit`, the application **must** ensure that a corresponding semaphore signal operation is executed before forward progress can be made.

Command buffers in the submission **can** include `vkCmdWaitEvents` commands that wait on events that will not be signaled by earlier commands in the queue. Such events **must** be signaled by the application using `vkSetEvent`, and the `vkCmdWaitEvents` commands that wait upon them **must** not be inside a render pass instance. The event **must** be set before the `vkCmdWaitEvents` command is executed.

**Note**

Implementations may have some tolerance for waiting on events to be set, but this is defined outside of the scope of Vulkan.
6.7. Secondary Command Buffer Execution

A secondary command buffer must not be directly submitted to a queue. Instead, secondary command buffers are recorded to execute as part of a primary command buffer with the command:

```c
// Provided by VK_VERSION_1_0
void vkCmdExecuteCommands(
    VkCommandBuffer commandBuffer,
    uint32_t commandBufferCount,
    const VkCommandBuffer* pCommandBuffers);
```

- `commandBuffer` is a handle to a primary command buffer that the secondary command buffers are executed in.
- `commandBufferCount` is the length of the `pCommandBuffers` array.
- `pCommandBuffers` is a pointer to an array of `commandBufferCount` secondary command buffer handles, which are recorded to execute in the primary command buffer in the order they are listed in the array.

If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, and it was recorded into any other primary command buffer which is currently in the executable or recording state, that primary command buffer becomes invalid.
Valid Usage

• VUID-vkCmdExecuteCommands-pCommandBuffers-00088
  Each element of `pCommandBuffers` must have been allocated with a level of `VK_COMMAND_BUFFER_LEVEL_SECONDARY`.

• VUID-vkCmdExecuteCommands-pCommandBuffers-00089
  Each element of `pCommandBuffers` must be in the pending or executable state.

• VUID-vkCmdExecuteCommands-pCommandBuffers-00091
  If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it must not be in the pending state.

• VUID-vkCmdExecuteCommands-pCommandBuffers-00092
  If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it must not have already been recorded to `commandBuffer`.

• VUID-vkCmdExecuteCommands-pCommandBuffers-00093
  If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it must not appear more than once in `pCommandBuffers`.

• VUID-vkCmdExecuteCommands-pCommandBuffers-00094
  Each element of `pCommandBuffers` must have been allocated from a `VkCommandPool` that was created for the same queue family as the `VkCommandPool` from which `commandBuffer` was allocated.

• VUID-vkCmdExecuteCommands-contents-00095
  If `vkCmdExecuteCommands` is being called within a render pass instance, that render pass instance must have been begun with the `contents` parameter of `vkCmdBeginRenderPass` set to `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS`.

• VUID-vkCmdExecuteCommands-pCommandBuffers-00096
  If `vkCmdExecuteCommands` is being called within a render pass instance, each element of `pCommandBuffers` must have been recorded with `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`.

• VUID-vkCmdExecuteCommands-pCommandBuffers-00097
  If `vkCmdExecuteCommands` is being called within a render pass instance, each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::subpass` set to the index of the subpass which the given command buffer will be executed in.

• VUID-vkCmdExecuteCommands-pInheritanceInfo-00098
  If `vkCmdExecuteCommands` is being called within a render pass instance, the render passes specified in the `pBeginInfo->pInheritanceInfo->renderPass` members of the `vkBeginCommandBuffer` commands used to begin recording each element of `pCommandBuffers` must be compatible with the current render pass.

• VUID-vkCmdExecuteCommands-pCommandBuffers-00099
  If `vkCmdExecuteCommands` is being called within a render pass instance, and any element of `pCommandBuffers` was recorded with `VkCommandBufferInheritanceInfo::framebuffer` not equal to `VK_NULL_HANDLE`, that `VkFramebuffer` must match the `VkFramebuffer` used in the current render pass instance.
If `vkCmdExecuteCommands` is being called within a render pass instance that included `VkRenderPassTransformBeginInfoQCOM` in the `pNext` chain of `VkRenderPassBeginInfo`, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` in the `pNext` chain of `VkCommandBufferBeginInfo`.

If `vkCmdExecuteCommands` is being called within a render pass instance that included `VkRenderPassTransformBeginInfoQCOM` in the `pNext` chain of `VkRenderPassBeginInfo`, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceRenderPassTransformInfoQCOM::transform` identical to `VkRenderPassTransformBeginInfoQCOM::transform`.

If `vkCmdExecuteCommands` is being called within a render pass instance that included `VkRenderPassTransformBeginInfoQCOM` in the `pNext` chain of `VkRenderPassBeginInfo`, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceRenderPassTransformInfoQCOM::renderArea` identical to `VkRenderPassBeginInfo::renderArea`.

If `vkCmdExecuteCommands` is not being called within a render pass instance, each element of `pCommandBuffers` must not have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`.

If the inherited queries feature is not enabled, `commandBuffer` must not have any queries active.

If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::occlusionQueryEnable` set to `VK_TRUE`.

If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::queryFlags` having all bits set that are set for the query.

If `commandBuffer` has a `VK_QUERY_TYPE_PIPELINE_STATISTICS` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::pipelineStatistics` having all bits set that are set in the `VkQueryPool` the query uses.

Each element of `pCommandBuffers` must not begin any query types that are active in `commandBuffer`.

If `commandBuffer` is a protected command buffer, then each element of `pCommandBuffers` must be a protected command buffer.
If `commandBuffer` is an unprotected command buffer, then each element of `pCommandBuffers` must be an unprotected command buffer.

- VUID-vkCmdExecuteCommands-None-02286

This command must not be recorded when transform feedback is active.

## Valid Usage (Implicit)

- VUID-vkCmdExecuteCommands-commandBuffer-parameter
  commandBuffer must be a valid `VkCommandBuffer` handle

- VUID-vkCmdExecuteCommands-pCommandBuffers-parameter
  pCommandBuffers must be a valid pointer to an array of `commandBufferCount` valid `VkCommandBuffer` handles

- VUID-vkCmdExecuteCommands-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdExecuteCommands-commandBuffer-cmdpool
  The `VkCommandPool` that commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdExecuteCommands-bufferlevel
  commandBuffer must be a primary `VkCommandBuffer`

- VUID-vkCmdExecuteCommands-commandBufferCount-arraylength
  commandBufferCount must be greater than 0

- VUID-vkCmdExecuteCommands-commonparent
  Both of commandBuffer, and the elements of pCommandBuffers must have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the `VkCommandPool` that commandBuffer was allocated from must be externally synchronized

6.8. Command Buffer Device Mask

Each command buffer has a piece of state storing the current device mask of the command buffer. This mask controls which physical devices within the logical device all subsequent commands will execute on, including state-setting commands, action commands, and synchronization commands.

Scissor, exclusive scissor, and viewport state (excluding the count of each) can be set to different values on each physical device (only when set as dynamic state), and each physical device will render using its local copy of the state. Other state is shared between physical devices, such that all physical devices use the most recently set values for the state. However, when recording an action command that uses a piece of state, the most recent command that set that state must have included all physical devices that execute the action command in its current device mask.

The command buffer’s device mask is orthogonal to the pCommandBufferDeviceMasks member of VkDeviceGroupSubmitInfo. Commands only execute on a physical device if the device index is set in both device masks.

If the pNext chain of VkCommandBufferBeginInfo includes a VkDeviceGroupCommandBufferBeginInfo structure, then that structure includes an initial device mask for the command buffer.

The VkDeviceGroupCommandBufferBeginInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupCommandBufferBeginInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceMask;
} VkDeviceGroupCommandBufferBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupCommandBufferBeginInfo VkDeviceGroupCommandBufferBeginInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- deviceMask is the initial value of the command buffer’s device mask.

The initial device mask also acts as an upper bound on the set of devices that can ever be in the device mask in the command buffer.

If this structure is not present, the initial value of a command buffer’s device mask is set to include all physical devices in the logical device when the command buffer begins recording.
Valid Usage

- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00106
  
  deviceMask must be a valid device mask value

- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00107
  
  deviceMask must not be zero

Valid Usage (Implicit)

- VUID-VkDeviceGroupCommandBufferBeginInfo-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_COMMAND_BUFFER_BEGIN_INFO

To update the current device mask of a command buffer, call:

```c
// Provided by VK_VERSION_1_1
void vkCmdSetDeviceMask(
    VkCommandBuffer commandBuffer,
    uint32_t deviceMask);
```

or the equivalent command

```c
// Provided by VK_KHR_device_group
void vkCmdSetDeviceMaskKHR(
    VkCommandBuffer commandBuffer,
    uint32_t deviceMask);
```

- commandBuffer is command buffer whose current device mask is modified.
- deviceMask is the new value of the current device mask.

deviceMask is used to filter out subsequent commands from executing on all physical devices whose bit indices are not set in the mask, except commands beginning a render pass instance, commands transitioning to the next subpass in the render pass instance, and commands ending a render pass instance, which always execute on the set of physical devices whose bit indices are included in the deviceMask member of the VkDeviceGroupRenderPassBeginInfo structure passed to the command beginning the corresponding render pass instance.
**Valid Usage**

- VUID-vkCmdSetDeviceMask-deviceMask-00108  
  `deviceMask` must be a valid device mask value

- VUID-vkCmdSetDeviceMask-deviceMask-00109  
  `deviceMask` must not be zero

- VUID-vkCmdSetDeviceMask-deviceMask-00110  
  `deviceMask` must not include any set bits that were not in the `VkDeviceGroupCommandBufferBeginInfo::deviceMask` value when the command buffer began recording

- VUID-vkCmdSetDeviceMask-deviceMask-00111  
  If `vkCmdSetDeviceMask` is called inside a render pass instance, `deviceMask` must not include any set bits that were not in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` value when the render pass instance began recording

**Valid Usage (Implicit)**

- VUID-vkCmdSetDeviceMask-commandBuffer-parameter  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDeviceMask-commandBuffer-recording  
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetDeviceMask-commandBuffer-cmdpool  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, or transfer operations

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

Chapter 7. Synchronization and Cache Control

Synchronization of access to resources is primarily the responsibility of the application in Vulkan. The order of execution of commands with respect to the host and other commands on the device has few implicit guarantees, and needs to be explicitly specified. Memory caches and other optimizations are also explicitly managed, requiring that the flow of data through the system is largely under application control.

Whilst some implicit guarantees exist between commands, five explicit synchronization mechanisms are exposed by Vulkan:

**Fences**
- Fences can be used to communicate to the host that execution of some task on the device has completed.

**Semaphores**
- Semaphores can be used to control resource access across multiple queues.

**Events**
- Events provide a fine-grained synchronization primitive which can be signaled either within a command buffer or by the host, and can be waited upon within a command buffer or queried on the host.

**Pipeline Barriers**
- Pipeline barriers also provide synchronization control within a command buffer, but at a single point, rather than with separate signal and wait operations.

**Render Passes**
- Render passes provide a useful synchronization framework for most rendering tasks, built upon the concepts in this chapter. Many cases that would otherwise need an application to use other synchronization primitives can be expressed more efficiently as part of a render pass.

### 7.1. Execution and Memory Dependencies

An *operation* is an arbitrary amount of work to be executed on the host, a device, or an external entity such as a presentation engine. Synchronization commands introduce explicit *execution dependencies*, and *memory dependencies* between two sets of operations defined by the command’s two *synchronization scopes*.

The synchronization scopes define which other operations a synchronization command is able to create execution dependencies with. Any type of operation that is not in a synchronization command’s synchronization scopes will not be included in the resulting dependency. For example, for many synchronization commands, the synchronization scopes can be limited to just operations executing in specific *pipeline stages*, which allows other pipeline stages to be excluded from a dependency. Other scoping options are possible, depending on the particular command.
An execution dependency is a guarantee that for two sets of operations, the first set must happen-before the second set. If an operation happens-before another operation, then the first operation must complete before the second operation is initiated. More precisely:

- Let A and B be separate sets of operations.
- Let S be a synchronization command.
- Let A_S and B_S be the synchronization scopes of S.
- Let A' be the intersection of sets A and A_S.
- Let B' be the intersection of sets B and B_S.
- Submitting A, S and B for execution, in that order, will result in execution dependency E between A' and B'.
- Execution dependency E guarantees that A' happens-before B'.

An execution dependency chain is a sequence of execution dependencies that form a happens-before relation between the first dependency's A' and the final dependency's B'. For each consecutive pair of execution dependencies, a chain exists if the intersection of B_S in the first dependency and A_S in the second dependency is not an empty set. The formation of a single execution dependency from an execution dependency chain can be described by substituting the following in the description of execution dependencies:

- Let S be a set of synchronization commands that generate an execution dependency chain.
- Let A_S be the first synchronization scope of the first command in S.
- Let B_S be the second synchronization scope of the last command in S.

Execution dependencies alone are not sufficient to guarantee that values resulting from writes in one set of operations can be read from another set of operations.

Three additional types of operation are used to control memory access. Availability operations cause the values generated by specified memory write accesses to become available to a memory domain for future access. Any available value remains available until a subsequent write to the same memory location occurs (whether it is made available or not) or the memory is freed. Memory domain operations cause writes that are available to a source memory domain to become available to a destination memory domain (an example of this is making writes available to the host domain available to the device domain). Visibility operations cause values available to a memory domain to become visible to specified memory accesses.

Availability, visibility, memory domains, and memory domain operations are formally defined in the Availability and Visibility section of the Memory Model chapter. Which API operations perform each of these operations is defined in Availability, Visibility, and Domain Operations.

A memory dependency is an execution dependency which includes availability and visibility operations such that:

- The first set of operations happens-before the availability operation.
- The availability operation happens-before the visibility operation.
- The visibility operation happens-before the second set of operations.
Once written values are made visible to a particular type of memory access, they can be read or written by that type of memory access. Most synchronization commands in Vulkan define a memory dependency.

The specific memory accesses that are made available and visible are defined by the access scopes of a memory dependency. Any type of access that is in a memory dependency’s first access scope and occurs in \( A' \) is made available. Any type of access that is in a memory dependency’s second access scope and occurs in \( B' \) has any available writes made visible to it. Any type of operation that is not in a synchronization command’s access scopes will not be included in the resulting dependency.

A memory dependency enforces availability and visibility of memory accesses and execution order between two sets of operations. Adding to the description of execution dependency chains:

- Let \( a \) be the set of memory accesses performed by \( A' \).
- Let \( b \) be the set of memory accesses performed by \( B' \).
- Let \( a_s \) be the first access scope of the first command in \( S \).
- Let \( b_s \) be the second access scope of the last command in \( S \).
- Let \( a' \) be the intersection of sets \( a \) and \( a_s \).
- Let \( b' \) be the intersection of sets \( b \) and \( b_s \).
- Submitting \( A, S \) and \( B \) for execution, in that order, will result in a memory dependency \( m \) between \( A' \) and \( B' \).
- Memory dependency \( m \) guarantees that:
  - Memory writes in \( a' \) are made available.
  - Available memory writes, including those from \( a' \), are made visible to \( b' \).

Note

Execution and memory dependencies are used to solve data hazards, i.e. to ensure that read and write operations occur in a well-defined order. Write-after-read hazards can be solved with just an execution dependency, but read-after-write and write-after-write hazards need appropriate memory dependencies to be included between them. If an application does not include dependencies to solve these hazards, the results and execution orders of memory accesses are undefined.

7.1.1. Image Layout Transitions

Image subresources can be transitioned from one layout to another as part of a memory dependency (e.g. by using an image memory barrier). When a layout transition is specified in a memory dependency, it happens-after the availability operations in the memory dependency, and happens-before the visibility operations. Image layout transitions may perform read and write accesses on all memory bound to the image subresource range, so applications must ensure that all memory writes have been made available before a layout transition is executed. Available memory is automatically made visible to a layout transition, and writes performed by a layout transition are automatically made available.
Layout transitions always apply to a particular image subresource range, and specify both an old layout and new layout. The old layout must either be `VK_IMAGE_LAYOUT_UNDEFINED`, or match the current layout of the image subresource range. If the old layout matches the current layout of the image subresource range, the transition preserves the contents of that range. If the old layout is `VK_IMAGE_LAYOUT_UNDEFINED`, the contents of that range may be discarded.

As image layout transitions may perform read and write accesses on the memory bound to the image, if the image subresource affected by the layout transition is bound to peer memory for any device in the current device mask then the memory heap the bound memory comes from must support the `VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT` and `VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT` capabilities as returned by `vkGetDeviceGroupPeerMemoryFeatures`.

Note

Applications must ensure that layout transitions happen-after all operations accessing the image with the old layout, and happen-before any operations that will access the image with the new layout. Layout transitions are potentially read/write operations, so not defining appropriate memory dependencies to guarantee this will result in a data race.

Image layout transitions interact with memory aliasing.

Layout transitions that are performed via image memory barriers execute in their entirety in submission order, relative to other image layout transitions submitted to the same queue, including those performed by render passes. In effect there is an implicit execution dependency from each such layout transition to all layout transitions previously submitted to the same queue.

The image layout of each image subresource of a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus when the image member of an image memory barrier is an image created with this flag the application can chain a `VkSampleLocationsInfoEXT` structure to the `pNext` chain of `VkImageMemoryBarrier2KHR` or `VkImageMemoryBarrier` to specify the sample locations to use during any image layout transition.

If the `VkSampleLocationsInfoEXT` structure does not match the sample location state last used to render to the image subresource range specified by `subresourceRange`, or if no `VkSampleLocationsInfoEXT` structure is present, then the contents of the given image subresource range becomes undefined as if `oldLayout` would equal `VK_IMAGE_LAYOUT_UNDEFINED`.

### 7.1.2. Pipeline Stages

The work performed by an action or synchronization command consists of multiple operations, which are performed as a sequence of logically independent steps known as pipeline stages. The exact pipeline stages executed depend on the particular command that is used, and current command buffer state when the command was recorded. Drawing commands, dispatching commands, copy commands, clear commands, and synchronization commands all execute in different sets of pipeline stages. Synchronization commands do not execute in a defined pipeline.
Note
Operations performed by synchronization commands (e.g. availability and visibility operations) are not executed by a defined pipeline stage. However other commands can still synchronize with them by using the synchronization scopes to create a dependency chain.

Execution of operations across pipeline stages must adhere to implicit ordering guarantees, particularly including pipeline stage order. Otherwise, execution across pipeline stages may overlap or execute out of order with regards to other stages, unless otherwise enforced by an execution dependency.

Several of the synchronization commands include pipeline stage parameters, restricting the synchronization scopes for that command to just those stages. This allows fine grained control over the exact execution dependencies and accesses performed by action commands. Implementations should use these pipeline stages to avoid unnecessary stalls or cache flushing.

`VkPipelineStageFlags2KHR` is a bitmask type for setting a mask of zero or more `VkPipelineStageFlagBits2KHR` flags:

```c
// Provided by VK_KHR_synchronization2
typedef VkFlags64 VkPipelineStageFlags2KHR;
```

Flags which can be set for a `VkPipelineStageFlags2KHR` mask are:

```c
// Provided by VK_KHR_synchronization2
// Flag bits for VkPipelineStageFlagBits2KHR
typedef VkFlags64 VkPipelineStageFlags2KHR;
static const VkPipelineStageFlags2KHR VK_PIPELINE_STAGE_2_NONE_KHR = 0ULL;
static const VkPipelineStageFlags2KHR VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT_KHR = 0x00000001ULL;
static const VkPipelineStageFlags2KHR VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT_KHR = 0x00000002ULL;
static const VkPipelineStageFlags2KHR VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT_KHR = 0x00000004ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT_KHR = 0x00000008ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT_KHR = 0x00000010ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT_KHR = 0x00000020ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR = 0x00000040ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT_KHR = 0x00000080ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT_KHR = 0x00000100ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT_KHR = 0x00000200ULL;
```
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT_KHR = 0x00000400ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT_KHR = 0x00000800ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT_KHR = 0x00001000ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_TRANSFER_BIT_KHR = 0x00001000;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_BOTTOM_OF_PIPE_BIT_KHR = 0x00002000ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_HOST_BIT_KHR = 0x00004000ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR = 0x00008000ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR = 0x00010000ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_COPY_BIT_KHR = 0x100000000ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_RESOLVE_BIT_KHR = 0x200000000ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_BLIT_BIT_KHR = 0x400000000ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_CLEAR_BIT_KHR = 0x800000000ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT_KHR = 0x1000000000ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT_KHR = 0x2000000000ULL;
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_PRE_RASTERIZATION_SHADERS_BIT_KHR = 0x4000000000ULL;
#ifdef VK_ENABLE_BETA_EXTENSIONS
// Provided by VK_KHR_video_decode_queue
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR = 0x04000000ULL;
#endif
#ifdef VK_ENABLE_BETA_EXTENSIONS
// Provided by VK_KHR_video_encode_queue
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR = 0x08000000ULL;
#endif
// Provided by VK_KHR_synchronization2 with VK_EXT_transform_feedback
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT = 0x010000000ULL;
// Provided by VK_KHR_synchronization2 with VK_EXT_conditional_rendering
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT = 0x00040000ULL;
// Provided by VK_KHR_synchronization2 with VK_NV_device_generated_commands
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV = 0x00020000ULL;
// Provided by VK_KHR_synchronization2 with VK_KHR_fragment_shading_rate
static const VkPipelineStageFlagBits2KHR VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_BIT_KHR = 0x00080000ULL;

206 | Chapter 7. Synchronization and Cache Control
• **VK_PIPELINE_STAGE_2_NONE_KHR** specifies no stages of execution.

• **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT_KHR** specifies the stage of the pipeline where indirect command parameters are consumed. This stage also includes reading commands written by `vkCmdPreprocessGeneratedCommandsNV`.

• **VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_NV** specifies the task shader stage.

• **VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_NV** specifies the mesh shader stage.

• **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT_KHR** specifies the stage of the pipeline where index buffers are consumed.

• **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT_KHR** specifies the stage of the pipeline where vertex buffers are consumed.

• **VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT_KHR** is equivalent to the logical OR of:
  - **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT_KHR**
  - **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT_KHR**

• **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT_KHR** specifies the vertex shader stage.

• **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT_KHR** specifies the tessellation control shader stage.

• **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT_KHR** specifies the tessellation evaluation shader stage.
• **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR** specifies the geometry shader stage.

• **VK_PIPELINE_STAGE_2_PRE_RASTERIZATION_SHADERS_BIT_KHR** is equivalent to specifying all supported stages from:
  ◦ **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT_KHR**
  ◦ **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT_KHR**
  ◦ **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT_KHR**
  ◦ **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR**
  ◦ **VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_NV**
  ◦ **VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_NV**

• **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT_KHR** specifies the fragment shader stage.

• **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT_KHR** specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes subpass load operations for framebuffer attachments with a depth/stencil format.

• **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT_KHR** specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes subpass store operations for framebuffer attachments with a depth/stencil format.

• **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT_KHR** specifies the stage of the pipeline after blending where the final color values are output from the pipeline. This stage also includes subpass load and store operations and multisample resolve operations for framebuffer attachments with a color or depth/stencil format.

• **VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT_KHR** specifies the compute shader stage.

• **VK_PIPELINE_STAGE_2_HOST_BIT_KHR** specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.

• **VK_PIPELINE_STAGE_2_COPY_BIT_KHR** specifies the execution of all copy commands, including `vkCmdCopyQueryPoolResults`.

• **VK_PIPELINE_STAGE_2_BLIT_BIT_KHR** specifies the execution of `vkCmdBlitImage`.

• **VK_PIPELINE_STAGE_2_RESOLVE_BIT_KHR** specifies the execution of `vkCmdResolveImage`.

• **VK_PIPELINE_STAGE_2_CLEAR_BIT_KHR** specifies the execution of clear commands, with the exception of `vkCmdClearAttachments`.

• **VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT_KHR** is equivalent to specifying all of:
  ◦ **VK_PIPELINE_STAGE_2_COPY_BIT_KHR**
  ◦ **VK_PIPELINE_STAGE_2_BLIT_BIT_KHR**
  ◦ **VK_PIPELINE_STAGE_2_RESOLVE_BIT_KHR**
  ◦ **VK_PIPELINE_STAGE_2_CLEAR_BIT_KHR**

• **VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR** specifies the execution of the ray tracing shader stages.

• **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** specifies the execution of
acceleration structure commands.

- **VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR** specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
  - **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT_KHR**
  - **VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_NV**
  - **VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_NV**
  - **VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT_KHR**
  - **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT_KHR**
  - **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT_KHR**
  - **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT_KHR**
  - **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR**
  - **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT_KHR**
  - **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT_KHR**
  - **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT_KHR**
  - **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT_KHR**
  - **VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT**
  - **VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT**
  - **VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV**
  - **VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT**

- **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR** specifies all operations performed by all commands supported on the queue it is used with.

- **VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT** specifies the stage of the pipeline where the predicate of conditional rendering is consumed.

- **VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT** specifies the stage of the pipeline where vertex attribute output values are written to the transform feedback buffers.

- **VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV** specifies the stage of the pipeline where device-side generation of commands via `vkCmdPreprocessGeneratedCommandsNV` is handled.

- **VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies the stage of the pipeline where the fragment shading rate attachment or shading rate image is read to determine the fragment shading rate for portions of a rasterized primitive.

- **VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT** specifies the stage of the pipeline where the fragment density map is read to generate the fragment areas.

- **VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR** specifies the stage of the pipeline where video decode operation are performed.

- **VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR** specifies the stage of the pipeline where video encode operation are performed.

- **VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT_KHR** is equivalent to **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR** with `VkAccessFlags2KHR` set to 0 when specified in
the second synchronization scope, but equivalent to VK_PIPELINE_STAGE_2_NONE_KHR in the first scope.

- **VK_PIPELINE_STAGE_2_BOTTOM_OF_PIPE_BIT_KHR** is equivalent to VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR with VkAccessFlags2KHR set to 0 when specified in the first synchronization scope, but equivalent to VK_PIPELINE_STAGE_2_NONE_KHR in the second scope.

**Note**

The TOP and BOTTOM pipeline stages are deprecated, and applications should prefer VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR and VK_PIPELINE_STAGE_2_NONE_KHR.

**Note**

The VkPipelineStageFlags2KHR bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how VkPipelineStageFlagBits is defined. The first 31 values are common to both, and are interchangeable.

The VkPipelineStageFlagBits enum is defined as:
typedef enum VkPipelineStageFlagBits {
    VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT = 0x00000001,
    VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT = 0x00000002,
    VK_PIPELINE_STAGE_VERTEX_INPUT_BIT = 0x00000004,
    VK_PIPELINE_STAGE_VERTEX_SHADER_BIT = 0x00000008,
    VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010,
    VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020,
    VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT = 0x00000040,
    VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT = 0x00000080,
    VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT = 0x00000100,
    VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT = 0x00000200,
    VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT = 0x00000400,
    VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT = 0x00000800,
    VK_PIPELINE_STAGE_TRANSFER_BIT = 0x00001000,
    VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT = 0x00002000,
    VK_PIPELINE_STAGE_HOST_BIT = 0x00004000,
    VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT = 0x00008000,
    VK_PIPELINE_STAGE_ALL_COMMANDS_BIT = 0x00010000,
    VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT = 0x01000000,
    VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT = 0x00040000,
    VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR = 0x02000000,
    VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR = 0x00200000,
    VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV = 0x00400000,
    VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV = 0x00080000,
    VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV = 0x00100000,
    VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT = 0x00800000,
    VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV = 0x00020000,
    VK_PIPELINE_STAGE_NONE_KHR = 0,
    VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_NV = VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR,
    VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_NV = VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
    VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR = VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV,
} VkPipelineStageFlagBits;
These values all have the same value/meaning as the equivalently named values for \texttt{VkPipelineStageFlags2KHR}.

- \texttt{VK_PIPELINE_STAGE_NONE_KHR} specifies no stages of execution.
- \texttt{VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT} specifies the stage of the pipeline where Draw/DispatchIndirect/TraceRaysIndirect data structures are consumed. This stage also includes reading commands written by \texttt{vkCmdExecuteGeneratedCommandsNV}.
- \texttt{VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV} specifies the task shader stage.
- \texttt{VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV} specifies the mesh shader stage.
- \texttt{VK_PIPELINE_STAGE_VERTEX_INPUT_BIT} specifies the stage of the pipeline where vertex and index buffers are consumed.
- \texttt{VK_PIPELINE_STAGE_VERTEX_SHADER_BIT} specifies the vertex shader stage.
- \texttt{VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT} specifies the tessellation control shader stage.
- \texttt{VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT} specifies the tessellation evaluation shader stage.
- \texttt{VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT} specifies the geometry shader stage.
- \texttt{VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT} specifies the fragment shader stage.
- \texttt{VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT} specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes subpass load operations for framebuffer attachments with a depth/stencil format.
- \texttt{VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT} specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes subpass store operations for framebuffer attachments with a depth/stencil format.
- \texttt{VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT} specifies the stage of the pipeline after blending where the final color values are output from the pipeline. This stage also includes subpass load and store operations and multisample resolve operations for framebuffer attachments with a color or depth/stencil format.
- \texttt{VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT} specifies the execution of a compute shader.
- \texttt{VK_PIPELINE_STAGE_TRANSFER_BIT} specifies the following commands:
  - All copy commands, including \texttt{vkCmdCopyQueryPoolResults}
  - \texttt{vkCmdBlitImage2KHR} and \texttt{vkCmdBlitImage}
  - \texttt{vkCmdResolveImage2KHR} and \texttt{vkCmdResolveImage}
  - All clear commands, with the exception of \texttt{vkCmdClearAttachments}
- \texttt{VK_PIPELINE_STAGE_HOST_BIT} specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.
- \texttt{VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR} specifies the execution of \texttt{vkCmdBuildAccelerationStructureNV}, \texttt{vkCmdCopyAccelerationStructureNV}, \texttt{vkCmdWriteAccelerationStructuresPropertiesNV}, \texttt{vkCmdBuildAccelerationStructuresKHR},...
• **VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR** specifies the execution of the ray tracing shader stages, via `vkCmdTraceRaysNV`, `vkCmdTraceRaysKHR`, or `vkCmdTraceRaysIndirectKHR`.

• **VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT** specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:

  ◦ **VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT**
  ◦ **VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV**
  ◦ **VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV**
  ◦ **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT**
  ◦ **VK_PIPELINE_STAGE_VERTEX_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT**
  ◦ **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT**
  ◦ **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT**
  ◦ **VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT**
  ◦ **VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT**
  ◦ **VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**
  ◦ **VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT**

• **VK_PIPELINE_STAGE_ALL_COMMANDS_BIT** specifies all operations performed by all commands supported on the queue it is used with.

• **VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT** specifies the stage of the pipeline where the predicate of conditional rendering is consumed.

• **VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT** specifies the stage of the pipeline where vertex attribute output values are written to the transform feedback buffers.

• **VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV** specifies the stage of the pipeline where device-side preprocessing for generated commands via `vkCmdPreprocessGeneratedCommandsNV` is handled.

• **VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies the stage of the pipeline where the fragment shading rate attachment or shading rate image is read to determine the fragment shading rate for portions of a rasterized primitive.

• **VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT** specifies the stage of the pipeline where the fragment density map is read to generate the fragment areas.
- **VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT** is equivalent to **VK_PIPELINE_STAGE_ALL_COMMANDS_BIT** with **VkAccessFlags** set to 0 when specified in the second synchronization scope, but specifies no stage of execution when specified in the first scope.

- **VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT** is equivalent to **VK_PIPELINE_STAGE_ALL_COMMANDS_BIT** with **VkAccessFlags** set to 0 when specified in the first synchronization scope, but specifies no stage of execution when specified in the second scope.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineStageFlags;
```

**VkPipelineStageFlags** is a bitmask type for setting a mask of zero or more **VkPipelineStageFlagBits**.

If a synchronization command includes a source stage mask, its first **synchronization scope** only includes execution of the pipeline stages specified in that mask, and its first **access scope** only includes memory access performed by pipeline stages specified in that mask. If a synchronization command includes a destination stage mask, its second **synchronization scope** only includes execution of the pipeline stages specified in that mask, and its second **access scope** only includes memory access performed by pipeline stages specified in that mask.

**Note**

Including a particular pipeline stage in the first **synchronization scope** of a command implicitly includes **logically earlier** pipeline stages in the synchronization scope. Similarly, the second **synchronization scope** includes **logically later** pipeline stages.

However, note that **access scopes** are not affected in this way - only the precise stages specified are considered part of each access scope.

Certain pipeline stages are only available on queues that support a particular set of operations. The following table lists, for each pipeline stage flag, which queue capability flag **must** be supported by the queue. When multiple flags are enumerated in the second column of the table, it means that the pipeline stage is supported on the queue if it supports any of the listed capability flags. For further details on queue capabilities see **Physical Device Enumeration** and **Queues**.

**Table 3. Supported pipeline stage flags**

</tbody>
</table>

Pipeline stages that execute as a result of a command logically complete execution in a specific order, such that completion of a logically later pipeline stage must not happen-before completion of a logically earlier stage. This means that including any stage in the source stage mask for a particular synchronization command also implies that any logically earlier stages are included in $A_s$ for that command.

Similarly, initiation of a logically earlier pipeline stage must not happen-after initiation of a logically later pipeline stage. Including any given stage in the destination stage mask for a particular synchronization command also implies that any logically later stages are included in $B_s$ for that command.
Note

Implementations may not support synchronization at every pipeline stage for every synchronization operation. If a pipeline stage that an implementation does not support synchronization for appears in a source stage mask, it may substitute any logically later stage in its place for the first synchronization scope. If a pipeline stage that an implementation does not support synchronization for appears in a destination stage mask, it may substitute any logically earlier stage in its place for the second synchronization scope.

For example, if an implementation is unable to signal an event immediately after vertex shader execution is complete, it may instead signal the event after color attachment output has completed.

If an implementation makes such a substitution, it must not affect the semantics of execution or memory dependencies or image and buffer memory barriers.

Graphics pipelines are executable on queues supporting VK_QUEUE_GRAPHICS_BIT. Stages executed by graphics pipelines can only be specified in commands recorded for queues supporting VK_QUEUE_GRAPHICS_BIT.

The graphics primitive pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:

- VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT
- VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT_KHR
- VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT_KHR
- VK_PIPELINE_STAGE_VERTEX_SHADER_BIT
- VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT
- VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT
- VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT
- VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT
- VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
- VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT
- VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT

The graphics mesh pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:

- VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT
- VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV
- VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV
• VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
• VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT
• VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT
• VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT
• VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT

For the compute pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT
• VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT

For graphics pipeline commands executing in a render pass with a fragment density map attachment, the following pipeline stage where the fragment density map read happens has no particular order relative to the other stages, except that it is logically earlier than VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT:

• VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT
• VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT

The conditional rendering stage is formally part of both the graphics, and the compute pipeline. The pipeline stage where the predicate read happens has unspecified order relative to other stages of these pipelines:

• VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

For the transfer pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_TRANSFER_BIT

For host operations, only one pipeline stage occurs, so no order is guaranteed:

• VK_PIPELINE_STAGE_HOST_BIT

For the command preprocessing pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV

For acceleration structure operations, only one pipeline stage occurs, so no order is guaranteed:

• VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR

For the ray tracing pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT
• VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

7.1.3. Access Types

Memory in Vulkan can be accessed from within shader invocations and via some fixed-function
stages of the pipeline. The *access type* is a function of the *descriptor type* used, or how a fixed-function stage accesses memory.

Some synchronization commands take sets of access types as parameters to define the *access scopes* of a memory dependency. If a synchronization command includes a source access mask, its first *access scope* only includes accesses via the access types specified in that mask. Similarly, if a synchronization command includes a destination access mask, its second *access scope* only includes accesses via the access types specified in that mask.

`VkAccessFlags2KHR` is a bitmask type for setting a mask of zero or more `VkAccessFlagBits2KHR`:

```c
// Provided by VK_KHR_synchronization2
typedef VkFlags64 VkAccessFlags2KHR;
```

Flags which can be set for a `VkAccessFlags2KHR` mask are:

```c
// Provided by VK_KHR_synchronization2
// Flag bits for VkAccessFlagBits2KHR
typedef VkFlags64 VkAccessFlagBits2KHR;
static const VkAccessFlagBits2KHR VK_ACCESS_2_NONE_KHR = 0ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT_KHR = 0x00000001ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_INDEX_READ_BIT_KHR = 0x00000002ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT_KHR = 0x00000004ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_UNIFORM_READ_BIT_KHR = 0x00000008ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT_KHR = 0x00000010ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_SHADER_READ_BIT_KHR = 0x00000020ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_SHADER_WRITE_BIT_KHR = 0x00000040ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT_KHR = 0x00000080ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT_KHR = 0x00000100ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT_KHR = 0x00000200ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT_KHR = 0x00000400ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_TRANSFER_READ_BIT_KHR = 0x00000800ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_TRANSFER_WRITE_BIT_KHR = 0x00001000ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_HOST_READ_BIT_KHR = 0x00002000ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_HOST_WRITE_BIT_KHR = 0x00004000ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_MEMORY_READ_BIT_KHR = 0x00008000ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_MEMORY_WRITE_BIT_KHR = 0x00010000ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_SHADER_SAMPLED_READ_BIT_KHR = 0x100000000ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_SHADER_STORAGE_READ_BIT_KHR = 0x200000000ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT_KHR = 0x400000000ULL;
```
```c
0x400000000ULL;
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_decode_queue
    static const VkAccessFlagBits2KHR VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR = 0x800000000ULL;
#endif
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_decode_queue
    static const VkAccessFlagBits2KHR VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR = 0x1000000000ULL;
#endif
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_encode_queue
    static const VkAccessFlagBits2KHR VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR = 0x2000000000ULL;
#endif
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_encode_queue
    static const VkAccessFlagBits2KHR VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR = 0x4000000000ULL;
#endif
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_synchronization2 with VK_EXT_transform_feedback
    static const VkAccessFlagBits2KHR VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT = 0x02000000ULL;
#endif
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_synchronization2 with VK_EXT_transform_feedback
    static const VkAccessFlagBits2KHR VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT = 0x04000000ULL;
#endif
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_synchronization2 with VK_EXT_transform_feedback
    static const VkAccessFlagBits2KHR VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT = 0x08000000ULL;
#endif
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_synchronization2 with VK_KHR_fragment_shading_rate
    static const VkAccessFlagBits2KHR VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR = 0x008000000ULL;
#endif
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_synchronization2 with VK_KHR_acceleration_structure
    static const VkAccessFlagBits2KHR VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR = 0x00200000ULL;
#endif
```
static const VkAccessFlagBits2KHR VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_NV = 0x00200000;
static const VkAccessFlagBits2KHR VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_NV = 0x00400000;
static const VkAccessFlagBits2KHR VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT = 0x01000000ULL;
static const VkAccessFlagBits2KHR VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT = 0x00080000ULL;

• VK_ACCESS_2_NONE_KHR specifies no accesses.
• VK_ACCESS_2_MEMORY_READ_BIT_KHR specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all READ access flags that are valid where it is used.
• VK_ACCESS_2_MEMORY_WRITE_BIT_KHR specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all WRITE access flags that are valid where it is used.
• VK_ACCESS_2 INDIRECT_COMMAND_READ_BIT_KHR specifies read access to indirect buffers in the VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT_KHR pipeline stage.
• VK_ACCESS_2_INDEX_READ_BIT_KHR specifies read access to an index buffer in the VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT_KHR pipeline stage.
• VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT_KHR specifies read access to a vertex buffer in the VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT_KHR pipeline stage.
• VK_ACCESS_2_UNIFORM_READ_BIT_KHR specifies read access to a uniform buffer in any shader pipeline stage.
• VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT_KHR specifies read access to an input attachment in the VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT_KHR pipeline stage.
• VK_ACCESS_2_SHADER_SAMPLED_READ_BIT_KHR specifies read access to a uniform texel buffer or sampled image in any shader pipeline stage.
• VK_ACCESS_2_SHADER_STORAGE_READ_BIT_KHR specifies read access to a storage buffer, physical storage buffer, storage texel buffer, or storage image in any shader pipeline stage.
• VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT_KHR specifies write access to a storage buffer, physical storage buffer, storage texel buffer, or storage image in any shader pipeline stage.
• VK_ACCESS_2_SHADER_READ_BIT_KHR is equivalent to the logical OR of:
  ◦ VK_ACCESS_2_UNIFORM_READ_BIT_KHR
  ◦ VK_ACCESS_2_SHADER_SAMPLED_READ_BIT_KHR
  ◦ VK_ACCESS_2_SHADER_STORAGE_READ_BIT_KHR
• VK_ACCESS_2_SHADER_WRITE_BIT_KHR is equivalent to VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT_KHR.
• VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT_KHR specifies read access to a color attachment (excluding advanced blend operations) in the VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT_KHR pipeline stage.
• **VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT_KHR** specifies write access to a color or resolve attachment in the **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT_KHR** pipeline stage.

• **VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT_KHR** specifies read access to a depth/stencil attachment in the **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT_KHR** or **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT_KHR** pipeline stages.

• **VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT_KHR** specifies write access to a depth/stencil attachment in the **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT_KHR** or **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT_KHR** pipeline stages.

• **VK_ACCESS_2_TRANSFER_READ_BIT_KHR** specifies read access to an image or buffer in the **VK_PIPELINE_STAGE_2_COPY_BIT_KHR**, **VK_PIPELINE_STAGE_2_BLIT_BIT_KHR**, or **VK_PIPELINE_STAGE_2_RESOLVE_BIT_KHR** pipeline stages.

• **VK_ACCESS_2_TRANSFER_WRITE_BIT_KHR** specifies write access to an image or buffer in the **VK_PIPELINE_STAGE_2_COPY_BIT_KHR**, **VK_PIPELINE_STAGE_2_BLIT_BIT_KHR**, **VK_PIPELINE_STAGE_2_CLEAR_BIT_KHR**, or **VK_PIPELINE_STAGE_2_RESOLVE_BIT_KHR** pipeline stages.

• **VK_ACCESS_2_HOST_READ_BIT_KHR** specifies read access to memory in the **VK_PIPELINE_STAGE_2_HOST_BIT_KHR** pipeline stage.

• **VK_ACCESS_2_HOST_WRITE_BIT_KHR** specifies write access to memory in the **VK_PIPELINE_STAGE_2_HOST_BIT_KHR** pipeline stage.

• **VK_ACCESS_2CONDITIONAL_RENDERING_READ_BIT_EXT** specifies read access to a predicate in the **VK_PIPELINE_STAGE_2CONDITIONAL_RENDERING_BIT_EXT** pipeline stage.

• **VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT** specifies write access to a transform feedback buffer in the **VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT** pipeline stage.

• **VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT** specifies read access to a transform feedback counter buffer in the **VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT** pipeline stage.

• **VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT** specifies write access to a transform feedback counter buffer in the **VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT** pipeline stage.

• **VK_ACCESS_2_COMMANDPREPROCESS_READ_BIT_NV** specifies reads from VkBuffer inputs to **vkCmdPreprocessGeneratedCommandsNV** in the **VK_PIPELINE_STAGE_2_COMMANDPREPROCESS_BIT_NV** pipeline stage.

• **VK_ACCESS_2_COMMANDPREPROCESS_WRITE_BIT_NV** specifies writes to the target command buffer in the **VK_PIPELINE_STAGE_2_COMMANDPREPROCESS_BIT_NV** pipeline stage.

• **VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT** specifies read access to color attachments, including advanced blend operations, in the **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT_KHR** pipeline stage.

• **VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV** specifies read access to a shading rate image in the **VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV** pipeline stage.

• **VK_ACCESS_2_ACCELERATIONSTRUCTURE_READ_BIT_KHR** specifies read access to an acceleration structure in the **VK_PIPELINE_STAGE_2_ACCELERATIONSTRUCTUREBUILD_BIT_KHR** or **VK_PIPELINE_STAGE_2_RAYTRACING_SHADER_BIT_KHR** pipeline stages.

• **VK_ACCESS_2_ACCELERATIONSTRUCTURE_WRITE_BIT_KHR** specifies write access to an acceleration structure in the **VK_PIPELINE_STAGE_2_ACCELERATIONSTRUCTUREBUILD_BIT_KHR** pipeline stage.
• **VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT** specifies read access to a fragment density map attachment in the **VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT** pipeline stage.

• **VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR** specifies read access to an image or buffer resource as part of a video decode operation.

• **VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR** specifies write access to an image or buffer resource as part of a video decode operation.

• **VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR** specifies read access to an image or buffer resource as part of a video encode operation.

• **VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR** specifies write access to an image or buffer resource as part of a video encode operation.

**Note**

In situations where an application wishes to select all access types for a given set of pipeline stages, **VK_ACCESS_2_MEMORY_READ_BIT_KHR** or **VK_ACCESS_2_MEMORY_WRITE_BIT_KHR** can be used. This is particularly useful when specifying stages that only have a single access type.

**Note**

The **VkAccessFlags2KHR** bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how **VkAccessFlagBits** is defined. The first 31 values are common to both, and are interchangeable.

The **VkAccessFlagBits** enums is defined as:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAccessFlagBits {
    VK_ACCESS_INDIRECT_COMMAND_READ_BIT = 0x00000001,
    VK_ACCESS_INDEX_READ_BIT = 0x00000002,
    VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT = 0x00000004,
    VK_ACCESS_UNIFORM_READ_BIT = 0x00000008,
    VK_ACCESS_INPUT_ATTACHMENT_READ_BIT = 0x00000010,
    VK_ACCESS_SHADER_READ_BIT = 0x00000020,
    VK_ACCESS_SHADER_WRITE_BIT = 0x00000040,
    VK_ACCESS_COLOR_ATTACHMENT_READ_BIT = 0x00000080,
    VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT = 0x00000100,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT = 0x00000200,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT = 0x00000400,
    VK_ACCESS_TRANSFER_READ_BIT = 0x00000800,
    VK_ACCESS_TRANSFER_WRITE_BIT = 0x00001000,
    VK_ACCESS_HOST_READ_BIT = 0x00002000,
    VK_ACCESS_HOST_WRITE_BIT = 0x00004000,
    VK_ACCESS_MEMORY_READ_BIT = 0x00008000,
    VK_ACCESS_MEMORY_WRITE_BIT = 0x00010000,
    // Provided by VK_EXT_transform_feedback
    VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT = 0x02000000,
    // Provided by VK_EXT_transform_feedback
```
VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT = 0x04000000,
// Provided by VK_EXT_transform_feedback
VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT = 0x08000000,
// Provided by VK_EXT_transform_feedback
VK_ACCESS_CONDITIONAL_RENDERING_READ_BIT_EXT = 0x00100000,
// Provided by VK_EXT_conditional_rendering
VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT = 0x00080000,
// Provided by VK_KHR_acceleration_structure
VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR = 0x00200000,
// Provided by VK_KHR_acceleration_structure
VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR = 0x00400000,
// Provided by VK_KHR_acceleration_structure
VK_ACCESS_SHADING_RATE_IMAGE_READ_BIT_NV = 0x00800000,
// Provided by VK_EXT_fragment_density_map
VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT = 0x01000000,
// Provided by VK_NV_device_generated_commands
VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV = 0x00020000,
// Provided by VK_NV_device_generated_commands
VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV = 0x00040000,
// Provided by VK_KHR_synchronization2
VK_ACCESS_NONE_KHR = 0,
// Provided by VK_NV_ray_tracing
VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_NV = VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR,
// Provided by VK_KHR_acceleration_structure
VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_NV = VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR,
// Provided by VK_KHR_acceleration_structure
VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT = VK_ACCESS_SHADING_RATE_IMAGE_READ_BIT_NV,
// Provided by VK_EXT_device_memory
VK_ACCESS_SHADER_READ_BIT
// Specifies read access to a storage buffer, physical storage buffer, shader binding table, uniform texel buffer, storage texel buffer, sampled image, or storage

These values all have the same value/meaning as the equivalently named values for VkAccessFlags2KHR.

- **VK_ACCESS_NONE_KHR** specifies no accesses.
- **VK_ACCESS_INDIRECT_COMMAND_READ_BIT** specifies read access to indirect command data read as part of an indirect build, trace, drawing or dispatch command.
- **VK_ACCESS_INDEX_READ_BIT** specifies read access to an index buffer as part of an indexed drawing command, bound by vkCmdBindIndexBuffer.
- **VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT** specifies read access to a vertex buffer as part of a drawing command, bound by vkCmdBindVertexBuffer.
- **VK_ACCESS_UNIFORM_READ_BIT** specifies read access to a uniform buffer.
- **VK_ACCESS_INPUT_ATTACHMENT_READ_BIT** specifies read access to an input attachment within a render pass during fragment shading.
- **VK_ACCESS_SHADER_READ_BIT** specifies read access to a storage buffer, physical storage buffer, shader binding table, uniform texel buffer, storage texel buffer, sampled image, or storage...
VK_ACCESS_SHADER_WRITE_BIT specifies write access to a storage buffer, physical storage buffer, storage texel buffer, or storage image.

VK_ACCESS_COLOR_ATTACHMENT_READ_BIT specifies read access to a color attachment, such as via blending, logic operations, or via certain subpass load operations. It does not include advanced blend operations.

VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT specifies write access to a color, resolve, or depth/stencil resolve attachment during a render pass or via certain subpass load and store operations.

VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT specifies read access to a depth/stencil attachment, via depth or stencil operations or via certain subpass load operations.

VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT specifies write access to a depth/stencil attachment, via depth or stencil operations or via certain subpass load and store operations.

VK_ACCESS_TRANSFER_READ_BIT specifies read access to an image or buffer in a copy operation.

VK_ACCESS_TRANSFER_WRITE_BIT specifies write access to an image or buffer in a clear or copy operation.

VK_ACCESS_HOST_READ_BIT specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory.

VK_ACCESS_HOST_WRITE_BIT specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory.

VK_ACCESS_MEMORY_READ_BIT specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all READ access flags that are valid where it is used.

VK_ACCESS_MEMORY_WRITE_BIT specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all WRITE access flags that are valid where it is used.

VK_ACCESS_CONDITIONAL_RENDERING_READ_BIT_EXT specifies read access to a predicate as part of conditional rendering.

VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT specifies write access to a transform feedback buffer made when transform feedback is active.

VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT specifies read access to a transform feedback counter buffer which is read when vkCmdBeginTransformFeedbackEXT executes.

VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT specifies write access to a transform feedback counter buffer which is written when vkCmdEndTransformFeedbackEXT executes.

VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV specifies reads from VkBuffer inputs to vkCmdPreprocessGeneratedCommandsNV.

VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV specifies writes to the VkBuffer preprocess outputs in vkCmdPreprocessGeneratedCommandsNV.

VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT is similar to VK_ACCESS_COLOR_ATTACHMENT_READ_BIT, but also includes advanced blend operations.

VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR specifies read access to a fragment shading rate attachment or shading rate image during rasterization.

VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR specifies read access to an acceleration image.
structure as part of a trace, build, or copy command, or to an acceleration structure scratch buffer as part of a build command.

- **VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR** specifies write access to an acceleration structure or acceleration structure scratch buffer as part of a build or copy command.

- **VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT** specifies read access to a fragment density map attachment during dynamic fragment density map operations

Certain access types are only performed by a subset of pipeline stages. Any synchronization command that takes both stage masks and access masks uses both to define the access scopes - only the specified access types performed by the specified stages are included in the access scope. An application must not specify an access flag in a synchronization command if it does not include a pipeline stage in the corresponding stage mask that is able to perform accesses of that type. The following table lists, for each access flag, which pipeline stages can perform that type of access.

### Table 4. Supported access types

<table>
<thead>

// Provided by VK_VERSION_1_0
typedef VkFlags VkAccessFlags;

VkAccessFlags is a bitmask type for setting a mask of zero or more VkAccessFlagBits.

If a memory object does not have the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT property, then vkFlushMappedMemoryRanges must be called in order to guarantee that writes to the memory object from the host are made available to the host domain, where they can be further made available to the device domain via a domain operation. Similarly, vkInvalidateMappedMemoryRanges must be called to guarantee that writes which are available to the host domain are made visible to host operations.

If the memory object does have the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT property flag, writes to the memory object from the host are automatically made available to the host domain. Similarly, writes made available to the host domain are automatically made visible to the host.

Note
Queue submission commands automatically perform a domain operation from host to device for all writes performed before the command executes, so in most cases an explicit memory barrier is not needed for this case. In the few circumstances where a submit does not occur between the host write and the device read access, writes can be made available by using an explicit memory barrier.

7.1.4. Framebuffer Region Dependencies

Pipeline stages that operate on, or with respect to, the framebuffer are collectively the framebuffer-space pipeline stages. These stages are:
• VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT
• VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT
• VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT
• VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT

For these pipeline stages, an execution or memory dependency from the first set of operations to the second set can either be a single framebuffer-global dependency, or split into multiple framebuffer-local dependencies. A dependency with non-framebuffer-space pipeline stages is neither framebuffer-global nor framebuffer-local.

A framebuffer region is a subset of the entire framebuffer, and can either be:

• A sample region, which is set of sample (x, y, layer, sample) coordinates that is a subset of the entire framebuffer, or
• A fragment region, which is a set of fragment (x, y, layer) coordinates that is a subset of the entire framebuffer.

Both synchronization scopes of a framebuffer-local dependency include only the operations performed within corresponding framebuffer regions (as defined below). No ordering guarantees are made between different framebuffer regions for a framebuffer-local dependency.

Both synchronization scopes of a framebuffer-global dependency include operations on all framebuffer-regions.

If the first synchronization scope includes operations on pixels/fragments with N samples and the second synchronization scope includes operations on pixels/fragments with M samples, where N does not equal M, then a framebuffer region containing all samples at a given (x, y, layer) coordinate in the first synchronization scope corresponds to a region containing all samples at the same coordinate in the second synchronization scope. In other words, the framebuffer region is a fragment region and it is a pixel granularity dependency. If N equals M, and if the VkSubpassDescription::flags does not specify the VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM flag, then a framebuffer region containing a single (x, y, layer, sample) coordinate in the first synchronization scope corresponds to a region containing the same sample at the same coordinate in the second synchronization scope. In other words, the framebuffer region is a sample region and it is a sample granularity dependency.

Note

Since fragment invocations are not specified to run in any particular groupings, the size of a framebuffer region is implementation-dependent, not known to the application, and must be assumed to be no larger than specified above.
Practically, the pixel vs sample granularity dependency means that if an input attachment has a different number of samples than the pipeline's `rasterizationSamples`, then a fragment can access any sample in the input attachment's pixel even if it only uses framebuffer-local dependencies. If the input attachment has the same number of samples, then the fragment can only access the covered samples in its input `SampleMask` (i.e. the fragment operations happen-after a framebuffer-local dependency for each sample the fragment covers). To access samples that are not covered, either the `VkSubpassDescription::flags VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM` flag is required, or a framebuffer-global dependency is required.

If a synchronization command includes a `dependencyFlags` parameter, and specifies the `VK_DEPENDENCY_BY_REGION_BIT` flag, then it defines framebuffer-local dependencies for the framebuffer-space pipeline stages in that synchronization command, for all framebuffer regions. If no `dependencyFlags` parameter is included, or the `VK_DEPENDENCY_BY_REGION_BIT` flag is not specified, then a framebuffer-global dependency is specified for those stages. The `VK_DEPENDENCY_BY_REGION_BIT` flag does not affect the dependencies between non-framebuffer-space pipeline stages, nor does it affect the dependencies between framebuffer-space and non-framebuffer-space pipeline stages.

Framebuffer-local dependencies are more optimal for most architectures; particularly tile-based architectures - which can keep framebuffer-regions entirely in on-chip registers and thus avoid external bandwidth across such a dependency. Including a framebuffer-global dependency in your rendering will usually force all implementations to flush data to memory, or to a higher level cache, breaking any potential locality optimizations.

### 7.1.5. View-Local Dependencies

In a render pass instance that has `multiview` enabled, dependencies can be either view-local or view-global.

A view-local dependency only includes operations from a single source view from the source subpass in the first synchronization scope, and only includes operations from a single destination view from the destination subpass in the second synchronization scope. A view-global dependency includes all views in the view mask of the source and destination subpasses in the corresponding synchronization scopes.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag, then it defines view-local dependencies for that synchronization command, for all views. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag is not specified, then a view-global dependency is specified.
7.1.6. Device-Local Dependencies

Dependencies can be either device-local or non-device-local. A device-local dependency acts as multiple separate dependencies, one for each physical device that executes the synchronization command, where each dependency only includes operations from that physical device in both synchronization scopes. A non-device-local dependency is a single dependency where both synchronization scopes include operations from all physical devices that participate in the synchronization command. For subpass dependencies, all physical devices in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` participate in the dependency, and for pipeline barriers all physical devices that are set in the command buffer's current device mask participate in the dependency.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag, then it defines a non-device-local dependency for that synchronization command. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag is not specified, then it defines device-local dependencies for that synchronization command, for all participating physical devices.

Semaphore and event dependencies are device-local and only execute on the one physical device that performs the dependency.

7.2. Implicit Synchronization Guarantees

A small number of implicit ordering guarantees are provided by Vulkan, ensuring that the order in which commands are submitted is meaningful, and avoiding unnecessary complexity in common operations.

Submission order is a fundamental ordering in Vulkan, giving meaning to the order in which action and synchronization commands are recorded and submitted to a single queue. Explicit and implicit ordering guarantees between commands in Vulkan all work on the premise that this ordering is meaningful. This order does not itself define any execution or memory dependencies; synchronization commands and other orderings within the API use this ordering to define their scopes.

Submission order for any given set of commands is based on the order in which they were recorded to command buffers and then submitted. This order is determined as follows:

1. The initial order is determined by the order in which `vkQueueSubmit` and `vkQueueSubmit2KHR` commands are executed on the host, for a single queue, from first to last.
2. The order in which `VkSubmitInfo` structures are specified in the `pSubmits` parameter of `vkQueueSubmit`, or in which `VkSubmitInfo2KHR` structures are specified in the `pSubmits` parameter of `vkQueueSubmit2KHR`, from lowest index to highest.
3. The order in which command buffers are specified in the `pCommandBuffers` member of `VkSubmitInfo` or `VkSubmitInfo2KHR` from lowest index to highest.
4. The order in which commands were recorded to a command buffer on the host, from first to last:
   - For commands recorded outside a render pass, this includes all other commands recorded
outside a render pass, including `vkCmdBeginRenderPass` and `vkCmdEndRenderPass` commands; it does not directly include commands inside a render pass.

- For commands recorded inside a render pass, this includes all other commands recorded inside the same subpass, including the `vkCmdBeginRenderPass` and `vkCmdEndRenderPass` commands that delimit the same render pass instance; it does not include commands recorded to other subpasses. **State commands** do not execute any operations on the device, instead they set the state of the command buffer when they execute on the host, in the order that they are recorded. **Action commands** consume the current state of the command buffer when they are recorded, and will execute state changes on the device as required to match the recorded state.

Query commands, the order of primitives passing through the graphics pipeline and image layout transitions as part of an image memory barrier provide additional guarantees based on submission order.

Execution of **pipeline stages** within a given command also has a loose ordering, dependent only on a single command.

**Signal operation order** is a fundamental ordering in Vulkan, giving meaning to the order in which semaphore and fence signal operations occur when submitted to a single queue. The signal operation order for queue operations is determined as follows:

1. The initial order is determined by the order in which `vkQueueSubmit` commands are executed on the host, for a single queue, from first to last.
2. The order in which `VkSubmitInfo` structures are specified in the `pSubmits` parameter of `vkQueueSubmit`, from lowest index to highest.
3. The fence signal operation defined by the `fence` parameter of a `vkQueueSubmit` or `vkQueueBindSparse` command is ordered after all semaphore signal operations defined by that command.

Semaphore signal operations defined by a single `VkSubmitInfo` or `VkBindSparseInfo` structure are unordered with respect to other semaphore signal operations defined within the same `VkSubmitInfo` or `VkBindSparseInfo` structure.

The `vkSignalSemaphore` command does not execute on a queue but instead performs the signal operation from the host. The semaphore signal operation defined by executing a `vkSignalSemaphore` command happens-after the `vkSignalSemaphore` command is invoked and happens-before the command returns.
When signaling timeline semaphores, it is the responsibility of the application to ensure that they are ordered such that the semaphore value is strictly increasing. Because the first synchronization scope for a semaphore signal operation contains all semaphore signal operations which occur earlier in submission order, all semaphore signal operations contained in any given batch are guaranteed to happen-after all semaphore signal operations contained in any previous batches. However, no ordering guarantee is provided between the semaphore signal operations defined within a single batch. This, combined with the requirement that timeline semaphore values strictly increase, means that it is invalid to signal the same timeline semaphore twice within a single batch.

If an application wishes to ensure that some semaphore signal operation happens-after some other semaphore signal operation, it can submit a separate batch containing only semaphore signal operations, which will happen-after the semaphore signal operations in any earlier batches.

When signaling a semaphore from the host, the only ordering guarantee is that the signal operation happens-after when `vkSignalSemaphore` is called and happens-before it returns. Therefore, it is invalid to call `vkSignalSemaphore` while there are any outstanding signal operations on that semaphore from any queue submissions unless those queue submissions have some dependency which ensures that they happen-after the host signal operation. One example of this would be if the pending signal operation is, itself, waiting on the same semaphore at a lower value and the call to `vkSignalSemaphore` signals that lower value. Furthermore, if there are two or more processes or threads signaling the same timeline semaphore from the host, the application must ensure that the `vkSignalSemaphore` with the lower semaphore value returns before `vkSignalSemaphore` is called with the higher value.

### 7.3. Fences

Fences are a synchronization primitive that can be used to insert a dependency from a queue to the host. Fences have two states - signaled and unsignaled. A fence can be signaled as part of the execution of a queue submission command. Fences can be unsignaled on the host with `vkResetFences`. Fences can be waited on by the host with the `vkWaitForFences` command, and the current state can be queried with `vkGetFenceStatus`.

The internal data of a fence may include a reference to any resources and pending work associated with signal or unsignal operations performed on that fence object, collectively referred to as the fence’s payload. Mechanisms to import and export that internal data to and from fences are provided below. These mechanisms indirectly enable applications to share fence state between two or more fences and other synchronization primitives across process and API boundaries.

Fences are represented by `VkFence` handles:
To create a fence, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateFence(
    VkDevice                                    device,
    const VkFenceCreateInfo*                    pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkFence*                                    pFence);
```

- `device` is the logical device that creates the fence.
- `pCreateInfo` is a pointer to a `VkFenceCreateInfo` structure containing information about how the fence is to be created.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pFence` is a pointer to a handle in which the resulting fence object is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateFence-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkCreateFence-pCreateInfo-parameter**
  - `pCreateInfo` must be a valid pointer to a valid `VkFenceCreateInfo` structure
- **VUID-vkCreateFence-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreateFence-pFence-parameter**
  - `pFence` must be a valid pointer to a `VkFence` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkFenceCreateInfo` structure is defined as:
typedef struct VkFenceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFenceCreateFlags flags;
} VkFenceCreateInfo;

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **flags** is a bitmask of **VkFenceCreateFlagBits** specifying the initial state and behavior of the fence.

### Valid Usage (Implicit)

- **VUID-VkFenceCreateInfo-sType-sType**
  sType **must** be **VK_STRUCTURE_TYPE_FENCE_CREATE_INFO**

- **VUID-VkFenceCreateInfo-pNext-pNext**
  Each pNext member of any structure (including this one) in the pNext chain **must** be either **NULL** or a pointer to a valid instance of **VkExportFenceCreateInfo** or **VkExportFenceWin32HandleInfoKHR**

- **VUID-VkFenceCreateInfo-sType-unique**
  The sType value of each struct in the pNext chain **must** be unique

- **VUID-VkFenceCreateInfo-flags-parameter**
  flags **must** be a valid combination of **VkFenceCreateFlagBits** values

---

typedef enum VkFenceCreateFlagBits {
    VK_FENCE_CREATE_SIGNALED_BIT = 0x00000001,
} VkFenceCreateFlagBits;

- **VK_FENCE_CREATE_SIGNALED_BIT** specifies that the fence object is created in the signaled state. Otherwise, it is created in the unsignaled state.

typedef VkFlags VkFenceCreateFlags;

**VkFenceCreateFlags** is a bitmask type for setting a mask of zero or more **VkFenceCreateFlagBits**.

To create a fence whose payload **can** be exported to external handles, add a **VkExportFenceCreateInfo** structure to the pNext chain of the **VkFenceCreateInfo** structure. The **VkExportFenceCreateInfo** structure is defined as:
### Valid Usage

- **VUID-VkExportFenceCreateInfo-handleTypes-01446**
  
  The bits in `handleTypes` must be supported and compatible, as reported by `VkExternalFenceProperties`.

### Valid Usage (Implicit)

- **VUID-VkExportFenceCreateInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_FENCE_CREATE_INFO`.

- **VUID-VkExportFenceCreateInfo-handleTypes-parameter**
  
  `handleTypes` must be a valid combination of `VkExternalFenceHandleTypeFlagBits` values.

To specify additional attributes of NT handles exported from a fence, add a `VkExportFenceWin32HandleInfoKHR` structure to the `pNext` chain of the `VkFenceCreateInfo` structure. The `VkExportFenceWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExportFenceCreateInfo {  
    VkStructureType                   sType;  
    const void*                       pNext;  
    VkExternalFenceHandleTypeFlags    handleTypes;  
} VkExportFenceCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence
typedef VkExportFenceCreateInfo VkExportFenceCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **handleTypes** is a bitmask of `VkExternalFenceHandleTypeFlagBits` specifying one or more fence handle types the application can export from the resulting fence. The application can request multiple handle types for the same fence.
typedef struct VkExportFenceWin32HandleInfoKHR {
    VkStructureType               sType;
    const void*                   pNext;
    const SECURITY_ATTRIBUTES*    pAttributes;
    DWORD                         dwAccess;
    LPCWSTR                       name;
} VkExportFenceWin32HandleInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pAttributes** is a pointer to a Windows SECURITY_ATTRIBUTES structure specifying security attributes of the handle.
- **dwAccess** is a DWORD specifying access rights of the handle.
- **name** is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created fence.

If **VkExportFenceCreateInfo** is not present in the same **pNext** chain, this structure is ignored.

If **VkExportFenceCreateInfo** is present in the **pNext** chain of **VkFenceCreateInfo** with a Windows **handleType**, but either **VkExportFenceWin32HandleInfoKHR** is not present in the **pNext** chain, or if it is but **pAttributes** is set to NULL, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights will be

```plaintext
DXGI_SHARED_RESOURCE_READ | DXGI_SHARED_RESOURCE_WRITE
```

for handles of the following types:

**VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT**

1

---

**Valid Usage**

- **VUID-VkExportFenceWin32HandleInfoKHR-handleTypes-01447**

If **VkExportFenceCreateInfo::handleTypes** does not include **VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT**, a **VkExportFenceWin32HandleInfoKHR** structure must not be included in the **pNext** chain of **VkFenceCreateInfo**
To export a Windows handle representing the state of a fence, call:

```c
// Provided by VK_KHR_external_fence_win32
VkResult vkGetFenceWin32HandleKHR(
    VkDevice                                device,
    const VkFenceGetWin32HandleInfoKHR*    pGetWin32HandleInfo,  
    HANDLE*                                 pHandle);
```

- **device** is the logical device that created the fence being exported.
- **pGetWin32HandleInfo** is a pointer to a `VkFenceGetWin32HandleInfoKHR` structure containing parameters of the export operation.
- **pHandle** will return the Windows handle representing the fence state.

For handle types defined as NT handles, the handles returned by `vkGetFenceWin32HandleKHR` are owned by the application. To avoid leaking resources, the application must release ownership of them using the `CloseHandle` system call when they are no longer needed.

Exporting a Windows handle from a fence may have side effects depending on the transference of the specified handle type, as described in Importing Fence Payloads.
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

The `VkFenceGetWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_fence_win32
typedef struct VkFenceGetWin32HandleInfoKHR {
    VkStructureType                      sType;
    const void*                          pNext;
    VkFence                              fence;
    VkExternalFenceHandleTypeFlagBits    handleType;
} VkFenceGetWin32HandleInfoKHR;
```

• `sType` is the type of this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `fence` is the fence from which state will be exported.
• `handleType` is the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalFenceHandleTypeFlagBits` for a description of the properties of the defined external fence handle types.
Valid Usage

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01448**
  
  handleType must have been included in `VkExportFenceCreateInfo::handleTypes` when the fence’s current payload was created.

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01449**
  
  If handleType is defined as an NT handle, `vkGetFenceWin32HandleKHR` must be called no more than once for each valid unique combination of fence and handleType.

- **VUID-VkFenceGetWin32HandleInfoKHR-fence-01450**
  
  fence must not currently have its payload replaced by an imported payload as described below in Importing Fence Payloads unless that imported payload’s handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for handleType.

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01451**
  
  If handleType refers to a handle type with copy payload transference semantics, fence must be signaled, or have an associated fence signal operation pending execution.

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01452**
  
  handleType must be defined as an NT handle or a global share handle.

Valid Usage (Implicit)

- **VUID-VkFenceGetWin32HandleInfoKHR-sType-sType**
  
  sType must be `VK_STRUCTURE_TYPE_FENCE_GET_WIN32_HANDLE_INFO_KHR`.

- **VUID-VkFenceGetWin32HandleInfoKHR-pNext-pNext**
  
  pNext must be NULL.

- **VUID-VkFenceGetWin32HandleInfoKHR-fence-parameter**
  
  fence must be a valid `VkFence` handle.

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-parameter**
  
  handleType must be a valid `VkExternalFenceHandleTypeFlagBits` value.

To export a POSIX file descriptor representing the payload of a fence, call:

```c
// Provided by VK_KHR_external_fence_fd
VkResult vkGetFenceFdKHR(
    VkDevice                                    device,
    const VkFenceGetFdInfoKHR*                  pGetFdInfo,
    int*                                        pFd);
```

- **device** is the logical device that created the fence being exported.

- **pGetFdInfo** is a pointer to a `VkFenceGetFdInfoKHR` structure containing parameters of the export operation.

- **pFd** will return the file descriptor representing the fence payload.
Each call to `vkGetFenceFdKHR` **must** create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application **must** release ownership of the file descriptor when it is no longer needed.

**Note**
Ownership can be released in many ways. For example, the application can call `close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a fence payload.

If `pGetFdInfo->handleType` is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` and the fence is signaled at the time `vkGetFenceFdKHR` is called, `pFd` **may** return the value `-1` instead of a valid file descriptor.

Where supported by the operating system, the implementation **must** set the file descriptor to be closed automatically when an `execve` system call is made.

Exporting a file descriptor from a fence **may** have side effects depending on the transference of the specified handle type, as described in Importing Fence State.

### Valid Usage (Implicit)

- **VUID-vkGetFenceFdKHR-device-parameter**
  - `device` **must** be a valid `VkDevice` handle
- **VUID-vkGetFenceFdKHR-pGetFdInfo-parameter**
  - `pGetFdInfo` **must** be a valid pointer to a valid `VkFenceGetFdInfoKHR` structure
- **VUID-vkGetFenceFdKHR-pFd-parameter**
  - `pFd` **must** be a valid pointer to an `int` value

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkFenceGetFdInfoKHR` structure is defined as:
Provided by VK_KHR_external_fence_fd

typedef struct VkFenceGetFdInfoKHR {
    VkStructureType                      sType;
    const void*                          pNext;
    VkFence                              fence;
    VkExternalFenceHandleTypeFlagBits    handleType;
} VkFenceGetFdInfoKHR;

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **fence** is the fence from which state will be exported.
- **handleType** is the type of handle requested.

The properties of the file descriptor returned depend on the value of `handleType`. See `VkExternalFenceHandleTypeFlagBits` for a description of the properties of the defined external fence handle types.

Valid Usage

- **VUID-VkFenceGetFdInfoKHR-handleType-01453**
  
  `handleType` must have been included in `VkExportFenceCreateInfo::handleTypes` when `fence`'s current payload was created

- **VUID-VkFenceGetFdInfoKHR-handleType-01454**
  
  If `handleType` refers to a handle type with copy payload transference semantics, `fence` must be signaled, or have an associated `fence signal operation` pending execution

- **VUID-VkFenceGetFdInfoKHR-fence-01455**
  
  `fence` must not currently have its payload replaced by an imported payload as described below in Importing Fence Payloads unless that imported payload's handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for `handleType`

- **VUID-VkFenceGetFdInfoKHR-handleType-01456**
  
  `handleType` must be defined as a POSIX file descriptor handle
Valid Usage (Implicit)

- **VUID-VkFenceGetFdInfoKHR-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_FENCE_GET_FD_INFO_KHR`

- **VUID-VkFenceGetFdInfoKHR-pNext-pNext**
  
  `pNext` **must** be `NULL`

- **VUID-VkFenceGetFdInfoKHR-fence-parameter**
  
  `fence` **must** be a valid `VkFence` handle

- **VUID-VkFenceGetFdInfoKHR-handleType-parameter**
  
  `handleType` **must** be a valid `VkExternalFenceHandleTypeFlagBits` value

To destroy a fence, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyFence( 
    VkDevice device, 
    VkFence fence, 
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the fence.
- `fence` is the handle of the fence to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- **VUID-vkDestroyFence-fence-01120**
  
  All queue submission commands that refer to `fence` **must** have completed execution

- **VUID-vkDestroyFence-fence-01121**
  
  If `VkAllocationCallbacks` were provided when `fence` was created, a compatible set of callbacks **must** be provided here

- **VUID-vkDestroyFence-fence-01122**
  
  If no `VkAllocationCallbacks` were provided when `fence` was created, `pAllocator` **must** be `NULL`
Valid Usage (Implicit)

- **VUID-vkDestroyFence-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkDestroyFence-fence-parameter**
  
  If `fence` is not `VK_NULL_HANDLE`, `fence` must be a valid `VkFence` handle

- **VUID-vkDestroyFence-pAllocator-parameter**
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyFence-fence-parent**
  
  If `fence` is a valid handle, it must have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `fence` must be externally synchronized

To query the status of a fence from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetFenceStatus(
        VkDevice device,
        VkFence fence);
```

- `device` is the logical device that owns the fence.
- `fence` is the handle of the fence to query.

Upon success, `vkGetFenceStatus` returns the status of the fence object, with the following return codes:

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SUCCESS</td>
<td>The fence specified by <code>fence</code> is signaled.</td>
</tr>
<tr>
<td>VK_NOT_READY</td>
<td>The fence specified by <code>fence</code> is unsignaled.</td>
</tr>
<tr>
<td>VK_ERROR_DEVICE_LOST</td>
<td>The device has been lost. See Lost Device.</td>
</tr>
</tbody>
</table>

If a queue submission command is pending execution, then the value returned by this command may immediately be out of date.

If the device has been lost (see Lost Device), `vkGetFenceStatus` may return any of the above status codes.
codes. If the device has been lost and `vkGetFenceStatus` is called repeatedly, it will eventually return either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

### Valid Usage (Implicit)

- **VUID-vkGetFenceStatus-device-parameter**
  
  *device* must be a valid `VkDevice` handle

- **VUID-vkGetFenceStatus-fence-parameter**
  
  *fence* must be a valid `VkFence` handle

- **VUID-vkGetFenceStatus-fence-parent**
  
  *fence* must have been created, allocated, or retrieved from *device*

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_NOT_READY`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

To set the state of fences to unsignaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetFences(
    VkDevice device,                      // Logical device that owns the fences.
    uint32_t fenceCount,                 // Number of fences to reset.
    const VkFence* pFences);            // Pointer to array of fence handles to reset.
```

- *device* is the logical device that owns the fences.
- *fenceCount* is the number of fences to reset.
- *pFences* is a pointer to an array of fence handles to reset.

If any member of *pFences* currently has its payload imported with temporary permanence, that fence’s prior permanent payload is first restored. The remaining operations described therefore operate on the restored payload.

When `vkResetFences` is executed on the host, it defines a fence unsignal operation for each fence, which resets the fence to the unsignaled state.

If any member of *pFences* is already in the unsignaled state when `vkResetFences` is executed, then
vkResetFences has no effect on that fence.

### Valid Usage

- VUID-vkResetFences-pFences-01123
  
  Each element of pFences must not be currently associated with any queue command that has not yet completed execution on that queue

### Valid Usage (Implicit)

- VUID-vkResetFences-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkResetFences-pFences-parameter
  
  pFences must be a valid pointer to an array of fenceCount valid VkFence handles

- VUID-vkResetFences-fenceCount-arraylength
  
  fenceCount must be greater than 0

- VUID-vkResetFences-pFences-parent
  
  Each element of pFences must have been created, allocated, or retrieved from device

### Host Synchronization

- Host access to each member of pFences must be externally synchronized

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_DEVICE_MEMORY

When a fence is submitted to a queue as part of a queue submission command, it defines a memory dependency on the batches that were submitted as part of that command, and defines a fence signal operation which sets the fence to the signaled state.

The first synchronization scope includes every batch submitted in the same queue submission command. Fence signal operations that are defined by vkQueueSubmit additionally include in the first synchronization scope all commands that occur earlier in submission order. Fence signal operations that are defined by vkQueueSubmit or vkQueueBindSparse additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in signal operation order.

The second synchronization scope only includes the fence signal operation.
The first access scope includes all memory access performed by the device.

The second access scope is empty.

To wait for one or more fences to enter the signaled state on the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkWaitForFences(
    VkDevice device,                  // Provided by VK_VERSION_1_0
    uint32_t fenceCount,              // Provided by VK_VERSION_1_0
    const VkFence* pFences,           // Provided by VK_VERSION_1_0
    VkBool32 waitAll,                 // Provided by VK_VERSION_1_0
    uint64_t timeout);                // Provided by VK_VERSION_1_0
```

- `device` is the logical device that owns the fences.
- `fenceCount` is the number of fences to wait on.
- `pFences` is a pointer to an array of `fenceCount` fence handles.
- `waitAll` is the condition that must be satisfied to successfully unblock the wait. If `waitAll` is `VK_TRUE`, then the condition is that all fences in `pFences` are signaled. Otherwise, the condition is that at least one fence in `pFences` is signaled.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which may be substantially longer than one nanosecond, and may be longer than the requested period.

If the condition is satisfied when `vkWaitForFences` is called, then `vkWaitForFences` returns immediately. If the condition is not satisfied at the time `vkWaitForFences` is called, then `vkWaitForFences` will block and wait until the condition is satisfied or the `timeout` has expired, whichever is sooner.

If `timeout` is zero, then `vkWaitForFences` does not wait, but simply returns the current state of the fences. `VK_TIMEOUT` will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the `timeout` has expired, `vkWaitForFences` returns `VK_SUCCESS`. Otherwise, `vkWaitForFences` returns `VK_TIMEOUT` after the `timeout` has expired.

If device loss occurs (see Lost Device) before the timeout has expired, `vkWaitForFences` must return in finite time with either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

**Note**
While we guarantee that `vkWaitForFences` must return in finite time, no guarantees are made that it returns immediately upon device loss. However, the client can reasonably expect that the delay will be on the order of seconds and that calling `vkWaitForFences` will not result in a permanently (or seemingly permanently) dead process.
Valid Usage (Implicit)

• VUID-vkWaitForFences-device-parameter
device must be a valid VkDevice handle

• VUID-vkWaitForFences-pFences-parameter
pFences must be a valid pointer to an array of fenceCount valid VkFence handles

• VUID-vkWaitForFences-fenceCount-arraylength
fenceCount must be greater than 0

• VUID-vkWaitForFences-pFences-parent
Each element of pFences must have been created, allocated, or retrieved from device

Return Codes

Success

• VK_SUCCESS
• VK_TIMEOUT

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_DEVICE_LOST

An execution dependency is defined by waiting for a fence to become signaled, either via vkWaitForFences or by polling on vkGetFenceStatus.

The first synchronization scope includes only the fence signal operation.

The second synchronization scope includes the host operations of vkWaitForFences or vkGetFenceStatus indicating that the fence has become signaled.

Note

Signaling a fence and waiting on the host does not guarantee that the results of memory accesses will be visible to the host, as the access scope of a memory dependency defined by a fence only includes device access. A memory barrier or other memory dependency must be used to guarantee this. See the description of host access types for more information.

7.3.1. Alternate Methods to Signal Fences

Besides submitting a fence to a queue as part of a queue submission command, a fence may also be signaled when a particular event occurs on a device or display.

To create a fence that will be signaled when an event occurs on a device, call:
Provided by VK_EXT_display_control

```c
VkResult vkRegisterDeviceEventEXT(
    VkDevice                                    device,
    const VkDeviceEventInfoEXT*                 pDeviceEventInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkFence*                                    pFence);
```

- **device** is a logical device on which the event may occur.
- **pDeviceEventInfo** is a pointer to a VkDeviceEventInfoEXT structure describing the event of interest to the application.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pFence** is a pointer to a handle in which the resulting fence object is returned.

### Valid Usage (Implicit)

- **VUID-vkRegisterDeviceEventEXT-device-parameter**
  - device must be a valid VkDevice handle
- **VUID-vkRegisterDeviceEventEXT-pDeviceEventInfo-parameter**
  - pDeviceEventInfo must be a valid pointer to a valid VkDeviceEventInfoEXT structure
- **VUID-vkRegisterDeviceEventEXT-pAllocator-parameter**
  - If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- **VUID-vkRegisterDeviceEventEXT-pFence-parameter**
  - pFence must be a valid pointer to a VkFence handle

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**

The VkDeviceEventInfoEXT structure is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkDeviceEventInfoEXT {
    VkStructureType         sType;
    const void*             pNext;
    VkDeviceEventTypeEXT    deviceEvent;
} VkDeviceEventInfoEXT;
```
• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **device** is a VkDeviceEventTypeEXT value specifying when the fence will be signaled.

### Valid Usage (Implicit)

- VUID-VkDeviceEventInfoEXT-sType-sType
  
  **sType** must be VK_STRUCTURE_TYPE_DEVICE_EVENT_INFO_EXT

- VUID-VkDeviceEventInfoEXT-pNext-pNext
  
  **pNext** must be NULL

- VUID-VkDeviceEventInfoEXT-deviceEvent-parameter
  
  **deviceEvent** must be a valid VkDeviceEventTypeEXT value

Possible values of **VkDeviceEventInfoEXT::device**, specifying when a fence will be signaled, are:

```c
// Provided by VK_EXT_display_control
typedef enum VkDeviceEventTypeEXT {
    VKDEVICE_EVENTTYPE_DISPLAYHOTPLUG_EXT = 0,
} VkDeviceEventTypeEXT;
```

- **VK_DEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT** specifies that the fence is signaled when a display is plugged into or unplugged from the specified device. Applications can use this notification to determine when they need to re-enumerate the available displays on a device.

To create a fence that will be signaled when an event occurs on a VkDisplayKHR object, call:

```c
// Provided by VK_EXT_display_control
VkResult vkRegisterDisplayEventEXT(
    VkDevice device,
    VkDisplayKHR display,
    const VkDisplayEventInfoEXT* pDisplayEventInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFence* pFence);
```

- **device** is a logical device associated with **display**
- **display** is the display on which the event may occur.
- **pDisplayEventInfo** is a pointer to a VkDisplayEventInfoEXT structure describing the event of interest to the application.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pFence** is a pointer to a handle in which the resulting fence object is returned.
Valid Usage (Implicit)

- **VUID-vkRegisterDisplayEventEXT-device-parameter**
  *device* must be a valid *VkDevice* handle

- **VUID-vkRegisterDisplayEventEXT-display-parameter**
  *display* must be a valid *VkDisplayKHR* handle

- **VUID-vkRegisterDisplayEventEXT-pDisplayEventInfo-parameter**
  *pDisplayEventInfo* must be a valid pointer to a valid *VkDisplayEventInfoEXT* structure

- **VUID-vkRegisterDisplayEventEXT-pAllocator-parameter**
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure

- **VUID-vkRegisterDisplayEventEXT-pFence-parameter**
  *pFence* must be a valid pointer to a *VkFence* handle

- **VUID-vkRegisterDisplayEventEXT-commonparent**
  Both of *device*, and *display* must have been created, allocated, or retrieved from the same *VkPhysicalDevice*

Return Codes

**Success**
- *VK_SUCCESS*

**Failure**
- *VK_ERROR_OUT_OF_HOST_MEMORY*

The *VkDisplayEventInfoEXT* structure is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkDisplayEventInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDisplayEventTypeEXT displayEvent;
} VkDisplayEventInfoEXT;
```

- *sType* is the type of this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- *displayEvent* is a *VkDisplayEventTypeEXT* specifying when the fence will be signaled.
Valid Usage (Implicit)

- **VUID-VkDisplayEventInfoEXT-sType-sType**
  
  sType must be `VK_STRUCTURE_TYPE_DISPLAY_EVENT_INFO_EXT`

- **VUID-VkDisplayEventInfoEXT-pNext-pNext**
  
  pNext must be `NULL`

- **VUID-VkDisplayEventInfoEXT-displayEvent-parameter**
  
  displayEvent must be a valid `VkDisplayEventTypeEXT` value

Possible values of `VkDisplayEventInfoEXT::displayEvent`, specifying when a fence will be signaled, are:

```c
// Provided by VK_EXT_display_control
typedef enum VkDisplayEventTypeEXT {
    VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT = 0,
} VkDisplayEventTypeEXT;
```

- `VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT` specifies that the fence is signaled when the first pixel of the next display refresh cycle leaves the display engine for the display.

### 7.3.2. Importing Fence Payloads

Applications can import a fence payload into an existing fence using an external fence handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the fence will be restored to its permanent state the next time that fence is passed to `vkResetFences`.

**Note**

Restoring a fence to its prior permanent payload is a distinct operation from resetting a fence payload. See `vkResetFences` for more detail.

Performing a subsequent temporary import on a fence before resetting it has no effect on this requirement; the next unsignal of the fence must still restore its last permanent state. A permanent payload import behaves as if the target fence was destroyed, and a new fence was created with the same handle but the imported payload. Because importing a fence payload temporarily or permanently detaches the existing payload from a fence, similar usage restrictions to those applied to `vkDestroyFence` are applied to any command that imports a fence payload. Which of these import types is used is referred to as the import operation’s permanence. Each handle type supports either one or both types of permanence.

The implementation must perform the import operation by either referencing or copying the payload referred to by the specified external fence handle, depending on the handle’s type. The import method used is referred to as the handle type’s transference. When using handle types with reference transference, importing a payload to a fence adds the fence to the set of all fences sharing that payload. This set includes the fence from which the payload was exported. Fence signaling,
waiting, and resetting operations performed on any fence in the set must behave as if the set were a single fence. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Fence signaling, waiting, and resetting operations performed on the target of copy imports must not affect any other fence or payload.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a fence payload to a handle with copy transference has the same side effects on the source fence's payload as executing a fence reset operation. If the fence was using a temporarily imported payload, the fence's prior permanent payload will be restored.

Note

The tables Handle Types Supported by VkImportFenceWin32HandleInfoKHR and Handle Types Supported by VkImportFenceFdInfoKHR define the permanence and transference of each handle type.

External synchronization allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for fences sharing a payload across processes, satisfying the external synchronization requirements of VkFence parameters as if all fences in the set were the same object is sometimes infeasible. Satisfying valid usage constraints on the state of a fence would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific fence handle, not to its payload. For distinct fence objects which share a payload:

- If multiple commands which queue a signal operation, or which unsignal a fence, are called concurrently, behavior will be as if the commands were called in an arbitrary sequential order.
- If a queue submission command is called with a fence that is sharing a payload, and the payload is already associated with another queue command that has not yet completed execution, either one or both of the commands will cause the fence to become signaled when they complete execution.
- If a fence payload is reset while it is associated with a queue command that has not yet completed execution, the payload will become unsignaled, but may become signaled again when the command completes execution.
- In the preceding cases, any of the devices associated with the fences sharing the payload may be lost, or any of the queue submission or fence reset commands may return VK_ERROR_INITIALIZATION_FAILED.

Other than these non-deterministic results, behavior is well defined. In particular:

- The implementation must not crash or enter an internally inconsistent state where future valid Vulkan commands might cause undefined results,
- Timeouts on future wait commands on fences sharing the payload must be effective.
These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared fence for more than synchronizing access to the shared memory. For example, a process should not use a fence with shared payload to tell when commands it submitted to a queue have completed and objects used by those commands may be destroyed, since the other process can accidentally or maliciously cause the fence to signal before the commands actually complete.

When a fence is using an imported payload, its `VkExportFenceCreateInfo::handleTypes` value is that specified when creating the fence from which the payload was exported, rather than that specified when creating the fence. Additionally, `VkExternalFenceProperties::exportFromImportedHandleTypes` restricts which handle types can be exported from such a fence based on the specific handle type used to import the current payload. Passing a fence to `vkAcquireNextImageKHR` is equivalent to temporarily importing a fence payload to that fence.

Because the exportable handle types of an imported fence correspond to its current imported payload, and `vkAcquireNextImageKHR` behaves the same as a temporary import operation for which the source fence is opaque to the application, applications have no way of determining whether any external handle types can be exported from a fence in this state. Therefore, applications must not attempt to export handles from fences using a temporarily imported payload from `vkAcquireNextImageKHR`.

When importing a fence payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations must perform sufficient validation of external handles to ensure that the operation results in a valid fence which will not cause program termination, device loss, queue stalls, host thread stalls, or corruption of other resources when used as allowed according to its import parameters. If the external handle provided does not meet these requirements, the implementation must fail the fence payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

To import a fence payload from a Windows handle, call:

```c
// Provided by VK_KHR_external_fence_win32
VkResult vkImportFenceWin32HandleKHR(
    VkDevice device,
    const VkImportFenceWin32HandleInfoKHR* pImportFenceWin32HandleInfo);
```

- `device` is the logical device that created the fence.
- `pImportFenceWin32HandleInfo` is a pointer to a `VkImportFenceWin32HandleInfoKHR` structure specifying the fence and import parameters.

Importing a fence payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release...
ownership using the \texttt{CloseHandle} system call when the handle is no longer needed.

Applications can import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

### Valid Usage

- \texttt{VUID-vkImportFenceWin32HandleKHR-fence-04448}
  - \texttt{fence} must not be associated with any queue command that has not yet completed execution on that queue

### Valid Usage (Implicit)

- \texttt{VUID-vkImportFenceWin32HandleKHR-device-parameter}
  - device must be a valid \texttt{VkDevice} handle
- \texttt{VUID-vkImportFenceWin32HandleKHR-pImportFenceWin32HandleInfo-parameter}
  - \texttt{pImportFenceWin32HandleInfo} must be a valid pointer to a valid \texttt{VkImportFenceWin32HandleInfoKHR} structure

### Return Codes

**Success**
- \texttt{VK_SUCCESS}

**Failure**
- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_INVALID_EXTERNAL_HANDLE}

The \texttt{VkImportFenceWin32HandleInfoKHR} structure is defined as:

```c
// Provided by VK_KHR_external_fence_win32
typedef struct VkImportFenceWin32HandleInfoKHR {
    VkStructureType                      sType;
    const void*                          pNext;
    VkFence                              fence;
    VkFenceImportFlags                   flags;
    VkExternalFenceHandleTypeFlagBits    handleType;
    HANDLE                               handle;
    LPCWSTR                              name;
} VkImportFenceWin32HandleInfoKHR;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is NULL or a pointer to a structure extending this structure.
• **fence** is the fence into which the state will be imported.

• **flags** is a bitmask of `VkFenceImportFlagBits` specifying additional parameters for the fence payload import operation.

• **handleType** specifies the type of **handle**.

• **handle** is the external handle to import, or **NULL**.

• **name** is a null-terminated UTF-16 string naming the underlying synchronization primitive to import, or **NULL**.

The handle types supported by **handleType** are:

**Table 6. Handle Types Supported by `VkImportFenceWin32HandleInfoKHR`**

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT</code></td>
<td>Reference</td>
<td>Temporary, Permanent</td>
</tr>
<tr>
<td><code>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT</code></td>
<td>Reference</td>
<td>Temporary, Permanent</td>
</tr>
</tbody>
</table>

**Valid Usage**

- **VUID-VkImportFenceWin32HandleInfoKHR-handleType-01457**
  
  **handleType** **must** be a value included in the Handle Types Supported by `VkImportFenceWin32HandleInfoKHR` table

- **VUID-VkImportFenceWin32HandleInfoKHR-handleType-01459**
  
  If **handleType** is not `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT`, **name** **must** be **NULL**

- **VUID-VkImportFenceWin32HandleInfoKHR-handleType-01460**
  
  If **handle** is **NULL**, **name** **must** name a valid synchronization primitive of the type specified by **handleType**

- **VUID-VkImportFenceWin32HandleInfoKHR-handleType-01461**
  
  If **name** is **NULL**, **handle** **must** be a valid handle of the type specified by **handleType**

- **VUID-VkImportFenceWin32HandleInfoKHR-handle-01462**
  
  If **handle** is **not** **NULL**, **name** **must** be **NULL**

- **VUID-VkImportFenceWin32HandleInfoKHR-handle-01539**
  
  If **handle** is **not** **NULL**, it **must** obey any requirements listed for **handleType** in external fence handle types compatibility

- **VUID-VkImportFenceWin32HandleInfoKHR-name-01540**
  
  If **name** is **not** **NULL**, it **must** obey any requirements listed for **handleType** in external fence handle types compatibility
Valid Usage (Implicit)

- VUID-VkImportFenceWin32HandleInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMPORT_FENCE_WIN32_HANDLE_INFO_KHR

- VUID-VkImportFenceWin32HandleInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkImportFenceWin32HandleInfoKHR-fence-parameter
  fence must be a valid VkFence handle

- VUID-VkImportFenceWin32HandleInfoKHR-flags-parameter
  flags must be a valid combination of VkFenceImportFlagBits values

Host Synchronization

- Host access to fence must be externally synchronized

To import a fence payload from a POSIX file descriptor, call:

```c
// Provided by VK_KHR_external_fence_fd
VkResult vkImportFenceFdKHR(
    VkDevice                                    device,
    const VkImportFenceFdInfoKHR*               pImportFenceFdInfo);
```

- device is the logical device that created the fence.

- pImportFenceFdInfo is a pointer to a VkImportFenceFdInfoKHR structure specifying the fence and import parameters.

Importing a fence payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application must not perform any operations on the file descriptor after a successful import.

Applications can import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage

- VUID-vkImportFenceFdKHR-fence-01463
  fence must not be associated with any queue command that has not yet completed execution on that queue
Valid Usage (Implicit)

- VUID-vkImportFenceFdKHR-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkImportFenceFdKHR-pImportFenceFdInfo-parameter
  
  pImportFenceFdInfo must be a valid pointer to a valid VkImportFenceFdInfoKHR structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkImportFenceFdInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_fence_fd
typedef struct VkImportFenceFdInfoKHR {
    VkStructureType                      sType;
    const void*                          pNext;
    VkFence                              fence;
    VkFenceImportFlags                   flags;
    VkExternalFenceHandleTypeFlagBits    handleType;
    int                                  fd;
} VkImportFenceFdInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- fence is the fence into which the payload will be imported.
- flags is a bitmask of VkFenceImportFlagBits specifying additional parameters for the fence payload import operation.
- handleType specifies the type of fd.
- fd is the external handle to import.

The handle types supported by handleType are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_FENCEHANDLE_TYPE_OPAQUE_FD_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
</tbody>
</table>

Chapter 7. Synchronization and Cache Control | 257
### Valid Usage

- **VUID-VkImportFenceFdInfoKHR-handleType-01464**
  
  **handleType must** be a value included in the Handle Types Supported by VkImportFenceFdInfoKHR table

- **VUID-VkImportFenceFdInfoKHR-fd-01541**
  
  **fd must** obey any requirements listed for **handleType** in external fence handle types compatibility

If **handleType** is **VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT**, the special value **-1** for **fd** is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the **VkFence** will have a temporarily imported payload as if a valid file descriptor had been provided.

#### Note

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a **-1** file descriptor when exporting a **VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT** from a **VkFence** which is signaled.

### Valid Usage (Implicit)

- **VUID-VkImportFenceFdInfoKHR-sType-sType**
  
  **sType must** be **VK_STRUCTURE_TYPE_IMPORT_FENCE_FD_INFO_KHR**

- **VUID-VkImportFenceFdInfoKHR-pNext-pNext**
  
  **pNext must** be **NULL**

- **VUID-VkImportFenceFdInfoKHR-fence-parameter**
  
  **fence must** be a valid **VkFence** handle

- **VUID-VkImportFenceFdInfoKHR-flags-parameter**
  
  **flags must** be a valid combination of **VkFenceImportFlagBits** values

- **VUID-VkImportFenceFdInfoKHR-handleType-parameter**
  
  **handleType must** be a valid **VkExternalFenceHandleTypeFlagBits** value

### Host Synchronization

- Host access to **fence must** be externally synchronized
Bits which can be set in `VkImportFenceWin32HandleInfoKHR::flags` and `VkImportFenceFdInfoKHR::flags` specifying additional parameters of a fence import operation are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkFenceImportFlagBits {
    VK_FENCE_IMPORT_TEMPORARY_BIT = 0x00000001,
} VkFenceImportFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence
typedef VkFenceImportFlagBits VkFenceImportFlagBitsKHR;
```

- `VK_FENCE_IMPORT_TEMPORARY_BIT` specifies that the fence payload will be imported only temporarily, as described in Importing Fence Payloads, regardless of the permanence of `handleType`.

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkFenceImportFlags;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence
typedef VkFenceImportFlags VkFenceImportFlagsKHR;
```

`VkFenceImportFlags` is a bitmask type for setting a mask of zero or more `VkFenceImportFlagBits`.

### 7.4. Semaphores

Semaphores are a synchronization primitive that can be used to insert a dependency between queue operations or between a queue operation and the host. Binary semaphores have two states—signaled and unsignaled. Timeline semaphores have a strictly increasing 64-bit unsigned integer payload and are signaled with respect to a particular reference value. A semaphore can be signaled after execution of a queue operation is completed, and a queue operation can wait for a semaphore to become signaled before it begins execution. A timeline semaphore can additionally be signaled from the host with the `vkSignalSemaphore` command and waited on from the host with the `vkWaitSemaphores` command.

The internal data of a semaphore may include a reference to any resources and pending work associated with signal or unsignal operations performed on that semaphore object, collectively referred to as the semaphore's payload. Mechanisms to import and export that internal data to and from semaphores are provided below. These mechanisms indirectly enable applications to share semaphore state between two or more semaphores and other synchronization primitives across
process and API boundaries.

Semaphores are represented by `VkSemaphore` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSemaphore)
```

To create a semaphore, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateSemaphore(  
    VkDevice                                    device,  
    const VkSemaphoreCreateInfo*                pCreateInfo,  
    const VkAllocationCallbacks*                pAllocator,  
    VkSemaphore*                                pSemaphore);
```

- `device` is the logical device that creates the semaphore.
- `pCreateInfo` is a pointer to a `VkSemaphoreCreateInfo` structure containing information about how the semaphore is to be created.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pSemaphore` is a pointer to a handle in which the resulting semaphore object is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateSemaphore-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkCreateSemaphore-pCreateInfo-parameter**
  
  `pCreateInfo` must be a valid pointer to a valid `VkSemaphoreCreateInfo` structure

- **VUID-vkCreateSemaphore-pAllocator-parameter**
  
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateSemaphore-pSemaphore-parameter**
  
  `pSemaphore` must be a valid pointer to a `VkSemaphore` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
The `VkSemaphoreCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSemaphoreCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkSemaphoreCreateFlags    flags;
} VkSemaphoreCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

### Valid Usage (Implicit)

- `VUID-VkSemaphoreCreateInfo-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO`

- `VUID-VkSemaphoreCreateInfo-pNext-pNext`  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkExportSemaphoreCreateInfo`, `VkExportSemaphoreWin32HandleInfoKHR`, or `VkSemaphoreTypeCreateInfo`

- `VUID-VkSemaphoreCreateInfo-sType-unique`  
  The `sType` value of each struct in the `pNext` chain must be unique

- `VUID-VkSemaphoreCreateInfo-flags-zerobitmask`  
  `flags` must be 0

---

// Provided by VK_VERSION_1_0
```
typedef VkFlags VkSemaphoreCreateFlags;
```

`VkSemaphoreCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To create a semaphore of a specific type, add a `VkSemaphoreTypeCreateInfo` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkSemaphoreTypeCreateInfo` structure is defined as:

```c
typedef struct VkSemaphoreTypeCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkSemaphoreType    semaphoreType;
    uint64_t           initialValue;
} VkSemaphoreTypeCreateInfo;
```

or the equivalent
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreTypeCreateInfo VkSemaphoreTypeCreateInfoKHR;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphoreType` is a `VkSemaphoreType` value specifying the type of the semaphore.
- `initialValue` is the initial payload value if `semaphoreType` is `VK_SEMAPHORE_TYPE_TIMELINE`.

### Valid Usage (Implicit)

- VUID-VkSemaphoreTypeCreateInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_TYPE_CREATE_INFO`

- VUID-VkSemaphoreTypeCreateInfo-semaphoreType-parameter
  
  `semaphoreType` must be a valid `VkSemaphoreType`

### Valid Usage

- VUID-VkSemaphoreTypeCreateInfo-timelineSemaphore-03252
  
  If the `timelineSemaphore` feature is not enabled, `semaphoreType` must not equal `VK_SEMAPHORE_TYPE_TIMELINE`

- VUID-VkSemaphoreTypeCreateInfo-semaphoreType-03279
  
  If `semaphoreType` is `VK_SEMAPHORE_TYPE_BINARY`, `initialValue` must be zero

If no `VkSemaphoreTypeCreateInfo` structure is included in the `pNext` chain of `VkSemaphoreCreateInfo`, then the created semaphore will have a default `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`.

Possible values of `VkSemaphoreTypeCreateInfo::semaphoreType`, specifying the type of a semaphore, are:

```c
typedef enum VkSemaphoreType {
    VK_SEMAPHORE_TYPE_BINARY = 0,
    VK_SEMAPHORE_TYPE_TIMELINE = 1,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_TYPE_BINARY_KHR = VK_SEMAPHORE_TYPE_BINARY,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_TYPE_TIMELINE_KHR = VK_SEMAPHORE_TYPE_TIMELINE,
} VkSemaphoreType;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreType VkSemaphoreTypeKHR;
```
• **VK_SEMAPHORE_TYPE_BINARY** specifies a *binary semaphore* type that has a boolean payload indicating whether the semaphore is currently signaled or unsignaled. When created, the semaphore is in the unsignaled state.

• **VK_SEMAPHORE_TYPE_TIMELINE** specifies a *timeline semaphore* type that has a strictly increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. When created, the semaphore payload has the value given by the `initialValue` field of `VkSemaphoreTypeCreateInfo`.

To create a semaphore whose payload can be exported to external handles, add a `VkExportSemaphoreCreateInfo` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkExportSemaphoreCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExportSemaphoreCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalSemaphoreHandleTypeFlags handleTypes;
} VkExportSemaphoreCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_semaphore
typedef VkExportSemaphoreCreateInfo VkExportSemaphoreCreateInfoKHR;
```

• `sType` is the type of this structure.

• `pNext` is NULL or a pointer to a structure extending this structure.

• `handleTypes` is a bitmask of `VkExternalSemaphoreHandleTypeFlagBits` specifying one or more semaphore handle types the application can export from the resulting semaphore. The application can request multiple handle types for the same semaphore.

---

**Valid Usage**

- VUID-VkExportSemaphoreCreateInfo-handleTypes-01124
  The bits in `handleTypes` must be supported and compatible, as reported by `VkExternalSemaphoreProperties`

---

**Valid Usage (Implicit)**

- VUID-VkExportSemaphoreCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_CREATE_INFO`

- VUID-VkExportSemaphoreCreateInfo-handleTypes-parameter
  `handleTypes` must be a valid combination of `VkExternalSemaphoreHandleTypeFlagBits` values
To specify additional attributes of NT handles exported from a semaphore, add a `VkExportSemaphoreWin32HandleInfoKHR` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkExportSemaphoreWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkExportSemaphoreWin32HandleInfoKHR {
    VkStructureType               sType;
    const void*                   pNext;
    const SECURITY_ATTRIBUTES*    pAttributes;
    DWORD                         dwAccess;
    LPCWSTR                       name;
} VkExportSemaphoreWin32HandleInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- `dwAccess` is a `DWORD` specifying access rights of the handle.
- `name` is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created semaphore.

If `VkExportSemaphoreCreateInfo` is not present in the same `pNext` chain, this structure is ignored.

If `VkExportSemaphoreCreateInfo` is present in the `pNext` chain of `VkSemaphoreCreateInfo` with a Windows `handleType`, but either `VkExportSemaphoreWin32HandleInfoKHR` is not present in the `pNext` chain, or if it is but `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights used depend on the handle type.

For handles of the following types:

**VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT**

The implementation **must** ensure the access rights allow both signal and wait operations on the semaphore.

For handles of the following types:

**VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT**

The access rights **must** be:

**GENERIC_ALL**

1

Valid Usage

- VUID-VkExportSemaphoreWin32HandleInfoKHR-handleTypes-01125
  If \( \text{VkExportSemaphoreCreateInfo::handleTypes} \) does not include \( \text{VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT} \) or \( \text{VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT} \), \( \text{VkExportSemaphoreWin32HandleInfoKHR} \) must not be included in the \( \text{pNext} \) chain of \( \text{VkSemaphoreCreateInfo} \).

Valid Usage (Implicit)

- VUID-VkExportSemaphoreWin32HandleInfoKHR-sType-sType
  \( \text{sType} \) must be \( \text{VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR} \)

- VUID-VkExportSemaphoreWin32HandleInfoKHR-pAttributes-parameter
  If \( \text{pAttributes} \) is not NULL, \( \text{pAttributes} \) must be a valid pointer to a valid \( \text{SECURITY_ATTRIBUTES} \) value.

To export a Windows handle representing the payload of a semaphore, call:

```c
// Provided by VK_KHR_external_semaphore_win32
VkResult vkGetSemaphoreWin32HandleKHR(
    VkDevice device,
    const VkSemaphoreGetWin32HandleInfoKHR* pGetWin32HandleInfo,
    HANDLE* pHandle);
```

- \( \text{device} \) is the logical device that created the semaphore being exported.
- \( \text{pGetWin32HandleInfo} \) is a pointer to a \( \text{VkSemaphoreGetWin32HandleInfoKHR} \) structure containing parameters of the export operation.
- \( \text{pHandle} \) will return the Windows handle representing the semaphore state.

For handle types defined as NT handles, the handles returned by \( \text{vkGetSemaphoreWin32HandleKHR} \) are owned by the application. To avoid leaking resources, the application must release ownership of them using the \text{CloseHandle} system call when they are no longer needed.

Exporting a Windows handle from a semaphore may have side effects depending on the transference of the specified handle type, as described in Importing Semaphore Payloads.
Valid Usage (Implicit)

- **VUID-vkGetSemaphoreWin32HandleKHR-device-parameter**
  
  *device must be a valid VkDevice handle*

- **VUID-vkGetSemaphoreWin32HandleKHR-pGetWin32HandleInfo-parameter**
  
  *pGetWin32HandleInfo must be a valid pointer to a valid VkSemaphoreGetWin32HandleInfoKHR structure*

- **VUID-vkGetSemaphoreWin32HandleKHR-pHandle-parameter**
  
  *pHandle must be a valid pointer to a HANDLE value*

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The **VkSemaphoreGetWin32HandleInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkSemaphoreGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetWin32HandleInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **semaphore** is the semaphore from which state will be exported.
- **handleType** is the type of handle requested.

The properties of the handle returned depend on the value of **handleType**. See **VkExternalSemaphoreHandleTypeFlagBits** for a description of the properties of the defined external semaphore handle types.
Valid Usage

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01126**
  
  `handleType` must have been included in `VkExportSemaphoreCreateInfo::handleTypes` when the semaphore's current payload was created.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01127**
  
  If `handleType` is defined as an NT handle, `vkGetSemaphoreWin32HandleKHR` must be called no more than once for each valid unique combination of `semaphore` and `handleType`.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-01128**
  
  `semaphore` must not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload’s handle type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for `handleType`.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01129**
  
  If `handleType` refers to a handle type with copy payload transference semantics, as defined below in Importing Semaphore Payloads, there must be no queue waiting on `semaphore`.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01130**
  
  If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` must be signaled, or have an associated semaphore signal operation pending execution.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01131**
  
  `handleType` must be defined as an NT handle or a global share handle.

Valid Usage (Implicit)

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_WIN32_HANDLE_INFO_KHR`.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-pNext-pNext**
  
  `pNext` must be NULL.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-parameter**
  
  `semaphore` must be a valid `VkSemaphore` handle.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-parameter**
  
  `handleType` must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value.

To export a POSIX file descriptor representing the payload of a semaphore, call:

```c
// Provided by VK_KHR_external_semaphore_fd
VkResult vkGetSemaphoreFdKHR(VkDevice device, const VkSemaphoreGetFdInfoKHR* pGetFdInfo, int* pFd);
```

- `device` is the logical device that created the semaphore being exported.
• \textit{pGetFdInfo} is a pointer to a \texttt{VkSemaphoreGetFdInfoKHR} structure containing parameters of the export operation.

• \textit{pFd} will return the file descriptor representing the semaphore payload.

Each call to \texttt{vkGetSemaphoreFdKHR} \textbf{must} create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application \textbf{must} release ownership of the file descriptor when it is no longer needed.

\begin{quote}
\textit{Note}
Ownership can be released in many ways. For example, the application can call \texttt{close()} on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.
\end{quote}

Where supported by the operating system, the implementation \textbf{must} set the file descriptor to be closed automatically when an \texttt{execve} system call is made.

Exporting a file descriptor from a semaphore \textbf{may} have side effects depending on the transference of the specified handle type, as described in \texttt{Importing Semaphore State}.

\begin{quote}
\textbf{Valid Usage (Implicit)}
\begin{itemize}
\item VUID-vkGetSemaphoreFdKHR-device-parameter
\hspace{1em} device \textbf{must} be a valid \texttt{VkDevice} handle
\item VUID-vkGetSemaphoreFdKHR-pGetFdInfo-parameter
\hspace{1em} \textit{pGetFdInfo} \textbf{must} be a valid pointer to a valid \texttt{VkSemaphoreGetFdInfoKHR} structure
\item VUID-vkGetSemaphoreFdKHR-pFd-parameter
\hspace{1em} \textit{pFd} \textbf{must} be a valid pointer to an \texttt{int} value
\end{itemize}
\end{quote}

\begin{quote}
\textbf{Return Codes}
\begin{itemize}
\item \textbf{Success}
\hspace{1em} \texttt{VK_SUCCESS}
\item \textbf{Failure}
\hspace{1em} \texttt{VK_ERROR_TOO_MANY_OBJECTS}
\hspace{1em} \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
\end{itemize}
\end{quote}

The \texttt{VkSemaphoreGetFdInfoKHR} structure is defined as:
// Provided by VK_KHR_external_semaphore_fd

typedef struct VkSemaphoreGetFdInfoKHR {
  VkStructureType                          sType;
  const void*                              pNext;
  VkSemaphore                              semaphore;
  VkExternalSemaphoreHandleTypeFlagBits    handleType;
} VkSemaphoreGetFdInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **semaphore** is the semaphore from which state will be exported.
- **handleType** is the type of handle requested.

The properties of the file descriptor returned depend on the value of **handleType**. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.

**Valid Usage**

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01132**
  handleType must have been included in `VkExportSemaphoreCreateInfo::handleTypes` when semaphore's current payload was created

- **VUID-VkSemaphoreGetFdInfoKHR-semaphore-01133**
  semaphore must not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload's handle type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for handleType

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01134**
  If handleType refers to a handle type with copy payload transference semantics, as defined below in Importing Semaphore Payloads, there must be no queue waiting on semaphore

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01135**
  If handleType refers to a handle type with copy payload transference semantics, semaphore must be signaled, or have an associated semaphore signal operation pending execution

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01136**
  handleType must be defined as a POSIX file descriptor handle

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-03253**
  If handleType refers to a handle type with copy payload transference semantics, semaphore must have been created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-03254**
  If handleType refers to a handle type with copy payload transference semantics, semaphore must have an associated semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) must have also been submitted for execution
Valid Usage (Implicit)

- **VUID-VkSemaphoreGetFdInfoKHR-sType-sType**
  sType must be VK_STRUCTURE_TYPE_SEMAPHORE_GET_FD_INFO_KHR

- **VUID-VkSemaphoreGetFdInfoKHR-pNext-pNext**
  pNext must be NULL

- **VUID-VkSemaphoreGetFdInfoKHR-semaphore-parameter**
  semaphore must be a valid VkSemaphore handle

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-parameter**
  handleType must be a valid VkExternalSemaphoreHandleTypeFlagBits value

To export a Zircon event handle representing the payload of a semaphore, call:

```c
// Provided by VK_FUCHSIA_external_semaphore
VkResult vkGetSemaphoreZirconHandleFUCHSIA(
    VkDevice                                    device,
    const    VkSemaphoreGetZirconHandleInfoFUCHSIA*  pGetZirconHandleInfo,
    zx_handle_t*                                pZirconHandle);
```

- **device** is the logical device that created the semaphore being exported.
- **pGetZirconHandleInfo** is a pointer to a VkSemaphoreGetZirconHandleInfoFUCHSIA structure containing parameters of the export operation.
- **pZirconHandle** will return the Zircon event handle representing the semaphore payload.

Each call to **vkGetSemaphoreZirconHandleFUCHSIA** must create a Zircon event handle and transfer ownership of it to the application. To avoid leaking resources, the application must release ownership of the Zircon event handle when it is no longer needed.

**Note**

Ownership can be released in many ways. For example, the application can call zx_handle_close() on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.

Exporting a Zircon event handle from a semaphore may have side effects depending on the transference of the specified handle type, as described in Importing Semaphore State.
Valid Usage (Implicit)

- VUID-vkGetSemaphoreZirconHandleFUCHSIA-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetSemaphoreZirconHandleFUCHSIA-pGetZirconHandleInfo-parameter
  pGetZirconHandleInfo must be a valid pointer to a valid VkSemaphoreGetZirconHandleInfoFUCHSIA structure

- VUID-vkGetSemaphoreZirconHandleFUCHSIA-pZirconHandle-parameter
  pZirconHandle must be a valid pointer to a zx_handle_t value

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkSemaphoreGetZirconHandleInfoFUCHSIA structure is defined as:

```c
typedef struct VkSemaphoreGetZirconHandleInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetZirconHandleInfoFUCHSIA;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- semaphore is the semaphore from which state will be exported.
- handleType is the type of handle requested.

The properties of the Zircon event handle returned depend on the value of handleType. See VkExternalSemaphoreHandleTypeFlagBits for a description of the properties of the defined external semaphore handle types.
Valid Usage

- **VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04758**
  
  ```
  handleType must have been included in VkExportSemaphoreCreateInfo::handleTypes when_semaphore's current payload was created.
  ```

- **VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-04759**
  
  ```
  semaphore must not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload's handle type was included in VkExternalSemaphoreProperties::exportFromImportedHandleTypes for handleType.
  ```

- **VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04760**
  
  If handleType refers to a handle type with copy payload transference semantics, as defined below in Importing Semaphore Payloads, there must be no queue waiting on semaphore.

- **VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04761**
  
  If handleType refers to a handle type with copy payload transference semantics, semaphore must be signaled, or have an associated semaphore signal operation pending execution.

- **VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04762**
  
  handleType must be defined as a Zircon event handle.

- **VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-04763**
  
  ```
  semaphore must have been created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY.
  ```

Valid Usage (Implicit)

- **VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-sType-sType**
  
  ```
  sType must be VK_STRUCTURE_TYPE_SEMAPHORE_GET_ZIRCON_HANDLE_INFO_FUCHSIA
  ```

- **VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-pNext-pNext**
  
  ```
  pNext must be NULL
  ```

- **VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-parameter**
  
  ```
  semaphore must be a valid VkSemaphore handle
  ```

- **VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-parameter**
  
  ```
  handleType must be a valid VkExternalSemaphoreHandleTypeFlagBits value
  ```

To destroy a semaphore, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroySemaphore(  
    VkDevice device,  
    VkSemaphore semaphore,  
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the semaphore.
• semaphore is the handle of the semaphore to destroy.

• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroySemaphore-semaphore-01137
  All submitted batches that refer to semaphore must have completed execution

- VUID-vkDestroySemaphore-semaphore-01138
  If VkAllocationCallbacks were provided when semaphore was created, a compatible set of callbacks must be provided here

- VUID-vkDestroySemaphore-semaphore-01139
  If no VkAllocationCallbacks were provided when semaphore was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroySemaphore-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroySemaphore-semaphore-parameter
  If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle

- VUID-vkDestroySemaphore-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroySemaphore-semaphore-parent
  If semaphore is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to semaphore must be externally synchronized

7.4.1. Semaphore Signaling

When a batch is submitted to a queue via a queue submission, and it includes semaphores to be signaled, it defines a memory dependency on the batch, and defines semaphore signal operations which set the semaphores to the signaled state.

In case of semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE the semaphore is considered signaled with respect to the counter value set to be signaled as specified in VkTimelineSemaphoreSubmitInfo or VkSemaphoreSignalInfo.

The first synchronization scope includes every command submitted in the same batch. In the case of vkQueueSubmit2KHR, the first synchronization scope is limited to the pipeline stage specified by
VkSemaphoreSubmitInfoKHR::stage. Semaphore signal operations that are defined by vkQueueSubmit or vkQueueSubmit2KHR additionally include all commands that occur earlier in submission order. Semaphore signal operations that are defined by vkQueueSubmit or vkQueueBindSparse additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in signal operation order.

The second synchronization scope includes only the semaphore signal operation.

The first access scope includes all memory access performed by the device.

The second access scope is empty.

### 7.4.2. Semaphore Waiting

When a batch is submitted to a queue via a queue submission, and it includes semaphores to be waited on, it defines a memory dependency between prior semaphore signal operations and the batch, and defines semaphore wait operations.

Such semaphore wait operations set the semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY to the unsignaled state. In case of semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE a prior semaphore signal operation defines a memory dependency with a semaphore wait operation if the value the semaphore is signaled with is greater than or equal to the value the semaphore is waited with, thus the semaphore will continue to be considered signaled with respect to the counter value waited on as specified in VkTimelineSemaphoreSubmitInfo.

The first synchronization scope includes all semaphore signal operations that operate on semaphores waited on in the same batch, and that happen-before the wait completes.

The second synchronization scope includes every command submitted in the same batch. In the case of vkQueueSubmit, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by the corresponding element of pWaitDstStageMask. In the case of vkQueueSubmit2KHR, the second synchronization scope is limited to the pipeline stage specified by VkSemaphoreSubmitInfoKHR::stage. Also, in the case of either vkQueueSubmit2KHR or vkQueueSubmit, the second synchronization scope additionally includes all commands that occur later in submission order.

The first access scope is empty.

The second access scope includes all memory access performed by the device.

The semaphore wait operation happens-after the first set of operations in the execution dependency, and happens-before the second set of operations in the execution dependency.
Note
Unlike timeline semaphores, fences or events, the act of waiting for a binary semaphore also unsignals that semaphore. Applications must ensure that between two such wait operations, the semaphore is signaled again, with execution dependencies used to ensure these occur in order. Binary semaphore waits and signals should thus occur in discrete 1:1 pairs.

Note
A common scenario for using pWaitDstStageMask with values other than VK_PIPELINE_STAGE_ALL_COMMANDS_BIT is when synchronizing a window system presentation operation against subsequent command buffers which render the next frame. In this case, a presentation image must not be overwritten until the presentation operation completes, but other pipeline stages can execute without waiting. A mask of VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT prevents subsequent color attachment writes from executing until the semaphore signals. Some implementations may be able to execute transfer operations and/or vertex processing work before the semaphore is signaled.

If an image layout transition needs to be performed on a presentable image before it is used in a framebuffer, that can be performed as the first operation submitted to the queue after acquiring the image, and should not prevent other work from overlapping with the presentation operation. For example, a VkImageMemoryBarrier could use:

- srcStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT
- srcAccessMask = 0
- dstStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT
- dstAccessMask = VK_ACCESS_COLOR_ATTACHMENT_READ_BIT | VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT.
- oldLayout = VK_IMAGE_LAYOUT_PRESENT_SRC_KHR
- newLayout = VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

Alternatively, oldLayout can be VK_IMAGE_LAYOUT_UNDEFINED, if the image’s contents need not be preserved.

This barrier accomplishes a dependency chain between previous presentation operations and subsequent color attachment output operations, with the layout transition performed in between, and does not introduce a dependency between previous work and any vertex processing stages. More precisely, the semaphore signals after the presentation operation completes, the semaphore wait stalls the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT stage, and there is a dependency from that same stage to itself with the layout transition performed in between.
7.4.3. Semaphore State Requirements for Wait Operations

Before waiting on a semaphore, the application must ensure the semaphore is in a valid state for a wait operation. Specifically, when a semaphore wait operation is submitted to a queue:

- A binary semaphore must be signaled, or have an associated semaphore signal operation that is pending execution.
- Any semaphore signal operations on which the pending binary semaphore signal operation depends must also be completed or pending execution.
- There must be no other queue waiting on the same binary semaphore when the operation executes.

7.4.4. Host Operations on Semaphores

In addition to semaphore signal operations and semaphore wait operations submitted to device queues, timeline semaphores support the following host operations:

- Query the current counter value of the semaphore using the `vkGetSemaphoreCounterValue` command.
- Wait for a set of semaphores to reach particular counter values using the `vkWaitSemaphores` command.
- Signal the semaphore with a particular counter value from the host using the `vkSignalSemaphore` command.

To query the current counter value of a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` from the host, call:

```
// Provided by VK_KHR_timeline_semaphore
VkResult vkGetSemaphoreCounterValueKHR(
    VkDevice                                    device,  // Provided by VK_KHR_timeline_semaphore
    VkSemaphore                                 semaphore,  // Provided by VK_KHR_timeline_semaphore
    uint64_t*                                   pValue);  // Provided by VK_KHR_timeline_semaphore
```

- `device` is the logical device that owns the semaphore.
- `semaphore` is the handle of the semaphore to query.
- `pValue` is a pointer to a 64-bit integer value in which the current counter value of the semaphore is returned.

**Note**

If a queue submission command is pending execution, then the value returned by this command may immediately be out of date.
**Valid Usage**

- VUID-vkGetSemaphoreCounterValue-semaphore-03255
  
  ```
  semaphore must have been created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE
  ```

**Valid Usage (Implicit)**

- VUID-vkGetSemaphoreCounterValue-device-parameter
  
  ```
  device must be a valid VkDevice handle
  ```

- VUID-vkGetSemaphoreCounterValue-semaphore-parameter
  
  ```
  semaphore must be a valid VkSemaphore handle
  ```

- VUID-vkGetSemaphoreCounterValue-pValue-parameter
  
  ```
  pValue must be a valid pointer to a uint64_t value
  ```

- VUID-vkGetSemaphoreCounterValue-semaphore-parent
  
  ```
  semaphore must have been created, allocated, or retrieved from device
  ```

**Return Codes**

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

To wait for a set of semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE to reach particular counter values on the host, call:

```c
// Provided by VK_KHR_timeline_semaphore
VkResult vkWaitSemaphoresKHR(
    VkDevice                                    device,
    const VkSemaphoreWaitInfo*                  pWaitInfo,
    uint64_t                                    timeout);
```

- **device** is the logical device that owns the semaphore.
- **pWaitInfo** is a pointer to a VkSemaphoreWaitInfo structure containing information about the wait condition.
- **timeout** is the timeout period in units of nanoseconds. timeout is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which may be substantially longer...
than one nanosecond, and may be longer than the requested period.

If the condition is satisfied when `vkWaitSemaphores` is called, then `vkWaitSemaphores` returns immediately. If the condition is not satisfied at the time `vkWaitSemaphores` is called, then `vkWaitSemaphores` will block and wait until the condition is satisfied or the `timeout` has expired, whichever is sooner.

If `timeout` is zero, then `vkWaitSemaphores` does not wait, but simply returns information about the current state of the semaphore. `VK_TIMEOUT` will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the `timeout` has expired, `vkWaitSemaphores` returns `VK_SUCCESS`. Otherwise, `vkWaitSemaphores` returns `VK_TIMEOUT` after the `timeout` has expired.

If device loss occurs (see Lost Device) before the timeout has expired, `vkWaitSemaphores` must return in finite time with either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

### Valid Usage (Implicit)

- VUID-vkWaitSemaphores-device-parameter
  - `device` must be a valid `VkDevice` handle

- VUID-vkWaitSemaphores-pWaitInfo-parameter
  - `pWaitInfo` must be a valid pointer to a valid `VkSemaphoreWaitInfo` structure

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_TIMEOUT`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

The `VkSemaphoreWaitInfo` structure is defined as:
typedef struct VkSemaphoreWaitInfo {
    VkStructureType         sType;
    const void*             pNext;
    VkSemaphoreWaitFlags    flags;
    uint32_t                semaphoreCount;
    const VkSemaphore*      pSemaphores;
    const uint64_t*         pValues;
} VkSemaphoreWaitInfo;

or the equivalent

// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitInfo VkSemaphoreWaitInfoKHR;

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **flags** is a bitmask of VkSemaphoreWaitFlagBits specifying additional parameters for the semaphore wait operation.
• **semaphoreCount** is the number of semaphores to wait on.
• **pSemaphores** is a pointer to an array of semaphoreCount semaphore handles to wait on.
• **pValues** is a pointer to an array of semaphoreCount timeline semaphore values.

### Valid Usage

• **VUID-VkSemaphoreWaitInfo-pSemaphores-03256**
  
  All of the elements of **pSemaphores** must reference a semaphore that was created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE**
Valid Usage (Implicit)

- **VUID-VkSemaphoreWaitInfo-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_WAIT_INFO`

- **VUID-VkSemaphoreWaitInfo-pNext-pNext**
  
  `pNext` **must** be `NULL`

- **VUID-VkSemaphoreWaitInfo-flags-parameter**
  
  `flags` **must** be a valid combination of `VkSemaphoreWaitFlagBits` values

- **VUID-VkSemaphoreWaitInfo-pSemaphores-parameter**
  
  `pSemaphores` **must** be a valid pointer to an array of `semaphoreCount` valid `VkSemaphore` handles

- **VUID-VkSemaphoreWaitInfo-pValues-parameter**
  
  `pValues` **must** be a valid pointer to an array of `semaphoreCount` `uint64_t` values

- **VUID-VkSemaphoreWaitInfo-semaphoreCount-arraylength**
  
  `semaphoreCount` **must** be greater than `0`

Bits which **can** be set in `VkSemaphoreWaitInfo::flags`, specifying additional parameters of a semaphore wait operation, are:

```c
typedef enum VkSemaphoreWaitFlagBits {
    VK_SEMAPHORE_WAIT_ANY_BIT = 0x00000001,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_WAIT_ANY_BIT_KHR = VK_SEMAPHORE_WAIT_ANY_BIT,
} VkSemaphoreWaitFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitFlagBits VkSemaphoreWaitFlagBitsKHR;
```

- `VK_SEMAPHORE_WAIT_ANY_BIT` specifies that the semaphore wait condition is that at least one of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` has reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`. If `VK_SEMAPHORE_WAIT_ANY_BIT` is not set, the semaphore wait condition is that all of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` have reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`.

```c
typedef VkFlags VkSemaphoreWaitFlags;
```

or the equivalent

```
```
VkSemaphoreWaitFlags is a bitmask type for setting a mask of zero or more VkSemaphoreWaitFlagBits.

To signal a semaphore created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE with a particular counter value, on the host, call:

```c
VkResult vkSignalSemaphoreKHR(VkDevice device, const VkSemaphoreSignalInfo* pSignalInfo);
```

- `device` is the logical device that owns the semaphore.
- `pSignalInfo` is a pointer to a VkSemaphoreSignalInfo structure containing information about the signal operation.

When `vkSignalSemaphore` is executed on the host, it defines and immediately executes a semaphore signal operation which sets the timeline semaphore to the given value.

The first synchronization scope is defined by the host execution model, but includes execution of `vkSignalSemaphore` on the host and anything that happened-before it.

The second synchronization scope is empty.

### Valid Usage (Implicit)

- VUID-vkSignalSemaphore-device-parameter
  - `device` must be a valid VkDevice handle
- VUID-vkSignalSemaphore-pSignalInfo-parameter
  - `pSignalInfo` must be a valid pointer to a valid VkSemaphoreSignalInfo structure

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OFDEVICE_MEMORY

The VkSemaphoreSignalInfo structure is defined as:
```c
typedef struct VkSemaphoreSignalInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    uint64_t value;
} VkSemaphoreSignalInfo;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreSignalInfo VkSemaphoreSignalInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **semaphore** is the handle of the semaphore to signal.
- **value** is the value to signal.

**Valid Usage**

- VUID-VkSemaphoreSignalInfo-semaphore-03257
  `semaphore` must have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`

- VUID-VkSemaphoreSignalInfo-value-03258
  `value` must have a value greater than the current value of the semaphore

- VUID-VkSemaphoreSignalInfo-value-03259
  `value` must be less than the value of any pending semaphore signal operations

- VUID-VkSemaphoreSignalInfo-value-03260
  `value` must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on `semaphore` by more than `maxTimelineSemaphoreValueDifference`

**Valid Usage (Implicit)**

- VUID-VkSemaphoreSignalInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_SIGNAL_INFO`

- VUID-VkSemaphoreSignalInfo-pNext-pNext
  `pNext` must be **NULL**

- VUID-VkSemaphoreSignalInfo-semaphore-parameter
  `semaphore` must be a valid `VkSemaphore` handle
## 7.4.5. Importing Semaphore Payloads

Applications can import a semaphore payload into an existing semaphore using an external semaphore handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the implementation must restore the semaphore to its prior permanent state after submitting the next semaphore wait operation. Performing a subsequent temporary import on a semaphore before performing a semaphore wait has no effect on this requirement; the next wait submitted on the semaphore must still restore its last permanent state. A permanent payload import behaves as if the target semaphore was destroyed, and a new semaphore was created with the same handle but the imported payload. Because importing a semaphore payload temporarily or permanently detaches the existing payload from a semaphore, similar usage restrictions to those applied to `vkDestroySemaphore` are applied to any command that imports a semaphore payload. Which of these import types is used is referred to as the import operation's permanence. Each handle type supports either one or both types of permanence.

The implementation must perform the import operation by either referencing or copying the payload referred to by the specified external semaphore handle, depending on the handle's type. The import method used is referred to as the handle type's transference. When using handle types with reference transference, importing a payload to a semaphore adds the semaphore to the set of all semaphores sharing that payload. This set includes the semaphore from which the payload was exported. Semaphoresignaling and waiting operations performed on any semaphore in the set must behave as if the set were a single semaphore. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Semaphoresignaling and waiting operations performed on the target of copy imports must not affect any other semaphore or payload.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a semaphore payload to a handle with copy transference has the same side effects on the source semaphore's payload as executing a semaphore wait operation. If the semaphore was using a temporarily imported payload, the semaphore's prior permanent payload will be restored.

### Note
The permanence and transference of handle types can be found in:

- **Handle Types Supported by** `VkImportSemaphoreWin32HandleInfoKHR`
- **Handle Types Supported by** `VkImportSemaphoreFdInfoKHR`
- **Handle Types Supported by** `VkImportSemaphoreZirconHandleInfoFUCHSIA`

**External synchronization** allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for semaphores sharing a payload across processes, satisfying the external synchronization requirements of `VkSemaphore` parameters as if all semaphores in the set were the same object is sometimes infeasible. Satisfying the wait operation state requirements would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific semaphore handle, not to its payload. For distinct semaphore objects which share a payload, if the semaphores are passed to
separate queue submission commands concurrently, behavior will be as if the commands were called in an arbitrary sequential order. If the wait operation state requirements are violated for the shared payload by a queue submission command, or if a signal operation is queued for a shared payload that is already signaled or has a pending signal operation, effects must be limited to one or more of the following:

- Returning VK_ERROR_INITIALIZATION_FAILED from the command which resulted in the violation.
- Losing the logical device on which the violation occurred immediately or at a future time, resulting in a VK_ERROR_DEVICE_LOST error from subsequent commands, including the one causing the violation.
- Continuing execution of the violating command or operation as if the semaphore wait completed successfully after an implementation-dependent timeout. In this case, the state of the payload becomes undefined, and future operations on semaphores sharing the payload will be subject to these same rules. The semaphore must be destroyed or have its payload replaced by an import operation to again have a well-defined state.

Note
These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared semaphore for more than synchronizing access to the shared memory. For example, a process should not use a shared semaphore as part of an execution dependency chain that, when complete, leads to objects being destroyed, if it does not trust other processes sharing the semaphore payload.

When a semaphore is using an imported payload, its VkExportSemaphoreCreateInfo::handleTypes value is that specified when creating the semaphore from which the payload was exported, rather than that specified when creating the semaphore. Additionally, VkExternalSemaphoreProperties::exportFromImportedHandleTypes restricts which handle types can be exported from such a semaphore based on the specific handle type used to import the current payload. Passing a semaphore to vkAcquireNextImageKHR is equivalent to temporarily importing a semaphore payload to that semaphore.

Note
Because the exportable handle types of an imported semaphore correspond to its current imported payload, and vkAcquireNextImageKHR behaves the same as a temporary import operation for which the source semaphore is opaque to the application, applications have no way of determining whether any external handle types can be exported from a semaphore in this state. Therefore, applications must not attempt to export external handles from semaphores using a temporarily imported payload from vkAcquireNextImageKHR.

When importing a semaphore payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations must perform sufficient validation of external handles to ensure that the operation results in a valid semaphore which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its import parameters, and excepting those side effects allowed for violations of the valid semaphore state for wait operations rules. If the external
handle provided does not meet these requirements, the implementation must fail the semaphore payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

In addition, when importing a semaphore payload that is not compatible with the payload type corresponding to the `VkSemaphoreType` the semaphore was created with, the implementation may fail the semaphore payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

### Note

As the introduction of the external semaphore handle type `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` is preserved for backwards compatibility. However, applications should prefer importing such handle types into semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`.

To import a semaphore payload from a Windows handle, call:

```c
// Provided by VK_KHR_external_semaphore_win32
VkResult vkImportSemaphoreWin32HandleKHR(
    VkDevice                                    device,
    const VkImportSemaphoreWin32HandleInfoKHR*  pImportSemaphoreWin32HandleInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreWin32HandleInfo` is a pointer to a `VkImportSemaphoreWin32HandleInfoKHR` structure specifying the semaphore and import parameters.

Importing a semaphore payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release ownership using the `CloseHandle` system call when the handle is no longer needed.

Applications can import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

### Valid Usage (Implicit)

- VUID-vkImportSemaphoreWin32HandleKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkImportSemaphoreWin32HandleKHR-pImportSemaphoreWin32HandleInfo-parameter
  - `pImportSemaphoreWin32HandleInfo` must be a valid pointer to a valid `VkImportSemaphoreWin32HandleInfoKHR` structure
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The `VkImportSemaphoreWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkImportSemaphoreWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportSemaphoreWin32HandleInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore into which the payload will be imported.
- `flags` is a bitmask of `VkSemaphoreImportFlagBits` specifying additional parameters for the semaphore payload import operation.
- `handleType` specifies the type of `handle`.
- `handle` is the external handle to import, or `NULL`.
- `name` is a null-terminated UTF-16 string naming the underlying synchronization primitive to import, or `NULL`.

The handle types supported by `handleType` are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
</tbody>
</table>

Table 8. Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR`

286 | Chapter 7. Synchronization and Cache Control
<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
</tbody>
</table>

### Valid Usage

- **VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01140**
  - `handleType` **must** be a value included in the **Handle Types Supported by VkImportSemaphoreWin32HandleInfoKHR** table

- **VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01466**
  - If `handleType` is not VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT or VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT, `name` **must** be NULL

- **VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01467**
  - If `handle` is NULL, `name` **must** name a valid synchronization primitive of the type specified by `handleType`

- **VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01468**
  - If `name` is NULL, `handle` **must** be a valid handle of the type specified by `handleType`

- **VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01469**
  - If `handle` is not NULL, `name` **must** be NULL

- **VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01542**
  - If `handle` is not NULL, it **must** obey any requirements listed for `handleType` in **external semaphore handle types compatibility**

- **VUID-VkImportSemaphoreWin32HandleInfoKHR-name-01543**
  - If `name` is not NULL, it **must** obey any requirements listed for `handleType` in **external semaphore handle types compatibility**

- **VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-03261**
  - If `handleType` is VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT or VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, the VkSemaphoreCreateInfo::flags field **must** match that of the semaphore from which `handle` or `name` was exported

- **VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-03262**
  - If `handleType` is VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT or VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, the VkSemaphoreTypeCreateInfo::semaphoreType field **must** match that of the semaphore from which `handle` or `name` was exported

- **VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-03322**
  - If `flags` contains VK_SEMAPHORE_IMPORT_TEMPORARY_BIT, the VkSemaphoreTypeCreateInfo::semaphoreType field of the semaphore from which `handle` or `name` was exported **must** not be VK_SEMAPHORE_TYPE_TIMELINE
Valid Usage (Implicit)

- **VUID-VkImportSemaphoreWin32HandleInfoKHR-sType-sType**
  
  *sType must be* `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR`

- **VUID-VkImportSemaphoreWin32HandleInfoKHR-pNext-pNext**
  
  *pNext must be NULL*

- **VUID-VkImportSemaphoreWin32HandleInfoKHR-semaphore-parameter**
  
  *semaphore must be a valid* `VkSemaphore` *handle*

- **VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-parameter**
  
  *flags must be a valid combination of* `VkSemaphoreImportFlagBits` *values*

Host Synchronization

- Host access to *semaphore must be externally synchronized*

To import a semaphore payload from a POSIX file descriptor, call:

```c
// Provided by VK_KHR_external_semaphore_fd
VkResult vkImportSemaphoreFdKHR(
    VkDevice device,
    const VkImportSemaphoreFdInfoKHR* pImportSemaphoreFdInfo);
```

- **device** is the logical device that created the semaphore.

- **pImportSemaphoreFdInfo** is a pointer to a `VkImportSemaphoreFdInfoKHR` structure specifying the semaphore and import parameters.

Importing a semaphore payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import.

Applications **can** import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage

- **VUID-vkImportSemaphoreFdKHR-semaphore-01142**
  
  *semaphore must not be associated with any queue command that has not yet completed execution on that queue*
Valid Usage (Implicit)

- VUID-vkImportSemaphoreFdKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkImportSemaphoreFdKHR-pImportSemaphoreFdInfo-parameter
  pImportSemaphoreFdInfo must be a valid pointer to a valid VkImportSemaphoreFdInfoKHR structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkImportSemaphoreFdInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkImportSemaphoreFdInfoKHR {
    VkStructureType                          sType;
    const void*                              pNext;
    VkSemaphore                              semaphore;
    VkSemaphoreImportFlags                   flags;
    VkExternalSemaphoreHandleTypeFlagBits    handleType;
    int                                       fd;
} VkImportSemaphoreFdInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **semaphore** is the semaphore into which the payload will be imported.
- **flags** is a bitmask of VkSemaphoreImportFlagBits specifying additional parameters for the semaphore payload import operation.
- **handleType** specifies the type of fd.
- **fd** is the external handle to import.

The handle types supported by handleType are:

Table 9. Handle Types Supported by VkImportSemaphoreFdInfoKHR
### Valid Usage

- **VUID-VkImportSemaphoreFdInfoKHR-handleType-01143**
  
  `handleType` **must** be a value included in the `Handle Types Supported by VkImportSemaphoreFdInfoKHR` table.

- **VUID-VkImportSemaphoreFdInfoKHR-fd-01544**
  
  `fd` **must** obey any requirements listed for `handleType` in external semaphore handle types compatibility.

- **VUID-VkImportSemaphoreFdInfoKHR-handleType-03263**
  
  If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreCreateInfo::flags` field **must** match that of the semaphore from which `fd` was exported.

- **VUID-VkImportSemaphoreFdInfoKHR-handleType-03264**
  
  If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field **must** match that of the semaphore from which `fd` was exported.

- **VUID-VkImportSemaphoreFdInfoKHR-flags-03323**
  
  If `flags` contains `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field of the semaphore from which `fd` was exported **must** not be `VK_SEMAPHORE_TYPE_TIMELINE`.

---

If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT`, the special value `-1` for `fd` is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the `VkSemaphore` will have a temporarily imported payload as if a valid file descriptor had been provided.

**Note**

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a `-1` file descriptor when exporting a `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT` from a `VkSemaphore` which is signaled.
Valid Usage (Implicit)

- **VUID-VkImportSemaphoreFdInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_FD_INFO_KHR`

- **VUID-VkImportSemaphoreFdInfoKHR-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkImportSemaphoreFdInfoKHR-semaphore-parameter**
  
  `semaphore` must be a valid `VkSemaphore` handle

- **VUID-VkImportSemaphoreFdInfoKHR-flags-parameter**
  
  `flags` must be a valid combination of `VkSemaphoreImportFlagBits` values

- **VUID-VkImportSemaphoreFdInfoKHR-handleType-parameter**
  
  `handleType` must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

Host Synchronization

- Host access to `semaphore` must be externally synchronized

To import a semaphore payload from a Zircon event handle, call:

```c
// Provided by VK_FUCHSIA_external_semaphore
VkResult vkImportSemaphoreZirconHandleFUCHSIA(
    VkDevice device,
    const VkImportSemaphoreZirconHandleInfoFUCHSIA* pImportSemaphoreZirconHandleInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreZirconHandleInfo` is a pointer to a `VkImportSemaphoreZirconHandleInfoFUCHSIA` structure specifying the semaphore and import parameters.

Importing a semaphore payload from a Zircon event handle transfers ownership of the handle from the application to the Vulkan implementation. The application must not perform any operations on the handle after a successful import.

Applications can import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage

- **VUID-vkImportSemaphoreZirconHandleFUCHSIA-semaphore-04764**
  
  `semaphore` must not be associated with any queue command that has not yet completed execution on that queue.
Valid Usage (Implicit)

- VUID-vkImportSemaphoreZirconHandleFUCHSIA-device-parameter
device must be a valid VkDevice handle

- VUID-vkImportSemaphoreZirconHandleFUCHSIA-pImportSemaphoreZirconHandleInfo-parameter
pImportSemaphoreZirconHandleInfo must be a valid pointer to a valid VkImportSemaphoreZirconHandleInfoFUCHSIA structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkImportSemaphoreZirconHandleInfoFUCHSIA structure is defined as:

```c
// Provided by VK_FUCHSIA_external_semaphore
typedef struct VkImportSemaphoreZirconHandleInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    zx_handle_t zirconHandle;
} VkImportSemaphoreZirconHandleInfoFUCHSIA;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- semaphore is the semaphore into which the payload will be imported.
- flags is a bitmask of VkSemaphoreImportFlagBits specifying additional parameters for the semaphore payload import operation.
- handleType specifies the type of zirconHandle.
- zirconHandle is the external handle to import.

The handle types supported by handleType are:

Table 10. Handle Types Supported by VkImportSemaphoreZirconHandleInfoFUCHSIA
### Valid Usage

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-handleType-04765**
  
  `handleType` **must** be a value included in the **Handle Types Supported by VkImportSemaphoreZirconHandleInfoFUCHSIA** table.

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-zirconHandle-04766**
  
  `zirconHandle` **must** obey any requirements listed for `handleType` in **external semaphore handle types compatibility**.

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-zirconHandle-04767**
  
  `zirconHandle` **must** have `ZX_RIGHTS_BASIC` and `ZX_RIGHTS_SIGNAL` rights.

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-semaphoreType-04768**
  
  The `VkSemaphoreTypeCreateInfo::semaphoreType` field **must** not be `VK_SEMAPHORE_TYPE_TIMELINE`.

### Valid Usage (Implicit)

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_ZIRCON_HANDLE_INFO_FUCHSIA`.

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-pNext-pNext**
  
  `pNext` **must** be `NULL`.

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-semaphore-parameter**
  
  `semaphore` **must** be a valid `VkSemaphore` handle.

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-flags-parameter**
  
  `flags` **must** be a valid combination of `VkSemaphoreImportFlagBits` values.

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-handleType-parameter**
  
  `handleType` **must** be a valid `VkExternalSemaphoreHandleTypeFlagBits` value.

### Host Synchronization

- Host access to `semaphore` **must** be externally synchronized.

Additional parameters of a semaphore import operation are specified by `VkImportSemaphoreWin32HandleInfoKHR::flags` or `VkImportSemaphoreFdInfoKHR::flags`. Bits which can be set include:
or the equivalent

```
// Provided by VK_KHR_external_semaphore
typedef VkSemaphoreImportFlagBits VkSemaphoreImportFlagBitsKHR;
```

These bits have the following meanings:

- `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT` specifies that the semaphore payload will be imported only temporarily, as described in Importing Semaphore Payloads, regardless of the permanence of `handleType`.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkSemaphoreImportFlags;
```

or the equivalent

```
// Provided by VK_KHR_external_semaphore
typedef VkSemaphoreImportFlags VkSemaphoreImportFlagsKHR;
```

`VkSemaphoreImportFlags` is a bitmask type for setting a mask of zero or more `VkSemaphoreImportFlagBits`.

### 7.5. Events

Events are a synchronization primitive that can be used to insert a fine-grained dependency between commands submitted to the same queue, or between the host and a queue. Events must not be used to insert a dependency between commands submitted to different queues. Events have two states - signaled and unsignaled. An application can signal or unsignal an event either on the host or on the device. A device can be made to wait for an event to become signaled before executing further operations. No command exists to wait for an event to become signaled on the host, but the current state of an event can be queried.

Events are represented by `VkEvent` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkEvent)
```
To create an event, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateEvent(
    VkDevice device,
    const VkEventCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkEvent* pEvent);
```

- **device** is the logical device that creates the event.
- **pCreateInfo** is a pointer to a `VkEventCreateInfo` structure containing information about how the event is to be created.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pEvent** is a pointer to a handle in which the resulting event object is returned.

When created, the event object is in the unsignaled state.

### Valid Usage

- **VUID-vkCreateEvent-events-04468**
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::events` is `VK_FALSE`, then the implementation does not support events, and `vkCreateEvent` must not be used.

### Valid Usage (Implicit)

- **VUID-vkCreateEvent-device-parameter**
  `device` must be a valid `VkDevice` handle
- **VUID-vkCreateEvent-pCreateInfo-parameter**
  `pCreateInfo` must be a valid pointer to a valid `VkEventCreateInfo` structure
- **VUID-vkCreateEvent-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreateEvent-pEvent-parameter**
  `pEvent` must be a valid pointer to a `VkEvent` handle
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkEventCreateInfo` structure is defined as:

```cpp
// Provided by VK_VERSION_1_0
typedef struct VkEventCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkEventCreateFlags flags;
} VkEventCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkEventCreateFlagBits` defining additional creation parameters.

Valid Usage (Implicit)

- VUID-VkEventCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_EVENT_CREATE_INFO`
- VUID-VkEventCreateInfo-pNext-pNext
  `pNext` must be NULL
- VUID-VkEventCreateInfo-flags-parameter
  `flags` must be a valid combination of `VkEventCreateFlagBits` values

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkEventCreateFlags;
```

`VkEventCreateFlags` is a bitmask type for setting a mask of `VkEventCreateFlagBits`.

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkEventCreateFlagBits {
    // Provided by VK_KHR_synchronization2
    VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR = 0x00000001,
} VkEventCreateFlagBits;
```
VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR specifies that host event commands will not be used with this event.

To destroy an event, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyEvent(
    VkDevice device,
    VkEvent event,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the event.
- **event** is the handle of the event to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyEvent-event-01145**
  All submitted commands that refer to **event** must have completed execution

- **VUID-vkDestroyEvent-event-01146**
  If **VkAllocationCallbacks** were provided when **event** was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyEvent-event-01147**
  If no **VkAllocationCallbacks** were provided when **event** was created, **pAllocator** must be NULL

### Valid Usage (Implicit)

- **VUID-vkDestroyEvent-device-parameter**
  **device** must be a valid **VkDevice** handle

- **VUID-vkDestroyEvent-event-parameter**
  If **event** is not **VK_NULL_HANDLE**, **event** must be a valid **VkEvent** handle

- **VUID-vkDestroyEvent-pAllocator-parameter**
  If **pAllocator** is not NULL, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- **VUID-vkDestroyEvent-event-parent**
  If **event** is a valid handle, it must have been created, allocated, or retrieved from **device**

### Host Synchronization

- Host access to **event** must be externally synchronized
To query the state of an event from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetEventStatus(
    VkDevice device,
    VkEvent event);
```

- `device` is the logical device that owns the event.
- `event` is the handle of the event to query.

Upon success, `vkGetEventStatus` returns the state of the event object with the following return codes:

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EVENT_SET</td>
<td>The event specified by <code>event</code> is signaled.</td>
</tr>
<tr>
<td>VK_EVENT_RESET</td>
<td>The event specified by <code>event</code> is unsignaled.</td>
</tr>
</tbody>
</table>

If a `vkCmdSetEvent` or `vkCmdResetEvent` command is in a command buffer that is in the pending state, then the value returned by this command may immediately be out of date.

The state of an event can be updated by the host. The state of the event is immediately changed, and subsequent calls to `vkGetEventStatus` will return the new state. If an event is already in the requested state, then updating it to the same state has no effect.

### Valid Usage

- VUID-vkGetEventStatus-event-03940
  
  `event` must not have been created with `VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR`

### Valid Usage (Implicit)

- VUID-vkGetEventStatus-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkGetEventStatus-event-parameter
  
  `event` must be a valid `VkEvent` handle

- VUID-vkGetEventStatus-event-parent
  
  `event` must have been created, allocated, or retrieved from `device`
Return Codes

**Success**
- VK_EVENT_SET
- VK_EVENT_RESET

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

To set the state of an event to signaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkSetEvent(
    VkDevice device,
    VkEvent event);
```

- `device` is the logical device that owns the event.
- `event` is the event to set.

When `vkSetEvent` is executed on the host, it defines an *event signal operation* which sets the event to the signaled state.

If `event` is already in the signaled state when `vkSetEvent` is executed, then `vkSetEvent` has no effect, and no event signal operation occurs.

**Valid Usage**
- `VUID-vkSetEvent-event-03941`
  - `event` must not have been created with `VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR`

**Valid Usage (Implicit)**
- `VUID-vkSetEvent-device-parameter`
  - `device` must be a valid `VkDevice` handle
- `VUID-vkSetEvent-event-parameter`
  - `event` must be a valid `VkEvent` handle
- `VUID-vkSetEvent-event-parent`
  - `event` must have been created, allocated, or retrieved from `device`
Host Synchronization

- Host access to event must be externally synchronized

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To set the state of an event to unsignaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetEvent(
    VkDevice device,
    VkEvent event);
```

- `device` is the logical device that owns the event.
- `event` is the event to reset.

When `vkResetEvent` is executed on the host, it defines an event unsignal operation which resets the event to the unsignaled state.

If `event` is already in the unsignaled state when `vkResetEvent` is executed, then `vkResetEvent` has no effect, and no event unsignal operation occurs.

Valid Usage

- VUID-vkResetEvent-event-03821
  There must be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter

- VUID-vkResetEvent-event-03822
  There must be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents2KHR` that includes `event` in its `pEvents` parameter

- VUID-vkResetEvent-event-03823
  `event` must not have been created with VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR
Valid Usage (Implicit)

- **VUID-vkResetEvent-device-parameter**
  
  device must be a valid VkDevice handle

- **VUID-vkResetEvent-event-parameter**
  
  event must be a valid VkEvent handle

- **VUID-vkResetEvent-event-parent**
  
  event must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to event must be externally synchronized

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_DEVICE_MEMORY

The state of an event can also be updated on the device by commands inserted in command buffers.

To signal an event from a device, call:

```c
// Provided by VK_KHR_synchronization2
void vkCmdSetEvent2KHR(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    const VkDependencyInfoKHR* pDependencyInfo);
```

- commandBuffer is the command buffer into which the command is recorded.
- event is the event that will be signaled.
- pDependencyInfo is a pointer to a VkDependencyInfoKHR structure defining the first scopes of this operation.

When `vkCmdSetEvent2KHR` is submitted to a queue, it defines the first half of memory dependencies defined by `pDependencyInfo`, as well as an event signal operation which sets the event to the signaled state. A memory dependency is defined between the event signal operation and commands that occur earlier in submission order.

The first synchronization scope and access scope are defined by the union of all the memory
dependencies defined by \texttt{pDependencyInfo}, and are applied to all operations that occur earlier in submission order. Queue family ownership transfers and image layout transitions defined by \texttt{pDependencyInfo} are also included in the first scopes.

The second synchronization scope includes only the event signal operation, and any queue family ownership transfers and image layout transitions defined by \texttt{pDependencyInfo}.

The second access scope includes only queue family ownership transfers and image layout transitions.

Future \texttt{vkCmdWaitEvents2KHR} commands rely on all values of each element in \texttt{pDependencyInfo} matching exactly with those used to signal the corresponding event. \texttt{vkCmdWaitEvents} must not be used to wait on the result of a signal operation defined by \texttt{vkCmdSetEvent2KHR}.

\begin{note}

The extra information provided by \texttt{vkCmdSetEvent2KHR} compared to \texttt{vkCmdSetEvent} allows implementations to more efficiently schedule the operations required to satisfy the requested dependencies. With \texttt{vkCmdSetEvent}, the full dependency information is not known until \texttt{vkCmdWaitEvents} is recorded, forcing implementations to insert the required operations at that point and not before.

If \texttt{event} is already in the signaled state when \texttt{vkCmdSetEvent2KHR} is executed on the device, then \texttt{vkCmdSetEvent2KHR} has no effect, no event signal operation occurs, and no dependency is generated.

\end{note}

\textbf{Valid Usage}

- \textbf{VUID-vkCmdSetEvent2KHR-synchronization2-03824}
  
  The \textit{synchronization2} feature must be enabled

- \textbf{VUID-vkCmdSetEvent2KHR-dependencyFlags-03825}
  
  The \textit{dependencyFlags} member of \texttt{dependencyInfo} must be 0

- \textbf{VUID-vkCmdSetEvent2KHR-commandBuffer-03826}
  
  The current device mask of \texttt{commandBuffer} must include exactly one physical device.

- \textbf{VUID-vkCmdSetEvent2KHR-srcStageMask-03827}
  
  The \textit{srcStageMask} member of any element of the \texttt{pMemoryBarriers}, \texttt{pBufferMemoryBarriers}, or \texttt{pImageMemoryBarriers} members of \texttt{pDependencyInfo} must only include pipeline stages valid for the queue family that was used to create the command pool that \texttt{commandBuffer} was allocated from

- \textbf{VUID-vkCmdSetEvent2KHR-dstStageMask-03828}
  
  The \textit{dstStageMask} member of any element of the \texttt{pMemoryBarriers}, \texttt{pBufferMemoryBarriers}, or \texttt{pImageMemoryBarriers} members of \texttt{pDependencyInfo} must only include pipeline stages valid for the queue family that was used to create the command pool that \texttt{commandBuffer} was allocated from
Valid Usage (Implicit)

- VUID-vkCmdSetEvent2KHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetEvent2KHR-event-parameter
  event must be a valid VkEvent handle

- VUID-vkCmdSetEvent2KHR-pDependencyInfo-parameter
  pDependencyInfo must be a valid pointer to a valid VkDependencyInfoKHR structure

- VUID-vkCmdSetEvent2KHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetEvent2KHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdSetEvent2KHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdSetEvent2KHR-commonparent
  Both of commandBuffer, and event must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>

<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

The VkDependencyInfoKHR structure is defined as:
typedef struct VkDependencyInfoKHR {
    VkStructureType                     sType;
    const void*                         pNext;
    VkDependencyFlags                   dependencyFlags;
    uint32_t                            memoryBarrierCount;
    const VkMemoryBarrier2KHR*          pMemoryBarriers;
    uint32_t                            bufferMemoryBarrierCount;
    const VkBufferMemoryBarrier2KHR*    pBufferMemoryBarriers;
    uint32_t                            imageMemoryBarrierCount;
    const VkImageMemoryBarrier2KHR*     pImageMemoryBarriers;
} VkDependencyInfoKHR;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **dependencyFlags** is a bitmask of *VkDependencyFlagBits* specifying how execution and memory dependencies are formed.
• **memoryBarrierCount** is the length of the *pMemoryBarriers* array.
• **pMemoryBarriers** is a pointer to an array of *VkMemoryBarrier2KHR* structures that define memory dependencies between any memory accesses.
• **bufferMemoryBarrierCount** is the length of the *pBufferMemoryBarriers* array.
• **pBufferMemoryBarriers** is a pointer to an array of *VkBufferMemoryBarrier2KHR* structures that define memory dependencies between buffer ranges.
• **imageMemoryBarrierCount** is the length of the *pImageMemoryBarriers* array.
• **pImageMemoryBarriers** is a pointer to an array of *VkImageMemoryBarrier2KHR* structures that define memory dependencies between image subresources.

This structure defines a set of memory dependencies, as well as queue family transfer operations and image layout transitions.

Each member of *pMemoryBarriers*, *pBufferMemoryBarriers*, and *pImageMemoryBarriers* defines a separate memory dependency.
Valid Usage (Implicit)

- **VUID-VkDependencyInfoKHR-sType-sType**
  
  *sType must be VK_STRUCTURE_TYPE_DEPENDENCY_INFO_KHR*

- **VUID-VkDependencyInfoKHR-pNext-pNext**
  
  *pNext must be NULL*

- **VUID-VkDependencyInfoKHR-dependencyFlags-parameter**
  
  *dependencyFlags must be a valid combination of VkDependencyFlagBits values*

- **VUID-VkDependencyInfoKHR-pMemoryBarriers-parameter**
  
  *If memoryBarrierCount is not 0, pMemoryBarriers must be a valid pointer to an array of memoryBarrierCount valid VkMemoryBarrier2KHR structures*

- **VUID-VkDependencyInfoKHR-pBufferMemoryBarriers-parameter**
  
  *If bufferMemoryBarrierCount is not 0, pBufferMemoryBarriers must be a valid pointer to an array of bufferMemoryBarrierCount valid VkBufferMemoryBarrier2KHR structures*

- **VUID-VkDependencyInfoKHR-pImageMemoryBarriers-parameter**
  
  *If imageMemoryBarrierCount is not 0, pImageMemoryBarriers must be a valid pointer to an array of imageMemoryBarrierCount valid VkImageMemoryBarrier2KHR structures*

To set the state of an event to signaled from a device, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetEvent(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags stageMask);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **event** is the event that will be signaled.
- **stageMask** specifies the source stage mask used to determine the first synchronization scope.

`vkCmdSetEvent` behaves identically to `vkCmdSetEvent2KHR`, except that it does not define an access scope, and must only be used with `vkCmdWaitEvents`, not `vkCmdWaitEvents2KHR`. 
Valid Usage

- VUID-vkCmdSetEvent-stageMask-04090
  If the geometry shaders feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-vkCmdSetEvent-stageMask-04091
  If the tessellation shaders feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-vkCmdSetEvent-stageMask-04092
  If the conditional rendering feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- VUID-vkCmdSetEvent-stageMask-04093
  If the fragment density map feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- VUID-vkCmdSetEvent-stageMask-04094
  If the transform feedback feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-vkCmdSetEvent-stageMask-04095
  If the mesh shaders feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`

- VUID-vkCmdSetEvent-stageMask-04096
  If the task shaders feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`

- VUID-vkCmdSetEvent-stageMask-04097
  If the shading rate image feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV`

- VUID-vkCmdSetEvent-stageMask-4098
  Any pipeline stage included in stageMask must be supported by the capabilities of the queue family specified by the queueFamilyIndex member of the VkCommandPoolCreateInfo structure that was used to create the VkCommandPool that commandBuffer was allocated from, as specified in the table of supported pipeline stages.

- VUID-vkCmdSetEvent-stageMask-03937
  If the synchronization2 feature is not enabled, stageMask must not be 0

- VUID-vkCmdSetEvent-stageMask-01149
  stageMask must not include `VK_PIPELINE_STAGE_HOST_BIT`

- VUID-vkCmdSetEvent-commandBuffer-01152
  commandBuffer's current device mask must include exactly one physical device
Valid Usage (Implicit)

- VUID-vkCmdSetEvent-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetEvent-event-parameter
  `event` must be a valid `VkEvent` handle

- VUID-vkCmdSetEvent-stageMask-parameter
  `stageMask` must be a valid combination of `VkPipelineStageFlagBits` values

- VUID-vkCmdSetEvent-stageMask-requiredbitsetmask
  `stageMask` must not be 0

- VUID-vkCmdSetEvent-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetEvent-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdSetEvent-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdSetEvent-commonparent
  Both of `commandBuffer`, and `event` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

To unsignal the event from a device, call:
// Provided by VK_KHR_synchronization2
void vkCmdResetEvent2KHR(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags2KHR stageMask);

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be unsignaled.
- `stageMask` is a VkPipelineStageFlags2KHR mask of pipeline stages used to determine the first synchronization scope.

When `vkCmdResetEvent2KHR` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and defines an event unsignal operation which resets the event to the unsignaled state.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations by stage or stages that are logically earlier than stage.

The second synchronization scope includes only the event unsignal operation.

If `event` is already in the unsignaled state when `vkCmdResetEvent` is executed on the device, then `vkCmdResetEvent` has no effect, no event unsignal operation occurs, and no execution dependency is generated.
Valid Usage

- If the geometry shaders feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR`

- If the tessellation shaders feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT_KHR` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT_KHR`

- If the conditional rendering feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- If the fragment density map feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- If the transform feedback feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- If the mesh shaders feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_NV`

- If the task shaders feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_NV`

- If the shading rate image feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV`

The synchronization2 feature must be enabled

- `stageMask` must not include `VK_PIPELINE_STAGE_2_HOST_BIT_KHR`

There must be an execution dependency between `vkCmdResetEvent2KHR` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter

There must be an execution dependency between `vkCmdResetEvent2KHR` and the execution of any `vkCmdWaitEvents2KHR` that includes `event` in its `pEvents` parameter

`commandBuffer`'s current device mask must include exactly one physical device.
Valid Usage (Implicit)

- VUID-vkCmdResetEvent2KHR-commandBuffer-parameter
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdResetEvent2KHR-event-parameter
  \texttt{event} must be a valid \texttt{VkEvent} handle

- VUID-vkCmdResetEvent2KHR-stageMask-parameter
  \texttt{stageMask} must be a valid combination of \texttt{VkPipelineStageFlagBits2KHR} values

- VUID-vkCmdResetEvent2KHR-stageMask-requiredbitmask
  \texttt{stageMask} must not be 0

- VUID-vkCmdResetEvent2KHR-commandBuffer-recording
  \texttt{commandBuffer} must be in the recording state

- VUID-vkCmdResetEvent2KHR-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics, or compute operations

- VUID-vkCmdResetEvent2KHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdResetEvent2KHR-commonparent
  Both of \texttt{commandBuffer}, and \texttt{event} must have been created, allocated, or retrieved from the same \texttt{VkDevice}

Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

To set the state of an event to unsignaled from a device, call:
// Provided by VK_VERSION_1_0

```c
void vkCmdResetEvent(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be unsignaled.
- `stageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the source stage mask used to determine when the `event` is unsignaled.

`vkCmdResetEvent` behaves identically to `vkCmdResetEvent2KHR`. 

Chapter 7. Synchronization and Cache Control | 311
Valid Usage

- VUID-vkCmdResetEvent-stageMask-04090
  If the **geometry shaders** feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-vkCmdResetEvent-stageMask-04091
  If the **tessellation shaders** feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-vkCmdResetEvent-stageMask-04092
  If the **conditional rendering** feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- VUID-vkCmdResetEvent-stageMask-04093
  If the **fragment density map** feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- VUID-vkCmdResetEvent-stageMask-04094
  If the **transform feedback** feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-vkCmdResetEvent-stageMask-04095
  If the **mesh shaders** feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`

- VUID-vkCmdResetEvent-stageMask-04096
  If the **task shaders** feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`

- VUID-vkCmdResetEvent-stageMask-04097
  If the **shading rate image** feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV`

- VUID-vkCmdResetEvent-stageMask-4098
  Any pipeline stage included in `stageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages

- VUID-vkCmdResetEvent-stageMask-03937
  If the **synchronization2** feature is not enabled, `stageMask` **must** not be 0

- VUID-vkCmdResetEvent-stageMask-01153
  `stageMask` **must** not include `VK_PIPELINE_STAGE_HOST_BIT`

- VUID-vkCmdResetEvent-event-03834
  There **must** be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter

- VUID-vkCmdResetEvent-event-03835
  There **must** be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents2KHR` that includes `event` in its `pEvents` parameter

- VUID-vkCmdResetEvent-commandBuffer-01157
  `commandBuffer`’s current device mask **must** include exactly one physical device
Valid Usage (Implicit)

- **VUID-vkCmdResetEvent-commandBuffer-parameter**
  \textit{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- **VUID-vkCmdResetEvent-event-parameter**
  \textit{event} must be a valid \texttt{VkEvent} handle

- **VUID-vkCmdResetEvent-stageMask-parameter**
  \textit{stageMask} must be a valid combination of \texttt{VkPipelineStageFlagBits} values

- **VUID-vkCmdResetEvent-stageMask-requiredbitmask**
  \textit{stageMask} must not be 0

- **VUID-vkCmdResetEvent-commandBuffer-recording**
  \textit{commandBuffer} must be in the recording state

- **VUID-vkCmdResetEvent-commandBuffer-cmdpool**
  The \texttt{VkCommandPool} that \textit{commandBuffer} was allocated from must support graphics, or compute operations

- **VUID-vkCmdResetEvent-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdResetEvent-commonparent**
  Both of \textit{commandBuffer}, and \textit{event} must have been created, allocated, or retrieved from the same \texttt{VkDevice}

Host Synchronization

- Host access to \textit{commandBuffer} must be externally synchronized

- Host access to the \texttt{VkCommandPool} that \textit{commandBuffer} was allocated from must be externally synchronized

Command Properties

<table>

To wait for one or more events to enter the signaled state on a device, call:
// Provided by VK_KHR_synchronization2
void vkCmdWaitEvents2KHR(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    eventCount,
    const VkEvent*                              pEvents,
    const VkDependencyInfoKHR*                  pDependencyInfos);

• commandBuffer is the command buffer into which the command is recorded.
• eventCount is the length of the pEvents array.
• pEvents is an array of events to wait on.
• pDependencyInfos is an array of VkDependencyInfoKHR structures, defining the second synchronization scope.

When vkCmdWaitEvents2KHR is submitted to a queue, it inserts memory dependencies according to the elements of pDependencyInfos and each corresponding element of pEvents. vkCmdWaitEvents2KHR must not be used to wait on event signal operations occurring on other queues, or signal operations executed by vkCmdSetEvent.

The first synchronization scope and access scope of each memory dependency defined by any element i of pDependencyInfos are applied to operations commands that occurred earlier in submission order than the last event signal operation on element i of pEvents.

Signal operations for an event at index i are only included if:

• The event was signaled by a vkCmdSetEvent2KHR command that occurred earlier in submission order with a dependencyInfo parameter exactly equal to the element of pDependencyInfos at index i; or
• The event was created without VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR, and the first synchronization scope defined by the element of pDependencyInfos at index i only includes host operations (VK_PIPELINE_STAGE_2_HOST_BIT_KHR).

The second synchronization scope and access scope of each memory dependency defined by any element i of pDependencyInfos are applied to operations commands that occurred later in submission order than vkCmdWaitEvents2KHR.

Note

vkCmdWaitEvents2KHR is used with vkCmdSetEvent2KHR to define a memory dependency between two sets of action commands, roughly in the same way as pipeline barriers, but split into two commands such that work between the two may execute unhindered.
Note

Applications should be careful to avoid race conditions when using events. There is no direct ordering guarantee between `vkCmdSetEvent2KHR` and `vkCmdResetEvent2KHR`, `vkCmdResetEvent`, or `vkCmdSetEvent`. Another execution dependency (e.g. a pipeline barrier or semaphore with `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`) is needed to prevent such a race condition.
Valid Usage

- **VUID-vkCmdWaitEvents2KHR-synchronization2-03836**
  The synchronization2 feature must be enabled

- **VUID-vkCmdWaitEvents2KHR-pEvents-03837**
  Members of pEvents must not have been signaled by vkCmdSetEvent

- **VUID-vkCmdWaitEvents2KHR-pEvents-03838**
  For any element i of pEvents, if that event is signaled by vkCmdSetEvent2KHR, that command's dependencyInfo parameter must be exactly equal to the ith element of pDependencyInfos

- **VUID-vkCmdWaitEvents2KHR-pEvents-03839**
  For any element i of pEvents, if that event is signaled by vkSetEvent, barriers in the ith element of pDependencyInfos must include only host operations in their first synchronization scope

- **VUID-vkCmdWaitEvents2KHR-pEvents-03840**
  For any element i of pEvents, if barriers in the ith element of pDependencyInfos include only host operations, the ith element of pEvents must be signaled before vkCmdWaitEvents2KHR is executed

- **VUID-vkCmdWaitEvents2KHR-pEvents-03841**
  For any element i of pEvents, if barriers in the ith element of pDependencyInfos do not include host operations, the ith element of pEvents must be by a corresponding vkCmdSetEvent2KHR that occurred earlier in submission order

- **VUID-vkCmdWaitEvents2KHR-srcStageMask-03842**
  The srcStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfo must either include only pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from, or include only VK_PIPELINE_STAGE_2_HOST_BIT_KHR

- **VUID-vkCmdWaitEvents2KHR-dstStageMask-03843**
  The dstStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfo must only include pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from

- **VUID-vkCmdWaitEvents2KHR-dependencyFlags-03844**
  The dependencyFlags member of any element of dependencyInfo must be 0

- **VUID-vkCmdWaitEvents2KHR-pEvents-03845**
  If pEvents includes one or more events that will be signaled by vkSetEvent after commandBuffer has been submitted to a queue, then vkCmdWaitEvents2KHR must not be called inside a render pass instance

- **VUID-vkCmdWaitEvents2KHR-commandBuffer-03846**
  commandBuffer’s current device mask must include exactly one physical device
Valid Usage (Implicit)

- **VUID-vkCmdWaitEvents2KHR-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdWaitEvents2KHR-pEvents-parameter**
  `pEvents` must be a valid pointer to an array of `eventCount` valid `VkEvent` handles

- **VUID-vkCmdWaitEvents2KHR-pDependencyInfos-parameter**
  `pDependencyInfos` must be a valid pointer to an array of `eventCount` valid `VkDependencyInfoKHR` structures

- **VUID-vkCmdWaitEvents2KHR-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdWaitEvents2KHR-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- **VUID-vkCmdWaitEvents2KHR-eventCount-arraylength**
  `eventCount` must be greater than 0

- **VUID-vkCmdWaitEvents2KHR-commonparent**
  Both of `commandBuffer`, and the elements of `pEvents` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

To wait for one or more events to enter the signaled state on a device, call:
// Provided by VK_VERSION_1_0

void vkCmdWaitEvents(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    eventCount,
    constVkEvent*                              pEvents,
    VkPipelineStageFlags                        srcStageMask,
    VkPipelineStageFlags                        dstStageMask,
    uint32_t                                    memoryBarrierCount,
    constVkMemoryBarrier*                      pMemoryBarriers,
    uint32_t                                    bufferMemoryBarrierCount,
    constVkBufferMemoryBarrier*                pBufferMemoryBarriers,
    uint32_t                                    imageMemoryBarrierCount,
    constVkImageMemoryBarrier*                 pImageMemoryBarriers);

• commandBuffer is the command buffer into which the command is recorded.
• eventCount is the length of the pEvents array.
• pEvents is a pointer to an array of event object handles to wait on.
• srcStageMask is a bitmask of VkPipelineStageFlagBits specifying the source stage mask.
• dstStageMask is a bitmask of VkPipelineStageFlagBits specifying the destination stage mask.
• memoryBarrierCount is the length of the pMemoryBarriers array.
• pMemoryBarriers is a pointer to an array of VkMemoryBarrier structures.
• bufferMemoryBarrierCount is the length of the pBufferMemoryBarriers array.
• pBufferMemoryBarriers is a pointer to an array of VkBufferMemoryBarrier structures.
• imageMemoryBarrierCount is the length of the pImageMemoryBarriers array.
• pImageMemoryBarriers is a pointer to an array of VkImageMemoryBarrier structures.

vkCmdWaitEvents is largely similar to vkCmdWaitEvents2KHR, but can only wait on signal operations defined by vkCmdSetEvent. As vkCmdSetEvent doesn’t define any access scopes, vkCmdWaitEvents defines the first access scope for each event signal operation in addition to its own access scopes.

**Note**
Since vkCmdSetEvent doesn’t have any dependency information beyond a stage mask, implementations do not have the same opportunity to perform availability and visibility operations or image layout transitions in advance as they do with vkCmdSetEvent2KHR and vkCmdWaitEvents2KHR.

When vkCmdWaitEvents is submitted to a queue, it defines a memory dependency between prior event signal operations on the same queue or the host, and subsequent commands. vkCmdWaitEvents must not be used to wait on event signal operations occurring on other queues.

The first synchronization scope only includes event signal operations that operate on members of pEvents, and the operations that happened-before the event signal operations. Event signal operations performed by vkCmdSetEvent that occur earlier in submission order are included in the first synchronization scope, if the logically latest pipeline stage in their stageMask parameter is
logically earlier than or equal to the logically latest pipeline stage in \texttt{srcStageMask}. Event signal operations performed by \texttt{vkSetEvent} are only included in the first synchronization scope if \texttt{VK_PIPELINE_STAGE_HOST_BIT} is included in \texttt{srcStageMask}.

The second synchronization scope includes all commands that occur later in submission order. The second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by \texttt{dstStageMask}.

The first access scope is limited to access in the pipeline stages determined by the source stage mask specified by \texttt{srcStageMask}. Within that, the first access scope only includes the first access scopes defined by elements of the \texttt{pMemoryBarriers}, \texttt{pBufferMemoryBarriers} and \texttt{pImageMemoryBarriers} arrays, which each define a set of memory barriers. If no memory barriers are specified, then the first access scope includes no accesses.

The second access scope is limited to access in the pipeline stages determined by the destination stage mask specified by \texttt{dstStageMask}. Within that, the second access scope only includes the second access scopes defined by elements of the \texttt{pMemoryBarriers}, \texttt{pBufferMemoryBarriers} and \texttt{pImageMemoryBarriers} arrays, which each define a set of memory barriers. If no memory barriers are specified, then the second access scope includes no accesses.
Valid Usage

- **VUID-vkCmdWaitEvents-srcStageMask-04090**
  If the geometry shaders feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- **VUID-vkCmdWaitEvents-srcStageMask-04091**
  If the tessellation shaders feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- **VUID-vkCmdWaitEvents-srcStageMask-04092**
  If the conditional rendering feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`.

- **VUID-vkCmdWaitEvents-srcStageMask-04093**
  If the fragment density map feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.

- **VUID-vkCmdWaitEvents-srcStageMask-04094**
  If the transform feedback feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

- **VUID-vkCmdWaitEvents-srcStageMask-04095**
  If the mesh shaders feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`.

- **VUID-vkCmdWaitEvents-srcStageMask-04096**
  If the task shaders feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`.

- **VUID-vkCmdWaitEvents-srcStageMask-04097**
  If the shading rate image feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV`.

- **VUID-vkCmdWaitEvents-srcStageMask-04098**
  Any pipeline stage included in `srcStageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages.

- **VUID-vkCmdWaitEvents-srcStageMask-03937**
  If the synchronization2 feature is not enabled, `srcStageMask` must not be 0.

- **VUID-vkCmdWaitEvents-dstStageMask-04090**
  If the geometry shaders feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- **VUID-vkCmdWaitEvents-dstStageMask-04091**
  If the tessellation shaders feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- **VUID-vkCmdWaitEvents-dstStageMask-04092**
  If the conditional rendering feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`.

- **VUID-vkCmdWaitEvents-dstStageMask-04093**
  If the synchronization2 feature is not enabled, `dstStageMask` must not be 0.
If the fragment density map feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

- VUID-vkCmdWaitEvents-dstStageMask-04094

If the transform feedback feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

- VUID-vkCmdWaitEvents-dstStageMask-04095

If the mesh shaders feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV

- VUID-vkCmdWaitEvents-dstStageMask-04096

If the task shaders feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV

- VUID-vkCmdWaitEvents-dstStageMask-04097

If the shading rate image feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV

- VUID-vkCmdWaitEvents-dstStageMask-4098

Any pipeline stage included in dstStageMask must be supported by the capabilities of the queue family specified by the queueFamilyIndex member of the VkCommandPoolCreateInfo structure that was used to create the VkCommandPool that commandBuffer was allocated from, as specified in the table of supported pipeline stages

- VUID-vkCmdWaitEvents-dstStageMask-03937

If the synchronization2 feature is not enabled, dstStageMask must not be 0

- VUID-vkCmdWaitEvents-srcAccessMask-02815

The srcAccessMask member of each element of pMemoryBarriers must only include access flags that are supported by one or more of the pipeline stages in srcStageMask, as specified in the table of supported access types

- VUID-vkCmdWaitEvents-dstAccessMask-02816

The dstAccessMask member of each element of pMemoryBarriers must only include access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types

- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-02817

For any element of pBufferMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its srcQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its srcAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in srcStageMask, as specified in the table of supported access types

- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-02818

For any element of pBufferMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its dstAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-02819
For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the table of supported access types.

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-02820

For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

- VUID-vkCmdWaitEvents-srcStageMask-01158
  `srcStageMask` must be the bitwise OR of the `stageMask` parameter used in previous calls to `vkCmdSetEvent` with any of the members of `pEvents` and `VK_PIPELINE_STAGE_HOST_BIT` if any of the members of `pEvents` was set using `vkSetEvent`.

- VUID-vkCmdWaitEvents-pEvents-01163
  If `pEvents` includes one or more events that will be signaled by `vkSetEvent` after `commandBuffer` has been submitted to a queue, then `vkCmdWaitEvents` must not be called inside a render pass instance.

- VUID-vkCmdWaitEvents-srcQueueFamilyIndex-02803
  The `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any element of `pBufferMemoryBarriers` or `pImageMemoryBarriers` must be equal.

- VUID-vkCmdWaitEvents-commandBuffer-01167
  `commandBuffer`’s current device mask must include exactly one physical device.

- VUID-vkCmdWaitEvents-pEvents-03847
  Members of `pEvents` must not have been signaled by `vkCmdSetEvent2KHR`.

322 | Chapter 7. Synchronization and Cache Control
Valid Usage (Implicit)

- **VUID-vkCmdWaitEvents-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdWaitEvents-pEvents-parameter**
  - `pEvents` must be a valid pointer to an array of `eventCount` valid `VkEvent` handles

- **VUID-vkCmdWaitEvents-srcStageMask-parameter**
  - `srcStageMask` must be a valid combination of `VkPipelineStageFlagBits` values

- **VUID-vkCmdWaitEvents-dstStageMask-parameter**
  - `dstStageMask` must be a valid combination of `VkPipelineStageFlagBits` values

- **VUID-vkCmdWaitEvents-pMemoryBarriers-parameter**
  - If `memoryBarrierCount` is not 0, `pMemoryBarriers` must be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier` structures

- **VUID-vkCmdWaitEvents-pBufferMemoryBarriers-parameter**
  - If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` must be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier` structures

- **VUID-vkCmdWaitEvents-pImageMemoryBarriers-parameter**
  - If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` must be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier` structures

- **VUID-vkCmdWaitEvents-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdWaitEvents-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- **VUID-vkCmdWaitEvents-eventCount-arraylength**
  - `eventCount` must be greater than 0

- **VUID-vkCmdWaitEvents-commonparent**
  - Both of `commandBuffer`, and the elements of `pEvents` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
7.6. Pipeline Barriers

To record a pipeline barrier, call:

```c
// Provided by VK_KHR_synchronization2
void vkCmdPipelineBarrier2KHR(
    VkCommandBuffer commandBuffer,
    const VkDependencyInfoKHR* pDependencyInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pDependencyInfo` is a pointer to a `VkDependencyInfoKHR` structure defining the scopes of this operation.

When `vkCmdPipelineBarrier2KHR` is submitted to a queue, it defines memory dependencies between commands that were submitted before it, and those submitted after it.

The first **synchronization scope** and **access scope** of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations commands that occurred earlier in submission order.

The second **synchronization scope** and **access scope** of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations commands that occurred later in submission order.

If `vkCmdPipelineBarrier2KHR` is recorded within a render pass instance, the synchronization scopes are **limited to operations within the same subpass**.
Valid Usage

- **VUID-vkCmdPipelineBarrier2KHR-pDependencies-02285**
  If *vkCmdPipelineBarrier2KHR* is called within a render pass instance, the render pass **must** have been created with at least one *VkSubpassDependency* instance in *VkRenderPassCreateInfo::pDependencies* that expresses a dependency from the current subpass to itself, with synchronization scopes and access scopes that are all supersets of the scopes defined in this command.

- **VUID-vkCmdPipelineBarrier2KHR-bufferMemoryBarrierCount-01178**
  If *vkCmdPipelineBarrier2KHR* is called within a render pass instance, it **must** not include any buffer memory barriers.

- **VUID-vkCmdPipelineBarrier2KHR-image-04073**
  If *vkCmdPipelineBarrier2KHR* is called within a render pass instance, the *image* member of any image memory barrier included in this command **must** be an attachment used in the current subpass both as an input attachment, and as either a color or depth/stencil attachment.

- **VUID-vkCmdPipelineBarrier2KHR-oldLayout-01181**
  If *vkCmdPipelineBarrier2KHR* is called within a render pass instance, the *oldLayout* and *newLayout* members of any image memory barrier included in this command **must** be equal.

- **VUID-vkCmdPipelineBarrier2KHR-srcQueueFamilyIndex-01182**
  If *vkCmdPipelineBarrier2KHR* is called within a render pass instance, the *srcQueueFamilyIndex* and *dstQueueFamilyIndex* members of any image memory barrier included in this command **must** be equal.

- **VUID-vkCmdPipelineBarrier2KHR-dependencyFlags-01186**
  If *vkCmdPipelineBarrier2KHR* is called outside of a render pass instance, **VK_DEPENDENCY_VIEW_LOCAL_BIT** must not be included in the dependency flags.

- **VUID-vkCmdPipelineBarrier2KHR-synchronization2-03848**
  The *synchronization2* feature **must** be enabled.

- **VUID-vkCmdPipelineBarrier2KHR-srcStageMask-03849**
  The *srcStageMask* member of any element of the *pMemoryBarriers*, *pBufferMemoryBarriers*, *pImageMemoryBarriers* members of *pDependencyInfo* **must** only include pipeline stages valid for the queue family that was used to create the command pool that *commandBuffer* was allocated from.

- **VUID-vkCmdPipelineBarrier2KHR-dstStageMask-03850**
  The *dstStageMask* member of any element of the *pMemoryBarriers*, *pBufferMemoryBarriers*, *pImageMemoryBarriers* members of *pDependencyInfo* **must** only include pipeline stages valid for the queue family that was used to create the command pool that *commandBuffer* was allocated from.
Valid Usage (Implicit)

- **VUID-vkCmdPipelineBarrier2KHR-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdPipelineBarrier2KHR-pDependencyInfo-parameter**
  
  `pDependencyInfo` must be a valid pointer to a valid `VkDependencyInfoKHR` structure.

- **VUID-vkCmdPipelineBarrier2KHR-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdPipelineBarrier2KHR-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Transfer, Graphics, Compute</td>
<td></td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To record a pipeline barrier, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdPipelineBarrier(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags srcStageMask,
    VkPipelineStageFlags dstStageMask,
    VkDependencyFlags dependencyFlags,
    uint32_t memoryBarrierCount,
    const VkMemoryBarrier* pMemoryBarriers,
    uint32_t bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier* pBufferMemoryBarriers,
    uint32_t imageMemoryBarrierCount,
    const VkImageMemoryBarrier* pImageMemoryBarriers);
```

- `commandBuffer` is the command buffer into which the command is recorded.
• **srcStageMask** is a bitmask of VkPipelineStageFlagBits specifying the *source stages*.

• **dstStageMask** is a bitmask of VkPipelineStageFlagBits specifying the *destination stages*.

• **dependencyFlags** is a bitmask of VkDependencyFlagBits specifying how execution and memory dependencies are formed.

• **memoryBarrierCount** is the length of the pMemoryBarriers array.

• **pMemoryBarriers** is a pointer to an array of VkMemoryBarrier structures.

• **bufferMemoryBarrierCount** is the length of the pBufferMemoryBarriers array.

• **pBufferMemoryBarriers** is a pointer to an array of VkBufferMemoryBarrier structures.

• **imageMemoryBarrierCount** is the length of the pImageMemoryBarriers array.

• **pImageMemoryBarriers** is a pointer to an array of VkImageMemoryBarrier structures.

**vkCmdPipelineBarrier** operates almost identically to **vkCmdPipelineBarrier2KHR**, other than the scopes and barriers defined as direct parameters rather than being defined by an VkDependencyInfoKHR.

When **vkCmdPipelineBarrier** is submitted to a queue, it defines a memory dependency between commands that were submitted before it, and those submitted after it.

If **vkCmdPipelineBarrier** was recorded outside a render pass instance, the first *synchronization scope* includes all commands that occur earlier in submission order. If **vkCmdPipelineBarrier** was recorded inside a render pass instance, the first synchronization scope includes only commands that occur earlier in submission order within the same subpass. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the *source stage mask* specified by **srcStageMask**.

If **vkCmdPipelineBarrier** was recorded outside a render pass instance, the second *synchronization scope* includes all commands that occur later in submission order. If **vkCmdPipelineBarrier** was recorded inside a render pass instance, the second synchronization scope includes only commands that occur later in submission order within the same subpass. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the *destination stage mask* specified by **dstStageMask**.

The first *access scope* is limited to access in the pipeline stages determined by the *source stage mask* specified by **srcStageMask**. Within that, the first access scope only includes the first access scopes defined by elements of the pMemoryBarriers, pBufferMemoryBarriers and pImageMemoryBarriers arrays, which each define a set of *memory barriers*. If no memory barriers are specified, then the first access scope includes no accesses.

The second *access scope* is limited to access in the pipeline stages determined by the *destination stage mask* specified by **dstStageMask**. Within that, the second access scope only includes the second access scopes defined by elements of the pMemoryBarriers, pBufferMemoryBarriers and pImageMemoryBarriers arrays, which each define a set of *memory barriers*. If no memory barriers are specified, then the second access scope includes no accesses.

If **dependencyFlags** includes VK_DEPENDENCY_BY_REGION_BIT, then any dependency between framebuffer-space pipeline stages is framebuffer-local - otherwise it is framebuffer-global.
Valid Usage

• **VUID-vkCmdPipelineBarrier-srcStageMask-04090**
  
  If the **geometry shaders** feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

• **VUID-vkCmdPipelineBarrier-srcStageMask-04091**

For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the table of supported access types

- [VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02820](#)

For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types

- [VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02820](#)

If `vkCmdPipelineBarrier` is called within a render pass instance, the render pass must have been created with at least one `VkSubpassDependency` instance in `VkRenderPassCreateInfo::pDependencies` that expresses a dependency from the current subpass to itself, with synchronization scopes and access scopes that are all supersets of the scopes defined in this command

- [VUID-vkCmdPipelineBarrier-pDependencies-02285](#)

If `vkCmdPipelineBarrier` is called within a render pass instance, it must not include any buffer memory barriers

- [VUID-vkCmdPipelineBarrier-bufferMemoryBarrierCount-01178](#)

If `vkCmdPipelineBarrier` is called within a render pass instance, the `image` member of any image memory barrier included in this command must be an attachment used in the current subpass both as an input attachment, and as either a color or depth/stencil attachment

- [VUID-vkCmdPipelineBarrier-image-04073](#)

If `vkCmdPipelineBarrier` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command must be equal

- [VUID-vkCmdPipelineBarrier-oldLayout-01181](#)

If `vkCmdPipelineBarrier` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any image memory barrier included in this command must be equal

- [VUID-vkCmdPipelineBarrier-srcQueueFamilyIndex-01182](#)

If `vkCmdPipelineBarrier` is called outside of a render pass instance, `VK_DEPENDENCY_VIEW_LOCAL_BIT` must not be included in the dependency flags

- [VUID-vkCmdPipelineBarrier-dependencyFlags-01186](#)
Valid Usage (Implicit)

- VUID-vkCmdPipelineBarrier-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdPipelineBarrier-srcStageMask-parameter
  srcStageMask must be a valid combination of VkPipelineStageFlagBits values

- VUID-vkCmdPipelineBarrier-srcStageMask-requiredbitmask
  srcStageMask must not be 0

- VUID-vkCmdPipelineBarrier-dstStageMask-parameter
  dstStageMask must be a valid combination of VkPipelineStageFlagBits values

- VUID-vkCmdPipelineBarrier-dstStageMask-requiredbitmask
  dstStageMask must not be 0

- VUID-vkCmdPipelineBarrier-dependencyFlags-parameter
  dependencyFlags must be a valid combination of VkDependencyFlagBits values

- VUID-vkCmdPipelineBarrier-pMemoryBarriers-parameter
  If memoryBarrierCount is not 0, pMemoryBarriers must be a valid pointer to an array of memoryBarrierCount valid VkMemoryBarrier structures

- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-parameter
  If bufferMemoryBarrierCount is not 0, pBufferMemoryBarriers must be a valid pointer to an array of bufferMemoryBarrierCount valid VkBufferMemoryBarrier structures

- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-parameter
  If imageMemoryBarrierCount is not 0, pImageMemoryBarriers must be a valid pointer to an array of imageMemoryBarrierCount valid VkImageMemoryBarrier structures

- VUID-vkCmdPipelineBarrier-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdPipelineBarrier-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
Bits which can be set in `vkCmdPipelineBarrier::dependencyFlags`, specifying how execution and memory dependencies are formed, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDependencyFlagBits {
    VKDEPENDENCYBYREGIONBIT = 0x00000001,
    // Provided by VK_VERSION_1_1
    VKDEPENDENCYDEVICEGROUPBIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VKDEPENDENCYVIEWLOCALBIT = 0x00000002,
    // Provided by VK_KHR_multiview
    VKDEPENDENCYVIEWLOCALBITKHR = VKDEPENDENCYVIEWLOCALBIT,
    // Provided by VK_KHR_device_group
    VKDEPENDENCYDEVICEGROUPBIT_KHR = VKDEPENDENCYDEVICEGROUPBIT,
} VkDependencyFlagBits;
```

- **VK_DEPENDENCY_BY_REGION_BIT** specifies that dependencies will be framebuffer-local.
- **VK_DEPENDENCY_VIEW_LOCAL_BIT** specifies that a subpass has more than one view.
- **VK_DEPENDENCY_DEVICE_GROUP_BIT** specifies that dependencies are non-device-local dependency.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDependencyFlags;
```

`VkDependencyFlags` is a bitmask type for setting a mask of zero or more `VkDependencyFlagBits`.

### 7.6.1. Subpass Self-dependency

If `vkCmdPipelineBarrier` or `vkCmdPipelineBarrier2KHR` is called inside a render pass instance, the following restrictions apply. For a given subpass to allow a pipeline barrier, the render pass must declare a self-dependency from that subpass to itself. That is, there must exist a subpass dependency with `srcSubpass` and `dstSubpass` both equal to that subpass index. More than one self-dependency can be declared for each subpass.

Self-dependencies must only include pipeline stage bits that are graphics stages. If any of the stages in `srcStages` are framebuffer-space stages, `dstStages` must only contain framebuffer-space stages. This means that pseudo-stages like `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` which include the execution...
of both framebuffer-space stages and non-framebuffer-space stages must not be used.

If the source and destination stage masks both include framebuffer-space stages, then dependencyFlags must include VK_DEPENDENCY_BY_REGION_BIT. If the subpass has more than one view, then dependencyFlags must include VK_DEPENDENCY_VIEW_LOCAL_BIT.

Each of the synchronization scopes and access scopes of a vkCmdPipelineBarrier2KHR or vkCmdPipelineBarrier command inside a render pass instance must be a subset of the scopes of one of the self-dependencies for the current subpass.

If the self-dependency has VK_DEPENDENCY_BY_REGION_BIT or VK_DEPENDENCY_VIEW_LOCAL_BIT set, then so must the pipeline barrier. Pipeline barriers within a render pass instance must not include buffer memory barriers. Image memory barriers must only specify image subresources that are used as attachments within the subpass, and must not define an image layout transition or queue family ownership transfer.

### 7.7. Memory Barriers

**Memory barriers** are used to explicitly control access to buffer and image subresource ranges. Memory barriers are used to transfer ownership between queue families, change image layouts, and define availability and visibility operations. They explicitly define the access types and buffer and image subresource ranges that are included in the access scopes of a memory dependency that is created by a synchronization command that includes them.

#### 7.7.1. Global Memory Barriers

Global memory barriers apply to memory accesses involving all memory objects that exist at the time of its execution.

The VkMemoryBarrier2KHR structure is defined as:

```c
typedef struct VkMemoryBarrier2KHR {
    VkStructureType             sType;
    const void*                 pNext;
    VkPipelineStageFlags2KHR    srcStageMask;
    VkAccessFlags2KHR           srcAccessMask;
    VkPipelineStageFlags2KHR    dstStageMask;
    VkAccessFlags2KHR           dstAccessMask;
} VkMemoryBarrier2KHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcStageMask** is a VkPipelineStageFlags2KHR mask of pipeline stages to be included in the first synchronization scope.
- **srcAccessMask** is a VkAccessFlags2KHR mask of pipeline first access scope.
- **dstStageMask** is a VkPipelineStageFlags2KHR mask of pipeline stages to be included in the image layout transition or queue family ownership transfer.
second synchronization scope.

- **dstStageMask** is a VkAccessFlags2KHR mask of pipeline second access scope.

This structure defines a memory dependency affecting all device memory.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by **srcStageMask** and **srcAccessMask**.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by **dstStageMask** and **dstAccessMask**.

---

**Valid Usage (Implicit)**

- **VUID-VkMemoryBarrier2KHR-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_MEMORY_BARRIER_2_KHR**

- **VUID-VkMemoryBarrier2KHR-srcStageMask-parameter**
  
  **srcStageMask** must be a valid combination of **VkPipelineStageFlagBits2KHR** values

- **VUID-VkMemoryBarrier2KHR-srcAccessMask-parameter**
  
  **srcAccessMask** must be a valid combination of **VkAccessFlagBits2KHR** values

- **VUID-VkMemoryBarrier2KHR-dstStageMask-parameter**
  
  **dstStageMask** must be a valid combination of **VkPipelineStageFlagBits2KHR** values

- **VUID-VkMemoryBarrier2KHR-dstAccessMask-parameter**
  
  **dstAccessMask** must be a valid combination of **VkAccessFlagBits2KHR** values
Valid Usage

- If the **geometry shaders** feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR`.
- If the **tessellation shaders** feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT_KHR` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT_KHR`.
- If the **conditional rendering** feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`.
- If the **transform feedback** feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`.
- If the **mesh shaders** feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_NV`.
- If the **task shaders** feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_NV`.
- If the **shading rate image** feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV`.
- If `srcAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`.
- If `srcAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`.
- If `srcAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT_KHR`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`.
- If `srcAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`.
If `srcAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT_KHR`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT_KHR`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT_KHR`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT_KHR`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`. 
VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT_KHR,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR

- VUID-VkMemoryBarrier2KHR-srcAccessMask-03914
  If srcAccessMask includes VK_ACCESS_2_TRANSFER_READ_BIT_KHR, srcStageMask must include
  VK_PIPELINE_STAGE_2_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_BLIT_BIT_KHR,

} VkMemoryBarrier2KHR;
```
Valid Usage (Implicit)

- VUID-VkMemoryBarrier-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_BARRIER`

- VUID-VkMemoryBarrier-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkMemoryBarrier-srcAccessMask-parameter
  
  `srcAccessMask` must be a valid combination of `VkAccessFlagBits` values

- VUID-VkMemoryBarrier-dstAccessMask-parameter
  
  `dstAccessMask` must be a valid combination of `VkAccessFlagBits` values

7.7.2. Buffer Memory Barriers

Buffer memory barriers only apply to memory accesses involving a specific buffer range. That is, a memory dependency formed from a buffer memory barrier is scoped to access via the specified buffer range. Buffer memory barriers can also be used to define a queue family ownership transfer for the specified buffer range.

The `VkBufferMemoryBarrier2KHR` structure is defined as:

```
// Provided by VK_KHR_synchronization2
typedef struct VkBufferMemoryBarrier2KHR {
    VkStructureType             sType;
    const void*                 pNext;
    VkPipelineStageFlags2KHR    srcStageMask;
    VkAccessFlags2KHR           srcAccessMask;
    VkPipelineStageFlags2KHR    dstStageMask;
    VkAccessFlags2KHR           dstAccessMask;
    uint32_t                    srcQueueFamilyIndex;
    uint32_t                    dstQueueFamilyIndex;
    VkBuffer                    buffer;
    VkDeviceSize                offset;
    VkDeviceSize                size;
} VkBufferMemoryBarrier2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcStageMask` is a `VkPipelineStageFlags2KHR` mask of pipeline stages to be included in the first synchronization scope.
- `srcAccessMask` is a `VkAccessFlags2KHR` mask of pipeline first access scope.
- `dstStageMask` is a `VkPipelineStageFlags2KHR` mask of pipeline stages to be included in the second synchronization scope.
- `dstStageMask` is a `VkAccessFlags2KHR` mask of pipeline second access scope.
- `srcQueueFamilyIndex` is the source queue family for a *queue family ownership transfer*.
- `dstQueueFamilyIndex` is the destination queue family for a *queue family ownership transfer*.
- `buffer` is a handle to the buffer whose backing memory is affected by the barrier.
- `offset` is an offset in bytes into the backing memory for `buffer`; this is relative to the base offset as bound to the buffer (see `vkBindBufferMemory`).
- `size` is a size in bytes of the affected area of backing memory for `buffer`, or `VK_WHOLE_SIZE` to use the range from `offset` to the end of the buffer.

This structure defines a *memory dependency* limited to a range of a buffer, and optionally defines a *queue family transfer operation* for that range.

The first *synchronization scope* and *access scope* described by this structure include only operations and memory accesses specified by elements `srcStageMask` and `srcAccessMask`.

The second *synchronization scope* and *access scope* described by this structure include only operations and memory accesses specified by elements `dstStageMask` and `dstAccessMask`.

Both *access scopes* are limited to only memory accesses to `buffer` in the range defined by `offset` and `size`.

If `buffer` was created with `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, this memory barrier defines a *queue family transfer operation*. When executed on a queue in the family identified by `srcQueueFamilyIndex`, this barrier defines a *queue family release operation* for the specified buffer range, and the second synchronization and access scopes do not synchronize operations on that queue. When executed on a queue in the family identified by `dstQueueFamilyIndex`, this barrier defines a *queue family acquire operation* for the specified buffer range, and the first synchronization and access scopes do not synchronize operations on that queue.

A *queue family transfer operation* is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in *Queue Family Ownership Transfer*. A *queue family release operation* is defined when `dstQueueFamilyIndex` is one of those values, and a *queue family acquire operation* is defined when `srcQueueFamilyIndex` is one of those values.
Valid Usage

- VUID-VkBufferMemoryBarrier2KHR-srcStageMask-03929
  If the geometry shaders feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR

- VUID-VkBufferMemoryBarrier2KHR-srcStageMask-03930
  If the tessellation shaders feature is not enabled, srcStageMask must not contain

  If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one must not be a special queue family reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer

- VUID-VkBufferMemoryBarrier2KHR-buffer-04089
  If buffer was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, and one of srcQueueFamilyIndex and dstQueueFamilyIndex is a special queue family values reserved for external memory transfers, the other must be VK_QUEUE_FAMILY_IGNORED

- VUID-VkBufferMemoryBarrier2KHR-buffer-04090
  If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and
The `VkBufferMemoryBarrier` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferMemoryBarrier {
    VkStructureType sType;
    const void* pNext;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkBufferMemoryBarrier;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
• `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a source access mask.
• `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a destination access mask.
• `SrcQueueFamilyIndex` is the source queue family for a queue family ownership transfer.
• `DstQueueFamilyIndex` is the destination queue family for a queue family ownership transfer.
• `buffer` is a handle to the buffer whose backing memory is affected by the barrier.
• `offset` is an offset in bytes into the backing memory for `buffer`; this is relative to the base offset as bound to the buffer (see `vkBindBufferMemory`).
• `size` is a size in bytes of the affected area of backing memory for `buffer`, or `VK_WHOLE_SIZE` to use the range from `offset` to the end of the buffer.

The first access scope is limited to access to memory through the specified buffer range, via access types in the source access mask specified by `srcAccessMask`. If `srcAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT`, memory writes performed by that access type are also made visible, as that access type is not performed through a resource.

The second access scope is limited to access to memory through the specified buffer range, via access types in the destination access mask specified by `dstAccessMask`. If `dstAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT` or `VK_ACCESS_HOST_READ_BIT`, available memory writes are also made visible to accesses of those types, as those access types are not performed through a resource.

If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, and `srcQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a queue family release operation for the specified buffer range, and the second access scope includes no access, as if `dstAccessMask` was 0.

If `dstQueueFamilyIndex` is not equal to `srcQueueFamilyIndex`, and `dstQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a queue family acquire operation for the specified buffer range, and the first access scope includes no access, as if `srcAccessMask` was 0.
Valid Usage

- **VUID-VkBufferMemoryBarrier-offset-01187**  
  *offset* must be less than the size of *buffer*

- **VUID-VkBufferMemoryBarrier-size-01188**  
  If *size* is not equal to VK_WHOLE_SIZE, *size* must be greater than 0

- **VUID-VkBufferMemoryBarrier-size-01189**  
  If *size* is not equal to VK_WHOLE_SIZE, *size* must be less than or equal to than the size of *buffer* minus *offset*

- **VUID-VkBufferMemoryBarrier-buffer-01931**  
  If *buffer* is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-VkBufferMemoryBarrier-srcQueueFamilyIndex-04087**  
  If *srcQueueFamilyIndex* is not equal to *dstQueueFamilyIndex*, at least one must not be a special queue family reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer

- **VUID-VkBufferMemoryBarrier-buffer-04088**  
  If *buffer* was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, *srcQueueFamilyIndex* and *dstQueueFamilyIndex* are not equal, and one of *srcQueueFamilyIndex* and *dstQueueFamilyIndex* is a special queue family values reserved for external memory transfers, the other must be VK_QUEUE_FAMILY_IGNORED

- **VUID-VkBufferMemoryBarrier-buffer-04089**  
  If *buffer* was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and *srcQueueFamilyIndex* and *dstQueueFamilyIndex* are not equal, *srcQueueFamilyIndex* and *dstQueueFamilyIndex* must both be valid queue families, or one of the special queue family values reserved for external memory transfers, as described in Queue Family Ownership Transfer

- **VUID-VkBufferMemoryBarrier-synchronization2-03853**  
  If the synchronization2 feature is not enabled, and *buffer* was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, at least one of *srcQueueFamilyIndex* and *dstQueueFamilyIndex* must be VK_QUEUE_FAMILY_IGNORED

Valid Usage (Implicit)

- **VUID-VkBufferMemoryBarrier-sType-sType**  
  *sType* must be VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER

- **VUID-VkBufferMemoryBarrier-pNext-pNext**  
  *pNext* must be NULL

- **VUID-VkBufferMemoryBarrier-buffer-parameter**  
  *buffer* must be a valid VkBuffer handle
7.7.3. Image Memory Barriers

Image memory barriers only apply to memory accesses involving a specific image subresource range. That is, a memory dependency formed from an image memory barrier is scoped to access via the specified image subresource range. Image memory barriers can also be used to define image layout transitions or a queue family ownership transfer for the specified image subresource range.

The `VkImageMemoryBarrier2KHR` structure is defined as:

```c
// Provided by VK_KHR_synchronization2
typedef struct VkImageMemoryBarrier2KHR {
    VkStructureType             sType;
    const void*                 pNext;

} VkImageMemoryBarrier2KHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `srcStageMask` is a `VkPipelineStageFlags2KHR` mask of pipeline stages to be included in the first synchronization scope.
- `srcAccessMask` is a `VkAccessFlags2KHR` mask of pipeline first access scope.
- `dstStageMask` is a `VkPipelineStageFlags2KHR` mask of pipeline stages to be included in the second synchronization scope.
- `dstStageMask` is a `VkAccessFlags2KHR` mask of pipeline second access scope.
- `oldLayout` is the old layout in an image layout transition.
- `newLayout` is the new layout in an image layout transition.
- `srcQueueFamilyIndex` is the source queue family for a queue family ownership transfer.
- `dstQueueFamilyIndex` is the destination queue family for a queue family ownership transfer.
- `image` is a handle to the image affected by this barrier.
- `subresourceRange` describes the image subresource range within image that is affected by this barrier.

This structure defines a memory dependency limited to an image subresource range, and optionally defines a queue family transfer operation and image layout transition for that.
subresource range.

The first **synchronization scope** and **access scope** described by this structure include only operations and memory accesses specified by elements `srcStageMask` and `srcAccessMask`.

The second **synchronization scope** and **access scope** described by this structure include only operations and memory accesses specified by elements `dstStageMask` and `dstAccessMask`.

Both **access scopes** are limited to only memory accesses to `image` in the subresource range defined by `subresourceRange`.

If `image` was created with `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, this memory barrier defines a **queue family transfer operation**. When executed on a queue in the family identified by `srcQueueFamilyIndex`, this barrier defines a **queue family release operation** for the specified image subresource range, and the second synchronization and access scopes do not synchronize operations on that queue. When executed on a queue in the family identified by `dstQueueFamilyIndex`, this barrier defines a **queue family acquire operation** for the specified image subresource range, and the first synchronization and access scopes do not synchronize operations on that queue.

A **queue family transfer operation** is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer. A **queue family release operation** is defined when `dstQueueFamilyIndex` is one of those values, and a **queue family acquire operation** is defined when `srcQueueFamilyIndex` is one of those values.

If `oldLayout` is not equal to `newLayout`, then the memory barrier defines an **image layout transition** for the specified image subresource range. If this memory barrier defines a **queue family transfer operation**, the layout transition is only executed once between the queues.

**Note**

When the old and new layout are equal, the layout values are ignored - data is preserved no matter what values are specified, or what layout the image is currently in.

If `image` has a multi-planar format and the image is **disjoint**, then including `VK_IMAGE_ASPECT_COLOR_BIT` in the `aspectMask` member of `subresourceRange` is equivalent to including `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, and (for three-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`. 
Valid Usage

• VUID-VkImageMemoryBarrier2KHR-srcStageMask-03929
  If the geometry shaders feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR`.

• VUID-VkImageMemoryBarrier2KHR-srcStageMask-03930
  If the tessellation shaders feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT_KHR` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT_KHR`.

• VUID-VkImageMemoryBarrier2KHR-srcStageMask-03931
  If the conditional rendering feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`.

• VUID-VkImageMemoryBarrier2KHR-srcStageMask-03932
  If the fragment density map feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.

• VUID-VkImageMemoryBarrier2KHR-srcStageMask-03933
  If the transform feedback feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`.

• VUID-VkImageMemoryBarrier2KHR-srcStageMask-03934
  If the mesh shaders feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_NV`.

• VUID-VkImageMemoryBarrier2KHR-srcStageMask-03935
  If the task shaders feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_NV`.

• VUID-VkImageMemoryBarrier2KHR-srcStageMask-03936
  If the shading rate image feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV`.

• VUID-VkImageMemoryBarrier2KHR-srcAccessMask-03900
  If `srcAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`.

• VUID-VkImageMemoryBarrier2KHR-srcAccessMask-03901
  If `srcAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`.

• VUID-VkImageMemoryBarrier2KHR-srcAccessMask-03902
  If `srcAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`.

• VUID-VkImageMemoryBarrier2KHR-srcAccessMask-03903
  If `srcAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`.
If `srcAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`

If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT_KHR`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`

If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT_KHR`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR`
VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT_KHR,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR

• VUID-VkImageMemoryBarrier2KHR-srcAccessMask-03914

  If dstAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT, dstStageMask  
  must include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT_KHR,  
  VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT,  
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR  

• VUID-VkImageMemoryBarrier2KHR-dstAccessMask-03922  
  If dstAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT, dstStageMask  
  must include VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV or  
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR  

• VUID-VkImageMemoryBarrier2KHR-dstAccessMask-03923  
  If dstAccessMask includes VK_ACCESS_2_SHADING_RATE_IMAGE_READ_NONCOHERENT_BIT_EXT, dstStageMask must  
  include VK_PIPELINE_STAGE_2SHADING_RATE_IMAGE_BIT_NV,  
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR  

• VUID-VkImageMemoryBarrier2KHR-dstAccessMask-03924  
  If dstAccessMask includes VK_ACCESS_2_COMMAND_PROCESS_READ_BIT_NV, dstStageMask must  
  include VK_PIPELINE_STAGE_2_COMMAND_PROCESS_READ_BIT_NV or  
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR  

• VUID-VkImageMemoryBarrier2KHR-dstAccessMask-03925  
  If dstAccessMask includes VK_ACCESS_2_COMMAND_PROCESS_WRITE_BIT_NV, dstStageMask must  
  include VK_PIPELINE_STAGE_2_COMMAND_PROCESS_WRITE_BIT_NV or  
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR  

• VUID-VkImageMemoryBarrier2KHR-dstAccessMask-03926  
  If dstAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT, dstStageMask must  
  include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT_KHR
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR

- VUID-VkImageMemoryBarrier2KHR-dstAccessMask-03927
  If \( \text{dstAccessMask} \) includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, \( \text{dstStageMask} \) must include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR

- VUID-VkImageMemoryBarrier2KHR-dstAccessMask-03928
  If \( \text{dstAccessMask} \) includes VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR, \( \text{dstStageMask} \) must include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT_KHR

- VUID-VkImageMemoryBarrier2KHR-dstAccessMask-04858
  If \( \text{dstAccessMask} \) includes VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR, \( \text{dstStageMask} \) must include VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR

- VUID-VkImageMemoryBarrier2KHR-dstAccessMask-04859
  If \( \text{dstAccessMask} \) includes VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR, \( \text{dstStageMask} \) must include VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR

- VUID-VkImageMemoryBarrier2KHR-subresourceRange-01486
  \( \text{subresourceRange.baseMipLevel} \) must be less than the \( \text{mipLevels} \) specified in \( \text{VkImageCreateInfo} \) when \( \text{image} \) was created

- VUID-VkImageMemoryBarrier2KHR-subresourceRange-01724
  If \( \text{subresourceRange.levelCount} \) is not VK_REMAINING_MIP_LEVELS, \( \text{subresourceRange.baseMipLevel} + \text{subresourceRange.levelCount} \) must be less than or equal to the \( \text{mipLevels} \) specified in \( \text{VkImageCreateInfo} \) when \( \text{image} \) was created

- VUID-VkImageMemoryBarrier2KHR-subresourceRange-01488
  \( \text{subresourceRange.baseArrayLayer} \) must be less than the \( \text{arrayLayers} \) specified in \( \text{VkImageCreateInfo} \) when \( \text{image} \) was created

- VUID-VkImageMemoryBarrier2KHR-subresourceRange-01725
  If \( \text{subresourceRange.layerCount} \) is not VK_REMAINING_ARRAY_LAYERS, \( \text{subresourceRange.baseArrayLayer} + \text{subresourceRange.layerCount} \) must be less than or equal to the \( \text{arrayLayers} \) specified in \( \text{VkImageCreateInfo} \) when \( \text{image} \) was created

- VUID-VkImageMemoryBarrier2KHR-image-01932
  If \( \text{image} \) is non-sparse then it must be bound completely and contiguously to a single \( \text{VkDeviceMemory} \) object

- VUID-VkImageMemoryBarrier2KHR-oldLayout-01208
  If \( \text{srcQueueFamilyIndex} \) and \( \text{dstQueueFamilyIndex} \) define a queue family ownership transfer or \( \text{oldLayout} \) and \( \text{newLayout} \) define an image layout transition, and \( \text{oldLayout} \) or \( \text{newLayout} \) is VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL then \( \text{image} \) must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.
If \( \text{srcQueueFamilyIndex} \) and \( \text{dstQueueFamilyIndex} \) define a queue family ownership transfer or \( \text{oldLayout} \) and \( \text{newLayout} \) define an image layout transition, and \( \text{oldLayout} \) or \( \text{newLayout} \) is \( \text{VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR} \), image must have been created with \( \text{VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT} \) or \( \text{VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT} \).

- **VUID-VkImageMemoryBarrier2KHR-srcQueueFamilyIndex-03939**
  If \( \text{srcQueueFamilyIndex} \) and \( \text{dstQueueFamilyIndex} \) define a queue family ownership transfer or \( \text{oldLayout} \) and \( \text{newLayout} \) define an image layout transition, and \( \text{oldLayout} \) or \( \text{newLayout} \) is \( \text{VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR} \), image must have been created with at least one of \( \text{VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT} \), \( \text{VK_IMAGE_USAGE_SAMPLED_BIT} \), or \( \text{VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT} \).

- **VUID-VkImageMemoryBarrier2KHR-oldLayout-02088**
  If \( \text{srcQueueFamilyIndex} \) and \( \text{dstQueueFamilyIndex} \) define a queue family ownership transfer or \( \text{oldLayout} \) and \( \text{newLayout} \) define an image layout transition, and \( \text{oldLayout} \) or \( \text{newLayout} \) is \( \text{VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR} \) then image must have been created with \( \text{VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR} \).

- **VUID-VkImageMemoryBarrier2KHR-image-01671**
  If image has a single-plane color format or is not disjoint, then the \( \text{aspectMask} \) member of \( \text{subresourceRange} \) must be \( \text{VK_IMAGE_ASPECT_COLOR_BIT} \).

- **VUID-VkImageMemoryBarrier2KHR-image-01672**
  If image has a multi-planar format and the image is disjoint, then the \( \text{aspectMask} \) member of \( \text{subresourceRange} \) must include either at least one of \( \text{VK_IMAGE_ASPECT_PLANE_0_BIT} \), \( \text{VK_IMAGE_ASPECT_PLANE_1_BIT} \), and \( \text{VK_IMAGE_ASPECT_PLANE_2_BIT} \); or \( \text{aspectMask} \) must include \( \text{VK_IMAGE_ASPECT_COLOR_BIT} \).

- **VUID-VkImageMemoryBarrier2KHR-image-01673**
  If image has a multi-planar format with only two planes, then the \( \text{aspectMask} \) member of \( \text{subresourceRange} \) must not include \( \text{VK_IMAGE_ASPECT_PLANE_2_BIT} \).

- **VUID-VkImageMemoryBarrier2KHR-image-03319**
  If image has a depth/stencil format with both depth and stencil and the \( \text{separateDepthStencilLayouts} \) feature is enabled, then the \( \text{aspectMask} \) member of \( \text{subresourceRange} \) must include either or both \( \text{VK_IMAGE_ASPECT_DEPTH_BIT} \) and \( \text{VK_IMAGE_ASPECT_STENCIL_BIT} \).

- **VUID-VkImageMemoryBarrier2KHR-image-03320**
  If image has a depth/stencil format with both depth and stencil and the \( \text{separateDepthStencilLayouts} \) feature is not enabled, then the \( \text{aspectMask} \) member of \( \text{subresourceRange} \) must include both \( \text{VK_IMAGE_ASPECT_DEPTH_BIT} \) and \( \text{VK_IMAGE_ASPECT_STENCIL_BIT} \).

- **VUID-VkImageMemoryBarrier2KHR-srcQueueFamilyIndex-04070**
  If \( \text{srcQueueFamilyIndex} \) is not equal to \( \text{dstQueueFamilyIndex} \), at least one must not be a special queue family reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer.

- **VUID-VkImageMemoryBarrier2KHR-image-04071**
  If image was created with a sharing mode of \( \text{VK_SHARING_MODE_CONCURRENT} \), \( \text{srcQueueFamilyIndex} \) and \( \text{dstQueueFamilyIndex} \) are not equal, and one of \( \text{srcQueueFamilyIndex} \) and \( \text{dstQueueFamilyIndex} \) is a special queue family values reserved for external memory transfers, the other must be \( \text{VK_QUEUE_FAMILY_IGNORED} \).
If image was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex and dstQueueFamilyIndex must both be valid queue families, or one of the special queue family values reserved for external memory transfers, as described in Queue Family Ownership Transfer.

If srcStageMask or dstStageMask include VK_PIPELINE_STAGE_2_HOST_BIT_KHR, srcQueueFamilyIndex and dstQueueFamilyIndex must be equal.

If srcStageMask includes VK_PIPELINE_STAGE_2_HOST_BIT_KHR, and srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define a image layout transition, oldLayout must be one of VK_IMAGE_LAYOUT_PREINITIALIZED, VK_IMAGE_LAYOUT_UNDEFINED, or VK_IMAGE_LAYOUT_GENERAL.

Valid Usage (Implicit)

sType must be VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER_2_KHR

pNext must be NULL or a pointer to a valid instance of VkSampleLocationsInfoEXT

The sType value of each struct in the pNext chain must be unique

srcStageMask must be a valid combination of VkPipelineStageFlagBits2KHR values

dstStageMask must be a valid combination of VkPipelineStageFlagBits2KHR values

srcAccessMask must be a valid combination of VkAccessFlagBits2KHR values

dstAccessMask must be a valid combination of VkAccessFlagBits2KHR values

oldLayout must be a valid VkImageLayout value

newLayout must be a valid VkImageLayout value

image must be a valid VkImage handle

subresourceRange must be a valid VkImageSubresourceRange structure

The VkImageMemoryBarrier structure is defined as:
typedef struct VkImageMemoryBarrier {
    VkStructureType sType;
    const void* pNext;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkImageLayout oldLayout;
    VkImageLayout newLayout;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkImage image;
    VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcAccessMask** is a bitmask of VkAccessFlagBits specifying a source access mask.
- **dstAccessMask** is a bitmask of VkAccessFlagBits specifying a destination access mask.
- **oldLayout** is the old layout in an image layout transition.
- **newLayout** is the new layout in an image layout transition.
- **srcQueueFamilyIndex** is the source queue family for a queue family ownership transfer.
- **dstQueueFamilyIndex** is the destination queue family for a queue family ownership transfer.
- **image** is a handle to the image affected by this barrier.
- **subresourceRange** describes the image subresource range within image that is affected by this barrier.

The first access scope is limited to access to memory through the specified image subresource range, via access types in the source access mask specified by srcAccessMask. If srcAccessMask includes VK_ACCESS_HOST_WRITE_BIT, memory writes performed by that access type are also made visible, as that access type is not performed through a resource.

The second access scope is limited to access to memory through the specified image subresource range, via access types in the destination access mask specified by dstAccessMask. If dstAccessMask includes VK_ACCESS_HOST_WRITE_BIT or VK_ACCESS_HOST_READ_BIT, available memory writes are also made visible to accesses of those types, as those access types are not performed through a resource.

If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, and srcQueueFamilyIndex is equal to the current queue family, then the memory barrier defines a queue family release operation for the specified image subresource range, and the second access scope includes no access, as if dstAccessMask was 0.

If dstQueueFamilyIndex is not equal to srcQueueFamilyIndex, and dstQueueFamilyIndex is equal to the current queue family, then the memory barrier defines a queue family acquire operation for the specified image subresource range, and the first access scope includes no access, as if srcAccessMask was 0.
If the **synchronization2 feature** is not enabled or **oldLayout** is not equal to **newLayout**, **oldLayout** and **newLayout** define an **image layout transition** for the specified image subresource range.

**Note**

If the **synchronization2 feature** is enabled, when the old and new layout are equal, the layout values are ignored - data is preserved no matter what values are specified, or what layout the image is currently in.

If **image** has a multi-planar format and the image is **disjoint**, then including **VK_IMAGE_ASPECT_COLOR_BIT** in the **aspectMask** member of **subresourceRange** is equivalent to including **VK_IMAGE_ASPECT_PLANE_0_BIT**, **VK_IMAGE_ASPECT_PLANE_1_BIT**, and (for three-plane formats only) **VK_IMAGE_ASPECT_PLANE_2_BIT**.
Valid Usage

• VUID-VkImageMemoryBarrier-subresourceRange-01486
  subresourceRange.baseMipLevel must be less than the mipLevels specified in VkImageCreateInfo when image was created

• VUID-VkImageMemoryBarrier-subresourceRange-01724
  If subresourceRange.levelCount is not VK_REMAINING_MIP_LEVELS, subresourceRange.baseMipLevel + subresourceRange.levelCount must be less than or equal to the mipLevels specified in VkImageCreateInfo when image was created

• VUID-VkImageMemoryBarrier-subresourceRange-01488
  subresourceRange.baseArrayLayer must be less than the arrayLayers specified in VkImageCreateInfo when image was created

• VUID-VkImageMemoryBarrier-subresourceRange-01725
  If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the arrayLayers specified in VkImageCreateInfo when image was created

• VUID-VkImageMemoryBarrier-image-01932
  If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-VkImageMemoryBarrier-oldLayout-01208
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

• VUID-VkImageMemoryBarrier-oldLayout-01209
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkImageMemoryBarrier-oldLayout-01210
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL then image must have been created with VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

• VUID-VkImageMemoryBarrier-oldLayout-01211
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL then image must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, `oldLayout` must be `VK_IMAGE_LAYOUT_UNDEFINED` or the current layout of the image subresources affected by the barrier.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, `newLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR`, image must have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`, image must have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR` then image must have been created with `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` set.

If image has a single-plane color format or is not disjoint, then the aspectMask member of subresourceRange must be `VK_IMAGE_ASPECT_COLOR_BIT`.

If image has a multi-planar format and the image is disjoint, then the aspectMask member

---

372 | Chapter 7. Synchronization and Cache Control
of subresourceRange must include either at least one of VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, and VK_IMAGE_ASPECT_PLANE_2_BIT; or must include VK_IMAGE_ASPECT_COLOR_BIT

• VUID-VkImageMemoryBarrier-image-01673

  If image has a multi-planar format with only two planes, then the aspectMask member of subresourceRange must not include VK_IMAGE_ASPECT_PLANE_2_BIT

• VUID-VkImageMemoryBarrier-image-03319

  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is enabled, then the aspectMask member of subresourceRange must include either or both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT

• VUID-VkImageMemoryBarrier-image-03320

  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is not enabled, then the aspectMask member of subresourceRange must include both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04070

  If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one must not be a special queue family reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04071

  If image was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, and one of srcQueueFamilyIndex and dstQueueFamilyIndex is a special queue family values reserved for external memory transfers, the other must be VK_QUEUE_FAMILY_IGNORED

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04072

  If image was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex and dstQueueFamilyIndex must both be valid queue families, or one of the special queue family values reserved for external memory transfers, as described in Queue Family Ownership Transfer

• VUID-VkImageMemoryBarrier-synchronization2-03857

  If the synchronization2 feature is not enabled, and image was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, at least one of srcQueueFamilyIndex and dstQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED
Valid Usage (Implicit)

- VUID-VkImageMemoryBarrier-sType-sType
  *sType* must be *VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER*

- VUID-VkImageMemoryBarrier-pNext-pNext
  *pNext* must be *NULL* or a pointer to a valid instance of *VkSampleLocationsInfoEXT*

- VUID-VkImageMemoryBarrier-sType-unique
  The *sType* value of each struct in the *pNext* chain must be unique

- VUID-VkImageMemoryBarrier-oldLayout-parameter
  *oldLayout* must be a valid *VkImageLayout* value

- VUID-VkImageMemoryBarrier-newLayout-parameter
  *newLayout* must be a valid *VkImageLayout* value

- VUID-VkImageMemoryBarrier-image-parameter
  *image* must be a valid *VkImage* handle

- VUID-VkImageMemoryBarrier-subresourceRange-parameter
  *subresourceRange* must be a valid *VkImageSubresourceRange* structure

7.7.4. Queue Family Ownership Transfer

Resources created with a *VkSharingMode* of *VK_SHARING_MODE_EXCLUSIVE* must have their ownership explicitly transferred from one queue family to another in order to access their content in a well-defined manner on a queue in a different queue family. Resources shared with external APIs or instances using external memory must also explicitly manage ownership transfers between local and external queues (or equivalent constructs in external APIs) regardless of the *VkSharingMode* specified when creating them. The special queue family index *VK_QUEUE_FAMILY_EXTERNAL* represents any queue external to the resource’s current Vulkan instance, as long as the queue uses the same underlying physical device or device group and uses the same driver version as the resource’s *VkDevice*, as indicated by *VkPhysicalDeviceIDProperties::deviceUUID* and *VkPhysicalDeviceIDProperties::driverUUID*. The special queue family index *VK_QUEUE_FAMILY_FOREIGN_EXT* represents any queue external to the resource’s current Vulkan instance, regardless of the queue’s underlying physical device or driver version. This includes, for example, queues for fixed-function image processing devices, media codec devices, and display devices, as well as all queues that use the same underlying physical device (or device group) and driver version as the resource’s *VkDevice*. If memory dependencies are correctly expressed between uses of such a resource between two queues in different families, but no ownership transfer is defined, the contents of that resource are undefined for any read accesses performed by the second queue family.

*Note*

If an application does not need the contents of a resource to remain valid when transferring from one queue family to another, then the ownership transfer *should* be skipped.
Applications should expect transfers to/from `VK_QUEUE_FAMILY_FOREIGN_EXT` to be more expensive than transfers to/from `VK_QUEUE_FAMILY_EXTERNAL_KHR`.

A queue family ownership transfer consists of two distinct parts:

1. Release exclusive ownership from the source queue family
2. Acquire exclusive ownership for the destination queue family

An application **must** ensure that these operations occur in the correct order by defining an execution dependency between them, e.g. using a semaphore.

A *release operation* is used to release exclusive ownership of a range of a buffer or image subresource range. A release operation is defined by executing a *buffer memory barrier* (for a buffer range) or an *image memory barrier* (for an image subresource range) using `vkCmdPipelineBarrier`, on a queue from the source queue family. The `srcQueueFamilyIndex` parameter of the barrier **must** be set to the source queue family index, and the `dstQueueFamilyIndex` parameter to the destination queue family index. `dstAccessMask` is ignored for such a barrier, such that no visibility operation is executed - the value of this mask does not affect the validity of the barrier. The release operation happens-after the availability operation, and happens-before operations specified in the second synchronization scope of the calling command.

An *acquire operation* is used to acquire exclusive ownership of a range of a buffer or image subresource range. An acquire operation is defined by executing a *buffer memory barrier* (for a buffer range) or an *image memory barrier* (for an image subresource range) using `vkCmdPipelineBarrier`, on a queue from the destination queue family. The buffer range or image subresource range specified in an acquire operation **must** match exactly that of a previous release operation. The `srcQueueFamilyIndex` parameter of the barrier **must** be set to the source queue family index, and the `dstQueueFamilyIndex` parameter to the destination queue family index. `srcAccessMask` is ignored for such a barrier, such that no availability operation is executed - the value of this mask does not affect the validity of the barrier. The acquire operation happens-after operations in the first synchronization scope of the calling command, and happens-before the visibility operation.

If the transfer is via an image memory barrier, and an *image layout transition* is desired, then the values of `oldLayout` and `newLayout` in the *release operation*’s memory barrier **must** be equal to values of `oldLayout` and `newLayout` in the *acquire operation*’s memory barrier. Although the image layout transition is submitted twice, it will only be executed once. A layout transition specified in
this way happens-after the release operation and happens-before the acquire operation.

If the values of srcQueueFamilyIndex and dstQueueFamilyIndex are equal, no ownership transfer is performed, and the barrier operates as if they were both set to VK_QUEUE_FAMILY_IGNORED.

Queue family ownership transfers may perform read and write accesses on all memory bound to the image subresource or buffer range, so applications must ensure that all memory writes have been made available before a queue family ownership transfer is executed. Available memory is automatically made visible to queue family release and acquire operations, and writes performed by those operations are automatically made available.

Once a queue family has acquired ownership of a buffer range or image subresource range of a VK_SHARING_MODE_EXCLUSIVE resource, its contents are undefined to other queue families unless ownership is transferred. The contents of any portion of another resource which aliases memory that is bound to the transferred buffer or image subresource range are undefined after a release or acquire operation.

Note
Because events cannot be used directly for inter-queue synchronization, and because vkCmdSetEvent does not have the queue family index or memory barrier parameters needed by a release operation, the release and acquire operations of a queue family ownership transfer can only be performed using vkCmdPipelineBarrier.

7.8. Wait Idle Operations

To wait on the host for the completion of outstanding queue operations for a given queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueWaitIdle(
    VkQueue queue);
```

- `queue` is the queue on which to wait.

`vkQueueWaitIdle` is equivalent to submitting a fence to a queue and waiting with an infinite timeout for that fence to signal.

Valid Usage (Implicit)

- `VUID-vkQueueWaitIdle-queue-parameter queue must be a valid VkQueue handle`

Host Synchronization

- Host access to `queue` must be externally synchronized
Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>Any</td>
<td>-</td>
</tr>
</tbody>
</table>

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

To wait on the host for the completion of outstanding queue operations for all queues on a given logical device, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkDeviceWaitIdle(
    VkDevice device);
```

- `device` is the logical device to idle.

`vkDeviceWaitIdle` is equivalent to calling `vkQueueWaitIdle` for all queues owned by `device`.

Valid Usage (Implicit)

- VUID-vkDeviceWaitIdle-device-parameter
  
  `device` must be a valid `VkDevice` handle

Host Synchronization

- Host access to all `VkQueue` objects created from `device` must be externally synchronized
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

7.9. Host Write Ordering Guarantees

When batches of command buffers are submitted to a queue via a queue submission command, it defines a memory dependency with prior host operations, and execution of command buffers submitted to the queue.

The first synchronization scope is defined by the host execution model, but includes execution of vkQueueSubmit on the host and anything that happened-before it.

The second synchronization scope includes all commands submitted in the same queue submission, and all commands that occur later in submission order.

The first access scope includes all host writes to mappable device memory that are available to the host memory domain.

The second access scope includes all memory access performed by the device.

7.10. Synchronization and Multiple Physical Devices

If a logical device includes more than one physical device, then fences, semaphores, and events all still have a single instance of the signaled state.

A fence becomes signaled when all physical devices complete the necessary queue operations.

Semaphore wait and signal operations all include a device index that is the sole physical device that performs the operation. These indices are provided in the VkDeviceGroupSubmitInfo and VkDeviceGroupBindSparseInfo structures. Semaphores are not exclusively owned by any physical device. For example, a semaphore can be signaled by one physical device and then waited on by a different physical device.

An event can only be waited on by the same physical device that signaled it (or the host).

7.11. Calibrated timestamps

In order to be able to correlate the time a particular operation took place at on timelines of different time domains (e.g. a device operation vs a host operation), Vulkan allows querying
calibrated timestamps from multiple time domains.

To query calibrated timestamps from a set of time domains, call:

```c
// Provided by VK_EXT_calibrated_timestamps
VkResult vkGetCalibratedTimestampsEXT(
    VkDevice device,                        // Logical device
    uint32_t timestampCount,               // Number of timestamps to query
    const VkCalibratedTimestampInfoEXT* pTimestampInfos,  // Pointer to array
    uint64_t* pTimestamps,                 // Pointer to output array
    uint64_t* pMaxDeviation);             // Pointer to max deviation
```

- **device** is the logical device used to perform the query.
- **timestampCount** is the number of timestamps to query.
- **pTimestampInfos** is a pointer to an array of **timestampCount** `VkCalibratedTimestampInfoEXT` structures, describing the time domains the calibrated timestamps should be captured from.
- **pTimestamps** is a pointer to an array of **timestampCount** 64-bit unsigned integer values in which the requested calibrated timestamp values are returned.
- **pMaxDeviation** is a pointer to a 64-bit unsigned integer value in which the strictly positive maximum deviation, in nanoseconds, of the calibrated timestamp values is returned.

**Note**

The maximum deviation **may** vary between calls to `vkGetCalibratedTimestampsEXT` even for the same set of time domains due to implementation and platform specific reasons. It is the application’s responsibility to assess whether the returned maximum deviation makes the timestamp values suitable for any particular purpose and **can** choose to re-issue the timestamp calibration call pursuing a lower deviation value.

Calibrated timestamp values **can** be extrapolated to estimate future coinciding timestamp values, however, depending on the nature of the time domains and other properties of the platform extrapolating values over a sufficiently long period of time **may** no longer be accurate enough to fit any particular purpose, so applications are expected to re-calibrate the timestamps on a regular basis.
Valid Usage (Implicit)

- VUID-vkGetCalibratedTimestampsEXT-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetCalibratedTimestampsEXT-pTimestampInfos-parameter
pTimestampInfos must be a valid pointer to an array of timestampCount valid VkCalibratedTimestampInfoEXT structures

- VUID-vkGetCalibratedTimestampsEXT-pTimestamps-parameter
pTimestamps must be a valid pointer to an array of timestampCount uint64_t values

- VUID-vkGetCalibratedTimestampsEXT-pMaxDeviation-parameter
pMaxDeviation must be a valid pointer to a uint64_t value

- VUID-vkGetCalibratedTimestampsEXT-timestampCount-arraylength
timestampCount must be greater than 0

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkCalibratedTimestampInfoEXT structure is defined as:

```
// Provided by VK_EXT_calibrated_timestamps
typedef struct VkCalibratedTimestampInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkTimeDomainEXT    timeDomain;
} VkCalibratedTimestampInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **timeDomain** is a VkTimeDomainEXT value specifying the time domain from which the calibrated timestamp value should be returned.
Valid Usage

- VUID-VkCalibratedTimestampInfoEXT-timeDomain-02354
timeDomain must be one of the VkTimeDomainEXT values returned by vkGetPhysicalDeviceCalibrateableTimeDomainsEXT

Valid Usage (Implicit)

- VUID-VkCalibratedTimestampInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_CALIBRATED_TIMESTAMP_INFO_EXT

- VUID-VkCalibratedTimestampInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkCalibratedTimestampInfoEXT-timeDomain-parameter
timeDomain must be a valid VkTimeDomainEXT value

The set of supported time domains consists of:

```
// Provided by VK_EXT_calibrated_timestamps
typedef enum VkTimeDomainEXT {
  VK_TIME_DOMAIN_DEVICE_EXT = 0,
  VK_TIME_DOMAIN_CLOCK_MONOTONIC_EXT = 1,
  VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_EXT = 2,
  VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_EXT = 3,
} VkTimeDomainEXT;
```

- **VK_TIME_DOMAIN_DEVICE_EXT** specifies the device time domain. Timestamp values in this time domain use the same units and are comparable with device timestamp values captured using vkCmdWriteTimestamp or vkCmdWriteTimestamp2KHR and are defined to be incrementing according to the timestampPeriod of the device.

- **VK_TIME_DOMAIN_CLOCK_MONOTONIC_EXT** specifies the CLOCK_MONOTONIC time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX clock_gettime API as computed by this example:

```
Note

An implementation supporting VK_EXT_calibrated_timestamps will use the same time domain for all its VkQueue so that timestamp values reported for VK_TIME_DOMAIN_DEVICE_EXT can be matched to any timestamp captured through vkCmdWriteTimestamp or vkCmdWriteTimestamp2KHR.
```
• **VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_EXT** specifies the CLOCK_MONOTONIC_RAW time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX clock_gettime API as computed by this example:

```c
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

• **VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_EXT** specifies the performance counter (QPC) time domain available on Windows. Timestamp values in this time domain are in the same units as those provided by the Windows QueryPerformanceCounter API and are comparable with platform timestamp values captured using that API as computed by this example:

```c
LARGE_INTEGER counter;
QueryPerformanceCounter(&counter);
return counter.QuadPart;
```
Chapter 8. Render Pass

A render pass represents a collection of attachments, subpasses, and dependencies between the subpasses, and describes how the attachments are used over the course of the subpasses. The use of a render pass in a command buffer is a render pass instance.

Render passes are represented by VkRenderPass handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkRenderPass)
```

An attachment description describes the properties of an attachment including its format, sample count, and how its contents are treated at the beginning and end of each render pass instance.

A subpass represents a phase of rendering that reads and writes a subset of the attachments in a render pass. Rendering commands are recorded into a particular subpass of a render pass instance.

A subpass description describes the subset of attachments that is involved in the execution of a subpass. Each subpass can read from some attachments as input attachments, write to some as color attachments or depth/stencil attachments, perform shader resolve operations to color_attachments or depth/stencil_attachments, and perform multisample resolve operations to resolve attachments. A subpass description can also include a set of preserve attachments, which are attachments that are not read or written by the subpass but whose contents must be preserved throughout the subpass.

A subpass uses an attachment if the attachment is a color, depth/stencil, resolve, depth/stencil resolve, fragment shading rate, or input attachment for that subpass (as determined by the pColorAttachments, pDepthStencilAttachment, pResolveAttachments, VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment, VkFragmentShadingRateAttachmentInfoKHR, and pInputAttachments members of VkSubpassDescription, respectively). A subpass does not use an attachment if that attachment is preserved by the subpass. The first use of an attachment is in the lowest numbered subpass that uses that attachment. Similarly, the last use of an attachment is in the highest numbered subpass that uses that attachment.

The subpasses in a render pass all render to the same dimensions, and fragments for pixel (x,y,layer) in one subpass can only read attachment contents written by previous subpasses at that same (x,y,layer) location. For multi-pixel fragments, the pixel read from an input attachment is selected from the pixels covered by that fragment in an implementation-dependent manner. However, this selection must be made consistently for any fragment with the same shading rate for the lifetime of the VkDevice.
Note

By describing a complete set of subpasses in advance, render passes provide the implementation an opportunity to optimize the storage and transfer of attachment data between subpasses.

In practice, this means that subpasses with a simple framebuffer-space dependency may be merged into a single tiled rendering pass, keeping the attachment data on-chip for the duration of a render pass instance. However, it is also quite common for a render pass to only contain a single subpass.

Subpass dependencies describe execution and memory dependencies between subpasses.

A subpass dependency chain is a sequence of subpass dependencies in a render pass, where the source subpass of each subpass dependency (after the first) equals the destination subpass of the previous dependency.

Execution of subpasses may overlap or execute out of order with regards to other subpasses, unless otherwise enforced by an execution dependency. Each subpass only respects submission order for commands recorded in the same subpass, and the vkCmdBeginRenderPass and vkCmdEndRenderPass commands that delimit the render pass - commands within other subpasses are not included. This affects most other implicit ordering guarantees.

A render pass describes the structure of subpasses and attachments independent of any specific image views for the attachments. The specific image views that will be used for the attachments, and their dimensions, are specified in VkFramebuffer objects. Framebuffers are created with respect to a specific render pass that the framebuffer is compatible with (see Render Pass Compatibility). Collectively, a render pass and a framebuffer define the complete render target state for one or more subpasses as well as the algorithmic dependencies between the subpasses.

The various pipeline stages of the drawing commands for a given subpass may execute concurrently and/or out of order, both within and across drawing commands, whilst still respecting pipeline order. However for a given (x,y,layer,sample) sample location, certain per-sample operations are performed in rasterization order.

8.1. Render Pass Creation

To create a render pass, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateRenderPass(
    VkDevice device,  // Provided by VK_VERSION_1_0
    const VkRenderPassCreateInfo* pCreateInfo,  // Provided by VK_VERSION_1_0
    const VkAllocationCallbacks* pAllocator,  // Provided by VK_VERSION_1_0
    VkRenderPass* pRenderPass);  // Provided by VK_VERSION_1_0
```

- `device` is the logical device that creates the render pass.
- `pCreateInfo` is a pointer to a VkRenderPassCreateInfo structure describing the parameters of the
render pass.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

• **pRenderPass** is a pointer to a *VkRenderPass* handle in which the resulting render pass object is returned.

---

### Valid Usage (Implicit)

- **VUID-vkCreateRenderPass-device-parameter**
  
  *device* must be a valid *VkDevice* handle

- **VUID-vkCreateRenderPass-pCreateInfo-parameter**
  
  *pCreateInfo* must be a valid pointer to a valid *VkRenderPassCreateInfo* structure

- **VUID-vkCreateRenderPass-pAllocator-parameter**
  
  If *pAllocator* is not *NULL*, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure

- **VUID-vkCreateRenderPass-pRenderPass-parameter**
  
  *pRenderPass* must be a valid pointer to a *VkRenderPass* handle

---

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The *VkRenderPassCreateInfo* structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassCreateInfo {
  VkStructureType sType;
  const void* pNext;
  VkRenderPassCreateFlags flags;
  uint32_t attachmentCount;
  const VkAttachmentDescription* pAttachments;
  uint32_t subpassCount;
  const VkSubpassDescription* pSubpasses;
  uint32_t dependencyCount;
  const VkSubpassDependency* pDependencies;
} VkRenderPassCreateInfo;
```

- **sType** is the type of this structure.

- **pNext** is *NULL* or a pointer to a structure extending this structure.
• **flags** is a bitmask of `VkRenderPassCreateFlagBits`.

• **attachmentCount** is the number of attachments used by this render pass.

• **pAttachments** is a pointer to an array of `attachmentCount` `VkAttachmentDescription` structures describing the attachments used by the render pass.

• **subpassCount** is the number of subpasses to create.

• **pSubpasses** is a pointer to an array of `subpassCount` `VkSubpassDescription` structures describing each subpass.

• **dependencyCount** is the number of memory dependencies between pairs of subpasses.

• **pDependencies** is a pointer to an array of `dependencyCount` `VkSubpassDependency` structures describing dependencies between pairs of subpasses.

**Note**

Care should be taken to avoid a data race here; if any subpasses access attachments with overlapping memory locations, and one of those accesses is a write, a subpass dependency needs to be included between them.
Valid Usage

- **VUID-VkRenderPassCreateInfo-attachment-00834**
  If the attachment member of any element of pInputAttachments, pColorAttachments, pResolveAttachments or pDepthStencilAttachment, or any element of pPreserveAttachments in any element of pSubpasses is not VK_ATTACHMENT_UNUSED, it must be less than attachmentCount.

- **VUID-VkRenderPassCreateInfo-pAttachments-00836**
  For any member of pAttachments with a loadOp equal to VK_ATTACHMENT_LOAD_OP_CLEAR, the first use of that attachment must not specify a layout equal to VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL.

- **VUID-VkRenderPassCreateInfo-pAttachments-02511**
  For any member of pAttachments with a stencilLoadOp equal to VK_ATTACHMENT_LOAD_OP_CLEAR, the first use of that attachment must not specify a layout equal to VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL.

- **VUID-VkRenderPassCreateInfo-pAttachments-01566**
  For any member of pAttachments with a loadOp equal to VK_ATTACHMENT_LOAD_OP_CLEAR, the first use of that attachment must not specify a layout equal to VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL.

- **VUID-VkRenderPassCreateInfo-pAttachments-01567**
  For any member of pAttachments with a stencilLoadOp equal to VK_ATTACHMENT_LOAD_OP_CLEAR, the first use of that attachment must not specify a layout equal to VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL.

- **VUID-VkRenderPassCreateInfo-pNext-01926**
  If the pNext chain includes a VkRenderPassInputAttachmentAspectCreateInfo structure, the subpass member of each element of its pAspectReferences member must be less than subpassCount.

- **VUID-VkRenderPassCreateInfo-pNext-01963**
  If the pNext chain includes a VkRenderPassInputAttachmentAspectCreateInfo structure, for any element of the pInputAttachments member of any element of pSubpasses where the attachment member is not VK_ATTACHMENT_UNUSED, the aspectMask member of the corresponding element of VkRenderPassInputAttachmentAspectCreateInfo::pAspectReferences must only include aspects that are present in images of the format specified by the element of pAttachments at attachment.

- **VUID-VkRenderPassCreateInfo-pNext-01928**
  If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, and its subpassCount member is not zero, that member must be equal to the value of subpassCount.
If the `pNext` chain includes a VkRenderPassMultiviewCreateInfo structure, if its dependencyCount member is not zero, it must be equal to dependencyCount

- VUID-VkRenderPassCreateInfo-pNext-01930
  If the `pNext` chain includes a VkRenderPassMultiviewCreateInfo structure, for each non-zero element of pViewOffsets, the srcSubpass and dstSubpass members of pDependencies at the same index must not be equal

- VUID-VkRenderPassCreateInfo-pNext-02512
  If the `pNext` chain includes a VkRenderPassMultiviewCreateInfo structure, for each non-zero element of pViewOffsets, the srcSubpass and dstSubpass members of pDependencies at the same index must be 0

- VUID-VkRenderPassCreateInfo-pNext-02513
  If the `pNext` chain includes a VkRenderPassMultiviewCreateInfo structure, for any element of pDependencies with a dependencyFlags member that does not include VK_DEPENDENCY_VIEW_LOCAL_BIT, the corresponding element of the pViewOffsets member of that VkRenderPassMultiviewCreateInfo instance must be 0

- VUID-VkRenderPassCreateInfo-pNext-02514
  If the `pNext` chain includes a VkRenderPassMultiviewCreateInfo structure, for any element of pDependencies with a dependencyFlags member that does not include VK_DEPENDENCY_VIEW_LOCAL_BIT, the corresponding element of the pViewOffsets member of that VkRenderPassMultiviewCreateInfo instance must be 0

- VUID-VkRenderPassCreateInfo-pNext-02515
  If the `pNext` chain includes a VkRenderPassMultiviewCreateInfo structure, for any element of pDependencies with a dependencyFlags member that does not include VK_DEPENDENCY_VIEW_LOCAL_BIT, the corresponding element of the pViewOffsets member of that VkRenderPassMultiviewCreateInfo instance must be 0

- VUID-VkRenderPassCreateInfo-pDependencies-00837
  For any element of pDependencies, if the srcSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the srcStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the source subpass

- VUID-VkRenderPassCreateInfo-pDependencies-00838
  For any element of pDependencies, if the dstSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the dstStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the destination subpass

- VUID-VkRenderPassCreateInfo-srcSubpass-02517
  The srcSubpass member of each element of pDependencies must be less than subpassCount

- VUID-VkRenderPassCreateInfo-dstSubpass-02518
  The dstSubpass member of each element of pDependencies must be less than subpassCount
Valid Usage (Implicit)

- **VUID-VkRenderPassCreateInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO`

- **VUID-VkRenderPassCreateInfo-pNext-pNext**
  - Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkRenderPassFragmentDensityMapCreateInfoEXT`, `VkRenderPassInputAttachmentAspectCreateInfo`, or `VkRenderPassMultiviewCreateInfo`

- **VUID-VkRenderPassCreateInfo-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkRenderPassCreateInfo-flags-parameter**
  - `flags` must be a valid combination of `VkRenderPassCreateFlagBits` values

- **VUID-VkRenderPassCreateInfo-pAttachments-parameter**
  - If `attachmentCount` is not 0, `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkAttachmentDescription` structures

- **VUID-VkRenderPassCreateInfo-pSubpasses-parameter**
  - `pSubpasses` must be a valid pointer to an array of `subpassCount` valid `VkSubpassDescription` structures

- **VUID-VkRenderPassCreateInfo-pDependencies-parameter**
  - If `dependencyCount` is not 0, `pDependencies` must be a valid pointer to an array of `dependencyCount` valid `VkSubpassDependency` structures

- **VUID-VkRenderPassCreateInfo-subpassCount-arraylength**
  - `subpassCount` must be greater than 0

Bits which **can** be set in `VkRenderPassCreateInfo::flags` describing additional properties of the render pass are:

```
// Provided by VK_VERSION_1_0
typedef enum VkRenderPassCreateFlagBits {
    // Provided by VK_QCOM_render_pass_transform
    VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM = 0x00000002,
} VkRenderPassCreateFlagBits;
```

- **VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM** specifies that the created renderpass is compatible with render pass transform.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkRenderPassCreateFlags;
```

`VkRenderPassCreateFlags` is a bitmask type for setting a mask of zero or more `VkRenderPassCreateFlagBits`.

If the `VkRenderPassCreateInfo::pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure,
then that structure includes an array of view masks, view offsets, and correlation masks for the render pass.

The `VkRenderPassMultiviewCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassMultiviewCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           subpassCount;
    const uint32_t*    pViewMasks;
    uint32_t           dependencyCount;
    const int32_t*     pViewOffsets;
    uint32_t           correlationMaskCount;
    const uint32_t*    pCorrelationMasks;
} VkRenderPassMultiviewCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_multiview
typedef VkRenderPassMultiviewCreateInfo VkRenderPassMultiviewCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `subpassCount` is zero or the number of subpasses in the render pass.
- `pViewMasks` is a pointer to an array of `subpassCount` view masks, where each mask is a bitfield of view indices describing which views rendering is broadcast to in each subpass, when multiview is enabled. If `subpassCount` is zero, each view mask is treated as zero.
- `dependencyCount` is zero or the number of dependencies in the render pass.
- `pViewOffsets` is a pointer to an array of `dependencyCount` view offsets, one for each dependency. If `dependencyCount` is zero, each dependency's view offset is treated as zero. Each view offset controls which views in the source subpass the views in the destination subpass depend on.
- `correlationMaskCount` is zero or the number of correlation masks.
- `pCorrelationMasks` is a pointer to an array of `correlationMaskCount` view masks indicating sets of views that `may` be more efficient to render concurrently.

When a subpass uses a non-zero view mask, `multiview` functionality is considered to be enabled. Multiview is all-or-nothing for a render pass - that is, either all subpasses `must` have a non-zero view mask (though some subpasses `may` have only one view) or all `must` be zero. Multiview causes all drawing and clear commands in the subpass to behave as if they were broadcast to each view, where a view is represented by one layer of the framebuffer attachments. All draws and clears are broadcast to each `view index` whose bit is set in the view mask. The view index is provided in the `ViewIndex` shader input variable, and color, depth/stencil, and input attachments all read/write the layer of the framebuffer corresponding to the view index.
If the view mask is zero for all subpasses, multiview is considered to be disabled and all drawing commands execute normally, without this additional broadcasting.

Some implementations may not support multiview in conjunction with geometry shaders or tessellation shaders.

When multiview is enabled, the `VK_DEPENDENCY_VIEW_LOCAL_BIT` bit in a dependency can be used to express a view-local dependency, meaning that each view in the destination subpass depends on a single view in the source subpass. Unlike pipeline barriers, a subpass dependency can potentially have a different view mask in the source subpass and the destination subpass. If the dependency is view-local, then each view (dstView) in the destination subpass depends on the view dstView + pViewOffsets[dependency] in the source subpass. If there is not such a view in the source subpass, then this dependency does not affect that view in the destination subpass. If the dependency is not view-local, then all views in the destination subpass depend on all views in the source subpass, and the view offset is ignored. A non-zero view offset is not allowed in a self-dependency.

The elements of `pCorrelationMasks` are a set of masks of views indicating that views in the same mask may exhibit spatial coherency between the views, making it more efficient to render them concurrently. Correlation masks must not have a functional effect on the results of the multiview rendering.

When multiview is enabled, at the beginning of each subpass all non-render pass state is undefined. In particular, each time `vkCmdBeginRenderPass` or `vkCmdNextSubpass` is called the graphics pipeline must be bound, any relevant descriptor sets or vertex/index buffers must be bound, and any relevant dynamic state or push constants must be set before they are used.

A multiview subpass can declare that its shaders will write per-view attributes for all views in a single invocation, by setting the `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX` bit in the subpass description. The only supported per-view attributes are position and viewport mask, and per-view position and viewport masks are written to output array variables decorated with `PositionPerViewNV` and `ViewportMaskPerViewNV`, respectively. If `VK_NV_viewport_array2` is not supported and enabled, `ViewportMaskPerViewNV` must not be used. Values written to elements of `PositionPerViewNV` and `ViewportMaskPerViewNV` must not depend on the `ViewIndex`. The shader must also write to an output variable decorated with `Position`, and the value written to `Position` must equal the value written to `PositionPerViewNV[ViewIndex]`. Similarly, if `ViewportMaskPerViewNV` is written to then the shader must also write to an output variable decorated with `ViewportMaskNV`, and the value written to `ViewportMaskNV` must equal the value written to `ViewportMaskPerViewNV[ViewIndex]`. Implementations will either use values taken from `Position` and `ViewportMaskNV` and invoke the shader once for each view, or will use values taken from `PositionPerViewNV` and `ViewportMaskPerViewNV` and invoke the shader fewer times. The values written to `Position` and `ViewportMaskNV` must not depend on the values written to `PositionPerViewNV` and `ViewportMaskPerViewNV`, or vice versa (to allow compilers to eliminate the unused outputs). All attributes that do not have *PerViewNV counterparts must not depend on `ViewIndex`.

Per-view attributes are all-or-nothing for a subpass. That is, all pipelines compiled against a subpass that includes the `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX` bit must write per-view attributes to the *PerViewNV[] shader outputs, in addition to the non-per-view (e.g. `Position`) outputs. Pipelines compiled against a subpass that does not include this bit must not include the *PerViewNV[] outputs in their interfaces.
Valid Usage

- VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-00841
  Each view index must not be set in more than one element of pCorrelationMasks

Valid Usage (Implicit)

- VUID-VkRenderPassMultiviewCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_MULTIVIEW_CREATE_INFO

- VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-parameter
  If subpassCount is not 0, pViewMasks must be a valid pointer to an array of subpassCount uint32_t values

- VUID-VkRenderPassMultiviewCreateInfo-pViewOffsets-parameter
  If dependencyCount is not 0, pViewOffsets must be a valid pointer to an array of dependencyCount int32_t values

- VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-parameter
  If correlationMaskCount is not 0, pCorrelationMasks must be a valid pointer to an array of correlationMaskCount uint32_t values

If the VkRenderPassCreateInfo::pNext chain includes a VkRenderPassFragmentDensityMapCreateInfoEXT structure, then that structure includes a fragment density map attachment for the render pass.

The VkRenderPassFragmentDensityMapCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_fragment_density_map
typedef struct VkRenderPassFragmentDensityMapCreateInfoEXT {
  VkStructureType          sType;
  const void              *pNext;
  VkAttachmentReference    fragmentDensityMapAttachment;
} VkRenderPassFragmentDensityMapCreateInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- fragmentDensityMapAttachment is the fragment density map to use for the render pass.

The fragment density map is read at an implementation-dependent time with the following constraints determined by the attachment's image view flags:

- VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT specifies that the fragment density map will be read by the device during VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT
- VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT specifies that the fragment density map will be read by the host during vkEndCommandBuffer of the primary command buffer that the render pass is recorded into
• Otherwise the fragment density map will be read by the host during `vkCmdBeginRenderPass`
The fragment density map may additionally be read by the device during `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT` for any mode.

If this structure is not present, it is as if `fragmentDensityMapAttachment` was given as `VK_ATTACHMENT_UNUSED`.

Valid Usage

• VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02547
  If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` must be less than `VkRenderPassCreateInfo::attachmentCount`

• VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02548
  If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` must not be an element of `VkSubpassDescription::pInputAttachments, VkSubpassDescription::pColorAttachments, VkSubpassDescription::pResolveAttachments, VkSubpassDescription::pDepthStencilAttachment, or VkSubpassDescription::pPreserveAttachments` for any subpass

• VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02549
  If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, layout must be equal to `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`, or `VK_IMAGE_LAYOUT_GENERAL`

• VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02550
  If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` must reference an attachment with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_LOAD` or `VK_ATTACHMENT_LOAD_OP_DONT_CARE`

• VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02551
  If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` must reference an attachment with a `storeOp` equal to `VK_ATTACHMENT.Store_OP_DONT_CARE`

Valid Usage (Implicit)

• VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_FRAGMENT_DENSITY_MAP_CREATE_INFO_EXT`

• VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-parameter
  `fragmentDensityMapAttachment` must be a valid `VkAttachmentReference` structure

The `VkAttachmentDescription` structure is defined as:
typedef struct VkAttachmentDescription {
    VkAttachmentDescriptionFlags flags;
    VkFormat format;
    VkSampleCountFlagBits samples;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkAttachmentLoadOp stencilLoadOp;
    VkAttachmentStoreOp stencilStoreOp;
    VkImageLayout initialLayout;
    VkImageLayout finalLayout;
} VkAttachmentDescription;

- **flags** is a bitmask of VkAttachmentDescriptionFlagBits specifying additional properties of the attachment.
- **format** is a VkFormat value specifying the format of the image view that will be used for the attachment.
- **samples** is the number of samples of the image as defined in VkSampleCountFlagBits.
- **loadOp** is a VkAttachmentLoadOp value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
- **storeOp** is a VkAttachmentStoreOp value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
- **stencilLoadOp** is a VkAttachmentLoadOp value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
- **stencilStoreOp** is a VkAttachmentStoreOp value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- **initialLayout** is the layout the attachment image subresource will be in when a render pass instance begins.
- **finalLayout** is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

If the attachment uses a color format, then loadOp and storeOp are used, and stencilLoadOp and stencilStoreOp are ignored. If the format has depth and/or stencil components, loadOp and storeOp apply only to the depth data, while stencilLoadOp and stencilStoreOp define how the stencil data is handled. loadOp and stencilLoadOp define the load operations that execute as part of the first subpass that uses the attachment. storeOp and stencilStoreOp define the store operations that execute as part of the last subpass that uses the attachment.

The load operation for each sample in an attachment happens-before any recorded command which accesses the sample in the first subpass where the attachment is used. Load operations for attachments with a depth/stencil format execute in the VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT pipeline stage. Load operations for attachments with a color format execute in the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage.

The store operation for each sample in an attachment happens-after any recorded command which
accesses the sample in the last subpass where the attachment is used. Store operations for attachments with a depth/stencil format execute in the VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT pipeline stage. Store operations for attachments with a color format execute in the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage.

If an attachment is not used by any subpass, then loadOp, storeOp, stencilStoreOp, and stencilLoadOp are ignored, and the attachment's memory contents will not be modified by execution of a render pass instance.

The load and store operations apply on the first and last use of each view in the render pass, respectively. If a view index of an attachment is not included in the view mask in any subpass that uses it, then the load and store operations are ignored, and the attachment's memory contents will not be modified by execution of a render pass instance.

During a render pass instance, input/color attachments with color formats that have a component size of 8, 16, or 32 bits must be represented in the attachment's format throughout the instance. Attachments with other floating- or fixed-point color formats, or with depth components may be represented in a format with a precision higher than the attachment format, but must be represented with the same range. When such a component is loaded via the loadOp, it will be converted into an implementation-dependent format used by the render pass. Such components must be converted from the render pass format, to the format of the attachment, before they are resolved or stored at the end of a render pass instance via storeOp. Conversions occur as described in Numeric Representation and Computation and Fixed-Point Data Conversions.

If flags includes VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT, then the attachment is treated as if it shares physical memory with another attachment in the same render pass. This information limits the ability of the implementation to reorder certain operations (like layout transitions and the loadOp) such that it is not improperly reordered against other uses of the same physical memory via a different attachment. This is described in more detail below.

If a render pass uses multiple attachments that alias the same device memory, those attachments must each include the VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT bit in their attachment description flags. Attachments aliasing the same memory occurs in multiple ways:

- Multiple attachments being assigned the same image view as part of framebuffer creation.
- Attachments using distinct image views that correspond to the same image subresource of an image.
- Attachments using views of distinct image subresources which are bound to overlapping memory ranges.

Note

Render passes must include subpass dependencies (either directly or via a subpass dependency chain) between any two subpasses that operate on the same attachment or aliasing attachments and those subpass dependencies must include execution and memory dependencies separating uses of the aliases, if at least one of those subpasses writes to one of the aliases. These dependencies must not include the VK_DEPENDENCY_BY_REGION_BIT if the aliases are views of distinct image subresources which overlap in memory.
Multiple attachments that alias the same memory **must** not be used in a single subpass. A given attachment index **must** not be used multiple times in a single subpass, with one exception: two subpass attachments **can** use the same attachment index if at least one use is as an input attachment and neither use is as a resolve or preserve attachment. In other words, the same view **can** be used simultaneously as an input and color or depth/stencil attachment, but **must** not be used as multiple color or depth/stencil attachments nor as resolve or preserve attachments. The precise set of valid scenarios is described in more detail below.

If a set of attachments alias each other, then all except the first to be used in the render pass **must** use an initialLayout of VK_IMAGE_LAYOUT_UNDEFINED, since the earlier uses of the other aliases make their contents undefined. Once an alias has been used and a different alias has been used after it, the first alias **must** not be used in any later subpasses. However, an application **can** assign the same image view to multiple aliasing attachment indices, which allows that image view to be used multiple times even if other aliases are used in between.

**Note**

Once an attachment needs the VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT bit, there **should** be no additional cost of introducing additional aliases, and using these additional aliases **may** allow more efficient clearing of the attachments on multiple uses via VK_ATTACHMENT_LOAD_OP_CLEAR.
Valid Usage

- VUID-VkAttachmentDescription-finalLayout-00843
  `finalLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

- VUID-VkAttachmentDescription-format-03280
  If `format` is a color format, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

- VUID-VkAttachmentDescription-format-03281
  If `format` is a depth/stencil format, `initialLayout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`.

- VUID-VkAttachmentDescription-format-03282
  If `format` is a color format, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

- VUID-VkAttachmentDescription-format-03283
  If `format` is a depth/stencil format, `finalLayout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`.

- VUID-VkAttachmentDescription-separateDepthStencilLayouts-03284
  If the `separateDepthStencilLayouts` feature is not enabled, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- VUID-VkAttachmentDescription-separateDepthStencilLayouts-03285
  If the `separateDepthStencilLayouts` feature is not enabled, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- VUID-VkAttachmentDescription-format-03286
  If `format` is a color format, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- VUID-VkAttachmentDescription-format-03287
  If `format` is a color format, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- VUID-VkAttachmentDescription-format-03288
  If `format` is a depth/stencil format which includes both depth and stencil aspects, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.
If format is a depth/stencil format which includes both depth and stencil aspects, finalLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

If format is a depth/stencil format which includes only the depth aspect, initialLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

If format is a depth/stencil format which includes only the depth aspect, finalLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

If format is a depth/stencil format which includes only the stencil aspect, initialLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL.

If format is a depth/stencil format which includes only the stencil aspect, finalLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL.
Valid Usage (Implicit)

- **flags** must be a valid combination of VkAttachmentDescriptionFlagBits values.

- **format** must be a valid VkFormat value.

- **samples** must be a valid VkSampleCountFlagBits value.

- **loadOp** must be a valid VkAttachmentLoadOp value.

- **storeOp** must be a valid VkAttachmentStoreOp value.

- **stencilLoadOp** must be a valid VkAttachmentLoadOp value.

- **stencilStoreOp** must be a valid VkAttachmentStoreOp value.

- **initialLayout** must be a valid VkImageLayout value.

- **finalLayout** must be a valid VkImageLayout value.

Bits which can be set in VkAttachmentDescription::flags describing additional properties of the attachment are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentDescriptionFlagBits {
    VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT = 0x00000001,
} VkAttachmentDescriptionFlagBits;
```

- **VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT** specifies that the attachment aliases the same device memory as other attachments.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkAttachmentDescriptionFlags;
```

VkAttachmentDescriptionFlags is a bitmask type for setting a mask of zero or more VkAttachmentDescriptionFlagBits.

Possible values of VkAttachmentDescription::loadOp and stencilLoadOp, specifying how the contents of the attachment are treated, are:
typedef enum VkAttachmentLoadOp {
    VK_ATTACHMENT_LOAD_OP_LOAD = 0,
    VK_ATTACHMENT_LOAD_OP_CLEAR = 1,
    VK_ATTACHMENT_LOAD_OP_DONT_CARE = 2,
} VkAttachmentLoadOp;

- **VK_ATTACHMENT_LOAD_OP_LOAD** specifies that the previous contents of the image within the render area will be preserved. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`.

- **VK_ATTACHMENT_LOAD_OP_CLEAR** specifies that the contents within the render area will be cleared to a uniform value, which is specified when a render pass instance is begun. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- **VK_ATTACHMENT_LOAD_OP_DONT_CARE** specifies that the previous contents within the area need not be preserved; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

Possible values of `VkAttachmentDescription::storeOp` and `stencilStoreOp`, specifying how the contents of the attachment are treated, are:

typedef enum VkAttachmentStoreOp {
    VK_ATTACHMENT_STORE_OP_STORE = 0,
    VK_ATTACHMENT_STORE_OP_DONT_CARE = 1,
    // Provided by VK_QCOM_render_pass_store_ops
    VK_ATTACHMENT_STORE_OP_NONE_QCOM = 1000301000,
} VkAttachmentStoreOp;

- **VK_ATTACHMENT_STORE_OP_STORE** specifies the contents generated during the render pass and within the render area are written to memory. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- **VK_ATTACHMENT_STORE_OP_DONT_CARE** specifies the contents within the render area are not needed after rendering, and **may** be discarded; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- **VK_ATTACHMENT_STORE_OP_NONE_QCOM** specifies that the contents within the render area were not written during rendering, and **may** not be written to memory. If the attachment was written to during the renderpass, the contents of the attachment will be undefined inside the render area.
Note

`VK_ATTACHMENT_STORE_OP_DONT_CARE` can cause contents generated during previous render passes to be discarded before reaching memory, even if no write to the attachment occurs during the current render pass.

To specify which aspects of an input attachment can be read, add a `VkRenderPassInputAttachmentAspectCreateInfo` structure to the `pNext` chain of the `VkRenderPassCreateInfo` structure:

The `VkRenderPassInputAttachmentAspectCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassInputAttachmentAspectCreateInfo {
    VkStructureType                           sType;
    const void*                                pNext;
    uint32_t                                    aspectReferenceCount;
    const VkInputAttachmentAspectReference*    pAspectReferences;
} VkRenderPassInputAttachmentAspectCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkRenderPassInputAttachmentAspectCreateInfo
VkRenderPassInputAttachmentAspectCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `aspectReferenceCount` is the number of elements in the `pAspectReferences` array.
- `pAspectReferences` is a pointer to an array of `aspectReferenceCount` `VkInputAttachmentAspectReference` structures containing a mask describing which aspect(s) can be accessed for a given input attachment within a given subpass.

An application can access any aspect of an input attachment that does not have a specified aspect mask in the `pAspectReferences` array. Otherwise, an application must not access aspect(s) of an input attachment other than those in its specified aspect mask.
Valid Usage (Implicit)

- **VUID-VkRenderPassInputAttachmentAspectCreateInfo-sType-sType**
  
  sType must be `VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO`

- **VUID-VkRenderPassInputAttachmentAspectCreateInfo-pAspectReferences-parameter**
  
  pAspectReferences must be a valid pointer to an array of `aspectReferenceCount` valid `VkInputAttachmentAspectReference` structures

- **VUID-VkRenderPassInputAttachmentAspectCreateInfo-aspectReferenceCount-arraylength**
  
  `aspectReferenceCount` must be greater than 0

The `VkInputAttachmentAspectReference` structure specifies an aspect mask for a specific input attachment of a specific subpass in the render pass.

*subpass* and *inputAttachmentIndex* index into the render pass as:

```
pCreateInfo->pSubpasses[subpass].pInputAttachments[inputAttachmentIndex]
```

// Provided by VK_VERSION_1_1
```c
typedef struct VkInputAttachmentAspectReference {
    uint32_t subpass;
    uint32_t inputAttachmentIndex;
    VkImageAspectFlags aspectMask;
} VkInputAttachmentAspectReference;
```

// Provided by VK_KHR_maintenance2
```c
typedef VkInputAttachmentAspectReference VkInputAttachmentAspectReferenceKHR;
```

- subpass is an index into the *pSubpasses* array of the parent `VkRenderPassCreateInfo` structure.
- inputAttachmentIndex is an index into the *pInputAttachments* of the specified subpass.
- aspectMask is a mask of which aspect(s) can be accessed within the specified subpass.

Valid Usage

- **VUID-VkInputAttachmentAspectReference-aspectMask-01964**
  
  aspectMask must not include `VK_IMAGE_ASPECT_METADATA_BIT`

- **VUID-VkInputAttachmentAspectReference-aspectMask-02250**
  
  aspectMask must not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index i
Valid Usage (Implicit)

- VUID-VkInputAttachmentAspectReference-aspectMask-parameter
  aspectMask must be a valid combination of VkImageAspectFlagBits values

- VUID-VkInputAttachmentAspectReference-aspectMask-requiredbitmask
  aspectMask must not be 0

The VkSubpassDescription structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDescription {
    VkSubpassDescriptionFlags       flags;
    VkPipelineBindPoint             pipelineBindPoint;
    uint32_t                        inputAttachmentCount;
    const VkAttachmentReference*    pInputAttachments;
    uint32_t                        colorAttachmentCount;
    const VkAttachmentReference*    pColorAttachments;
    const VkAttachmentReference*    pResolveAttachments;
    const VkAttachmentReference*    pDepthStencilAttachment;
    uint32_t                        preserveAttachmentCount;
    const uint32_t*                 pPreserveAttachments;
} VkSubpassDescription;
```

- **flags** is a bitmask of VkSubpassDescriptionFlagBits specifying usage of the subpass.
- **pipelineBindPoint** is a VkPipelineBindPoint value specifying the pipeline type supported for this subpass.
- **inputAttachmentCount** is the number of input attachments.
- **pInputAttachments** is a pointer to an array of VkAttachmentReference structures defining the input attachments for this subpass and their layouts.
- **colorAttachmentCount** is the number of color attachments.
- **pColorAttachments** is a pointer to an array of VkAttachmentReference structures defining the color attachments for this subpass and their layouts.
- **pResolveAttachments** is an optional array of colorAttachmentCount VkAttachmentReference structures defining the resolve attachments for this subpass and their layouts.
- **pDepthStencilAttachment** is a pointer to a VkAttachmentReference structure specifying the depth/stencil attachment for this subpass and its layout.
- **preserveAttachmentCount** is the number of preserved attachments.
- **pPreserveAttachments** is a pointer to an array of preserveAttachmentCount render pass attachment indices identifying attachments that are not used by this subpass, but whose contents must be preserved throughout the subpass.

Each element of the pInputAttachments array corresponds to an input attachment index in a fragment shader, i.e. if a shader declares an image variable decorated with a InputAttachmentIndex
value of $X$, then it uses the attachment provided in $\text{pInputAttachments}[X]$. Input attachments must also be bound to the pipeline in a descriptor set. If the attachment member of any element of $\text{pInputAttachments}$ is $\text{VK_ATTACHMENT_UNUSED}$, the application must not read from the corresponding input attachment index. Fragment shaders can use subpass input variables to access the contents of an input attachment at the fragment's $(x, y, \text{layer})$ framebuffer coordinates. Input attachments must not be used by any subpasses within a renderpass that enables render pass transform.

Each element of the $\text{pColorAttachments}$ array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a Location value of $X$, then it uses the attachment provided in $\text{pColorAttachments}[X]$. If the attachment member of any element of $\text{pColorAttachments}$ is $\text{VK_ATTACHMENT_UNUSED}$, or if Color Write Enable has been disabled for the corresponding attachment index, then writes to the corresponding location by a fragment are discarded.

If flags does not include $\text{VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM}$, and if $\text{pResolveAttachments}$ is not NULL, each of its elements corresponds to a color attachment (the element in $\text{pColorAttachments}$ at the same index), and a multisample resolve operation is defined for each attachment. At the end of each subpass, multisample resolve operations read the subpass's color attachments, and resolve the samples for each pixel within the render area to the same pixel location in the corresponding resolve attachments, unless the resolve attachment index is $\text{VK_ATTACHMENT_UNUSED}$.

Similarly, if flags does not include $\text{VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM}$, and $\text{VkSubpassDescriptionDepthStencilResolve}::\text{pDepthStencilResolveAttachment}$ is not NULL and does not have the value $\text{VK_ATTACHMENT_UNUSED}$, it corresponds to the depth/stencil attachment in $\text{pDepthStencilAttachment}$, and multisample resolve operations for depth and stencil are defined by $\text{VkSubpassDescriptionDepthStencilResolve}::\text{depthResolveMode}$ and $\text{VkSubpassDescriptionDepthStencilResolve}::\text{stencilResolveMode}$, respectively. At the end of each subpass, multisample resolve operations read the subpass's depth/stencil attachment, and resolve the samples for each pixel to the same pixel location in the corresponding resolve attachment. If $\text{VkSubpassDescriptionDepthStencilResolve}::\text{depthResolveMode}$ is $\text{VK_RESOLVE_MODE_NONE}$, then the depth component of the resolve attachment is not written to and its contents are preserved. Similarly, if $\text{VkSubpassDescriptionDepthStencilResolve}::\text{stencilResolveMode}$ is $\text{VK_RESOLVE_MODE_NONE}$, then the stencil component of the resolve attachment is not written to and its contents are preserved. $\text{VkSubpassDescriptionDepthStencilResolve}::\text{depthResolveMode}$ is ignored if the $\text{VkFormat}$ of the $\text{pDepthStencilResolveAttachment}$ does not have a depth component. Similarly, $\text{VkSubpassDescriptionDepthStencilResolve}::\text{stencilResolveMode}$ is ignored if the $\text{VkFormat}$ of the $\text{pDepthStencilResolveAttachment}$ does not have a stencil component.

If the image subresource range referenced by the depth/stencil attachment is created with $\text{VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT}$, then the multisample resolve operation uses the sample locations state specified in the sampleLocationsInfo member of the element of the $\text{VkRenderPassSampleLocationsBeginInfoEXT}::\text{pPostSubpassSampleLocations}$ for the subpass.

If $\text{pDepthStencilAttachment}$ is NULL, or if its attachment index is $\text{VK_ATTACHMENT_UNUSED}$, it indicates that no depth/stencil attachment will be used in the subpass.

The contents of an attachment within the render area become undefined at the start of a subpass S
if all of the following conditions are true:

- The attachment is used as a color, depth/stencil, or resolve attachment in any subpass in the render pass.
- There is a subpass $S_1$ that uses or preserves the attachment, and a subpass dependency from $S_1$ to $S$.
- The attachment is not used or preserved in subpass $S$.

In addition, the contents of an attachment within the render area become undefined at the start of a subpass $S$ if all of the following conditions are true:

- $\text{VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM}$ is set.
- The attachment is used as a color or depth/stencil in the subpass.

Once the contents of an attachment become undefined in subpass $S$, they remain undefined for subpasses in subpass dependency chains starting with subpass $S$ until they are written again. However, they remain valid for subpasses in other subpass dependency chains starting with subpass $S$, if those subpasses use or preserve the attachment.
Valid Usage

- VUID-VkSubpassDescription-pipelineBindPoint-00844
  pipelineBindPoint must be VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-VkSubpassDescription-colorAttachmentCount-00845
  colorAttachmentCount must be less than or equal to VkPhysicalDeviceLimits::maxColorAttachments

- VUID-VkSubpassDescription-loadOp-00846
  If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then loadOp must not be VK_ATTACHMENT_LOAD_OP_CLEAR

- VUID-VkSubpassDescription-pResolveAttachments-00847
  If pResolveAttachments is not NULL, for each resolve attachment that is not VK_ATTACHMENT_UNUSED, the corresponding color attachment must not be VK_ATTACHMENT_UNUSED

- VUID-VkSubpassDescription-pResolveAttachments-00848
  If pResolveAttachments is not NULL, for each resolve attachment that is not VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have a sample count of VK_SAMPLE_COUNT_1_BIT

- VUID-VkSubpassDescription-pResolveAttachments-00849
  If pResolveAttachments is not NULL, each resolve attachment that is not VK_ATTACHMENT_UNUSED must have a sample count of VK_SAMPLE_COUNT_1_BIT

- VUID-VkSubpassDescription-pColorAttachments-01417
  All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have the same sample count

- VUID-VkSubpassDescription-pInputAttachments-02647
  All attachments in pInputAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain at least VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkSubpassDescription-pColorAttachments-02648
  All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-VkSubpassDescription-pResolveAttachments-02649
  All attachments in pResolveAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-VkSubpassDescription-pDepthStencilAttachment-02650
  If pDepthStencilAttachment is not NULL and the attachment is not VK_ATTACHMENT_UNUSED then it must have an image format whose potential format features contain
If the `VK_AMD_mixed_attachment_samples` extension is enabled, and all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` must have a sample count that is smaller than or equal to the sample count of `pDepthStencilAttachment` if it is not `VK_ATTACHMENT_UNUSED`.

If neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, and if `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED` and any attachments in `pColorAttachments` are not `VK_ATTACHMENT_UNUSED`, they must have the same sample count.

The attachment member of each element of `pPreserveAttachments` must not be `VK_ATTACHMENT_UNUSED`.

Each element of `pPreserveAttachments` must not also be an element of any other member of the subpass description.

If any attachment is used by more than one `VkAttachmentReference` member, then each use must use the same layout.

Each attachment must follow the image layout requirements specified for its attachment type.

If `flags` includes `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX`, it must also include `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX`.

If `flags` includes `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, and if `pResolveAttachments` is not `NULL`, then each resolve attachment must be `VK_ATTACHMENT_UNUSED`.

If `flags` includes `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, and if `pDepthStencilResolveAttachmentKHR` is not `NULL`, then the depth/stencil resolve attachment must be `VK_ATTACHMENT_UNUSED`.

If `flags` includes `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, then the subpass must be the last subpass in a subpass dependency chain.

If `flags` includes `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM`, then the sample count of the input attachments must equal `rasterizationSamples`.

If `flags` includes `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM`, and if `sampleShadingEnable` is enabled (explicitly or implicitly) then `minSampleShading` must equal 0.0.
If the render pass is created with `VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM` each of the elements of `pInputAttachments` must be `VK_ATTACHMENT_UNUSED`.

`pDepthStencilAttachment` and `pColorAttachments` must not contain references to the same attachment.

### Valid Usage (Implicit)

- **flags** must be a valid combination of `VkSubpassDescriptionFlagBits` values.
- `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value.
- If `inputAttachmentCount` is not 0, `pInputAttachments` must be a valid pointer to an array of `inputAttachmentCount` valid `VkAttachmentReference` structures.
- If `colorAttachmentCount` is not 0, `pColorAttachments` must be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference` structures.
- If `colorAttachmentCount` is not 0, and `pResolveAttachments` is not NULL, `pResolveAttachments` must be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference` structures.
- If `pDepthStencilAttachment` is not NULL, `pDepthStencilAttachment` must be a valid pointer to a valid `VkAttachmentReference` structure.
- If `preserveAttachmentCount` is not 0, `pPreserveAttachments` must be a valid pointer to an array of `preserveAttachmentCount` `uint32_t` values.

Bits which can be set in `VkSubpassDescription::flags`, specifying usage of the subpass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSubpassDescriptionFlagBits {
    // Provided by VK_NVX_multiview_per_view_attributes
    VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX = 0x00000001,
    // Provided by VK_NVX_multiview_per_view_attributes
    VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX = 0x00000002,
    // Provided by VK_QCOM_render_pass_shader_resolve
    VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM = 0x00000004,
    // Provided by VK_QCOM_render_pass_shader_resolve
    VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM = 0x00000008,
} VkSubpassDescriptionFlagBits;
```
• **VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX** specifies that shaders compiled for this subpass write the attributes for all views in a single invocation of each vertex processing stage. All pipelines compiled against a subpass that includes this bit **must** write per-view attributes to the *PerViewNV[]* shader outputs, in addition to the non-per-view (e.g. *Position*) outputs.

• **VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX** specifies that shaders compiled for this subpass use per-view positions which only differ in value in the x component. Per-view viewport mask **can** also be used.

• **VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM** specifies that the framebuffer region is the fragment region, that is, the minimum region dependencies are by pixel rather than by sample, such that any fragment shader invocation **can** access any sample associated with that fragment shader invocation.

• **VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM** specifies that the subpass performs shader resolve operations.

  \[\text{Note}\]
  Shader resolve operations allow for custom resolve operations, but overwriting pixels **may** have a performance and/or power cost. Furthermore, since the content of any depth stencil attachment or color attachment is undefined at the begining of a shader resolve subpass, any depth testing, stencil testing, or blending operation which sources these undefined values also has undefined result value.

  // Provided by VK_VERSION_1_0
  typedef VkFlags VkSubpassDescriptionFlags;

  **VkSubpassDescriptionFlags** is a bitmask type for setting a mask of zero or more **VkSubpassDescriptionFlagBits**.

The **VkAttachmentReference** structure is defined as:

  // Provided by VK_VERSION_1_0
  typedef struct VkAttachmentReference {
    uint32_t attachment;
    VkImageLayout layout;
  } VkAttachmentReference;

• **attachment** is either an integer value identifying an attachment at the corresponding index in **VkRenderPassCreateInfo::pAttachments**, or **VK_ATTACHMENT_UNUSED** to signify that this attachment is not used.

• **layout** is a **VkImageLayout** value specifying the layout the attachment uses during the subpass.
Valid Usage

- **VUID-VkAttachmentReference-layout-00857**

  If `attachment` is not `VK_ATTACHMENT_UNUSED`, layout **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

Valid Usage (Implicit)

- **VUID-VkAttachmentReference-layout-parameter**

  layout **must** be a valid `VkImageLayout` value

The `VkSubpassDependency` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDependency {
    uint32_t                srcSubpass;
    uint32_t                dstSubpass;
    VkPipelineStageFlags    srcStageMask;
    VkPipelineStageFlags    dstStageMask;
    VkAccessFlags           srcAccessMask;
    VkAccessFlags           dstAccessMask;
    VkDependencyFlags       dependencyFlags;
} VkSubpassDependency;
```

- `srcSubpass` is the subpass index of the first subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `dstSubpass` is the subpass index of the second subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the source stage mask.
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the destination stage mask.
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a source access mask.
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a destination access mask.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits`.

If `srcSubpass` is equal to `dstSubpass` then the `VkSubpassDependency` describes a **subpass self-dependency**, and only constrains the pipeline barriers allowed within a subpass instance. Otherwise, when a render pass instance which includes a subpass dependency is submitted to a queue, it defines a memory dependency between the subpasses identified by `srcSubpass` and `dstSubpass`.

If `srcSubpass` is equal to `VK_SUBPASS_EXTERNAL`, the first **synchronization scope** includes commands that occur earlier in submission order than the `vkCmdBeginRenderPass` used to begin the render.
pass instance. Otherwise, the first set of commands includes all commands submitted as part of the subpass instance identified by srcSubpass and any load, store or multisample resolve operations on attachments used in srcSubpass. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the source stage mask specified by srcStageMask.

If dstSubpass is equal to VK_SUBPASS_EXTERNAL, the second synchronization scope includes commands that occur later in submission order than the vkCmdEndRenderPass used to end the render pass instance. Otherwise, the second set of commands includes all commands submitted as part of the subpass instance identified by dstSubpass and any load, store or multisample resolve operations on attachments used in dstSubpass. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by dstStageMask.

The first access scope is limited to access in the pipeline stages determined by the source stage mask specified by srcStageMask. It is also limited to access types in the source access mask specified by srcAccessMask.

The second access scope is limited to access in the pipeline stages determined by the destination stage mask specified by dstStageMask. It is also limited to access types in the destination access mask specified by dstAccessMask.

The availability and visibility operations defined by a subpass dependency affect the execution of image layout transitions within the render pass.

**Note**

For non-attachment resources, the memory dependency expressed by subpass dependency is nearly identical to that of a VkMemoryBarrier (with matching srcAccessMask and dstAccessMask parameters) submitted as a part of a vkCmdPipelineBarrier (with matching srcStageMask and dstStageMask parameters). The only difference being that its scopes are limited to the identified subpasses rather than potentially affecting everything before and after.

For attachments however, subpass dependencies work more like a VkImageMemoryBarrier defined similarly to the VkMemoryBarrier above, the queue family indices set to VK_QUEUE_FAMILY_IGNORED, and layouts as follows:

- The equivalent to oldLayout is the attachment's layout according to the subpass description for srcSubpass.
- The equivalent to newLayout is the attachment's layout according to the subpass description for dstSubpass.
Valid Usage

- **VUID-VkSubpassDependency-srcStageMask-00860**
  If the geometry shaders feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- **VUID-VkSubpassDependency-dstStageMask-00861**
  If the geometry shaders feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- **VUID-VkSubpassDependency-srcStageMask-00862**
  If the tessellation shaders feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- **VUID-VkSubpassDependency-dstStageMask-00863**
  If the tessellation shaders feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- **VUID-VkSubpassDependency-srcSubpass-00864**
  `srcSubpass` must be less than or equal to `dstSubpass`, unless one of them is `VK_SUBPASS_EXTERNAL`, to avoid cyclic dependencies and ensure a valid execution order.

- **VUID-VkSubpassDependency-srcSubpass-00865**
  `srcSubpass` and `dstSubpass` must not both be equal to `VK_SUBPASS_EXTERNAL`.

- **VUID-VkSubpassDependency-srcSubpass-00867**
  If `srcSubpass` is equal to `dstSubpass` and not all of the stages in `srcStageMask` and `dstStageMask` are framebuffer-space stages, the logically latest pipeline stage in `srcStageMask` must be logically earlier than or equal to the logically earliest pipeline stage in `dstStageMask`.

- **VUID-VkSubpassDependency-srcAccessMask-00868**
  Any access flag included in `srcAccessMask` must be supported by one of the pipeline stages in `srcStageMask`, as specified in the table of supported access types.

- **VUID-VkSubpassDependency-dstAccessMask-00869**
  Any access flag included in `dstAccessMask` must be supported by one of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

- **VUID-VkSubpassDependency-srcSubpass-02243**
  If `srcSubpass` equals `dstSubpass`, and `srcStageMask` and `dstStageMask` both include a framebuffer-space stage, then `dependencyFlags` must include `VK_DEPENDENCY_BY_REGION_BIT`.

- **VUID-VkSubpassDependency-dependencyFlags-02520**
  If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `srcSubpass` must not be equal to `VK_SUBPASS_EXTERNAL`.

- **VUID-VkSubpassDependency-dependencyFlags-02521**
  If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `dstSubpass` must not be equal to `VK_SUBPASS_EXTERNAL`.

- **VUID-VkSubpassDependency-srcSubpass-00872**
  If `srcSubpass` equals `dstSubpass` and that subpass has more than one bit set in the view mask, then `dependencyFlags` must include `VK_DEPENDENCY_VIEW_LOCAL_BIT`. 
If the mesh shaders feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV

If the task shaders feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV

If the mesh shaders feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV

If the task shaders feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV

Valid Usage (Implicit)

srcStageMask must be a valid combination of VkPipelineStageFlagBits values

dstStageMask must be a valid combination of VkPipelineStageFlagBits values

srcAccessMask must be a valid combination of VkAccessFlagBits values

dstAccessMask must be a valid combination of VkAccessFlagBits values

dependencyFlags must be a valid combination of VkDependencyFlagBits values

When multiview is enabled, the execution of the multiple views of one subpass may not occur simultaneously or even back-to-back, and rather may be interleaved with the execution of other subpasses. The load and store operations apply to attachments on a per-view basis. For example, an attachment using VK_ATTACHMENT_LOAD_OP_CLEAR will have each view cleared on first use, but the first use of one view may be temporally distant from the first use of another view.
Note

A good mental model for multiview is to think of a multiview subpass as if it were a collection of individual (per-view) subpasses that are logically grouped together and described as a single multiview subpass in the API. Similarly, a multiview attachment can be thought of like several individual attachments that happen to be layers in a single image. A view-local dependency between two multiview subpasses acts like a set of one-to-one dependencies between corresponding pairs of per-view subpasses. A view-global dependency between two multiview subpasses acts like a set of $N \times M$ dependencies between all pairs of per-view subpasses in the source and destination. Thus, it is a more compact representation which also makes clear the commonality and reuse that is present between views in a subpass. This interpretation motivates the answers to questions like “when does the load op apply” - it is on the first use of each view of an attachment, as if each view were a separate attachment.

If any two subpasses of a render pass activate transform feedback to the same bound transform feedback buffers, a subpass dependency must be included (either directly or via some intermediate subpasses) between them.

If there is no subpass dependency from VK_SUBPASS_EXTERNAL to the first subpass that uses an attachment, then an implicit subpass dependency exists from VK_SUBPASS_EXTERNAL to the first subpass it is used in. The implicit subpass dependency only exists if there exists an automatic layout transition away from initialLayout. The subpass dependency operates as if defined with the following parameters:

```cpp
VkSubpassDependency implicitDependency = {
    .srcSubpass = VK_SUBPASS_EXTERNAL;
    .dstSubpass = firstSubpass; // First subpass attachment is used in
    .srcStageMask = VK_PIPELINE_STAGE_NONE_KHR;
    .dstStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT;
    .srcAccessMask = 0;
    .dstAccessMask = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT |
        VK_ACCESS_COLOR_ATTACHMENT_READ_BIT |
        VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
        VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT |
        VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT;
    .dependencyFlags = 0;
};
```

Similarly, if there is no subpass dependency from the last subpass that uses an attachment to VK_SUBPASS_EXTERNAL, then an implicit subpass dependency exists from the last subpass it is used in to VK_SUBPASS_EXTERNAL. The implicit subpass dependency only exists if there exists an automatic layout transition into finalLayout. The subpass dependency operates as if defined with the following parameters:
VkSubpassDependency implicitDependency = {
    .srcSubpass = lastSubpass; // Last subpass attachment is used in
    .dstSubpass = VK_SUBPASS_EXTERNAL;
    .srcStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT;
    .dstStageMask = VK_PIPELINE_STAGE_NONE_KHR;
    .srcAccessMask = VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
                     VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT;
    .dstAccessMask = 0;
    .dependencyFlags = 0;
};

As subpasses may overlap or execute out of order with regards to other subpasses unless a subpass dependency chain describes otherwise, the layout transitions required between subpasses cannot be known to an application. Instead, an application provides the layout that each attachment must be in at the start and end of a render pass, and the layout it must be in during each subpass it is used in. The implementation then must execute layout transitions between subpasses in order to guarantee that the images are in the layouts required by each subpass, and in the final layout at the end of the render pass.

Automatic layout transitions apply to the entire image subresource attached to the framebuffer. If the attachment view is a 2D or 2D array view of a 3D image, even if the attachment view only refers to a subset of the slices of the selected mip level of the 3D image, automatic layout transitions apply to the entire subresource referenced which is the entire mip level in this case.

Automatic layout transitions away from the layout used in a subpass happen-after the availability operations for all dependencies with that subpass as the srcSubpass.

Automatic layout transitions into the layout used in a subpass happen-before the visibility operations for all dependencies with that subpass as the dstSubpass.

Automatic layout transitions away from initialLayout happens-after the availability operations for all dependencies with a srcSubpass equal to VK_SUBPASS_EXTERNAL, where dstSubpass uses the attachment that will be transitioned. For attachments created with VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT, automatic layout transitions away from initialLayout happen-after the availability operations for all dependencies with a srcSubpass equal to VK_SUBPASS_EXTERNAL, where dstSubpass uses any aliased attachment.

Automatic layout transitions into finalLayout happens-before the visibility operations for all dependencies with a dstSubpass equal to VK_SUBPASS_EXTERNAL, where srcSubpass uses the attachment that will be transitioned. For attachments created with VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT, automatic layout transitions into finalLayout happen-before the visibility operations for all dependencies with a dstSubpass equal to VK_SUBPASS_EXTERNAL, where srcSubpass uses any aliased attachment.

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT is dependent on the last sample locations used to render to the attachment, thus automatic layout transitions use the sample locations state specified in VkRenderPassSampleLocationsBeginInfoEXT.
Automatic layout transitions of an attachment referring to a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` use the sample locations the image subresource range referenced by the attachment was last rendered with. If the current render pass does not use the attachment as a depth/stencil attachment in any subpass that happens-before, the automatic layout transition uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pAttachmentInitialSampleLocations` array for which the `attachmentIndex` member equals the attachment index of the attachment, if one is specified. Otherwise, the automatic layout transition uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pPostSubpassSampleLocations` array for which the `subpassIndex` member equals the index of the subpass that last used the attachment as a depth/stencil attachment, if one is specified.

If no sample locations state has been specified for an automatic layout transition performed on an attachment referring to a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` the contents of the depth aspect of the depth/stencil attachment become undefined as if the layout of the attachment was transitioned from the `VK_IMAGE_LAYOUT_UNDEFINED` layout.

If two subpasses use the same attachment, and both subpasses use the attachment in a read-only layout, no subpass dependency needs to be specified between those subpasses. If an implementation treats those layouts separately, it **must** insert an implicit subpass dependency between those subpasses to separate the uses in each layout. The subpass dependency operates as if defined with the following parameters:

```c
// Used for input attachments
VkPipelineStageFlags inputAttachmentStages = VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT;
VkAccessFlags inputAttachmentDstAccess = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT;

// Used for depth/stencil attachments
VkPipelineStageFlags depthStencilAttachmentStages =
    VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT |
    VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT;
VkAccessFlags depthStencilAttachmentDstAccess =
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT;

VkSubpassDependency implicitDependency = {
    .srcSubpass = firstSubpass;
    .dstSubpass = secondSubpass;
    .srcStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .dstStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .srcAccessMask = 0;
    .dstAccessMask = inputAttachmentDstAccess | depthStencilAttachmentDstAccess;
    .dependencyFlags = 0;
};
```

If a subpass uses the same attachment as both an input attachment and either a color attachment or a depth/stencil attachment, writes via the color or depth/stencil attachment are not automatically...
made visible to reads via the input attachment, causing a feedback loop, except in any of the following conditions:

- If the color components or depth/stencil components read by the input attachment are mutually exclusive with the components written by the color or depth/stencil attachments, then there is no feedback loop. This requires the graphics pipelines used by the subpass to disable writes to color components that are read as inputs via the colorWriteEnable or colorWriteMask, and to disable writes to depth/stencil components that are read as inputs via depthWriteEnable or stencilTestEnable.

- If the attachment is used as an input attachment and depth/stencil attachment only, and the depth/stencil attachment is not written to.

Rendering within a subpass that contains a feedback loop creates a data race, except in the following cases:

- If a memory dependency is inserted between when the attachment is written and when it is subsequently read by later fragments. Pipeline barriers expressing a subpass self-dependency are the only way to achieve this, and one must be inserted every time a fragment will read values at a particular sample (x, y, layer, sample) coordinate, if those values have been written since the most recent pipeline barrier; or the since start of the subpass if there have been no pipeline barriers since the start of the subpass.

Attachments have requirements for a valid image layout depending on the usage

- An attachment used as an input attachment must be in the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL layout.

- An attachment used only as a color attachment must be in the VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR or VK_IMAGE_LAYOUT_GENERAL layout.

- An attachment used as both an input attachment and a color attachment must be in the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR or VK_IMAGE_LAYOUT_GENERAL layout.

- An attachment used only as a depth/stencil attachment must be in the VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL layout.

- An attachment used as an input attachment and depth/stencil attachment must be in the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL layout.
An attachment **must** not be used as both a depth/stencil attachment and a color attachment.

A more extensible version of render pass creation is also defined below.

To create a render pass, call:

```cpp
// Provided by VK_KHR_create_renderpass2
VkResult vkCreateRenderPass2KHR(
    VkDevice                                    device,
    const VkRenderPassCreateInfo2*              pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkRenderPass*                               pRenderPass);
```

- **device** is the logical device that creates the render pass.
- **pCreateInfo** is a pointer to a `VkRenderPassCreateInfo2` structure describing the parameters of the render pass.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pRenderPass** is a pointer to a `VkRenderPass` handle in which the resulting render pass object is returned.

This command is functionally identical to `vkCreateRenderPass`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage (Implicit)

- **VUID-vkCreateRenderPass2-device-parameter**
  
  * **device** must be a valid `VkDevice` handle

- **VUID-vkCreateRenderPass2-pCreateInfo-parameter**
  
  * **pCreateInfo** must be a valid pointer to a valid `VkRenderPassCreateInfo2` structure

- **VUID-vkCreateRenderPass2-pAllocator-parameter**
  
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateRenderPass2-pRenderPass-parameter**
  
  * **pRenderPass** must be a valid pointer to a `VkRenderPass` handle

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
The `VkRenderPassCreateInfo2` structure is defined as:

```c
typedef struct VkRenderPassCreateInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassCreateFlags flags;
    uint32_t attachmentCount;
    const VkAttachmentDescription2* pAttachments;
    uint32_t subpassCount;
    const VkSubpassDescription2* pSubpasses;
    uint32_t dependencyCount;
    const VkSubpassDependency2* pDependencies;
    uint32_t correlatedViewMaskCount;
    const uint32_t* pCorrelatedViewMasks;
} VkRenderPassCreateInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkRenderPassCreateInfo2 VkRenderPassCreateInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `attachmentCount` is the number of attachments used by this render pass.
- `pAttachments` is a pointer to an array of `attachmentCount` `VkAttachmentDescription2` structures describing the attachments used by the render pass.
- `subpassCount` is the number of subpasses to create.
- `pSubpasses` is a pointer to an array of `subpassCount` `VkSubpassDescription2` structures describing each subpass.
- `dependencyCount` is the number of dependencies between pairs of subpasses.
- `pDependencies` is a pointer to an array of `dependencyCount` `VkSubpassDependency2` structures describing dependencies between pairs of subpasses.
- `correlatedViewMaskCount` is the number of correlation masks.
- `pCorrelatedViewMasks` is a pointer to an array of view masks indicating sets of views that may be more efficient to render concurrently.

Parameters defined by this structure with the same name as those in `VkRenderPassCreateInfo` have the identical effect to those parameters; the child structures are variants of those used in `VkRenderPassCreateInfo` which add `sType` and `pNext` parameters, allowing them to be extended.

If the `VkSubpassDescription2::viewMask` member of any element of `pSubpasses` is not zero, `multiview` functionality is considered to be enabled for this render pass.
correlatedViewMaskCount and pCorrelatedViewMasks have the same effect as VkRenderPassMultiviewCreateInfo::correlationMaskCount and VkRenderPassMultiviewCreateInfo::pCorrelationMasks, respectively.
Valid Usage

- **VUID-VkRenderPassCreateInfo2-None-03049**
  If any two subpasses operate on attachments with overlapping ranges of the same `VkDeviceMemory` object, and at least one subpass writes to that area of `VkDeviceMemory`, a subpass dependency **must** be included (either directly or via some intermediate subpasses) between them.

- **VUID-VkRenderPassCreateInfo2-attachment-03050**
  If the attachment member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments`, or `pDepthStencilAttachment`, or the attachment indexed by any element of `pPreserveAttachments` in any given element of `pSubpasses` is bound to a range of a `VkDeviceMemory` object that overlaps with any other attachment in any subpass (including the same subpass), the `VkAttachmentDescription2` structures describing them **must** include `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` in flags.

- **VUID-VkRenderPassCreateInfo2-attachment-03051**
  If the attachment member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments`, or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any given element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, it **must** be less than `attachmentCount`.

- **VUID-VkRenderPassCreateInfo2-pAttachments-02522**
  For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo2-pAttachments-02523**
  For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo2-pDependencies-03054**
  For any element of `pDependencies`, if the `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `srcStageMask` member of that dependency **must** be a pipeline stage supported by the pipeline identified by the `pipelineBindPoint` member of the source subpass.

- **VUID-VkRenderPassCreateInfo2-pDependencies-03055**
  For any element of `pDependencies`, if the `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `dstStageMask` member of that dependency **must** be a pipeline stage supported by the pipeline identified by the `pipelineBindPoint` member of the destination subpass.

- **VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-03056**
  The set of bits included in any element of `pCorrelatedViewMasks` **must** not overlap with the set of bits included in any other element of `pCorrelatedViewMasks`.

- **VUID-VkRenderPassCreateInfo2-viewMask-03057**

Chapter 8. Render Pass | 421
If the `VkSubpassDescription2::viewMask` member of all elements of `pSubpasses` is 0, `correlatedViewMaskCount` must be 0

- **VUID-VkRenderPassCreateInfo2-viewMask-03058**
  The `VkSubpassDescription2::viewMask` member of all elements of `pSubpasses` must either all be 0, or all not be 0

- **VUID-VkRenderPassCreateInfo2-viewMask-03059**
  If the `VkSubpassDescription2::viewMask` member of all elements of `pSubpasses` is 0, the `dependencyFlags` member of any element of `pDependencies` must not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- **VUID-VkRenderPassCreateInfo2-pDependencies-03060**
  For any element of `pDependencies` where its `srcSubpass` member equals its `dstSubpass` member, if the `viewMask` member of the corresponding element of `pSubpasses` includes more than one bit, its `dependencyFlags` member must include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- **VUID-VkRenderPassCreateInfo2-attachment-02525**
  If the `attachment` member of any element of the `pInputAttachments` member of any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, the `aspectMask` member of that element of `pInputAttachments` must only include aspects that are present in images of the format specified by the element of `pAttachments` specified by `attachment`

- **VUID-VkRenderPassCreateInfo2-srcSubpass-02526**
  The `srcSubpass` member of each element of `pDependencies` must be less than `subpassCount`

- **VUID-VkRenderPassCreateInfo2-dstSubpass-02527**
  The `dstSubpass` member of each element of `pDependencies` must be less than `subpassCount`

- **VUID-VkRenderPassCreateInfo2-pAttachments-04585**
  If any element of `pAttachments` is used as a fragment shading rate attachment in any subpass, it must not be used as any other attachment in the render pass

- **VUID-VkRenderPassCreateInfo2-flags-04521**
  If `flags` includes `VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM`, an element of `pSubpasses` includes an instance of `VkFragmentShadingRateAttachmentInfoKHR` in its `pNext` chain, and the `pFragmentShadingRateAttachment` member of that structure is not equal to NULL, the `attachment` member of `pFragmentShadingRateAttachment` must be `VK_ATTACHMENT_UNUSED`

- **VUID-VkRenderPassCreateInfo2-pAttachments-04586**
  If any element of `pAttachments` is used as a fragment shading rate attachment in any subpass, it must have an image format whose potential format features contain `VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
Valid Usage (Implicit)

- **VUID-VkRenderPassCreateInfo2-sType-sType**
  
  *sType must be* \texttt{VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO_2}.

- **VUID-VkRenderPassCreateInfo2-pNext-pNext**
  
  *pNext must be* \texttt{NULL} or a pointer to a valid instance of \texttt{VkRenderPassFragmentDensityMapCreateInfoEXT}.

- **VUID-VkRenderPassCreateInfo2-sType-unique**
  
  The *sType value of each struct in the pNext chain must be unique*.

- **VUID-VkRenderPassCreateInfo2-flags-parameter**
  
  *flags must be a valid combination of* \texttt{VkRenderPassCreateFlagBits} values.

- **VUID-VkRenderPassCreateInfo2-pAttachments-parameter**
  
  If *attachmentCount is not 0, pAttachments must be a valid pointer to an array of attachmentCount valid* \texttt{VkAttachmentDescription2} structures.

- **VUID-VkRenderPassCreateInfo2-pSubpasses-parameter**
  
  *pSubpasses must be a valid pointer to an array of subpassCount valid* \texttt{VkSubpassDescription2} structures.

- **VUID-VkRenderPassCreateInfo2-pDependencies-parameter**
  
  If *dependencyCount is not 0, pDependencies must be a valid pointer to an array of dependencyCount valid* \texttt{VkSubpassDependency2} structures.

- **VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-parameter**
  
  If *correlatedViewMaskCount is not 0, pCorrelatedViewMasks must be a valid pointer to an array of correlatedViewMaskCount uint32_t values*.

- **VUID-VkRenderPassCreateInfo2-subpassCount-arraylength**
  
  *subpassCount must be greater than 0*.

The \texttt{VkAttachmentDescription2} structure is defined as:

```c
typedef struct VkAttachmentDescription2 {
    VkStructureType sType;
    const void* pNext;
    VkAttachmentDescriptionFlags flags;
    VkFormat format;
    VkSampleCountFlagBits samples;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkAttachmentLoadOp stencilLoadOp;
    VkAttachmentStoreOp stencilStoreOp;
    VkImageLayout initialLayout;
    VkImageLayout finalLayout;
} VkAttachmentDescription2;
```

or the equivalent
// Provided by VK_KHR_create_renderpass2

typedef VkAttachmentDescription2 VkAttachmentDescription2KHR;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkAttachmentDescriptionFlagBits** specifying additional properties of the attachment.
- **format** is a **VkFormat** value specifying the format of the image that will be used for the attachment.
- **samples** is the number of samples of the image as defined in **VkSampleCountFlagBits**.
- **loadOp** is a **VkAttachmentLoadOp** value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
- **storeOp** is a **VkAttachmentStoreOp** value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
- **stencilLoadOp** is a **VkAttachmentLoadOp** value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
- **stencilStoreOp** is a **VkAttachmentStoreOp** value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- **initialLayout** is the layout the attachment image subresource will be in when a render pass instance begins.
- **finalLayout** is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

Parameters defined by this structure with the same name as those in **VkAttachmentDescription** have the identical effect to those parameters.

If the **separateDepthStencilLayouts** feature is enabled, and **format** is a depth/stencil format, **initialLayout** and **finalLayout** can be set to a layout that only specifies the layout of the depth aspect.

If the **pNext** chain includes a **VkAttachmentDescriptionStencilLayout** structure, then the **stencilInitialLayout** and **stencilFinalLayout** members specify the initial and final layouts of the stencil aspect of a depth/stencil format, and **initialLayout** and **finalLayout** only apply to the depth aspect. For depth-only formats, the **VkAttachmentDescriptionStencilLayout** structure is ignored. For stencil-only formats, the initial and final layouts of the stencil aspect are taken from the **VkAttachmentDescriptionStencilLayout** structure if present, or **initialLayout** and **finalLayout** if not present.

If **format** is a depth/stencil format, and either **initialLayout** or **finalLayout** does not specify a layout for the stencil aspect, then the application **must** specify the initial and final layouts of the stencil aspect by including a **VkAttachmentDescriptionStencilLayout** structure in the **pNext** chain.
Valid Usage

• VUID-VkAttachmentDescription2-finalLayout-03061
  finalLayout must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

• VUID-VkAttachmentDescription2-format-03294
  If format is a color format, initialLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescription2-format-03295
  If format is a depth/stencil format, initialLayout must not be
  VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescription2-format-03296
  If format is a color format, finalLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescription2-format-03297
  If format is a depth/stencil format, finalLayout must not be
  VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03298
  If the separateDepthStencilLayouts feature is not enabled, initialLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL
  or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03299
  If the separateDepthStencilLayouts feature is not enabled, finalLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL
  or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-03300
  If format is a color format, initialLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL
  or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-03301
  If format is a depth/stencil format which includes both depth and stencil aspects, and
  initialLayout is
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL
  or
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, the pNext chain must include a
**VkAttachmentDescriptionStencilLayout** structure

- **VUID-VkAttachmentDescription2-format-03303**
  If `format` is a depth/stencil format which includes both depth and stencil aspects, and `finalLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, the `pNext` chain **must** include a `VkAttachmentDescriptionStencilLayout` structure.

- **VUID-VkAttachmentDescription2-format-03304**
  If `format` is a depth/stencil format which includes only the depth aspect, `initialLayout` **must not** be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkAttachmentDescription2-format-03305**
  If `format` is a depth/stencil format which includes only the depth aspect, `finalLayout` **must not** be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkAttachmentDescription2-format-03306**
  If `format` is a depth/stencil format which includes only the stencil aspect, `initialLayout` **must not** be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- **VUID-VkAttachmentDescription2-format-03307**
  If `format` is a depth/stencil format which includes only the stencil aspect, `finalLayout` **must not** be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.
Valid Usage (Implicit)

- VUID-VkAttachmentDescription2-sType-sType
  
  **sType must** be **VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_2**

- VUID-VkAttachmentDescription2-pNext-pNext
  
  **pNext must** be **NULL** or a pointer to a valid instance of
  
  VkAttachmentDescriptionStencilLayout

- VUID-VkAttachmentDescription2-sType-unique
  
  The **sType** value of each struct in the **pNext** chain must be **unique**

- VUID-VkAttachmentDescription2-flags-parameter
  
  **flags must** be a valid combination of **VkAttachmentDescriptionFlagBits** values

- VUID-VkAttachmentDescription2-format-parameter
  
  **format must** be a valid **VkFormat** value

- VUID-VkAttachmentDescription2-samples-parameter
  
  **samples must** be a valid **VkSampleCountFlagBits** value

- VUID-VkAttachmentDescription2-loadOp-parameter
  
  **loadOp must** be a valid **VkAttachmentLoadOp** value

- VUID-VkAttachmentDescription2-storeOp-parameter
  
  **storeOp must** be a valid **VkAttachmentStoreOp** value

- VUID-VkAttachmentDescription2-stencilLoadOp-parameter
  
  **stencilLoadOp must** be a valid **VkAttachmentLoadOp** value

- VUID-VkAttachmentDescription2-stencilStoreOp-parameter
  
  **stencilStoreOp must** be a valid **VkAttachmentStoreOp** value

- VUID-VkAttachmentDescription2-initialLayout-parameter
  
  **initialLayout must** be a valid **VkImageLayout** value

- VUID-VkAttachmentDescription2-finalLayout-parameter
  
  **finalLayout must** be a valid **VkImageLayout** value

The **VkAttachmentDescriptionStencilLayout** structure is defined as:

```c
typedef struct VkAttachmentDescriptionStencilLayout {
    VkStructureType    sType;
    void*              pNext;
    VkImageLayout      stencilInitialLayout;
    VkImageLayout      stencilFinalLayout;
} VkAttachmentDescriptionStencilLayout;
```

or the equivalent

```c
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkAttachmentDescriptionStencilLayout VkAttachmentDescriptionStencilLayoutKHR;
```
• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **stencilInitialLayout** is the layout the stencil aspect of the attachment image subresource will be in when a render pass instance begins.

• **stencilFinalLayout** is the layout the stencil aspect of the attachment image subresource will be transitioned to when a render pass instance ends.

## Valid Usage

- **VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-03308**
  ```
  stencilInitialLayout must not be
  VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, or
  ```

- **VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03309**
  ```
  stencilFinalLayout must not be
  VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, or
  ```

- **VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03310**
  ```
  stencilFinalLayout must not be
  VK_IMAGE_LAYOUT_UNDEFINED or
  VK_IMAGE_LAYOUT_PREINITIALIZED
  ```

## Valid Usage (Implicit)

- **VUID-VkAttachmentDescriptionStencilLayout-sType-sType**
  ```
  sType must be
  VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_STENCIL_LAYOUT
  ```

- **VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-parameter**
  ```
  stencilInitialLayout must be a valid VkImageLayout value
  ```

- **VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-parameter**
  ```
  stencilFinalLayout must be a valid VkImageLayout value
  ```

The **VkSubpassDescription2** structure is defined as:
typedef struct VkSubpassDescription2 {
    VkStructureType                  sType;
    const void*                      pNext;
    VkSubpassDescriptionFlags        flags;
    VkPipelineBindPoint              pipelineBindPoint;
    uint32_t                         viewMask;
    uint32_t                         inputAttachmentCount;
    const VkAttachmentReference2*    pInputAttachments;
    uint32_t                         colorAttachmentCount;
    const VkAttachmentReference2*    pColorAttachments;
    const VkAttachmentReference2*    pResolveAttachments;
    const VkAttachmentReference2*    pDepthStencilAttachment;
    uint32_t                         preserveAttachmentCount;
    const uint32_t*                  pPreserveAttachments;
} VkSubpassDescription2;

or the equivalent

// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDescription2 VkSubpassDescription2KHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkSubpassDescriptionFlagBits specifying usage of the subpass.
- **pipelineBindPoint** is a VkPipelineBindPoint value specifying the pipeline type supported for this subpass.
- **viewMask** is a bitfield of view indices describing which views rendering is broadcast to in this subpass, when multiview is enabled.
- **inputAttachmentCount** is the number of input attachments.
- **pInputAttachments** is a pointer to an array of VkAttachmentReference2 structures defining the input attachments for this subpass and their layouts.
- **colorAttachmentCount** is the number of color attachments.
- **pColorAttachments** is a pointer to an array of VkAttachmentReference2 structures defining the color attachments for this subpass and their layouts.
- **pResolveAttachments** is an optional array of colorAttachmentCount VkAttachmentReference2 structures defining the resolve attachments for this subpass and their layouts.
- **pDepthStencilAttachment** is a pointer to a VkAttachmentReference2 structure specifying the depth/stencil attachment for this subpass and its layout.
- **preserveAttachmentCount** is the number of preserved attachments.
- **pPreserveAttachments** is a pointer to an array of preserveAttachmentCount render pass attachment indices identifying attachments that are not used by this subpass, but whose contents must be preserved throughout the subpass.
Parameters defined by this structure with the same name as those in `VkSubpassDescription` have the identical effect to those parameters.

`viewMask` has the same effect for the described subpass as `VkRenderPassMultiviewCreateInfo::pViewMasks` has on each corresponding subpass.

If an instance of `VkFragmentShadingRateAttachmentInfoKHR` is included in the `pNext` chain, `pFragmentShadingRateAttachment` is not `NULL`, and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the identified attachment defines a fragment shading rate attachment for that subpass.
Valid Usage

• VUID-VkSubpassDescription2-pipelineBindPoint-03062
  
  pipelineBindPoint must be VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-VkSubpassDescription2-colorAttachmentCount-03063
  
  colorAttachmentCount must be less than or equal to VkPhysicalDeviceLimits::maxColorAttachments

• VUID-VkSubpassDescription2-loadOp-03064
  
  If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then loadOp must not be VK_ATTACHMENT_LOAD_OP_CLEAR

• VUID-VkSubpassDescription2-pResolveAttachments-03065
  
  If pResolveAttachments is not NULL, for each resolve attachment that does not have the value VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have the value VK_ATTACHMENT_UNUSED

• VUID-VkSubpassDescription2-pResolveAttachments-03066
  
  If pResolveAttachments is not NULL, for each resolve attachment that is not VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have a sample count of VK_SAMPLE_COUNT_1_BIT

• VUID-VkSubpassDescription2-pResolveAttachments-03067
  
  If pResolveAttachments is not NULL, each resolve attachment that is not VK_ATTACHMENT_UNUSED must have a sample count of VK_SAMPLE_COUNT_1_BIT

• VUID-VkSubpassDescription2-pResolveAttachments-03068
  
  Any given element of pResolveAttachments must have the same VkFormat as its corresponding color attachment

• VUID-VkSubpassDescription2-pColorAttachments-03069
  
  All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have the same sample count

• VUID-VkSubpassDescription2-pInputAttachments-02897
  
  All attachments in pInputAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain at least VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkSubpassDescription2-pColorAttachments-02898
  
  All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

• VUID-VkSubpassDescription2-pResolveAttachments-02899
  
  All attachments in pResolveAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

• VUID-VkSubpassDescription2-pDepthStencilAttachment-02900
  
  If pDepthStencilAttachment is not NULL and the attachment is not VK_ATTACHMENT_UNUSED then it must have an image format whose potential format features contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT
If the `VK_AMD_mixed_attachment_samples` extension is enabled, all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` must have a sample count that is smaller than or equal to the sample count of `pDepthStencilAttachment` if it is not `VK_ATTACHMENT_UNUSED`.

If neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, and if `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED` and any attachments in `pColorAttachments` are not `VK_ATTACHMENT_UNUSED`, they must have the same sample count.

The attachment member of any element of `pPreserveAttachments` must not be `VK_ATTACHMENT_UNUSED`.

Any given element of `pPreserveAttachments` must not also be an element of any other member of the subpass description.

If any attachment is used by more than one `VkAttachmentReference` member, then each use must use the same layout.

Attachments must follow the image layout requirements based on the type of attachment it is being used as.

If `flags` includes `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX`, it must also include `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX`.

If the attachment member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member must be a valid combination of `VkImageAspectFlagBits`.

If the attachment member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member must not be 0.

If the attachment member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member must not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index `i`.

An attachment must not be used in both `pDepthStencilAttachment` and `pColorAttachments`.
Valid Usage (Implicit)

- VUID-VkSubpassDescription2-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_2

- VUID-VkSubpassDescription2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkFragmentShadingRateAttachmentInfoKHR or VkSubpassDescriptionDepthStencilResolve

- VUID-VkSubpassDescription2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkSubpassDescription2-flags-parameter
  flags must be a valid combination of VkSubpassDescriptionFlagBits values

- VUID-VkSubpassDescription2-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-VkSubpassDescription2-pInputAttachments-parameter
  If inputAttachmentCount is not 0, pInputAttachments must be a valid pointer to an array of inputAttachmentCount valid VkAttachmentReference2 structures

- VUID-VkSubpassDescription2-pColorAttachments-parameter
  If colorAttachmentCount is not 0, pColorAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference2 structures

- VUID-VkSubpassDescription2-pResolveAttachments-parameter
  If colorAttachmentCount is not 0, and pResolveAttachments is not NULL, pResolveAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference2 structures

- VUID-VkSubpassDescription2-pDepthStencilAttachment-parameter
  If pDepthStencilAttachment is not NULL, pDepthStencilAttachment must be a valid pointer to a valid VkAttachmentReference2 structure

- VUID-VkSubpassDescription2-pPreserveAttachments-parameter
  If preserveAttachmentCount is not 0, pPreserveAttachments must be a valid pointer to an array of preserveAttachmentCount uint32_t values

If the pNext list of VkSubpassDescription2 includes a VkSubpassDescriptionDepthStencilResolve structure, then that structure describes multisample resolve operations for the depth/stencil attachment in a subpass.

The VkSubpassDescriptionDepthStencilResolve structure is defined as:
typedef struct VkSubpassDescriptionDepthStencilResolve {
    VkStructureType                  sType;
    const void*                      pNext;
    VkResolveModeFlagBits            depthResolveMode;
    VkResolveModeFlagBits            stencilResolveMode;
    const VkAttachmentReference2*    pDepthStencilResolveAttachment;
} VkSubpassDescriptionDepthStencilResolve;

or the equivalent

// Provided by VK_KHR_depth_stencil_resolve
typedef VkSubpassDescriptionDepthStencilResolve
VkSubpassDescriptionDepthStencilResolveKHR;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `depthResolveMode` is a bitmask of `VkResolveModeFlagBits` describing the depth resolve mode.
- `stencilResolveMode` is a bitmask of `VkResolveModeFlagBits` describing the stencil resolve mode.
- `pDepthStencilResolveAttachment` is an optional `VkAttachmentReference` structure defining the depth/stencil resolve attachment for this subpass and its layout.
Valid Usage

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03177
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, pDepthStencilAttachment must not have the value VK_ATTACHMENT_UNUSED

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03178
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, depthResolveMode and stencilResolveMode must not both be VK_RESOLVE_MODE_NONE

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03179
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, pDepthStencilAttachment must not have a sample count of VK_SAMPLE_COUNT_1_BIT

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03180
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, pDepthStencilResolveAttachment must have a sample count of VK_SAMPLE_COUNT_1_BIT

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-02651
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED then it must have a format whose features contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03181
  If the VkFormat of pDepthStencilResolveAttachment has a depth component, then the VkFormat of pDepthStencilAttachment must have a depth component with the same number of bits and numerical type

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03182
  If the VkFormat of pDepthStencilResolveAttachment has a stencil component, then the VkFormat of pDepthStencilAttachment must have a stencil component with the same number of bits and numerical type

• VUID-VkSubpassDescriptionDepthStencilResolve-depthResolveMode-03183
  The value of depthResolveMode must be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes or VK_RESOLVE_MODE_NONE

• VUID-VkSubpassDescriptionDepthStencilResolve-stencilResolveMode-03184
  The value of stencilResolveMode must be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes or VK_RESOLVE_MODE_NONE

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03185
  If the VkFormat of pDepthStencilResolveAttachment has both depth and stencil components, VkPhysicalDeviceDepthStencilResolveProperties::independentResolve is VK_FALSE, and VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone is VK_FALSE, then the values of depthResolveMode and stencilResolveMode must be identical

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03186
  If the VkFormat of pDepthStencilResolveAttachment has both depth and stencil components, VkPhysicalDeviceDepthStencilResolveProperties::independentResolve is VK_FALSE, and VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone is VK_FALSE, then the values of depthResolveMode and stencilResolveMode must be identical
components, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE` and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_TRUE`, then the values of `depthResolveMode` and `stencilResolveMode` must be identical or one of them must be `VK_RESOLVE_MODE_NONE`.

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-04588
  If the `VkFormat` of `pDepthStencilResolveAttachment` has a depth component, `depthResolveMode` must be a valid `VkResolveModeFlagBits` value.

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-04589
  If the `VkFormat` of `pDepthStencilResolveAttachment` has a stencil component, `stencilResolveMode` must be a valid `VkResolveModeFlagBits` value.

### Valid Usage (Implicit)

- VUID-VkSubpassDescriptionDepthStencilResolve-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_DEPTH_STENCIL_RESOLVE`.

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-parameter
  If `pDepthStencilResolveAttachment` is not NULL, `pDepthStencilResolveAttachment` must be a valid pointer to a valid `VkAttachmentReference2` structure.

Possible values of `VkSubpassDescriptionDepthStencilResolve::depthResolveMode` and `stencilResolveMode`, specifying the depth and stencil resolve modes, are:

```c
typedef enum VkResolveModeFlagBits {  
  VK_RESOLVE_MODE_NONE = 0,  
  VK_RESOLVE_MODE_SAMPLE_ZERO_BIT = 0x00000001,  
  VK_RESOLVE_MODE_AVERAGE_BIT = 0x00000002,  
  VK_RESOLVE_MODE_MIN_BIT = 0x00000004,  
  VK_RESOLVE_MODE_MAX_BIT = 0x00000008,  
  // Provided by VK_KHR_depth_stencilResolve
  VK_RESOLVE_MODE_NONE_KHR = VK_RESOLVE_MODE_NONE,  
  // Provided by VK_KHR_depth_stencilResolve
  VK_RESOLVE_MODE_SAMPLE_ZERO_BIT_KHR = VK_RESOLVE_MODE_SAMPLE_ZERO_BIT,  
  // Provided by VK_KHR_depth_stencilResolve
  VK_RESOLVE_MODE_AVERAGE_BIT_KHR = VK_RESOLVE_MODE_AVERAGE_BIT,  
  // Provided by VK_KHR_depth_stencil_resolve
  VK_RESOLVE_MODE_MIN_BIT_KHR = VK_RESOLVE_MODE_MIN_BIT,  
  // Provided by VK_KHR_depth_stencil_resolve
  VK_RESOLVE_MODE_MAX_BIT_KHR = VK_RESOLVE_MODE_MAX_BIT,  
} VkResolveModeFlagBits;
```

or the equivalent:

```c
// Provided by VK_KHR_depth_stencil_resolve
typedef VkResolveModeFlagBits VkResolveModeFlagBitsKHR;
```
• **VK_RESOLVE_MODE_NONE** indicates that no resolve operation is done.
• **VK_RESOLVE_MODE_SAMPLE_ZERO_BIT** indicates that result of the resolve operation is equal to the value of sample 0.
• **VK_RESOLVE_MODE_AVERAGE_BIT** indicates that result of the resolve operation is the average of the sample values.
• **VK_RESOLVE_MODE_MIN_BIT** indicates that result of the resolve operation is the minimum of the sample values.
• **VK_RESOLVE_MODE_MAX_BIT** indicates that result of the resolve operation is the maximum of the sample values.

```c
typedef VkFlags VkResolveModeFlags;
```
or the equivalent

```c
// Provided by VK_KHR_depth_stencil_resolve
typedef VkResolveModeFlags VkResolveModeFlagsKHR;
```

**VkResolveModeFlags** is a bitmask type for setting a mask of zero or more **VkResolveModeFlagBits**.

The **VkFragmentShadingRateAttachmentInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkFragmentShadingRateAttachmentInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    const VkAttachmentReference2*  pFragmentShadingRateAttachment;
    VkExtent2D                shadingRateAttachmentTexelSize;
} VkFragmentShadingRateAttachmentInfoKHR;
```

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **pFragmentShadingRateAttachment** is an optional **VkAttachmentReference2KHR** structure defining the fragment shading rate attachment for this subpass.
• **shadingRateAttachmentTexelSize** specifies the size of the portion of the framebuffer corresponding to each texel in **pFragmentShadingRateAttachment**.

If no shading rate attachment is specified, or if this structure isn’t specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.
Valid Usage

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04524**: If `pFragmentShadingRateAttachment` is not `NULL` and its attachment member is not `VK_ATTACHMENT_UNUSED`, its layout member must be equal to `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`.

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04525**: If `pFragmentShadingRateAttachment` is not `NULL` and its attachment member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` must be a power of two.

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04526**: If `pFragmentShadingRateAttachment` is not `NULL` and its attachment member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.width`.

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04527**: If `pFragmentShadingRateAttachment` is not `NULL` and its attachment member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` must be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.width`.

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04528**: If `pFragmentShadingRateAttachment` is not `NULL` and its attachment member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.height` must be a power of two.

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04529**: If `pFragmentShadingRateAttachment` is not `NULL` and its attachment member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.height` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.height`.

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04530**: If `pFragmentShadingRateAttachment` is not `NULL` and its attachment member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.height` must be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.height`.

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04531**: If `pFragmentShadingRateAttachment` is not `NULL` and its attachment member is not `VK_ATTACHMENT_UNUSED`, the quotient of `shadingRateAttachmentTexelSize.width` and `shadingRateAttachmentTexelSize.height` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`.

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04532**: If `pFragmentShadingRateAttachment` is not `NULL` and its attachment member is not `VK_ATTACHMENT_UNUSED`, the quotient of `shadingRateAttachmentTexelSize.height` and `shadingRateAttachmentTexelSize.width` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`.

---

438 | Chapter 8. Render Pass
Valid Usage (Implicit)

- VUID-VkFragmentShadingRateAttachmentInfoKHR-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-parameter

  **pFragmentShadingRateAttachment** must be a valid pointer to a valid
  
  `VkAttachmentReference2` structure

The `VkAttachmentReference2` structure is defined as:

```c
typedef struct VkAttachmentReference2 {
    VkStructureType       sType;
    const void*           pNext;
    uint32_t              attachment;
    VkImageLayout         layout;
    VkImageAspectFlags    aspectMask;
} VkAttachmentReference2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkAttachmentReference2 VkAttachmentReference2KHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **attachment** is either an integer value identifying an attachment at the corresponding index in
  
  `VkRenderPassCreateInfo::pAttachments`, or `VK_ATTACHMENT_UNUSED` to signify that this attachment is
  
  not used.
- **layout** is a `VkImageLayout` value specifying the layout the attachment uses during the subpass.
- **aspectMask** is a mask of which aspect(s) can be accessed within the specified subpass as an input
  
  attachment.

Parameters defined by this structure with the same name as those in `VkAttachmentReference` have
the identical effect to those parameters.

**aspectMask** is ignored when this structure is used to describe anything other than an input
attachment reference.

If the `separateDepthStencilLayouts` feature is enabled, and **attachment** has a depth/stencil format,

**layout** can be set to a layout that only specifies the layout of the depth aspect.

If **layout** only specifies the layout of the depth aspect of the attachment, the layout of the stencil
aspect is specified by the **stencillayout** member of a `VkAttachmentReferenceStencilLayout`
structure included in the **pNext** chain. Otherwise, **layout** describes the layout for all relevant image
Valid Usage

- **VUID-VkAttachmentReference2-layout-03077**
  If attachment is not VK_ATTACHMENT_UNUSED, layout must not be VK_IMAGE_LAYOUT_UNDEFINED, VK_IMAGE_LAYOUT_PREINITIALIZED, or VK_IMAGE_LAYOUT_PRESENT_SRC_KHR.

- **VUID-VkAttachmentReference2-separateDepthStencilLayouts-03313**
  If the separateDepthStencils Layout feature is not enabled, and attachment is not VK_ATTACHMENT_UNUSED, layout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

- **VUID-VkAttachmentReference2-attachment-04754**
  If attachment is not VK_ATTACHMENT_UNUSED, and the format of the referenced attachment is a color format, layout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

- **VUID-VkAttachmentReference2-attachment-04755**
  If attachment is not VK_ATTACHMENT_UNUSED, and the format of the referenced attachment is a depth/stencil format which includes both depth and stencil aspects, and layout is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, the pNext chain must include a VkAttachmentReferenceStencilLayout structure.

- **VUID-VkAttachmentReference2-attachment-04756**
  If attachment is not VK_ATTACHMENT_UNUSED, and the format of the referenced attachment is a depth/stencil format which includes only the depth aspect, layout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

- **VUID-VkAttachmentReference2-attachment-04757**
  If attachment is not VK_ATTACHMENT_UNUSED, and the format of the referenced attachment is a depth/stencil format which includes only the stencil aspect, layout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL.

Valid Usage (Implicit)

- **VUID-VkAttachmentReference2-sType-sType**
  sType must be VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_2.

- **VUID-VkAttachmentReference2-pNext-pNext**
  pNext must be NULL or a pointer to a valid instance of VkAttachmentReferenceStencilLayout.

- **VUID-VkAttachmentReference2-sType-unique**
  The sType value of each struct in the pNext chain must be unique.

- **VUID-VkAttachmentReference2-layout-parameter**
  layout must be a valid VkImageLayout value.
The `VkAttachmentReferenceStencilLayout` structure is defined as:

```c
typedef struct VkAttachmentReferenceStencilLayout {
    VkStructureType sType;
    void* pNext;
    VkImageLayout stencilLayout;
} VkAttachmentReferenceStencilLayout;
```

or the equivalent

```c
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkAttachmentReferenceStencilLayout VkAttachmentReferenceStencilLayoutKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stencilLayout` is a `VkImageLayout` value specifying the layout the stencil aspect of the attachment uses during the subpass.

### Valid Usage

- VUID-VkAttachmentReferenceStencilLayout-stencilLayout-03318
  
  `stencilLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` or

### Valid Usage (Implicit)

- VUID-VkAttachmentReferenceStencilLayout-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_STENCIL_LAYOUT`

- VUID-VkAttachmentReferenceStencilLayout-stencilLayout-parameter
  
  `stencilLayout` must be a valid `VkImageLayout` value

The `VkSubpassDependency2` structure is defined as:

Chapter 8. Render Pass | 441
typedef struct VkSubpassDependency2 {
    VkStructureType         sType;
    const void*             pNext;
    uint32_t                srcSubpass;
    uint32_t                dstSubpass;
    VkPipelineStageFlags    srcStageMask;
    VkPipelineStageFlags    dstStageMask;
    VkAccessFlags           srcAccessMask;
    VkAccessFlags           dstAccessMask;
    VkDependencyFlags       dependencyFlags;
    int32_t                 viewOffset;
} VkSubpassDependency2;

or the equivalent

// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDependency2 VkSubpassDependency2KHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcSubpass** is the subpass index of the first subpass in the dependency, or **VK_SUBPASS_EXTERNAL**.
- **dstSubpass** is the subpass index of the second subpass in the dependency, or **VK_SUBPASS_EXTERNAL**.
- **srcStageMask** is a bitmask of **VkPipelineStageFlagBits** specifying the source stage mask.
- **dstStageMask** is a bitmask of **VkPipelineStageFlagBits** specifying the destination stage mask.
- **srcAccessMask** is a bitmask of **VkAccessFlagBits** specifying a source access mask.
- **dstAccessMask** is a bitmask of **VkAccessFlagBits** specifying a destination access mask.
- **dependencyFlags** is a bitmask of **VkDependencyFlagBits**.
- **viewOffset** controls which views in the source subpass the views in the destination subpass depend on.

Parameters defined by this structure with the same name as those in **VkSubpassDependency** have the identical effect to those parameters.

**viewOffset** has the same effect for the described subpass dependency as **VkRenderPassMultiviewCreateInfo::pViewOffsets** has on each corresponding subpass dependency.

If an instance of **VkMemoryBarrier2KHR** is included in the **pNext** chain, **srcStageMask**, **dstStageMask**, **srcAccessMask**, and **dstAccessMask** parameters are ignored. The synchronization and access scopes instead are defined by the parameters of **VkMemoryBarrier2KHR**.
Valid Usage

- VUID-VkSubpassDependency2-srcStageMask-03080
  If the geometry shaders feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- VUID-VkSubpassDependency2-dstStageMask-03081
  If the geometry shaders feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- VUID-VkSubpassDependency2-srcStageMask-03082
  If the tessellation shaders feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-VkSubpassDependency2-dstStageMask-03083
  If the tessellation shaders feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-VkSubpassDependency2-srcSubpass-03084
  srcSubpass must be less than or equal to dstSubpass, unless one of them is VK_SUBPASS_EXTERNAL, to avoid cyclic dependencies and ensure a valid execution order

- VUID-VkSubpassDependency2-srcSubpass-03085
  srcSubpass and dstSubpass must not both be equal to VK_SUBPASS_EXTERNAL

- VUID-VkSubpassDependency2-srcSubpass-03087
  If srcSubpass is equal to dstSubpass and not all of the stages in srcStageMask and dstStageMask are framebuffer-space stages, the logically latest pipeline stage in srcStageMask must be logically earlier than or equal to the logically earliest pipeline stage in dstStageMask

- VUID-VkSubpassDependency2-srcAccessMask-03088
  Any access flag included in srcAccessMask must be supported by one of the pipeline stages in srcStageMask, as specified in the table of supported access types

- VUID-VkSubpassDependency2-dstAccessMask-03089
  Any access flag included in dstAccessMask must be supported by one of the pipeline stages in dstStageMask, as specified in the table of supported access types

- VUID-VkSubpassDependency2-dependencyFlags-03090
  If dependencyFlags includes VK_DEPENDENCY_VIEW_LOCAL_BIT, srcSubpass must not be equal to VK_SUBPASS_EXTERNAL

- VUID-VkSubpassDependency2-dependencyFlags-03091
  If dependencyFlags includes VK_DEPENDENCY_VIEW_LOCAL_BIT, dstSubpass must not be equal to VK_SUBPASS_EXTERNAL

- VUID-VkSubpassDependency2-srcSubpass-02245
  If srcSubpass equals dstSubpass, and srcStageMask and dstStageMask both include a framebuffer-space stage, then dependencyFlags must include VK_DEPENDENCY_BY_REGION_BIT

- VUID-VkSubpassDependency2-viewOffset-02530
  If viewOffset is not equal to 0, srcSubpass must not be equal to dstSubpass

- VUID-VkSubpassDependency2-dependencyFlags-03092
If `dependencyFlags` does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `viewOffset` must be 0

- **VUID-VkSubpassDependency2-srcStageMask-02103**
  If the mesh shaders feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`

- **VUID-VkSubpassDependency2-srcStageMask-02104**
  If the task shaders feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`

- **VUID-VkSubpassDependency2-dstStageMask-02105**
  If the mesh shaders feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`

- **VUID-VkSubpassDependency2-dstStageMask-02106**
  If the task shaders feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`

---

### Valid Usage (Implicit)

- **VUID-VkSubpassDependency2-sType-sType**
  sType must be `VK_STRUCTURE_TYPE_SUBPASS_DEPENDENCY_2`

- **VUID-VkSubpassDependency2-pNext-pNext**
  pNext must be NULL or a pointer to a valid instance of `VkMemoryBarrier2KHR`

- **VUID-VkSubpassDependency2-sType-unique**
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkSubpassDependency2-srcStageMask-parameter**
  srcStageMask must be a valid combination of VkPipelineStageFlagBits values

- **VUID-VkSubpassDependency2-dstStageMask-parameter**
  dstStageMask must be a valid combination of VkPipelineStageFlagBits values

- **VUID-VkSubpassDependency2-srcAccessMask-parameter**
  srcAccessMask must be a valid combination of VkAccessFlagBits values

- **VUID-VkSubpassDependency2-dstAccessMask-parameter**
  dstAccessMask must be a valid combination of VkAccessFlagBits values

- **VUID-VkSubpassDependency2-dependencyFlags-parameter**
  dependencyFlags must be a valid combination of VkDependencyFlagBits values

---

To destroy a render pass, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyRenderPass(
    VkDevice    device,          // Provided by VK_VERSION_1_0
    VkRenderPass renderPass,     // Provided by VK_VERSION_1_0
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the render pass.
• `renderPass` is the handle of the render pass to destroy.

• `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyRenderPass-renderPass-00873**
  All submitted commands that refer to `renderPass` must have completed execution.

- **VUID-vkDestroyRenderPass-renderPass-00874**
  If `VkAllocationCallbacks` were provided when `renderPass` was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroyRenderPass-renderPass-00875**
  If no `VkAllocationCallbacks` were provided when `renderPass` was created, `pAllocator` must be `NULL`.

### Valid Usage (Implicit)

- **VUID-vkDestroyRenderPass-device-parameter**
  **device** must be a valid `VkDevice` handle.

- **VUID-vkDestroyRenderPass-renderPass-parameter**
  If `renderPass` is not `VK_NULL_HANDLE`, `renderPass` must be a valid `VkRenderPass` handle.

- **VUID-vkDestroyRenderPass-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkDestroyRenderPass-renderPass-parent**
  If `renderPass` is a valid handle, it must have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `renderPass` must be externally synchronized.

### 8.2. Render Pass Compatibility

Framebuffers and graphics pipelines are created based on a specific render pass object. They must only be used with that render pass object, or one compatible with it.

Two attachment references are compatible if they have matching format and sample count, or are both `VK_ATTACHMENT_UNUSED` or the pointer that would contain the reference is `NULL`.

Two arrays of attachment references are compatible if all corresponding pairs of attachments are compatible. If the arrays are of different lengths, attachment references not present in the smaller array are treated as `VK_ATTACHMENT_UNUSED`.

Chapter 8. Render Pass | 445
Two render passes are compatible if their corresponding color, input, resolve, and depth/stencil attachment references are compatible and if they are otherwise identical except for:

- Initial and final image layout in attachment descriptions
- Load and store operations in attachment descriptions
- Image layout in attachment references

As an additional special case, if two render passes have a single subpass, the resolve attachment reference and depth/stencil resolve mode compatibility requirements are ignored.

A framebuffer is compatible with a render pass if it was created using the same render pass or a compatible render pass.

### 8.3. Framebuffers

Render passes operate in conjunction with *framebuffers*. Framebuffers represent a collection of specific memory attachments that a render pass instance uses.

Framebuffers are represented by `VkFramebuffer` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFramebuffer)
```

To create a framebuffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateFramebuffer(
    VkDevice                                device,
    const VkFramebufferCreateInfo*         pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkFramebuffer*                         pFramebuffer);
```

- `device` is the logical device that creates the framebuffer.
- `pCreateInfo` is a pointer to a `VkFramebufferCreateInfo` structure describing additional information about framebuffer creation.
- `pAllocator` controls host memory allocation as described in the *Memory Allocation* chapter.
- `pFramebuffer` is a pointer to a `VkFramebuffer` handle in which the resulting framebuffer object is returned.
Valid Usage

• VUID-vkCreateFramebuffer-pCreateInfo-02777
  If `pCreateInfo->flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and `attachmentCount` is not 0, each element of `pCreateInfo->pAttachments` must have been created on device.

Valid Usage (Implicit)

• VUID-vkCreateFramebuffer-device-parameter
  `device` must be a valid `VkDevice` handle

• VUID-vkCreateFramebuffer-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkFramebufferCreateInfo` structure

• VUID-vkCreateFramebuffer-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

• VUID-vkCreateFramebuffer-pFramebuffer-parameter
  `pFramebuffer` must be a valid pointer to a `VkFramebuffer` handle

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkFramebufferCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkFramebufferCreateInfo {
  VkStructureType sType;
  const void* pNext;
  VkFramebufferCreateFlags flags;
  VkRenderPass renderPass;
  uint32_t attachmentCount;
  const VkImageView* pAttachments;
  uint32_t width;
  uint32_t height;
  uint32_t layers;
} VkFramebufferCreateInfo;
```
• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **flags** is a bitmask of **VkFramebufferCreateFlagBits**

• **renderPass** is a render pass defining what render passes the framebuffer will be compatible with. See **Render Pass Compatibility** for details.

• **attachmentCount** is the number of attachments.

• **pAttachments** is a pointer to an array of **VkImageView** handles, each of which will be used as the corresponding attachment in a render pass instance. If **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, this parameter is ignored.

• **width**, **height** and **layers** define the dimensions of the framebuffer. If the render pass uses multiview, then **layers must** be one and each attachment requires a number of layers that is greater than the maximum bit index set in the view mask in the subpasses in which it is used.

Other than the exceptions listed below, applications **must** ensure that all accesses to memory that backs image subresources used as attachments in a given renderpass instance either happen-before the **load operations** for those attachments, or happen-after the **store operations** for those attachments.

The exceptions to the general rule are:

• For depth/stencil attachments, an aspect **can** be used separately as attachment and non-attachment if both accesses are read-only.

• For depth/stencil attachments, each aspect **can** be used separately as attachments and non-attachments as long as the non-attachment accesses are also via an image subresource in either the **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL** layout or the **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** layout, and the attachment resource uses whichever of those two layouts the image accesses do not.

Use of non-attachment aspects in these cases is only well defined if the attachment is used in the subpass where the non-attachment access is being made, or the layout of the image subresource is constant throughout the entire render pass instance, including the **initialLayout** and **finalLayout**.

**Note**

These restrictions mean that the render pass has full knowledge of all uses of all of the attachments, so that the implementation is able to make correct decisions about when and how to perform layout transitions, when to overlap execution of subpasses, etc.

It is legal for a subpass to use no color or depth/stencil attachments, either because it has no attachment references or because all of them are **VK_ATTACHMENT_UNUSED**. This kind of subpass **can** use shader side effects such as image stores and atomics to produce an output. In this case, the subpass continues to use the **width**, **height**, and **layers** of the framebuffer to define the dimensions of the rendering area, and the **rasterizationSamples** from each pipeline's **VkPipelineMultisampleStateCreateInfo** to define the number of samples used in rasterization; however, if **VkPhysicalDeviceFeatures::variableMultisampleRate** is **VK_FALSE**, then all pipelines to be bound with the subpass **must** have the same value for **VkPipelineMultisampleStateCreateInfo**.
::rasterizationSamples.
Valid Usage

- VUID-VkFramebufferCreateInfo-attachmentCount-00876
  `attachmentCount` must be equal to the attachment count specified in `renderPass`

- VUID-VkFramebufferCreateInfo-flags-02778
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and `attachmentCount` is not 0, `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkImageView` handles

- VUID-VkFramebufferCreateInfo-pAttachments-00877
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a color attachment or resolve attachment by `renderPass` must have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- VUID-VkFramebufferCreateInfo-pAttachments-02633
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a depth/stencil attachment by `renderPass` must have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkFramebufferCreateInfo-pAttachments-02634
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a depth/stencil resolve attachment by `renderPass` must have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkFramebufferCreateInfo-pAttachments-00879
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as an input attachment by `renderPass` must have been created with a `usage` value including `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-VkFramebufferCreateInfo-pAttachments-02552
  Each element of `pAttachments` that is used as a fragment density map attachment by `renderPass` must not have been created with a `flags` value including `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`

- VUID-VkFramebufferCreateInfo-renderPass-02553
  If `renderPass` has a fragment density map attachment and non-subsample image feature is not enabled, each element of `pAttachments` must have been created with a `flags` value including `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT` unless that element is the fragment density map attachment

- VUID-VkFramebufferCreateInfo-pAttachments-00880
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` must have been created with a `VkFormat` value that matches the `VkFormat` specified by the corresponding `VkAttachmentDescription` in `renderPass`

- VUID-VkFramebufferCreateInfo-pAttachments-00881
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` must have been created with a `samples` value that matches the `samples` value specified by the corresponding `VkAttachmentDescription` in `renderPass`

- VUID-VkFramebufferCreateInfo-flags-04533
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of
pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have been created with a VkImageCreateInfo::width greater than or equal to width

• VUID-VkFramebufferCreateInfo-flags-04534
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have been created with a VkImageCreateInfo::height greater than or equal to height

• VUID-VkFramebufferCreateInfo-flags-04535
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have been created with a VkImageViewCreateInfo::subresourceRange.layerCount greater than or equal to layers

• VUID-VkFramebufferCreateInfo-renderPass-04536
  If renderPass was specified with non-zero view masks, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have a layerCount greater than the index of the most significant bit set in any of those view masks

• VUID-VkFramebufferCreateInfo-renderPass-02746
  If renderPass was specified with non-zero view masks, each element of pAttachments that is referenced by fragmentDensityMapAttachment must have a layerCount equal to 1 or greater than the index of the most significant bit set in any of those view masks

• VUID-VkFramebufferCreateInfo-renderPass-02747
  If renderPass was not specified with non-zero view masks, each element of pAttachments that is referenced by fragmentDensityMapAttachment must have a layerCount equal to 1

• VUID-VkFramebufferCreateInfo-pAttachments-02555
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, an element of pAttachments that is referenced by fragmentDensityMapAttachment must have a width at least as large as \[
  \left\lceil \frac{\text{maxFragmentDensityPerPixelSize.width}}{\text{width}} \right\rceil
  \]

• VUID-VkFramebufferCreateInfo-pAttachments-02556
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, an element of pAttachments that is referenced by fragmentDensityMapAttachment must have a height at least as large as \[
  \left\lceil \frac{\text{maxFragmentDensityPerPixelSize.height}}{\text{height}} \right\rceil
  \]

• VUID-VkFramebufferCreateInfo-flags-04537
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, and renderPass was specified with non-zero view masks, each element of pAttachments that is used as a fragment shading rate attachment by renderPass must have a layerCount that is either 1, or greater than the index of the most significant bit set in any of those view masks

• VUID-VkFramebufferCreateInfo-flags-04538
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, and renderPass was not specified with non-zero view masks, each element of pAttachments that is used as a fragment shading rate attachment by renderPass must have a layerCount that is either 1, or greater than layers

• VUID-VkFramebufferCreateInfo-flags-04539
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, an element of pAttachments
that is used as a **fragment shading rate attachment** must have a width at least as large as $\lceil \text{width} / \text{texelWidth} \rceil$, where \text{texelWidth} is the largest value of shadingRateAttachmentTexelSize.width in a \text{VkFragmentShadingRateAttachmentInfoKHR} which references that attachment.

- **VUID-VkFramebufferCreateInfo-flags-04540**
  
  If \text{flags} does not include \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT}, an element of \text{pAttachments} that is used as a **fragment shading rate attachment** must have a height at least as large as $\lceil \text{height} / \text{texelHeight} \rceil$, where \text{texelHeight} is the largest value of shadingRateAttachmentTexelSize.height in a \text{VkFragmentShadingRateAttachmentInfoKHR} which references that attachment.

- **VUID-VkFramebufferCreateInfo-pAttachments-00883**
  
  If \text{flags} does not include \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT}, each element of \text{pAttachments} must only specify a single mip level.

- **VUID-VkFramebufferCreateInfo-pAttachments-00884**
  
  If \text{flags} does not include \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT}, each element of \text{pAttachments} must have been created with the identity swizzle.

- **VUID-VkFramebufferCreateInfo-width-00885**
  
  \text{width} must be greater than 0.

- **VUID-VkFramebufferCreateInfo-width-00886**
  
  \text{width} must be less than or equal to \text{VkPhysicalDeviceLimits::maxFramebufferWidth}.

- **VUID-VkFramebufferCreateInfo-height-00887**
  
  \text{height} must be greater than 0.

- **VUID-VkFramebufferCreateInfo-height-00888**
  
  \text{height} must be less than or equal to \text{VkPhysicalDeviceLimits::maxFramebufferHeight}.

- **VUID-VkFramebufferCreateInfo-layers-00889**
  
  \text{layers} must be greater than 0.

- **VUID-VkFramebufferCreateInfo-layers-00890**
  
  \text{layers} must be less than or equal to \text{VkPhysicalDeviceLimits::maxFramebufferLayers}.

- **VUID-VkFramebufferCreateInfo-renderPass-02531**
  
  If \text{renderPass} was specified with non-zero view masks, \text{layers} must be 1.

- **VUID-VkFramebufferCreateInfo-pAttachments-00891**
  
  If \text{flags} does not include \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT}, each element of \text{pAttachments} that is a 2D or 2D array image view taken from a 3D image must not be a depth/stencil format.

- **VUID-VkFramebufferCreateInfo-flags-03189**
  
  If the \text{imageless framebuffer} feature is not enabled, \text{flags} must not include \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT}.

- **VUID-VkFramebufferCreateInfo-flags-03190**
  
  If \text{flags} includes \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT}, the \text{pNext} chain must include an instance of \text{VkFramebufferAttachmentsCreateInfo}.

- **VUID-VkFramebufferCreateInfo-flags-03191**
  
  If \text{flags} includes \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT}, the attachmentImageInfoCount member of an instance of \text{VkFramebufferAttachmentsCreateInfo} in the \text{pNext} chain must
be equal to either zero or attachmentCount

• VUID-VkFramebufferCreateInfo-flags-04541

If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of an instance of VkFramebufferAttachmentsCreateInfo in the pNext chain that is used as an input, color, resolve or depth/stencil attachment in pRenderPass must be greater than or equal to width

• VUID-VkFramebufferCreateInfo-flags-04542

If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the height member of any element of the pAttachmentImageInfos member of an instance of VkFramebufferAttachmentsCreateInfo in the pNext chain that is used as an input, color, resolve or depth/stencil attachment in pRenderPass must be greater than or equal to height

• VUID-VkFramebufferCreateInfo-flags-03196

If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of an instance of VkFramebufferAttachmentsCreateInfo in the pNext chain that is referenced by VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment in renderPass must be greater than or equal to \( \left\lceil \frac{width}{\max\text{FragmentDensityTexelSize.width}} \right\rceil \)

• VUID-VkFramebufferCreateInfo-flags-03197

If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the height member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that is referenced by VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment in renderPass must be greater than or equal to \( \left\lceil \frac{height}{\max\text{FragmentDensityTexelSize.height}} \right\rceil \)

• VUID-VkFramebufferCreateInfo-flags-04543

If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of an instance of VkFramebufferAttachmentsCreateInfo in the pNext chain that is used as a fragment shading rate attachment must be greater than or equal to \( \left\lceil \frac{width}{\text{texelWidth}} \right\rceil \), where texelWidth is the largest value of shadingRateAttachmentTexelSize.width in a VkFragmentShadingRateAttachmentInfoKHR which references that attachment

• VUID-VkFramebufferCreateInfo-flags-04544

If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the height member of any element of the pAttachmentImageInfos member of an instance of VkFramebufferAttachmentsCreateInfo in the pNext chain that is used as a fragment shading rate attachment must be greater than or equal to \( \left\lceil \frac{height}{\text{texelHeight}} \right\rceil \), where texelHeight is the largest value of shadingRateAttachmentTexelSize.height in a VkFragmentShadingRateAttachmentInfoKHR which references that attachment

• VUID-VkFramebufferCreateInfo-flags-04545

If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the layerCount member of any element of the pAttachmentImageInfos member of an instance of VkFramebufferAttachmentsCreateInfo in the pNext chain that is used as a fragment shading rate attachment must be either 1, or greater than or equal to layers

• VUID-VkFramebufferCreateInfo-flags-04587

If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, and renderPass was specified with non-zero view masks, each element of pAttachments that is used as a fragment shading
rate attachment by renderPass must have a layerCount that is either 1, or greater than the index of the most significant bit set in any of those view masks

- VUID-VkFramebufferCreateInfo-renderPass-03198
  If multiview is enabled for renderPass, and flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the layerCount member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain used as an input, color, resolve, or depth/stencil attachment in pRenderPass must be greater than the maximum bit index set in the view mask in the subpasses in which it is used in renderPass

- VUID-VkFramebufferCreateInfo-renderPass-04546
  If multiview is not enabled for renderPass, and flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the layerCount member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain used as an input, color, resolve, or depth/stencil attachment in pRenderPass must be greater than or equal to layers

- VUID-VkFramebufferCreateInfo-flags-03201
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a color attachment or resolve attachment by renderPass must include VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

- VUID-VkFramebufferCreateInfo-flags-03202
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a depth/stencil attachment by renderPass must include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkFramebufferCreateInfo-flags-03203
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a depth/stencil resolve attachment by renderPass must include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkFramebufferCreateInfo-flags-03204
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as an input attachment by renderPass must include VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkFramebufferCreateInfo-flags-03205
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, at least one element of the pViewFormats member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain must be equal to the corresponding value of VkAttachmentDescription::format used to create renderPass

- VUID-VkFramebufferCreateInfo-flags-04113
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of
pAttachments ***must*** have been created with **VkImageViewCreateInfo::viewType** not equal to **VK_IMAGE_VIEW_TYPE_3D**

- **VUID-VkFramebufferCreateInfo-flags-04548**
  - If ***flags*** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of pAttachments that is used as a fragment shading rate attachment by renderPass ***must*** have been created with a ***usage*** value including **VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**

- **VUID-VkFramebufferCreateInfo-flags-04549**
  - If ***flags*** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, the ***usage*** member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a fragment shading rate attachment by renderPass ***must*** include **VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**

### Valid Usage (Implicit)

- **VUID-VkFramebufferCreateInfo-sType-sType**
  - sType ***must*** be **VK_STRUCTURE_TYPE_FRAMEBUFFER_CREATE_INFO**

- **VUID-VkFramebufferCreateInfo-pNext-pNext**
  - pNext ***must*** be NULL or a pointer to a valid instance of VkFramebufferAttachmentsCreateInfo

- **VUID-VkFramebufferCreateInfo-sType-unique**
  - The sType value of each struct in the pNext chain ***must*** be unique

- **VUID-VkFramebufferCreateInfo-flags-parameter**
  - flags ***must*** be a valid combination of VkFramebufferCreateFlagBits values

- **VUID-VkFramebufferCreateInfo-renderPass-parameter**
  - renderPass ***must*** be a valid VkRenderPass handle

- **VUID-VkFramebufferCreateInfo-commonparent**
  - Both of renderPass, and the elements of pAttachments that are valid handles of non-ignored parameters ***must*** have been created, allocated, or retrieved from the same VkDevice

The VkFramebufferAttachmentsCreateInfo structure is defined as:

```c
typedef struct VkFramebufferAttachmentsCreateInfo {
    VkStructureType                            sType;
    const void*                                pNext;
    uint32_t                                    attachmentImageInfoCount;
    const VkFramebufferAttachmentImageInfo*    pAttachmentImageInfos;
} VkFramebufferAttachmentsCreateInfo;
```

or the equivalent
Provided by VK_KHR_imageless_framebuffer
typedef VkFramebufferAttachmentsCreateInfo VkFramebufferAttachmentsCreateInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **attachmentImageInfoCount** is the number of attachments being described.
- **pAttachmentImageInfos** is a pointer to an array of VkFramebufferAttachmentImageInfo instances, each of which describes a number of parameters of the corresponding attachment in a render pass instance.

Valid Usage (Implicit)

- **VUID-VkFramebufferAttachmentsCreateInfo-sType-sType**
  - **sType** must be VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENTS_CREATE_INFO
- **VUID-VkFramebufferAttachmentsCreateInfo-pAttachmentImageInfos-parameter**
  - If attachmentImageInfoCount is not 0, pAttachmentImageInfos must be a valid pointer to an array of attachmentImageInfoCount valid VkFramebufferAttachmentImageInfo structures

The VkFramebufferAttachmentImageInfo structure is defined as:

```c
typedef struct VkFramebufferAttachmentImageInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkImageCreateFlags        flags;
    VkImageUsageFlags         usage;
    uint32_t                   width;
    uint32_t                   height;
    uint32_t                   layerCount;
    uint32_t                   viewFormatCount;
    const VkFormat*           pViewFormats;
} VkFramebufferAttachmentImageInfo;
```

or the equivalent

Provided by VK_KHR_imageless_framebuffer
typedef VkFramebufferAttachmentImageInfo VkFramebufferAttachmentImageInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkImageCreateFlagBits, matching the value of VkImageCreateInfo::flags used to create an image that will be used with this framebuffer.
- **usage** is a bitmask of VkImageUsageFlagBits, matching the value of VkImageCreateInfo::usage

456 | Chapter 8. Render Pass
used to create an image used with this framebuffer.

- **width** is the width of the image view used for rendering.
- **height** is the height of the image view used for rendering.
- **viewFormatCount** is the number of entries in the `pViewFormats` array, matching the value of `VkImageFormatListCreateInfo::viewFormatCount` used to create an image used with this framebuffer.
- **pViewFormats** is an array which lists all formats which can be used when creating views of the image, matching the value of `VkImageFormatListCreateInfo::pViewFormats` used to create an image used with this framebuffer.

Images that can be used with the framebuffer when beginning a render pass, as specified by `VkRenderPassAttachmentBeginInfo`, **must** be created with parameters that are identical to those specified here.

### Valid Usage (Implicit)

- VUID-VkFramebufferAttachmentImageInfo-sType-sType
  
  sType **must** be `VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENT_IMAGE_INFO`

- VUID-VkFramebufferAttachmentImageInfo-pNext-pNext
  
  pNext **must** be `NULL`

- VUID-VkFramebufferAttachmentImageInfo-flags-parameter
  
  flags **must** be a valid combination of `VkImageCreateFlagBits` values

- VUID-VkFramebufferAttachmentImageInfo-usage-parameter
  
  usage **must** be a valid combination of `VkImageUsageFlagBits` values

- VUID-VkFramebufferAttachmentImageInfo-usage-required bitmask
  
  usage **must** not be `0`

- VUID-VkFramebufferAttachmentImageInfo-pViewFormats-parameter
  
  If `viewFormatCount` is not `0`, `pViewFormats **must** be a valid pointer to an array of `viewFormatCount` valid `VkFormat` values

Bits which can be set in `VkFramebufferCreateInfo::flags` to specify options for framebuffers are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkFramebufferCreateFlagBits {
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT = 0x00000001,
    // Provided by VK_KHR_imageless_framebuffer
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR = VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT,
} VkFramebufferCreateFlagBits;
```

- **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT** specifies that image views are not specified, and only attachment compatibility information will be provided via a `VkFramebufferAttachmentImageInfo` structure.
typedef VkFlagsVkFramebufferCreateFlags;

VkFramebufferCreateFlags is a bitmask type for setting a mask of zero or more VkFramebufferCreateFlagBits.

To destroy a framebuffer, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyFramebuffer(
    VkDevice device,
    VkFramebuffer framebuffer,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the framebuffer.
- **framebuffer** is the handle of the framebuffer to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyFramebuffer-framebuffer-00892**
  All submitted commands that refer to framebuffer **must** have completed execution

- **VUID-vkDestroyFramebuffer-framebuffer-00893**
  If VkAllocationCallbacks were provided when framebuffer was created, a compatible set of callbacks **must** be provided here

- **VUID-vkDestroyFramebuffer-framebuffer-00894**
  If no VkAllocationCallbacks were provided when framebuffer was created, pAllocator **must** be NULL

### Valid Usage (Implicit)

- **VUID-vkDestroyFramebuffer-device-parameter**
  device **must** be a valid VkDevice handle

- **VUID-vkDestroyFramebuffer-framebuffer-parameter**
  If framebuffer is not VK_NULL_HANDLE, framebuffer **must** be a valid VkFramebuffer handle

- **VUID-vkDestroyFramebuffer-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure

- **VUID-vkDestroyFramebuffer-framebuffer-parent**
  If framebuffer is a valid handle, it **must** have been created, allocated, or retrieved from device
8.4. Render Pass Commands

An application records the commands for a render pass instance one subpass at a time, by beginning a render pass instance, iterating over the subpasses to record commands for that subpass, and then ending the render pass instance.

To begin a render pass instance, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBeginRenderPass(
    VkCommandBuffer                             commandBuffer,
    const VkRenderPassBeginInfo*                pRenderPassBegin,
    VkSubpassContents                           contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a `VkRenderPassBeginInfo` structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- `contents` is a `VkSubpassContents` value specifying how the commands in the first subpass will be provided.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.
Valid Usage

- **VUID-vkCmdBeginRenderPass-initialLayout-00895**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- **VUID-vkCmdBeginRenderPass-initialLayout-01758**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- **VUID-vkCmdBeginRenderPass-initialLayout-02842**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- **VUID-vkCmdBeginRenderPass-stencilInitialLayout-02843**
  If any of the `stencilInitialLayout` or `stencilFinalLayout` member of the `VkAttachmentDescriptionStencilLayout` structures or the `stencilLayout` member of the `VkAttachmentReferenceStencilLayout` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- **VUID-vkCmdBeginRenderPass-initialLayout-00897**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have
been created with a usage value including `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-00898
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-00899
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including `VK_IMAGE_USAGE_TRANSFER_DST_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-00900
  If any of the initialLayout members of the VkAttachmentDescription structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is not `VK_IMAGE_LAYOUT_UNDEFINED`, then each such initialLayout must be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the framebuffer member of pRenderPassBegin

- VUID-vkCmdBeginRenderPass-srcStageMask-00901
  The srcStageMask and dstStageMask members of any element of the pDependencies member of VkRenderPassCreateInfo used to create renderPass must be supported by the capabilities of the queue family identified by the queueFamilyIndex member of the VkCommandPoolCreateInfo used to create the command pool which commandBuffer was allocated from

- VUID-vkCmdBeginRenderPass-framebuffer-02532
  For any attachment in framebuffer that is used by renderPass and is bound to memory locations that are also bound to another attachment used by renderPass, and if at least one of those uses causes either attachment to be written to, both attachments must have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set
Valid Usage (Implicit)

- VUID-vkCmdBeginRenderPass-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBeginRenderPass-pRenderPassBegin-parameter
  
  `pRenderPassBegin` must be a valid pointer to a valid `VkRenderPassBeginInfo` structure

- VUID-vkCmdBeginRenderPass-contents-parameter
  
  `contents` must be a valid `VkSubpassContents` value

- VUID-vkCmdBeginRenderPass-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdBeginRenderPass-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdBeginRenderPass-renderpass
  
  This command must only be called outside of a render pass instance

- VUID-vkCmdBeginRenderPass-bufferlevel
  
  `commandBuffer` must be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

Alternatively to begin a render pass, call:

```c
void vkCmdBeginRenderPass2(
    VkCommandBuffer          commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    const VkSubpassBeginInfo*  pSubpassBeginInfo);
```
void vkCmdBeginRenderPass2KHR(
    VkCommandBuffer commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    const VkSubpassBeginInfo* pSubpassBeginInfo);

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a `VkRenderPassBeginInfo` structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.
Valid Usage

- **VUID-vkCmdBeginRenderPass2-framebuffer-02779**
  Both the framebuffer and renderPass members of pRenderPassBegin must have been created on the same VkDevice that commandBuffer was allocated on.

- **VUID-vkCmdBeginRenderPass2-initialLayout-03094**
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT.

- **VUID-vkCmdBeginRenderPass2-initialLayout-03096**
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

- **VUID-vkCmdBeginRenderPass2-initialLayout-02844**
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

- **VUID-vkCmdBeginRenderPass2-stencilInitialLayout-02845**
  If any of the stencilInitialLayout or stencilFinalLayout member of the VkAttachmentDescriptionStencilLayout structures or the stencilLayout member of the VkAttachmentReferenceStencilLayout structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

- **VUID-vkCmdBeginRenderPass2-initialLayout-03097**
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.
creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

- **VUID-vkCmdBeginRenderPass2-initialLayout-03098**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`.

- **VUID-vkCmdBeginRenderPass2-initialLayout-03099**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_DST_BIT`.

- **VUID-vkCmdBeginRenderPass2-initialLayout-03100**
  If any of the `initialLayout` members of the `VkAttachmentDescription` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is not `VK_IMAGE_LAYOUT_UNDEFINED`, then each such `initialLayout` must be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin`.

- **VUID-vkCmdBeginRenderPass2-srcStageMask-03101**
  The `srcStageMask` and `dstStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` must be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from.

- **VUID-vkCmdBeginRenderPass2-framebuffer-02533**
  For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments must have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set.
Valid Usage (Implicit)

- **VUID-vkCmdBeginRenderPass2-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdBeginRenderPass2-pRenderPassBegin-parameter**
  
  `pRenderPassBegin` must be a valid pointer to a valid `VkRenderPassBeginInfo` structure.

- **VUID-vkCmdBeginRenderPass2-pSubpassBeginInfo-parameter**
  
  `pSubpassBeginInfo` must be a valid pointer to a valid `VkSubpassBeginInfo` structure.

- **VUID-vkCmdBeginRenderPass2-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdBeginRenderPass2-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdBeginRenderPass2-renderpass**
  
  This command must only be called outside of a render pass instance.

- **VUID-vkCmdBeginRenderPass2-bufferlevel**
  
  `commandBuffer` must be a primary `VkCommandBuffer`.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Graphics</td>
<td>Graphics</td>
</tr>
</tbody>
</table>

The `VkRenderPassBeginInfo` structure is defined as:
typedef struct VkRenderPassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderPass renderPass;
    VkFramebuffer framebuffer;
    VkRect2D renderArea;
    uint32_t clearValueCount;
    const VkClearValue* pClearValues;
} VkRenderPassBeginInfo;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **renderPass** is the render pass to begin an instance of.
- **framebuffer** is the framebuffer containing the attachments that are used with the render pass.
- **renderArea** is the render area that is affected by the render pass instance, and is described in more detail below.
- **clearValueCount** is the number of elements in **pClearValues**.
- **pClearValues** is a pointer to an array of **clearValueCount** VkClearValue structures that contains clear values for each attachment, if the attachment uses a **loadOp** value of VK_ATTACHMENT_LOAD_OP_CLEAR or if the attachment has a depth/stencil format and uses a **stencilLoadOp** value of VK_ATTACHMENT_LOAD_OP_CLEAR. The array is indexed by attachment number. Only elements corresponding to cleared attachments are used. Other elements of **pClearValues** are ignored.

**renderArea** is the render area that is affected by the render pass instance. The effects of attachment load, store and multisample resolve operations are restricted to the pixels whose x and y coordinates fall within the render area on all attachments. The render area extends to all layers of framebuffer. The application **must** ensure (using scissor if necessary) that all rendering is contained within the render area. The render area, after any transform specified by VkRenderPassTransformBeginInfoQCOM::transform is applied, **must** be contained within the framebuffer dimensions.

If **render pass transform** is enabled, then **renderArea** **must** equal the framebuffer pre-transformed dimensions. After **renderArea** has been transformed by VkRenderPassTransformBeginInfoQCOM::transform, the resulting render area **must** be equal to the framebuffer dimensions.

When multiview is enabled, the resolve operation at the end of a subpass applies to all views in the view mask.

**Note**

There **may** be a performance cost for using a render area smaller than the framebuffer, unless it matches the render area granularity for the render pass.
Valid Usage

- **VUID-VkRenderPassBeginInfo-clearValueCount-00902**
  
  `clearValueCount` must be greater than the largest attachment index in `renderPass` that specifies a `loadOp` (or `stencilLoadOp`, if the attachment has a depth/stencil format) of `VK_ATTACHMENT_LOAD_OP_CLEAR`

- **VUID-VkRenderPassBeginInfo-renderPass-00904**
  
  `renderPass` must be compatible with the `renderPass` member of the `VkFramebufferCreateInfo` structure specified when creating `framebuffer`

- **VUID-VkRenderPassBeginInfo-pNext-02850**
  
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` must be greater than or equal to 0

- **VUID-VkRenderPassBeginInfo-pNext-02851**
  
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` must be greater than or equal to 0

- **VUID-VkRenderPassBeginInfo-pNext-02852**
  
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.width` must be less than or equal to `VkFramebufferCreateInfo::width` the framebuffer was created with

- **VUID-VkRenderPassBeginInfo-pNext-02853**
  
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.height` must be less than or equal to `VkFramebufferCreateInfo::height` the framebuffer was created with

- **VUID-VkRenderPassBeginInfo-pNext-02854**
  
  If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, the `offset.x` member of each element of `pDeviceRenderAreas` must be greater than or equal to 0

- **VUID-VkRenderPassBeginInfo-pNext-02855**
  
  If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, the `offset.y` member of each element of `pDeviceRenderAreas` must be greater than or equal to 0

- **VUID-VkRenderPassBeginInfo-pNext-02856**
  
  If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.x + offset.width` of each element of `pDeviceRenderAreas` must be less than or equal to `VkFramebufferCreateInfo::width` the framebuffer was created with

- **VUID-VkRenderPassBeginInfo-pNext-02857**
  
  If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.y + offset.height` of each element of `pDeviceRenderAreas` must be less than or equal to `VkFramebufferCreateInfo::height` the framebuffer was created with

- **VUID-VkRenderPassBeginInfo-framebuffer-03207**
  
  If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that did not
include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, and the pNext chain includes a VkRenderPassAttachmentBeginInfo structure, its attachmentCount must be zero.

- VUID-VkRenderPassBeginInfo-framebuffer-03208
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the attachmentCount of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be equal to the value of VkFramebufferAttachmentsCreateInfo::attachmentImageInfoCount used to create framebuffer.

- VUID-VkRenderPassBeginInfo-framebuffer-02780
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must have been created on the same VkDevice as framebuffer and renderPass.

- VUID-VkRenderPassBeginInfo-framebuffer-03209
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageCreateInfo::flags equal to the flags member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer.

- VUID-VkRenderPassBeginInfo-framebuffer-04627
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView with an inherited usage equal to the usage member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer.

- VUID-VkRenderPassBeginInfo-framebuffer-03211
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView with a width equal to the width member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer.

- VUID-VkRenderPassBeginInfo-framebuffer-03212
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView with a height equal to the height member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer.

- VUID-VkRenderPassBeginInfo-framebuffer-03213
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageViewCreateInfo::subresourceRange.layerCount equal to the layerCount member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer.
element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03214
  If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain must be a `VkImageView` of an image created with a value of `VkImageFormatListCreateInfo::viewFormatCount` equal to the `viewFormatCount` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03215
  If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain must be a `VkImageView` of an image created with a set of elements in `VkImageFormatListCreateInfo::pViewFormats` equal to the set of elements in the `pViewFormats` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03216
  If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain must be a `VkImageView` of an image created with a value of `VkImageViewCreateInfo::format` equal to the corresponding value of `VkAttachmentDescription::format` in `renderPass`

- VUID-VkRenderPassBeginInfo-framebuffer-03217
  If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain must be a `VkImageView` of an image created with a value of `VkImageCreateInfo::samples` equal to the corresponding value of `VkAttachmentDescription::samples` in `renderPass`

- VUID-VkRenderPassBeginInfo-pNext-02869
  If the `pNext` chain includes `VkRenderPassTransformBeginInfoQCOM`, `renderArea.offset` must equal (0,0)

- VUID-VkRenderPassBeginInfo-pNext-02870
  If the `pNext` chain includes `VkRenderPassTransformBeginInfoQCOM`, `renderArea.extent` transformed by `VkRenderPassTransformBeginInfoQCOM::transform` must equal the framebuffer dimensions
Valid Usage (Implicit)

- VUID-VkRenderPassBeginInfo-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_BEGIN_INFO

- VUID-VkRenderPassBeginInfo-pNext-pNext
  
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceGroupRenderPassBeginInfo, VkRenderPassAttachmentBeginInfo, VkRenderPassSampleLocationsBeginInfoEXT, or VkRenderPassTransformBeginInfoQCOM

- VUID-VkRenderPassBeginInfo-sType-unique
  
  The sType value of each struct in the pNext chain must be unique

- VUID-VkRenderPassBeginInfo-renderPass-parameter
  
  renderPass must be a valid VkRenderPass handle

- VUID-VkRenderPassBeginInfo-framebuffer-parameter
  
  framebuffer must be a valid VkFramebuffer handle

- VUID-VkRenderPassBeginInfo-commonparent
  
  Both of framebuffer, and renderPass must have been created, allocated, or retrieved from the same VkDevice

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT is dependent on the last sample locations used to render to the image subresource, thus preserving the contents of such depth/stencil attachments across subpass boundaries requires the application to specify these sample locations whenever a layout transition of the attachment may occur. This information can be provided by adding a VkRenderPassSampleLocationsBeginInfoEXT structure to the pNext chain of VkRenderPassBeginInfo.

The VkRenderPassSampleLocationsBeginInfoEXT structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkRenderPassSampleLocationsBeginInfoEXT {
    VkStructureType                          sType;
    const void*                              pNext;
    uint32_t                                 attachmentInitialSampleLocationsCount;
    const VkAttachmentSampleLocationsEXT*    pAttachmentInitialSampleLocations;
    uint32_t                                 postSubpassSampleLocationsCount;
    const VkSubpassSampleLocationsEXT*       pPostSubpassSampleLocations;
} VkRenderPassSampleLocationsBeginInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- attachmentInitialSampleLocationsCount is the number of elements in the pAttachmentInitialSampleLocations array.
• **pAttachmentInitialSampleLocations** is a pointer to an array of `attachmentInitialSampleLocationsCount` `VkAttachmentSampleLocationsEXT` structures specifying the attachment indices and their corresponding sample location state. Each element of `pAttachmentInitialSampleLocations` can specify the sample location state to use in the automatic layout transition performed to transition a depth/stencil attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.

• **postSubpassSampleLocationsCount** is the number of elements in the `pPostSubpassSampleLocations` array.

• **pPostSubpassSampleLocations** is a pointer to an array of `postSubpassSampleLocationsCount` `VkSubpassSampleLocationsEXT` structures specifying the subpass indices and their corresponding sample location state. Each element of `pPostSubpassSampleLocations` can specify the sample location state to use in the automatic layout transition performed to transition the depth/stencil attachment used by the specified subpass to the image layout specified in a dependent subpass or to the final layout of the attachment in case the specified subpass is the last subpass using that attachment. In addition, if `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE`, each element of `pPostSubpassSampleLocations` must specify the sample location state that matches the sample locations used by all pipelines that will be bound to a command buffer during the specified subpass. If `variableSampleLocations` is `VK_TRUE`, the sample locations used for rasterization do not depend on `pPostSubpassSampleLocations`.

### Valid Usage (Implicit)

- **VUID-VkRenderPassSampleLocationsBeginInfoEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_SAMPLE_LOCATIONS_BEGIN_INFO_EXT`

- **VUID-VkRenderPassSampleLocationsBeginInfoEXT-pAttachmentInitialSampleLocations-parameter**
  
  If `attachmentInitialSampleLocationsCount` is not 0, `pAttachmentInitialSampleLocations` must be a valid pointer to an array of `attachmentInitialSampleLocationsCount` valid `VkAttachmentSampleLocationsEXT` structures

- **VUID-VkRenderPassSampleLocationsBeginInfoEXT-pPostSubpassSampleLocations-parameter**
  
  If `postSubpassSampleLocationsCount` is not 0, `pPostSubpassSampleLocations` must be a valid pointer to an array of `postSubpassSampleLocationsCount` valid `VkSubpassSampleLocationsEXT` structures

The `VkAttachmentSampleLocationsEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkAttachmentSampleLocationsEXT {
    uint32_t attachmentIndex;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkAttachmentSampleLocationsEXT;
```

• **attachmentIndex** is the index of the attachment for which the sample locations state is provided.
• `sampleLocationsInfo` is the sample locations state to use for the layout transition of the given attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.

If the image referenced by the framebuffer attachment at index `attachmentIndex` was not created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` then the values specified in `sampleLocationsInfo` are ignored.

### Valid Usage

- `VUID-VkAttachmentSampleLocationsEXT-attachmentIndex-01531`  
  `attachmentIndex` must be less than the `attachmentCount` specified in `VkRenderPassCreateInfo` the render pass specified by `VkRenderPassBeginInfo::renderPass` was created with

### Valid Usage (Implicit)

- `VUID-VkAttachmentSampleLocationsEXT-sampleLocationsInfo-parameter`  
  `sampleLocationsInfo` must be a valid `VkSampleLocationsInfoEXT` structure

The `VkSubpassSampleLocationsEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSubpassSampleLocationsEXT {
    uint32_t subpassIndex;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkSubpassSampleLocationsEXT;
```

- `subpassIndex` is the index of the subpass for which the sample locations state is provided.
- `sampleLocationsInfo` is the sample locations state to use for the layout transition of the depth/stencil attachment away from the image layout the attachment is used with in the subpass specified in `subpassIndex`.

If the image referenced by the depth/stencil attachment used in the subpass identified by `subpassIndex` was not created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` or if the subpass does not use a depth/stencil attachment, and `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_TRUE` then the values specified in `sampleLocationsInfo` are ignored.

### Valid Usage

- `VUID-VkSubpassSampleLocationsEXT-subpassIndex-01532`  
  `subpassIndex` must be less than the `subpassCount` specified in `VkRenderPassCreateInfo` the render pass specified by `VkRenderPassBeginInfo::renderPass` was created with
Valid Usage (Implicit)

- VUID-VkSubpassSampleLocationsEXT-sampleLocationsInfo-parameter
  sampleLocationsInfo must be a valid VkSampleLocationsInfoEXT structure

To begin a renderpass instance with render pass transform enabled, add the VkRenderPassTransformBeginInfoQCOM to the pNext chain of VkRenderPassBeginInfo structure passed to the vkCmdBeginRenderPass command specifying the renderpass transform.

The VkRenderPassTransformBeginInfoQCOM structure is defined as:

```c
// Provided by VK_QCOM_render_pass_transform
typedef struct VkRenderPassTransformBeginInfoQCOM {
    VkStructureType sType;
    void* pNext;
    VkSurfaceTransformFlagBitsKHR transform;
} VkRenderPassTransformBeginInfoQCOM;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- transform is a VkSurfaceTransformFlagBitsKHR value describing the transform to be applied to rasterization.

Valid Usage

- VUID-VkRenderPassTransformBeginInfoQCOM-transform-02871
  transform must be VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR, VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR, VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR, or VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR

- VUID-VkRenderPassTransformBeginInfoQCOM-flags-02872
  The renderpass must have been created with VkRenderPassCreateInfo::flags containing VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM

Valid Usage (Implicit)

- VUID-VkRenderPassTransformBeginInfoQCOM-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_TRANSFORM_BEGIN_INFO_QCOM

The VkSubpassBeginInfo structure is defined as:
```c
typedef struct VkSubpassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkSubpassContents contents;
} VkSubpassBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassBeginInfo VkSubpassBeginInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `contents` is a `VkSubpassContents` value specifying how the commands in the next subpass will be provided.

**Valid Usage (Implicit)**

- `VUID-VkSubpassBeginInfo-sType-sType`  
  `sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_BEGIN_INFO`
- `VUID-VkSubpassBeginInfo-pNext-pNext`  
  `pNext` **must** be `NULL`
- `VUID-VkSubpassBeginInfo-contents-parameter`  
  `contents` **must** be a valid `VkSubpassContents` value

Possible values of `vkCmdBeginRenderPass::contents`, specifying how the commands in the first subpass will be provided, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSubpassContents {
    VK_SUBPASS_CONTENTS_INLINE = 0,
    VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS = 1,
} VkSubpassContents;
```

- `VK_SUBPASS_CONTENTS_INLINE` specifies that the contents of the subpass will be recorded inline in the primary command buffer, and secondary command buffers **must** not be executed within the subpass.
- `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS` specifies that the contents are recorded in secondary command buffers that will be called from the primary command buffer, and `vkCmdExecuteCommands` is the only valid command on the command buffer until `vkCmdNextSubpass` or `vkCmdEndRenderPass`.

If the `pNext` chain of `VkRenderPassBeginInfo` includes a `VkDeviceGroupRenderPassBeginInfo` structure,
then that structure includes a device mask and set of render areas for the render pass instance.

The `VkDeviceGroupRenderPassBeginInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupRenderPassBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           deviceMask;
    uint32_t           deviceRenderAreaCount;
    const VkRect2D*    pDeviceRenderAreas;
} VkDeviceGroupRenderPassBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupRenderPassBeginInfo VkDeviceGroupRenderPassBeginInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **deviceMask** is the device mask for the render pass instance.
- **deviceRenderAreaCount** is the number of elements in the `pDeviceRenderAreas` array.
- **pDeviceRenderAreas** is a pointer to an array of `VkRect2D` structures defining the render area for each physical device.

The **deviceMask** serves several purposes. It is an upper bound on the set of physical devices that can be used during the render pass instance, and the initial device mask when the render pass instance begins. In addition, commands transitioning to the next subpass in the render pass instance and commands ending the render pass instance, and, accordingly render pass attachment load, store, and resolve operations and subpass dependencies corresponding to the render pass instance, are executed on the physical devices included in the device mask provided here.

If **deviceRenderAreaCount** is not zero, then the elements of **pDeviceRenderAreas** override the value of `VkRenderPassBeginInfo::renderArea`, and provide a render area specific to each physical device. These render areas serve the same purpose as `VkRenderPassBeginInfo::renderArea`, including controlling the region of attachments that are cleared by `VK_ATTACHMENT_LOAD_OP_CLEAR` and that are resolved into resolve attachments.

If this structure is not present, the render pass instance's device mask is the value of `VkDeviceGroupCommandBufferBeginInfo::deviceMask`. If this structure is not present or if **deviceRenderAreaCount** is zero, `VkRenderPassBeginInfo::renderArea` is used for all physical devices.
Valid Usage

- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00905
deviceMask must be a valid device mask value
- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00906
deviceMask must not be zero
- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00907
deviceMask must be a subset of the command buffer’s initial device mask
- VUID-VkDeviceGroupRenderPassBeginInfo-deviceRenderAreaCount-00908
deviceRenderAreaCount must either be zero or equal to the number of physical devices in the logical device

Valid Usage (Implicit)

- VUID-VkDeviceGroupRenderPassBeginInfo-sType-sType
sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_RENDER_PASS_BEGIN_INFO
- VUID-VkDeviceGroupRenderPassBeginInfo-pDeviceRenderAreas-parameter
If deviceRenderAreaCount is not 0, pDeviceRenderAreas must be a valid pointer to an array of deviceRenderAreaCount VkRect2D structures

The VkRenderPassAttachmentBeginInfo structure is defined as:

```c
typedef struct VkRenderPassAttachmentBeginInfo {
    VkStructureType       sType;
    const void*           pNext;
    uint32_t              attachmentCount;
    const VkImageView*    pAttachments;
} VkRenderPassAttachmentBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_imageless_framebuffer
typedef VkRenderPassAttachmentBeginInfo VkRenderPassAttachmentBeginInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- attachmentCount is the number of attachments.
- pAttachments is a pointer to an array of VkImageView handles, each of which will be used as the corresponding attachment in the render pass instance.
Valid Usage

- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03218
  Each element of `pAttachments` must only specify a single mip level

- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03219
  Each element of `pAttachments` must have been created with the identity swizzle

- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-04114
  Each element of `pAttachments` must have been created with `VkImageViewCreateInfo` `::viewType` not equal to `VK_IMAGE_VIEW_TYPE_3D`

Valid Usage (Implicit)

- VUID-VkRenderPassAttachmentBeginInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_ATTACHMENT_BEGIN_INFO`

- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-parameter
  If `attachmentCount` is not 0, `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkImageView` handles

To query the render area granularity, call:

```c
// Provided by VK_VERSION_1_0
void vkGetRenderAreaGranularity(
    VkDevice device,
    VkRenderPass renderPass,
    VkExtent2D* pGranularity);
```

- `device` is the logical device that owns the render pass.
- `renderPass` is a handle to a render pass.
- `pGranularity` is a pointer to a `VkExtent2D` structure in which the granularity is returned.

The conditions leading to an optimal `renderArea` are:

- the `offset.x` member in `renderArea` is a multiple of the `width` member of the returned `VkExtent2D` (the horizontal granularity).
- the `offset.y` member in `renderArea` is a multiple of the `height` of the returned `VkExtent2D` (the vertical granularity).
- either the `offset.width` member in `renderArea` is a multiple of the horizontal granularity or `offset.x+offset.width` is equal to the `width` of the framebuffer in the `VkRenderPassBeginInfo`.
- either the `offset.height` member in `renderArea` is a multiple of the vertical granularity or `offset.y+offset.height` is equal to the `height` of the framebuffer in the `VkRenderPassBeginInfo`.

Subpass dependencies are not affected by the render area, and apply to the entire image
subresources attached to the framebuffer as specified in the description of automatic layout transitions. Similarly, pipeline barriers are valid even if their effect extends outside the render area.

Valid Usage (Implicit)

- `VUID-vkGetRenderAreaGranularity-device-parameter`
  - `device` must be a valid `VkDevice` handle

- `VUID-vkGetRenderAreaGranularity-renderPass-parameter`
  - `renderPass` must be a valid `VkRenderPass` handle

- `VUID-vkGetRenderAreaGranularity-pGranularity-parameter`
  - `pGranularity` must be a valid pointer to a `VkExtent2D` structure

- `VUID-vkGetRenderAreaGranularity-renderPass-parent`
  - `renderPass` must have been created, allocated, or retrieved from `device`

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```c
// Provided by VK_VERSION_1_0
dataDefine void vkCmdNextSubpass(
    VkCommandBuffer commandBuffer,
    VkSubpassContents contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `contents` specifies how the commands in the next subpass will be provided, in the same fashion as the corresponding parameter of `vkCmdBeginRenderPass`.

The subpass index for a render pass begins at zero when `vkCmdBeginRenderPass` is recorded, and increments each time `vkCmdNextSubpass` is recorded.

Moving to the next subpass automatically performs any multisample resolve operations in the subpass being ended. End-of-subpass multisample resolves are treated as color attachment writes for the purposes of synchronization. This applies to resolve operations for both color and depth/stencil attachments. That is, they are considered to execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage and their writes are synchronized with `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`. Synchronization between rendering within a subpass and any resolve operations at the end of the subpass occurs automatically, without need for explicit dependencies or pipeline barriers. However, if the resolve attachment is also used in a different subpass, an explicit dependency is needed.

After transitioning to the next subpass, the application can record the commands for that subpass.
Valid Usage

- VUID-vkCmdNextSubpass-None-00909
  The current subpass index must be less than the number of subpasses in the render pass minus one

- VUID-vkCmdNextSubpass-None-02349
  This command must not be recorded when transform feedback is active

Valid Usage (Implicit)

- VUID-vkCmdNextSubpass-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdNextSubpass-contents-parameter
  contents must be a valid VkSubpassContents value

- VUID-vkCmdNextSubpass-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdNextSubpass-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdNextSubpass-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdNextSubpass-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Graphics</td>
<td>Graphics</td>
</tr>
</tbody>
</table>

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:
void vkCmdNextSubpass2(
    VkCommandBuffer commandBuffer,
    const VkSubpassBeginInfo* pSubpassBeginInfo,
    const VkSubpassEndInfo* pSubpassEndInfo);

// Provided by VK_KHR_create_renderpass2
void vkCmdNextSubpass2KHR(
    VkCommandBuffer commandBuffer,
    const VkSubpassBeginInfo* pSubpassBeginInfo,
    const VkSubpassEndInfo* pSubpassEndInfo);

- `commandBuffer` is the command buffer in which to record the command.
- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.
- `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfo` structure containing information about how the previous subpass will be ended.

`vkCmdNextSubpass2` is semantically identical to `vkCmdNextSubpass`, except that it is extensible, and that `contents` is provided as part of an extensible structure instead of as a flat parameter.

## Valid Usage

- VUID-vkCmdNextSubpass2-None-03102
  The current subpass index **must** be less than the number of subpasses in the render pass minus one

- VUID-vkCmdNextSubpass2-None-02350
  This command **must** not be recorded when transform feedback is active
Valid Usage (Implicit)

- VUID-vkCmdNextSubpass2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdNextSubpass2-pSubpassBeginInfo-parameter
  `pSubpassBeginInfo` must be a valid pointer to a valid `VkSubpassBeginInfo` structure

- VUID-vkCmdNextSubpass2-pSubpassEndInfo-parameter
  `pSubpassEndInfo` must be a valid pointer to a valid `VkSubpassEndInfo` structure

- VUID-vkCmdNextSubpass2-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdNextSubpass2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdNextSubpass2-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdNextSubpass2-bufferlevel
  `commandBuffer` must be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Graphics</td>
<td>Graphics</td>
</tr>
</tbody>
</table>

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdEndRenderPass(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer in which to end the current render pass instance.

Ending a render pass instance performs any multisample resolve operations on the final subpass.
Valid Usage

- VUID-vkCmdEndRenderPass-None-00910
  The current subpass index must be equal to the number of subpasses in the render pass minus one

- VUID-vkCmdEndRenderPass-None-02351
  This command must not be recorded when transform feedback is active

Valid Usage (Implicit)

- VUID-vkCmdEndRenderPass-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdEndRenderPass-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdEndRenderPass-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdEndRenderPass-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdEndRenderPass-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Graphics</td>
<td>Graphics</td>
</tr>
</tbody>
</table>

To record a command to end a render pass instance after recording the commands for the last subpass, call:
void vkCmdEndRenderPass2(
    VkCommandBuffer commandBuffer,
    const VkSubpassEndInfo* pSubpassEndInfo);

// Provided by VK_KHR_create_renderpass2
void vkCmdEndRenderPass2KHR(
    VkCommandBuffer commandBuffer,
    const VkSubpassEndInfo* pSubpassEndInfo);

- `commandBuffer` is the command buffer in which to end the current render pass instance.
- `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfo` structure containing information about how the previous subpass will be ended.

`vkCmdEndRenderPass2` is semantically identical to `vkCmdEndRenderPass`, except that it is extensible.

### Valid Usage

- **VUID-vkCmdEndRenderPass2-None-03103**
  The current subpass index must be equal to the number of subpasses in the render pass minus one
- **VUID-vkCmdEndRenderPass2-None-02352**
  This command must not be recorded when transform feedback is active

### Valid Usage (Implicit)

- **VUID-vkCmdEndRenderPass2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdEndRenderPass2-pSubpassEndInfo-parameter**
  `pSubpassEndInfo` must be a valid pointer to a valid `VkSubpassEndInfo` structure
- **VUID-vkCmdEndRenderPass2-commandBuffer-recording**
  `commandBuffer` must be in the recording state
- **VUID-vkCmdEndRenderPass2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- **VUID-vkCmdEndRenderPass2-renderpass**
  This command must only be called inside of a render pass instance
- **VUID-vkCmdEndRenderPass2-bufferlevel**
  `commandBuffer` must be a primary `VkCommandBuffer`
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Pipeline Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Graphics</td>
<td>Graphics</td>

</tbody>
</table>

The `VkSubpassEndInfo` structure is defined as:

```c
typedef struct VkSubpassEndInfo {
    VkStructureType    sType;
    const void*        pNext;
} VkSubpassEndInfo;
```

or the equivalent

```
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassEndInfo VkSubpassEndInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

Valid Usage (Implicit)

- VUID-VkSubpassEndInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SUBPASS_END_INFO`
- VUID-VkSubpassEndInfo-pNext-pNext
  `pNext` must be `NULL`
Chapter 9. Shaders

A shader specifies programmable operations that execute for each vertex, control point, tessellated vertex, primitive, fragment, or workgroup in the corresponding stage(s) of the graphics and compute pipelines.

Graphics pipelines include vertex shader execution as a result of primitive assembly, followed, if enabled, by tessellation control and evaluation shaders operating on patches, geometry shaders, if enabled, operating on primitives, and fragment shaders, if present, operating on fragments generated by Rasterization. In this specification, vertex, tessellation control, tessellation evaluation and geometry shaders are collectively referred to as vertex processing stages and occur in the logical pipeline before rasterization. The fragment shader occurs logically after rasterization.

Only the compute shader stage is included in a compute pipeline. Compute shaders operate on compute invocations in a workgroup.

Shaders can read from input variables, and read from and write to output variables. Input and output variables can be used to transfer data between shader stages, or to allow the shader to interact with values that exist in the execution environment. Similarly, the execution environment provides constants that describe capabilities.

Shader variables are associated with execution environment-provided inputs and outputs using built-in decorations in the shader. The available decorations for each stage are documented in the following subsections.

9.1. Shader Modules

Shader modules contain shader code and one or more entry points. Shaders are selected from a shader module by specifying an entry point as part of pipeline creation. The stages of a pipeline can use shaders that come from different modules. The shader code defining a shader module must be in the SPIR-V format, as described by the Vulkan Environment for SPIR-V appendix.

Shader modules are represented by VkShaderModule handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderModule)
```

To create a shader module, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateShaderModule(
    VkDevice device,
    const VkShaderModuleCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkShaderModule* pShaderModule);
```

- `device` is the logical device that creates the shader module.
• **pCreateInfo** is a pointer to a `VkShaderModuleCreateInfo` structure.
• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
• **pShaderModule** is a pointer to a `VkShaderModule` handle in which the resulting shader module object is returned.

Once a shader module has been created, any entry points it contains can be used in pipeline shader stages as described in Compute Pipelines and Graphics Pipelines.

If the shader stage fails to compile `VK_ERROR_INVALID_SHADER_NV` will be generated and the compile log will be reported back to the application by `VK_EXT_debug_report` if enabled.

### Valid Usage (Implicit)

- **VUID-vkCreateShaderModule-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkCreateShaderModule-pCreateInfo-parameter**
  - `pCreateInfo` must be a valid pointer to a valid `VkShaderModuleCreateInfo` structure
- **VUID-vkCreateShaderModule-pAllocator-parameter**
  - If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreateShaderModule-pShaderModule-parameter**
  - `pShaderModule` must be a valid pointer to a `VkShaderModule` handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OFDEVICE_MEMORY**
- **VK_ERROR_INVALID_SHADER_NV**

The `VkShaderModuleCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkShaderModuleCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkShaderModuleCreateFlags flags;
    size_t                    codeSize;
    const uint32_t*           pCode;
} VkShaderModuleCreateInfo;
```
- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `codeSize` is the size, in bytes, of the code pointed to by `pCode`.
- `pCode` is a pointer to code that is used to create the shader module. The type and format of the code is determined from the content of the memory addressed by `pCode`.

**Valid Usage**

- VUID-VkShaderModuleCreateInfo-codeSize-01085
  
  `codeSize` **must** be greater than 0

- VUID-VkShaderModuleCreateInfo-pCode-01376
  
  If `pCode` is a pointer to SPIR-V code, `codeSize` **must** be a multiple of 4

- VUID-VkShaderModuleCreateInfo-pCode-01377
  
  `pCode` **must** point to either valid SPIR-V code, formatted and packed as described by the Khronos SPIR-V Specification or valid GLSL code which **must** be written to the GL_KHR_vulkan_gls1 extension specification

- VUID-VkShaderModuleCreateInfo-pCode-01378
  
  If `pCode` is a pointer to SPIR-V code, that code **must** adhere to the validation rules described by the Validation Rules within a Module section of the SPIR-V Environment appendix

- VUID-VkShaderModuleCreateInfo-pCode-01379
  
  If `pCode` is a pointer to GLSL code, it **must** be valid GLSL code written to the GL_KHR_vulkan_gls1 GLSL extension specification

- VUID-VkShaderModuleCreateInfo-pCode-01089
  
  `pCode` **must** declare the Shader capability for SPIR-V code

- VUID-VkShaderModuleCreateInfo-pCode-01090
  
  `pCode` **must** not declare any capability that is not supported by the API, as described by the Capabilities section of the SPIR-V Environment appendix

- VUID-VkShaderModuleCreateInfo-pCode-01091
  
  If `pCode` declares any of the capabilities listed in the SPIR-V Environment appendix, one of the corresponding requirements **must** be satisfied

- VUID-VkShaderModuleCreateInfo-pCode-04146
  
  `pCode` **must** not declare any SPIR-V extension that is not supported by the API, as described by the Extension section of the SPIR-V Environment appendix

- VUID-VkShaderModuleCreateInfo-pCode-04147
  
  If `pCode` declares any of the SPIR-V extensions listed in the SPIR-V Environment appendix, one of the corresponding requirements **must** be satisfied
Valid Usage (Implicit)

- **VUID-VkShaderModuleCreateInfo-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO`

- **VUID-VkShaderModuleCreateInfo-pNext-pNext**
  
  *pNext* must be `NULL` or a pointer to a valid instance of `VkShaderModuleValidationCacheCreateInfoEXT`

- **VUID-VkShaderModuleCreateInfo-sType-unique**
  
  The *sType* value of each struct in the *pNext* chain must be unique

- **VUID-VkShaderModuleCreateInfo-flags-zerobitmask**
  
  *flags* must be `0`

- **VUID-VkShaderModuleCreateInfo-pCode-parameter**
  
  *pCode* must be a valid pointer to an array of \( \frac{codeSize}{4} \) `uint32_t` values

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderModuleCreateFlags;
```

`VkShaderModuleCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To use a `VkValidationCacheEXT` to cache shader validation results, add a `VkShaderModuleValidationCacheCreateInfoEXT` structure to the `pNext` chain of the `VkShaderModuleCreateInfo` structure, specifying the cache object to use.

The `VkShaderModuleValidationCacheCreateInfoEXT` struct is defined as:

```c
// Provided by VK_EXT_validation_cache
typedef struct VkShaderModuleValidationCacheCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkValidationCacheEXT     validationCache;
} VkShaderModuleValidationCacheCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **validationCache** is the validation cache object from which the results of prior validation attempts will be written, and to which new validation results for this `VkShaderModule` will be written (if not already present).
Valid Usage (Implicit)

- **VUID-VkShaderModuleValidationCacheCreateInfoEXT-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_SHADER_MODULE_VALIDATION_CACHE_CREATE_INFO_EXT`

- **VUID-VkShaderModuleValidationCacheCreateInfoEXT-validationCache-parameter**
  - `validationCache` **must** be a valid `VkValidationCacheEXT` handle

To destroy a shader module, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyShaderModule(
    VkDevice                                    device,
    VkShaderModule                              shaderModule,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the shader module.
- `shaderModule` is the handle of the shader module to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

A shader module **can** be destroyed while pipelines created using its shaders are still in use.

Valid Usage

- **VUID-vkDestroyShaderModule-shaderModule-01092**
  - If `VkAllocationCallbacks` were provided when `shaderModule` was created, a compatible set of callbacks **must** be provided here

- **VUID-vkDestroyShaderModule-shaderModule-01093**
  - If no `VkAllocationCallbacks` were provided when `shaderModule` was created, `pAllocator` **must** be `NULL`
Valid Usage (Implicit)

- VUID-vkDestroyShaderModule-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyShaderModule-shaderModule-parameter
  If shaderModule is not VK_NULL_HANDLE, shaderModule must be a valid VkShaderModule handle

- VUID-vkDestroyShaderModule-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyShaderModule-shaderModule-parent
  If shaderModule is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to shaderModule must be externally synchronized

9.2. Shader Execution

At each stage of the pipeline, multiple invocations of a shader may execute simultaneously. Further, invocations of a single shader produced as the result of different commands may execute simultaneously. The relative execution order of invocations of the same shader type is undefined. Shader invocations may complete in a different order than that in which the primitives they originated from were drawn or dispatched by the application. However, fragment shader outputs are written to attachments in rasterization order.

The relative execution order of invocations of different shader types is largely undefined. However, when invoking a shader whose inputs are generated from a previous pipeline stage, the shader invocations from the previous stage are guaranteed to have executed far enough to generate input values for all required inputs.

9.3. Shader Memory Access Ordering

The order in which image or buffer memory is read or written by shaders is largely undefined. For some shader types (vertex, tessellation evaluation, and in some cases, fragment), even the number of shader invocations that may perform loads and stores is undefined.

In particular, the following rules apply:

- Vertex and tessellation evaluation shaders will be invoked at least once for each unique vertex, as defined in those sections.
- Fragment shaders will be invoked zero or more times, as defined in that section.
- The relative execution order of invocations of the same shader type is undefined. A store issued
by a shader when working on primitive B might complete prior to a store for primitive A, even if primitive A is specified prior to primitive B. This applies even to fragment shaders; while fragment shader outputs are always written to the framebuffer in rasterization order, stores executed by fragment shader invocations are not.

- The relative execution order of invocations of different shader types is largely undefined.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>The above limitations on shader invocation order make some forms of synchronization between shader invocations within a single set of primitives unimplementable. For example, having one invocation poll memory written by another invocation assumes that the other invocation has been launched and will complete its writes in finite time.</td>
</tr>
</tbody>
</table>

The Memory Model appendix defines the terminology and rules for how to correctly communicate between shader invocations, such as when a write is Visible-To a read, and what constitutes a Data Race.

Applications must not cause a data race.

The SPIR-V SubgroupMemory, CrossWorkgroupMemory, and AtomicCounterMemory memory semantics are ignored. Sequentially consistent atomics and barriers are not supported and SequentiallyConsistent is treated as AcquireRelease. SequentiallyConsistent should not be used.

9.4. Shader Inputs and Outputs

Data is passed into and out of shaders using variables with input or output storage class, respectively. User-defined inputs and outputs are connected between stages by matching their Location decorations. Additionally, data can be provided by or communicated to special functions provided by the execution environment using BuiltIn decorations.

In many cases, the same BuiltIn decoration can be used in multiple shader stages with similar meaning. The specific behavior of variables decorated as BuiltIn is documented in the following sections.

9.5. Task Shaders

Task shaders operate in conjunction with the mesh shaders to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline. Its primary purpose is to create a variable amount of subsequent mesh shader invocations.

Task shaders are invoked via the execution of the programmable mesh shading pipeline.

The task shader has no fixed-function inputs other than variables identifying the specific workgroup and invocation. The only fixed output of the task shader is a task count, identifying the number of mesh shader workgroups to create. The task shader can write additional outputs to task memory, which can be read by all of the mesh shader workgroups it created.
9.5.1. Task Shader Execution

Task workloads are formed from groups of work items called workgroups and processed by the task shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Task shaders execute in global workgroups which are divided into a number of local workgroups with a size that can be set by assigning a value to the LocalSize execution mode or via an object decorated by the WorkgroupSize decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

9.6. Mesh Shaders

Mesh shaders operate in workgroups to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline. Each workgroup emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

Mesh shaders are invoked via the execution of the programmable mesh shading pipeline.

The only inputs available to the mesh shader are variables identifying the specific workgroup and invocation and, if applicable, any outputs written to task memory by the task shader that spawned the mesh shader’s workgroup. The mesh shader can operate without a task shader as well.

The invocations of the mesh shader workgroup write an output mesh, comprising a set of primitives with per-primitive attributes, a set of vertices with per-vertex attributes, and an array of indices identifying the mesh vertices that belong to each primitive. The primitives of this mesh are then processed by subsequent graphics pipeline stages, where the outputs of the mesh shader form an interface with the fragment shader.

9.6.1. Mesh Shader Execution

Mesh workloads are formed from groups of work items called workgroups and processed by the mesh shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Mesh shaders execute in global workgroups which are divided into a number of local workgroups with a size that can be set by assigning a value to the LocalSize execution mode or via an object decorated by the WorkgroupSize decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

The global workgroups may be generated explicitly via the API, or implicitly through the task shader’s work creation mechanism.

9.7. Vertex Shaders

Each vertex shader invocation operates on one vertex and its associated vertex attribute data, and outputs one vertex and associated data. Graphics pipelines using primitive shading must include a vertex shader, and the vertex shader stage is always the first shader stage in the graphics pipeline.
9.7.1. Vertex Shader Execution

A vertex shader must be executed at least once for each vertex specified by a draw command. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view. During execution, the shader is presented with the index of the vertex and instance for which it has been invoked. Input variables declared in the vertex shader are filled by the implementation with the values of vertex attributes associated with the invocation being executed.

If the same vertex is specified multiple times in a draw command (e.g. by including the same index value multiple times in an index buffer) the implementation may reuse the results of vertex shading if it can statically determine that the vertex shader invocations will produce identical results.

Note

It is implementation-dependent when and if results of vertex shading are reused, and thus how many times the vertex shader will be executed. This is true also if the vertex shader contains stores or atomic operations (see vertexPipelineStoresAndAtomics).

9.8. Tessellation Control Shaders

The tessellation control shader is used to read an input patch provided by the application and to produce an output patch. Each tessellation control shader invocation operates on an input patch (after all control points in the patch are processed by a vertex shader) and its associated data, and outputs a single control point of the output patch and its associated data, and can also output additional per-patch data. The input patch is sized according to the patchControlPoints member of VkPipelineTessellationStateCreateInfo, as part of input assembly.

The input patch can also be dynamically sized with patchControlPoints parameter of vkCmdSetPatchControlPointsEXT.

To dynamically specify the number of control points per patch:

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetPatchControlPointsEXT(
    VkCommandBuffer commandBuffer, 
    uint32_t patchControlPoints);
```

- commandBuffer is the command buffer into which the command will be recorded.
- patchControlPoints specifies number of control points per patch.

This command sets the state for a given draw when the graphics pipeline is created with VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates.
Valid Usage

- VUID-vkCmdSetPatchControlPointsEXT-None-04873
  The extendedDynamicState2PatchControlPoints feature must be enabled

- VUID-vkCmdSetPatchControlPointsEXT-patchControlPoints-04874
  patchControlPoints must be greater than zero and less than or equal to VkPhysicalDeviceLimits::maxTessellationPatchSize

Valid Usage (Implicit)

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>

</tr>
</tbody>
</table>

The size of the output patch is controlled by the OpExecutionMode OutputVertices specified in the tessellation control or tessellation evaluation shaders, which must be specified in at least one of the shaders. The size of the input and output patches must each be greater than zero and less than or equal to VkPhysicalDeviceLimits::maxTessellationPatchSize.

9.8.1. Tessellation Control Shader Execution

A tessellation control shader is invoked at least once for each output vertex in a patch. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.
Inputs to the tessellation control shader are generated by the vertex shader. Each invocation of the tessellation control shader can read the attributes of any incoming vertices and their associated data. The invocations corresponding to a given patch execute logically in parallel, with undefined relative execution order. However, the `OpControlBarrier` instruction can be used to provide limited control of the execution order by synchronizing invocations within a patch, effectively dividing tessellation control shader execution into a set of phases. Tessellation control shaders will read undefined values if one invocation reads a per-vertex or per-patch attribute written by another invocation at any point during the same phase, or if two invocations attempt to write different values to the same per-patch output in a single phase.

### 9.9. Tessellation Evaluation Shaders

The Tessellation Evaluation Shader operates on an input patch of control points and their associated data, and a single input barycentric coordinate indicating the invocation's relative position within the subdivided patch, and outputs a single vertex and its associated data.

#### 9.9.1. Tessellation Evaluation Shader Execution

A tessellation evaluation shader is invoked at least once for each unique vertex generated by the tessellator. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.

### 9.10. Geometry Shaders

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

#### 9.10.1. Geometry Shader Execution

A geometry shader is invoked at least once for each primitive produced by the tessellation stages, or at least once for each primitive generated by `primitive assembly` when tessellation is not in use. A shader can request that the geometry shader runs multiple instances. A geometry shader is invoked at least once for each instance. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.

### 9.11. Fragment Shaders

Fragment shaders are invoked as the result of rasterization in a graphics pipeline. Each fragment shader invocation operates on a single fragment and its associated data. With few exceptions, fragment shaders do not have access to any data associated with other fragments and are considered to execute in isolation of fragment shader invocations associated with other fragments.

#### 9.11.1. Fragment Shader Execution

Fragment shaders are invoked for each fragment generated by rasterization, or as helper invocations.
For fragment shaders invoked by fragments, the following rules apply:

- A fragment shader **must** not be executed if a fragment operation that executes before fragment shading discards the fragment.

- A fragment shader **may** not be executed if:
  
  ◦ An implementation determines that another fragment shader, invoked by a subsequent primitive in primitive order, overwrites all results computed by the shader (including writes to storage resources).
  
  ◦ Any other fragment operation discards the fragment, and the shader does not write to any storage resources.

- Otherwise, at least one fragment shader **must** be executed.
  
  ◦ If sample shading is enabled and multiple invocations per fragment are **required**, additional invocations **must** be executed as specified.
  
  ◦ If a shading rate image is used and multiple invocations per fragment are **required**, additional invocations **must** be executed as specified.
  
  ◦ Each covered sample **must** be included in at least one fragment shader invocation.

---

**Note**

Multiple fragment shader invocations may be executed for the same fragment for any number of implementation dependent reasons. When there is more than one fragment shader invocation per fragment, the association of samples to invocations is implementation-dependent. Stores and atomics performed by these additional invocations have the normal effect.

For example, if the subpass includes multiple views in its view mask, a fragment shader may be invoked separately for each view.

Similarly, if the render pass has a fragment density map attachment, more than one fragment shader invocation may be invoked for each covered sample. Such additional invocations are only produced if 

```
VkPhysicalDeviceFragmentDensityMapPropertiesEXT::fragmentDensityInvocations
```

is **VK_TRUE**. Implementations may generate these additional fragment shader invocations in order to make transitions between fragment areas with different fragment densities more smooth.

---

**Note**

Relative ordering of execution of different fragment shader invocations is explicitly not defined.

### 9.11.2. Early Fragment Tests

An explicit control is provided to allow fragment shaders to enable early fragment tests. If the fragment shader specifies the `EarlyFragmentTests OpExecutionMode`, additional per-fragment tests are performed prior to fragment shader execution.
If the fragment shader additionally specifies the `PostDepthCoverage OpExecutionMode`, the value of a variable decorated with the `SampleMask` built-in reflects the coverage after the early fragment tests. Otherwise, it reflects the coverage before the early fragment tests.

If early fragment tests are enabled, any depth value computed by the fragment shader has no effect.

### 9.11.3. Fragment Shader Interlock

In normal operation, it is possible for more than one fragment shader invocation to be executed simultaneously for the same pixel if there are overlapping primitives. If the `fragmentShaderSampleInterlock`, `fragmentShaderPixelInterlock`, or `fragmentShaderShadingRateInterlock` features are enabled, it is possible to define a critical section within the fragment shader that is guaranteed to not run simultaneously with another fragment shader invocation for the same sample(s) or pixel(s). It is also possible to control the relative ordering of execution of these critical sections across different fragment shader invocations.

If the `FragmentShaderSampleInterlockEXT`, `FragmentShaderPixelInterlockEXT`, or `FragmentShaderShadingRateInterlockEXT` capabilities are declared in the fragment shader, the `OpBeginInvocationInterlockEXT` and `OpEndInvocationInterlockEXT` instructions **must** be used to delimit a critical section of fragment shader code.

To ensure each invocation of the critical section is executed in *primitive order*, declare one of the `PixelInterlockOrderedEXT`, `SampleInterlockOrderedEXT`, or `ShadingRateInterlockOrderedEXT` execution modes. If the order of execution of each invocation of the critical section does not matter, declare one of the `PixelInterlockUnorderedEXT`, `SampleInterlockUnorderedEXT`, or `ShadingRateInterlockUnorderedEXT` execution modes.

The `PixelInterlockOrderedEXT` and `PixelInterlockUnorderedEXT` execution modes provide mutual exclusion in the critical section for any pair of fragments corresponding to the same pixel, or pixels if the fragment covers more than one pixel. With sample shading enabled, these execution modes are treated like `SampleInterlockOrderedEXT` or `SampleInterlockUnorderedEXT` respectively.

The `SampleInterlockOrderedEXT` and `SampleInterlockUnorderedEXT` execution modes only provide mutual exclusion for pairs of fragments that both cover at least one common sample in the same pixel; these are recommended for performance if shaders use per-sample data structures. If these execution modes are used in single-sample mode they are treated like `PixelInterlockOrderedEXT` or `PixelInterlockUnorderedEXT` respectively.

The `ShadingRateInterlockOrderedEXT` and `ShadingRateInterlockUnorderedEXT` execution modes provide mutual exclusion for pairs of fragments that both have at least one common sample in the same pixel, even if none of the common samples are covered by both fragments. With sample shading enabled, these execution modes are treated like `SampleInterlockOrderedEXT` or `SampleInterlockUnorderedEXT` respectively.

### 9.12. Compute Shaders

Compute shaders are invoked via `vkCmdDispatch` and `vkCmdDispatchIndirect` commands. In general, they have access to similar resources as shader stages executing as part of a graphics pipeline.
Compute workloads are formed from groups of work items called workgroups and processed by the compute shader in the current compute pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Compute shaders execute in global workgroups which are divided into a number of local workgroups with a size that can be set by assigning a value to the LocalSize execution mode or via an object decorated by the WorkgroupSize decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

9.13. Ray Generation Shaders

A ray generation shader is similar to a compute shader. Its main purpose is to execute ray tracing queries using OpTraceRayKHR instructions and process the results.

9.13.1. Ray Generation Shader Execution

One ray generation shader is executed per ray tracing dispatch. Its location in the shader binding table (see Shader Binding Table for details) is passed directly into vkCmdTraceRaysKHR using the raygenShaderBindingTableBuffer and raygenShaderBindingOffset parameters.

Intersection shaders enable the implementation of arbitrary, application defined geometric primitives. An intersection shader for a primitive is executed whenever its axis-aligned bounding box is hit by a ray.

Like other ray tracing shader domains, an intersection shader operates on a single ray at a time. It also operates on a single primitive at a time. It is therefore the purpose of an intersection shader to compute the ray-primitive intersections and report them. To report an intersection, the shader calls the OpReportIntersectionKHR instruction.

An intersection shader communicates with any-hit and closest shaders by generating attribute values that they can read. Intersection shaders cannot read or modify the ray payload.

9.14.1. Intersection Shader Execution

The order in which intersections are found along a ray, and therefore the order in which intersection shaders are executed, is unspecified.

The intersection shader of the closest AABB which intersects the ray is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

9.15. Any-Hit Shaders

The any-hit shader is executed after the intersection shader reports an intersection that lies within the current \([t_{\text{min}}, t_{\text{max}}]\) of the ray. The main use of any-hit shaders is to programmatically decide whether or not an intersection will be accepted. The intersection will be accepted unless the shader calls the OpIgnoreIntersectionKHR instruction. Any-hit shaders have read-only access to the
attributes generated by the corresponding intersection shader, and can read or modify the ray payload.

9.15.1. Any-Hit Shader Execution

The order in which intersections are found along a ray, and therefore the order in which any-hit shaders are executed, is unspecified.

The any-hit shader of the closest hit is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

9.16. Closest Hit Shaders

Closest hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and can read or modify the ray payload. They also have access to a number of system-generated values. Closest hit shaders can call OpTraceRayKHR to recursively trace rays.

9.16.1. Closest Hit Shader Execution

Exactly one closest hit shader is executed when traversal is finished and an intersection has been found and accepted.

9.17. Miss Shaders

Miss shaders can access the ray payload and can trace new rays through the OpTraceRayKHR instruction, but cannot access attributes since they are not associated with an intersection.

9.17.1. Miss Shader Execution

A miss shader is executed instead of a closest hit shader if no intersection was found during traversal.

9.18. Callable Shaders

Callable shaders can access a callable payload that works similarly to ray payloads to do subroutine work.

9.18.1. Callable Shader Execution

A callable shader is executed by calling OpExecuteCallableKHR from an allowed shader stage.

9.19. Interpolation Decorations

Interpolation decorations control the behavior of attribute interpolation in the fragment shader stage. Interpolation decorations can be applied to Input storage class variables in the fragment shader stage’s interface, and control the interpolation behavior of those variables.
Inputs that could be interpolated can be decorated by at most one of the following decorations:

- **Flat**: no interpolation
- **NoPerspective**: linear interpolation (for lines and polygons)

Fragment input variables decorated with neither Flat nor NoPerspective use perspective-correct interpolation (for lines and polygons).

The presence of and type of interpolation is controlled by the above interpolation decorations as well as the auxiliary decorations **Centroid** and **Sample**.

A variable decorated with Flat will not be interpolated. Instead, it will have the same value for every fragment within a triangle. This value will come from a single **provoking vertex**. A variable decorated with Flat can also be decorated with **Centroid** or **Sample**, which will mean the same thing as decorating it only as Flat.

For fragment shader input variables decorated with neither **Centroid** nor **Sample**, the assigned variable may be interpolated anywhere within the fragment and a single value may be assigned to each sample within the fragment.

If a fragment shader input is decorated with **Centroid**, a single value may be assigned to that variable for all samples in the fragment, but that value must be interpolated to a location that lies in both the fragment and in the primitive being rendered, including any of the fragment's samples covered by the primitive. Because the location at which the variable is interpolated may be different in neighboring fragments, and derivatives may be computed by computing differences between neighboring fragments, derivatives of centroid-sampled inputs may be less accurate than those for non-centroid interpolated variables. The **PostDepthCoverage** execution mode does not affect the determination of the centroid location.

If a fragment shader input is decorated with **Sample**, a separate value must be assigned to that variable for each covered sample in the fragment, and that value must be sampled at the location of the individual sample. When **rasterizationSamples** is **VK_SAMPLE_COUNT_1_BIT**, the fragment center must be used for **Centroid**, **Sample**, and undecorated attribute interpolation.

Fragment shader inputs that are signed or unsigned integers, integer vectors, or any double-precision floating-point type must be decorated with Flat.

When the **VK_AMD_shader_explicit_vertex_parameter** device extension is enabled inputs can be also decorated with the **CustomInterpAMD** interpolation decoration, including fragment shader inputs that are signed or unsigned integers, integer vectors, or any double-precision floating-point type. Inputs decorated with **CustomInterpAMD** can only be accessed by the extended instruction **InterpolateAtVertexAMD** and allows accessing the value of the input for individual vertices of the primitive.

When the **fragmentShaderBarycentric** feature is enabled, inputs can be also decorated with the **PerVertexNV** interpolation decoration, including fragment shader inputs that are signed or unsigned integers, integer vectors, or any double-precision floating-point type. Inputs decorated with **PerVertexNV** can only be accessed using an extra array dimension, where the extra index identifies one of the vertices of the primitive that produced the fragment.
9.20. Static Use

A SPIR-V module declares a global object in memory using the `OpVariable` instruction, which results in a pointer `x` to that object. A specific entry point in a SPIR-V module is said to `statically use` that object if that entry point's call tree contains a function containing a memory instruction or image instruction with `x` as an `id` operand. See the “Memory Instructions” and “Image Instructions” subsections of section 3 “Binary Form” of the SPIR-V specification for the complete list of SPIR-V memory instructions.

Static use is not used to control the behavior of variables with `Input` and `Output` storage. The effects of those variables are applied based only on whether they are present in a shader entry point’s interface.

9.21. Scope

A `scope` describes a set of shader invocations, where each such set is a `scope instance`. Each invocation belongs to one or more scope instances, but belongs to no more than one scope instance for each scope.

The operations available between invocations in a given scope instance vary, with smaller scopes generally able to perform more operations, and with greater efficiency.

9.21.1. Cross Device

All invocations executed in a Vulkan instance fall into a single `cross device scope instance`.

Whilst the `CrossDevice` scope is defined in SPIR-V, it is disallowed in Vulkan. API synchronization commands can be used to communicate between devices.

9.21.2. Device

All invocations executed on a single device form a `device scope instance`.

If the `vulkanMemoryModel` and `vulkanMemoryModelDeviceScope` features are enabled, this scope is represented in SPIR-V by the `Device Scope`, which can be used as a `Memory Scope` for barrier and atomic operations.

If both the `shaderDeviceClock` and `vulkanMemoryModelDeviceScope` features are enabled, using the `Device Scope` with the `OpReadClockKHR` instruction will read from a clock that is consistent across invocations in the same device scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this can only be done with API synchronization primitives.

Invocations executing on different devices in a device group operate in separate device scope instances.
9.21.3. Queue Family

Invocations executed by queues in a given queue family form a *queue family scope instance*.

This scope is identified in SPIR-V as the *QueueFamily Scope* if the *vulkanMemoryModel* feature is enabled, or if not, the *Device Scope*, which can be used as a *Memory Scope* for barrier and atomic operations.

If the *shaderDeviceClock* feature is enabled, but the *vulkanMemoryModelDeviceScope* feature is not enabled, using the *Device Scope* with the *OpReadClockKHR* instruction will read from a clock that is consistent across invocations in the same queue family scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this can only be done with API synchronization primitives.

Each invocation in a queue family scope instance must be in the same *device scope instance*.

9.21.4. Command

Any shader invocations executed as the result of a single command such as *vkCmdDispatch* or *vkCmdDraw* form a *command scope instance*. For indirect drawing commands with *drawCount* greater than one, invocations from separate draws are in separate command scope instances. For ray tracing shaders, an invocation group is an implementation-dependent subset of the set of shader invocations of a given shader stage which are produced by a single trace rays command.

There is no specific *Scope* for communication across invocations in a command scope instance. As this has a clear boundary at the API level, coordination here can be performed in the API, rather than in SPIR-V.

Each invocation in a command scope instance must be in the same *queue-family scope instance*.

For shaders without defined *workgroups*, this set of invocations forms an *invocation group* as defined in the SPIR-V specification.

9.21.5. Primitive

Any fragment shader invocations executed as the result of rasterization of a single primitive form a *primitive scope instance*.

There is no specific *Scope* for communication across invocations in a primitive scope instance.

Any generated *helper invocations* are included in this scope instance.

Each invocation in a primitive scope instance must be in the same *command scope instance*.

Any input variables decorated with *Flat* are uniform within a primitive scope instance.

9.21.6. Shader Call

Any *shader-call-related* invocations that are executed in one or more ray tracing execution models form a *shader call scope instance*. 
The ShaderCallKHR Scope can be used as Memory Scope for barrier and atomic operations.

Each invocation in a shader call scope instance must be in the same queue family scope instance.

### 9.21.7. Workgroup

A local workgroup is a set of invocations that can synchronize and share data with each other using memory in the Workgroup storage class.

The Workgroup Scope can be used as both an Execution Scope and Memory Scope for barrier and atomic operations.

Each invocation in a local workgroup must be in the same command scope instance.

Only task, mesh, and compute shaders have defined workgroups - other shader types cannot use workgroup functionality. For shaders that have defined workgroups, this set of invocations forms an invocation group as defined in the SPIR-V specification.

### 9.21.8. Subgroup

A subgroup (see the subsection “Control Flow” of section 2 of the SPIR-V 1.3 Revision 1 specification) is a set of invocations that can synchronize and share data with each other efficiently.

The Subgroup Scope can be used as both an Execution Scope and Memory Scope for barrier and atomic operations. Other subgroup features allow the use of group operations with subgroup scope.

If the shaderSubgroupClock feature is enabled, using the Subgroup Scope with the OpReadClockKHR instruction will read from a clock that is consistent across invocations in the same subgroup.

For shaders that have defined workgroups, each invocation in a subgroup must be in the same local workgroup.

In other shader stages, each invocation in a subgroup must be in the same device scope instance.

Only shader stages that support subgroup operations have defined subgroups.

### 9.21.9. Quad

A quad scope instance is formed of four shader invocations.

In a fragment shader, each invocation in a quad scope instance is formed of invocations in neighboring framebuffer locations \((x_i, y_i)\), where:

- \(i\) is the index of the invocation within the scope instance.
- \(w\) and \(h\) are the number of pixels the fragment covers in the \(x\) and \(y\) axes.
- \(w\) and \(h\) are identical for all participating invocations.
- \((x_0) = (x_1 - w) = (x_2) = (x_3 - w)\)
- \((y_0) = (y_1) = (y_2 - h) = (y_3 - h)\)

Each invocation has the same layer and sample indices.
In a compute shader, if the `DerivativeGroupQuadsNV` execution mode is specified, each invocation in a quad scope instance is formed of invocations with adjacent local invocation IDs \((x_i, y_i)\), where:

- \(i\) is the index of the invocation within the quad scope instance.
- \((x_0) = (x_1 - 1) = (x_2) = (x_3 - 1)\)
- \((y_0) = (y_1) = (y_2 - 1) = (y_3 - 1)\)
- \(x_0\) and \(y_0\) are integer multiples of 2.
- Each invocation has the same \(z\) coordinate.

In a compute shader, if the `DerivativeGroupLinearNV` execution mode is specified, each invocation in a quad scope instance is formed of invocations with adjacent local invocation indices \((l_i)\), where:

- \(i\) is the index of the invocation within the quad scope instance.
- \((l_0) = (l_1 - 1) = (l_2 - 2) = (l_3 - 3)\)
- \(l_0\) is an integer multiple of 4.

In all shaders, each invocation in a quad scope instance is formed of invocations in adjacent subgroup invocation indices \((s_i)\), where:

- \(i\) is the index of the invocation within the quad scope instance.
- \((s_0) = (s_1 - 1) = (s_2 - 2) = (s_3 - 3)\)
- \(s_0\) is an integer multiple of 4.

Each invocation in a quad scope instance must be in the same subgroup.

In a fragment shader, each invocation in a quad scope instance must be in the same primitive scope instance.

Fragment and compute shaders have defined quad scope instances. If the `quadOperationsInAllStages` limit is supported, any shader stages that support subgroup operations also have defined quad scope instances.

### 9.21.10. Fragment Interlock

A fragment interlock scope instance is formed of fragment shader invocations based on their framebuffer locations \((x,y,layer,sample)\), executed by commands inside a single subpass.

The specific set of invocations included varies based on the execution mode as follows:

- If the `SampleInterlockOrderedEXT` or `SampleInterlockUnorderedEXT` execution modes are used, only invocations with identical framebuffer locations \((x,y,layer,sample)\) are included.
- If the `PixelInterlockOrderedEXT` or `PixelInterlockUnorderedEXT` execution modes are used, fragments with different sample ids are also included.
- If the `ShadingRateInterlockOrderedEXT` or `ShadingRateInterlockUnorderedEXT` execution modes are used, fragments from neighbouring framebuffer locations are also included, as determined by the shading rate.
Only fragment shaders with one of the above execution modes have defined fragment interlock scope instances.

There is no specific Scope value for communication across invocations in a fragment interlock scope instance. However, this is implicitly used as a memory scope by `OpBeginInvocationInterlockEXT` and `OpEndInvocationInterlockEXT`.

Each invocation in a fragment interlock scope instance must be in the same queue family scope instance.

### 9.21.11. Invocation

The smallest scope is a single invocation; this is represented by the Invocation Scope in SPIR-V.

Fragment shader invocations must be in a primitive scope instance.

Invocations in fragment shaders that have a defined fragment interlock scope must be in a fragment interlock scope instance.

Invocations in shaders that have defined workgroups must be in a local workgroup.

Invocations in shaders that have a defined subgroup scope must be in a subgroup.

Invocations in shaders that have a defined quad scope must be in a quad scope instance.

All invocations in all stages must be in a command scope instance.

### 9.22. Group Operations

Group operations are executed by multiple invocations within a scope instance; with each invocation involved in calculating the result. This provides a mechanism for efficient communication between invocations in a particular scope instance.

Group operations all take a Scope defining the desired scope instance to operate within. Only the Subgroup scope can be used for these operations; the subgroupSupportedOperations limit defines which types of operation can be used.

#### 9.22.1. Basic Group Operations

Basic group operations include the use of `OpGroupNonUniformElect`, `OpControlBarrier`, `OpMemoryBarrier`, and atomic operations.

`OpGroupNonUniformElect` can be used to choose a single invocation to perform a task for the whole group. Only the invocation with the lowest id in the group will return `true`.

The Memory Model appendix defines the operation of barriers and atomics.

#### 9.22.2. Vote Group Operations

The vote group operations allow invocations within a group to compare values across a group. The
types of votes enabled are:

- Do all active group invocations agree that an expression is true?
- Do any active group invocations evaluate an expression to true?
- Do all active group invocations have the same value of an expression?

*Note*

These operations are useful in combination with control flow in that they allow for developers to check whether conditions match across the group and choose potentially faster code-paths in these cases.

### 9.22.3. Arithmetic Group Operations

The arithmetic group operations allow invocations to perform scans and reductions across a group. The operators supported are add, mul, min, max, and, or, xor.

For reductions, every invocation in a group will obtain the cumulative result of these operators applied to all values in the group. For exclusive scans, each invocation in a group will obtain the cumulative result of these operators applied to all values in invocations with a lower index in the group. Inclusive scans are identical to exclusive scans, except the cumulative result includes the operator applied to the value in the current invocation.

The order in which these operators are applied is implementation-dependent.

### 9.22.4. Ballot Group Operations

The ballot group operations allow invocations to perform more complex votes across the group. The ballot functionality allows all invocations within a group to provide a boolean value and get as a result what each invocation provided as their boolean value. The broadcast functionality allows values to be broadcast from an invocation to all other invocations within the group.

### 9.22.5. Shuffle Group Operations

The shuffle group operations allow invocations to read values from other invocations within a group.

### 9.22.6. Shuffle Relative Group Operations

The shuffle relative group operations allow invocations to read values from other invocations within the group relative to the current invocation in the group. The relative operations supported allow data to be shifted up and down through the invocations within a group.

### 9.22.7. Clustered Group Operations

The clustered group operations allow invocations to perform an operation among partitions of a group, such that the operation is only performed within the group invocations within a partition. The partitions for clustered group operations are consecutive power-of-two size groups of invocations and the cluster size **must** be known at pipeline creation time. The operations supported
are add, mul, min, max, and, or, xor.

9.23. Quad Group Operations

Quad group operations (OpGroupNonUniformQuad*) are a specialized type of group operations that only operate on quad scope instances. Whilst these instructions do include a Scope parameter, this scope is always overridden; only the quad scope instance is included in its execution scope.

Fragment shaders that statically execute quad group operations must launch sufficient invocations to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.

The index used to select participating invocations is i, as described for a quad scope instance, defined as the quad index in the SPIR-V specification.

For OpGroupNonUniformQuadBroadcast this value is equal to Index. For OpGroupNonUniformQuadSwap, it is equal to the implicit Index used by each participating invocation.

9.24. Derivative Operations

Derivative operations calculate the partial derivative for an expression P as a function of an invocation’s x and y coordinates.

Derivative operations operate on a set of invocations known as a derivative group as defined in the SPIR-V specification. A derivative group is equivalent to the quad scope instance for a compute shader invocation, or the primitive scope instance for a fragment shader invocation.

Derivatives are calculated assuming that P is piecewise linear and continuous within the derivative group. All dynamic instances of explicit derivative instructions (OpDPdx*, OpDPdy*, and OpFwidth*) must be executed in control flow that is uniform within a derivative group. For other derivative operations, results are undefined if a dynamic instance is executed in control flow is not uniform within the derivative group.

Fragment shaders that statically execute derivative operations must launch sufficient invocations to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.

Note

In a compute shader, it is the application’s responsibility to ensure that sufficient invocations are launched.

Derivative operations calculate their results as the difference between the result of P across invocations in the quad. For fine derivative operations (OpDPdxFine and OpDPdyFine), the values of DPdx(P) are calculated as

\[ DPdx(P_0) = DPdx(P_1) = P_1 - P_0 \]
\[ \text{DPdx}(P_2) = \text{DPdx}(P_3) = P_3 - P_2 \]

and the values of \( \text{DPdy}(P_i) \) are calculated as

\[ \begin{align*}
\text{DPdy}(P_0) &= \text{DPdy}(P_2) = P_2 - P_0 \\
\text{DPdy}(P_1) &= \text{DPdy}(P_3) = P_3 - P_1
\end{align*} \]

where \( i \) is the index of each invocation as described in *Quad*.

Coarse derivative operations (\text{OpDPdxCoarse} and \text{OpDPdyCoarse}), calculate their results in roughly the same manner, but \textbf{may} only calculate two values instead of four (one for each of \text{DPdx} and \text{DPdy}), reusing the same result no matter the originating invocation. If an implementation does this, it \textbf{should} use the fine derivative calculations described for \( P_0 \).

\( \text{Note} \)

Derivative values are calculated between fragments rather than pixels. If the fragment shader invocations involved in the calculation covers multiple pixels, these operations cover a wider area, resulting in larger derivative values. This in turn will result in a coarser level of detail being selected for image sampling operations using derivatives.

Applications may want to account for this when using multi-pixel fragments; if pixel derivatives are desired, applications should use explicit derivative operations and divide the results by the size of the fragment in each dimension as follows:

\[ \begin{align*}
\text{DPdx}(P_n)' &= \text{DPdx}(P_n) / w \\
\text{DPdy}(P_n)' &= \text{DPdy}(P_n) / h
\end{align*} \]

where \( w \) and \( h \) are the size of the fragments in the quad, and \( \text{DPdx}(P_n)' \) and \( \text{DPdy}(P_n)' \) are the pixel derivatives.

The results for \text{OpDPdx} and \text{OpDPdy} \textbf{may} be calculated as either fine or coarse derivatives, with implementations favouring the most efficient approach. Implementations \textbf{must} choose coarse or fine consistently between the two.

Executing \text{OpFwidthFine}, \text{OpFwidthCoarse}, or \text{OpFwidth} is equivalent to executing the corresponding \text{OpDPdx*} and \text{OpDPdy*} instructions, taking the absolute value of the results, and summing them.

Executing a \text{OpImage*Sample*ImplicitLod} instruction is equivalent to executing \text{OpDPdx(Coordinate)} and \text{OpDPdy(Coordinate)}, and passing the results as the \text{Grad} operands \( dx \) and \( dy \).
It is expected that using the `ImplicitLod` variants of sampling functions will be substantially more efficient than using the `ExplicitLod` variants with explicitly generated derivatives.

### 9.25. Helper Invocations

When performing derivative or quad group operations in a fragment shader, additional invocations may be spawned in order to ensure correct results. These additional invocations are known as helper invocations and can be identified by a non-zero value in the `HelperInvocation` built-in. Stores and atomic operations performed by helper invocations must not have any effect on memory, and values returned by atomic instructions in helper invocations are undefined.

Helper invocations may become inactive at any time for any reason, with one exception. If a helper invocation would be active if it were not a helper invocation, it must be active for derivative and quad group operations.

Helper invocations may become permanently inactive if all invocations in a quad scope instance become helper invocations.

A cooperative matrix type is a SPIR-V type where the storage for and computations performed on the matrix are spread across the invocations in a scope instance. These types give the implementation freedom in how to optimize matrix multiplies.

SPIR-V defines the types and instructions, but does not specify rules about what sizes/combinations are valid, and it is expected that different implementations may support different sizes.

To enumerate the supported cooperative matrix types and operations, call:

```c
// Provided by VK_NV_cooperative_matrix
VkResult vkGetPhysicalDeviceCooperativeMatrixPropertiesNV(
    VkPhysicalDevice                            physicalDevice,  
    uint32_t*                                   pPropertyCount,  
    VkCooperativeMatrixPropertiesNV*            pProperties);
```

- `physicalDevice` is the physical device.
- `pPropertyCount` is a pointer to an integer related to the number of cooperative matrix properties available or queried.
- `pProperties` is either `NULL` or a pointer to an array of `VkCooperativeMatrixPropertiesNV` structures.

If `pProperties` is `NULL`, then the number of cooperative matrix properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of elements.

510 | Chapter 9. Shaders
structures actually written to \textit{pProperties}. If \textit{pPropertyCount} is less than the number of cooperative matrix properties available, at most \textit{pPropertyCount} structures will be written, and \textit{VK_INCOMPLETE} will be returned instead of \textit{VK_SUCCESS}, to indicate that not all the available cooperative matrix properties were returned.

### Valid Usage (Implicit)

- \textbf{VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-physicalDevice-parameter}
  - \textit{physicalDevice} must be a valid \textit{VkPhysicalDevice} handle
- \textbf{VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-pPropertyCount-parameter}
  - \textit{pPropertyCount} must be a valid pointer to a \textit{uint32_t} value
- \textbf{VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-pProperties-parameter}
  - If the value referenced by \textit{pPropertyCount} is not 0, and \textit{pProperties} is not NULL, \textit{pProperties} must be a valid pointer to an array of \textit{pPropertyCount} \textit{VkCooperativeMatrixPropertiesNV} structures

### Return Codes

**Success**
- \textit{VK_SUCCESS}
- \textit{VK_INCOMPLETE}

**Failure**
- \textit{VK_ERROR_OUT_OF_HOST_MEMORY}
- \textit{VK_ERROR_OUT_OF_DEVICE_MEMORY}

Each \textit{VkCooperativeMatrixPropertiesNV} structure describes a single supported combination of types for a matrix multiply/add operation (\textit{OpCooperativeMatrixMulAddNV}). The multiply \textbf{can} be described in terms of the following variables and types (in SPIR-V pseudocode):

```plaintext
%A is of type OpTypeCooperativeMatrixNV %AType %scope %MSize %KSize
%B is of type OpTypeCooperativeMatrixNV %BType %scope %KSize %NSize
%C is of type OpTypeCooperativeMatrixNV % CType %scope %MSize %NSize
%D is of type OpTypeCooperativeMatrixNV %DType %scope %MSize %NSize

%D = %A * %B + %C // using OpCooperativeMatrixMulAddNV
```

A matrix multiply with these dimensions is known as an \textit{MxNxK} matrix multiply.

The \textit{VkCooperativeMatrixPropertiesNV} structure is defined as:
// Provided by VK_NV_cooperative_matrix
typedef struct VkCooperativeMatrixPropertiesNV {
    VkStructureType       sType;
    void*                 pNext;
    uint32_t              MSize;
    uint32_t              NSize;
    uint32_t              KSize;
    VkComponentTypeNV     AType;
    VkComponentTypeNV     BType;
    VkComponentTypeNV     CType;
    VkComponentTypeNV     DType;
    VkScopeNV             scope;
} VkCooperativeMatrixPropertiesNV;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **MSize** is the number of rows in matrices A, C, and D.
- **KSize** is the number of columns in matrix A and rows in matrix B.
- **NSize** is the number of columns in matrices B, C, D.
- **AType** is the component type of matrix A, of type \( \text{VkComponentTypeNV} \).
- **BType** is the component type of matrix B, of type \( \text{VkComponentTypeNV} \).
- ** CType** is the component type of matrix C, of type \( \text{VkComponentTypeNV} \).
- **DType** is the component type of matrix D, of type \( \text{VkComponentTypeNV} \).
- **scope** is the scope of all the matrix types, of type \( \text{VkScopeNV} \).

If some types are preferred over other types (e.g. for performance), they **should** appear earlier in the list enumerated by \( \text{vkGetPhysicalDeviceCooperativeMatrixPropertiesNV} \).

At least one entry in the list **must** have power of two values for all of **MSize**, **KSize**, and **NSize**.
Valid Usage (Implicit)

- **VUID-VkCooperativeMatrixPropertiesNV-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_PROPERTIES_NV`

- **VUID-VkCooperativeMatrixPropertiesNV-pNext-pNext**
  - `pNext` must be `NULL`

- **VUID-VkCooperativeMatrixPropertiesNV-ATYPE-parameter**
  - `ATYPE` must be a valid `VkComponentTypeNV` value

- **VUID-VkCooperativeMatrixPropertiesNV-BTYPE-parameter**
  - `BTYPE` must be a valid `VkComponentTypeNV` value

- **VUID-VkCooperativeMatrixPropertiesNV-CTYPE-parameter**
  - `CTYPE` must be a valid `VkComponentTypeNV` value

- **VUID-VkCooperativeMatrixPropertiesNV-DTYPE-parameter**
  - `DTYPE` must be a valid `VkComponentTypeNV` value

- **VUID-VkCooperativeMatrixPropertiesNV-SCOPE-parameter**
  - `scope` must be a valid `VkScopeNV` value

Possible values for `VkScopeNV` include:

```c
// Provided by VK_NV_cooperative_matrix
typedef enum VkScopeNV {
    VK_SCOPE_DEVICE_NV = 1,
    VK_SCOPE_WORKGROUP_NV = 2,
    VK_SCOPE_SUBGROUP_NV = 3,
    VK_SCOPE_QUEUE_FAMILY_NV = 5,
} VkScopeNV;
```

- **VK_SCOPE_DEVICE_NV** corresponds to SPIR-V **Device** scope.
- **VK_SCOPE_WORKGROUP_NV** corresponds to SPIR-V **Workgroup** scope.
- **VK_SCOPE_SUBGROUP_NV** corresponds to SPIR-V **Subgroup** scope.
- **VK_SCOPE_QUEUE_FAMILY_NV** corresponds to SPIR-V **QueueFamily** scope.

All enum values match the corresponding SPIR-V value.

Possible values for `VkComponentTypeNV` include:
typedef enum VkComponentTypeNV {
    VK_COMPONENT_TYPE_FLOAT16_NV = 0,
    VK_COMPONENT_TYPE_FLOAT32_NV = 1,
    VK_COMPONENT_TYPE_FLOAT64_NV = 2,
    VK_COMPONENT_TYPE_SINT8_NV = 3,
    VK_COMPONENT_TYPE_SINT16_NV = 4,
    VK_COMPONENT_TYPE_SINT32_NV = 5,
    VK_COMPONENT_TYPE_SINT64_NV = 6,
    VK_COMPONENT_TYPE_UINT8_NV = 7,
    VK_COMPONENT_TYPE_UINT16_NV = 8,
    VK_COMPONENT_TYPE_UINT32_NV = 9,
    VK_COMPONENT_TYPE_UINT64_NV = 10,
} VkComponentTypeNV;

• VK_COMPONENT_TYPE_FLOAT16_NV corresponds to SPIR-V OpTypeFloat 16.
• VK_COMPONENT_TYPE_FLOAT32_NV corresponds to SPIR-V OpTypeFloat 32.
• VK_COMPONENT_TYPE_FLOAT64_NV corresponds to SPIR-V OpTypeFloat 64.
• VK_COMPONENT_TYPE_SINT8_NV corresponds to SPIR-V OpTypeInt 8 1.
• VK_COMPONENT_TYPE_SINT16_NV corresponds to SPIR-V OpTypeInt 16 1.
• VK_COMPONENT_TYPE_SINT32_NV corresponds to SPIR-V OpTypeInt 32 1.
• VK_COMPONENT_TYPE_SINT64_NV corresponds to SPIR-V OpTypeInt 64 1.
• VK_COMPONENT_TYPE_UINT8_NV corresponds to SPIR-V OpTypeInt 8 0.
• VK_COMPONENT_TYPE_UINT16_NV corresponds to SPIR-V OpTypeInt 16 0.
• VK_COMPONENT_TYPE_UINT32_NV corresponds to SPIR-V OpTypeInt 32 0.
• VK_COMPONENT_TYPE_UINT64_NV corresponds to SPIR-V OpTypeInt 64 0.

### 9.27. Validation Cache

Validation cache objects allow the result of internal validation to be reused, both within a single application run and between multiple runs. Reuse within a single run is achieved by passing the same validation cache object when creating supported Vulkan objects. Reuse across runs of an application is achieved by retrieving validation cache contents in one run of an application, saving the contents, and using them to preinitialize a validation cache on a subsequent run. The contents of the validation cache objects are managed by the validation layers. Applications can manage the host memory consumed by a validation cache object and control the amount of data retrieved from a validation cache object.

Validation cache objects are represented by VkValidationCacheEXT handles:
To create validation cache objects, call:

```cpp
// Provided by VK_EXT_validation_cache
VkResult vkCreateValidationCacheEXT(
    VkDevice                                    device,
    const VkValidationCacheCreateInfoEXT*       pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkValidationCacheEXT*                       pValidationCache);
```

- `device` is the logical device that creates the validation cache object.
- `pCreateInfo` is a pointer to a `VkValidationCacheCreateInfoEXT` structure containing the initial parameters for the validation cache object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pValidationCache` is a pointer to a `VkValidationCacheEXT` handle in which the resulting validation cache object is returned.

**Note**

Applications can track and manage the total host memory size of a validation cache object using the `pAllocator`. Applications can limit the amount of data retrieved from a validation cache object in `vkGetValidationCacheDataEXT`. Implementations should not internally limit the total number of entries added to a validation cache object or the total host memory consumed.

Once created, a validation cache can be passed to the `vkCreateShaderModule` command by adding this object to the `VkShaderModuleCreateInfo` structure’s `pNext` chain. If a `VkShaderModuleValidationCacheCreateInfoEXT` object is included in the `VkShaderModuleCreateInfo::pNext` chain, and its `validationCache` field is not `VK_NULL_HANDLE`, the implementation will query it for possible reuse opportunities and update it with new content. The use of the validation cache object in these commands is internally synchronized, and the same validation cache object can be used in multiple threads simultaneously.

**Note**

Implementations should make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the duration of the `vkCreateShaderModule` command.
Valid Usage (Implicit)

- **VUID-vkCreateValidationCacheEXT-device-parameter**
  
  *device* **must** be a valid *VkDevice* handle

- **VUID-vkCreateValidationCacheEXT-pCreateInfo-parameter**
  
  *pCreateInfo* **must** be a valid pointer to a valid *VkValidationCacheCreateInfoEXT* structure

- **VUID-vkCreateValidationCacheEXT-pAllocator-parameter**
  
  If *pAllocator* is not **NULL**, *pAllocator* **must** be a valid pointer to a valid *VkAllocationCallbacks* structure

- **VUID-vkCreateValidationCacheEXT-pValidationCache-parameter**
  
  *pValidationCache* **must** be a valid pointer to a *VkValidationCacheEXT* handle

Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**

The *VkValidationCacheCreateInfoEXT* structure is defined as:

```c
// Provided by VK_EXT_validation_cache
typedef struct VkValidationCacheCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkValidationCacheCreateFlagsEXT flags;
    size_t initialDataSize;
    const void* pInitialData;
} VkValidationCacheCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **initialDataSize** is the number of bytes in *pInitialData*. If *initialDataSize* is zero, the validation cache will initially be empty.
- **pInitialData** is a pointer to previously retrieved validation cache data. If the validation cache data is incompatible (as defined below) with the device, the validation cache will be initially empty. If *initialDataSize* is zero, *pInitialData* is ignored.
Valid Usage

- VUID-VkValidationCacheCreateInfoEXT-initialDataSize-01534
  If `initialDataSize` is not 0, it must be equal to the size of `pInitialData`, as returned by `vkGetValidationCacheDataEXT` when `pInitialData` was originally retrieved.

- VUID-VkValidationCacheCreateInfoEXT-initialDataSize-01535
  If `initialDataSize` is not 0, `pInitialData` must have been retrieved from a previous call to `vkGetValidationCacheDataEXT`.

Valid Usage (Implicit)

- VUID-VkValidationCacheCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VALIDATION_CACHE_CREATE_INFO_EXT`.

- VUID-VkValidationCacheCreateInfoEXT-pNext-pNext
  `pNext` must be `NULL`.

- VUID-VkValidationCacheCreateInfoEXT-flags-zerobitmask
  `flags` must be 0.

- VUID-VkValidationCacheCreateInfoEXT-pInitialData-parameter
  If `initialDataSize` is not 0, `pInitialData` must be a valid pointer to an array of `initialDataSize` bytes.

// Provided by VK_EXT_validation_cache
typedef VkFlags VkValidationCacheCreateFlagsEXT;

`VkValidationCacheCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

Validation cache objects can be merged using the command:

// Provided by VK_EXT_validation_cache
VkResult vkMergeValidationCachesEXT(
    VkDevice                                    device,  
    VkValidationCacheEXT                        dstCache,  
    uint32_t                                    srcCacheCount,  
    const VkValidationCacheEXT*                 pSrcCaches);

- `device` is the logical device that owns the validation cache objects.
- `dstCache` is the handle of the validation cache to merge results into.
- `srcCacheCount` is the length of the `pSrcCaches` array.
- `pSrcCaches` is a pointer to an array of validation cache handles, which will be merged into `dstCache`. The previous contents of `dstCache` are included after the merge.
Note
The details of the merge operation are implementation dependent, but implementations should merge the contents of the specified validation caches and prune duplicate entries.

Valid Usage
- VUID-vkMergeValidationCachesEXT-dstCache-01536
dstCache must not appear in the list of source caches

Valid Usage (Implicit)
- VUID-vkMergeValidationCachesEXT-device-parameter
device must be a valid VkDevice handle
- VUID-vkMergeValidationCachesEXT-dstCache-parameter
dstCache must be a valid VkValidationCacheEXT handle
- VUID-vkMergeValidationCachesEXT-pSrcCaches-parameter
pSrcCaches must be a valid pointer to an array of srcCacheCount valid VkValidationCacheEXT handles
- VUID-vkMergeValidationCachesEXT-srcCacheCount-arraylength
srcCacheCount must be greater than 0
- VUID-vkMergeValidationCachesEXT-dstCache-parent
dstCache must have been created, allocated, or retrieved from device
- VUID-vkMergeValidationCachesEXT-pSrcCaches-parent
Each element of pSrcCaches must have been created, allocated, or retrieved from device

Host Synchronization
- Host access to dstCache must be externally synchronized

Return Codes
Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

Data can be retrieved from a validation cache object using the command:
Provided by VK_EXT_validation_cache

```c
VkResult vkGetValidationCacheDataEXT(
    VkDevice                                    device,
    VkValidationCacheEXT                        validationCache,
    size_t*                                     pDataSize,
    void*                                       pData);
```

- **device** is the logical device that owns the validation cache.
- **validationCache** is the validation cache to retrieve data from.
- **pDataSize** is a pointer to a value related to the amount of data in the validation cache, as described below.
- **pData** is either **NULL** or a pointer to a buffer.

If **pData** is **NULL**, then the maximum size of the data that can be retrieved from the validation cache, in bytes, is returned in **pDataSize**. Otherwise, **pDataSize** must point to a variable set by the user to the size of the buffer, in bytes, pointed to by **pData**, and on return the variable is overwritten with the amount of data actually written to **pData**. If **pDataSize** is less than the maximum size that can be retrieved by the validation cache, at most **pDataSize** bytes will be written to **pData**, and **vkGetValidationCacheDataEXT** will return **VK_INCOMPLETE** instead of **VK_SUCCESS**, to indicate that not all of the validation cache was returned.

Any data written to **pData** is valid and can be provided as the **pInitialData** member of the **VkValidationCacheCreateInfoEXT** structure passed to **vkCreateValidationCacheEXT**.

Two calls to **vkGetValidationCacheDataEXT** with the same parameters must retrieve the same data unless a command that modifies the contents of the cache is called between them.

Applications can store the data retrieved from the validation cache, and use these data, possibly in a future run of the application, to populate new validation cache objects. The results of validation, however, may depend on the vendor ID, device ID, driver version, and other details of the device. To enable applications to detect when previously retrieved data is incompatible with the device, the initial bytes written to **pData** must be a header consisting of the following members:

### Table 12. Layout for validation cache header version

<table>
<thead>
<tr>
<th>Offset</th>
<th>Size</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>4</td>
<td>length in bytes of the entire validation cache header written as a stream of bytes, with the least significant byte first</td>
</tr>
<tr>
<td>4</td>
<td>4</td>
<td>a <strong>VkValidationCacheHeaderVersionEXT</strong> value written as a stream of bytes, with the least significant byte first</td>
</tr>
<tr>
<td>8</td>
<td><strong>VK_UUID_SIZE</strong></td>
<td>a layer commit ID expressed as a UUID, which uniquely identifies the version of the validation layers used to generate these validation results</td>
</tr>
</tbody>
</table>
The first four bytes encode the length of the entire validation cache header, in bytes. This value includes all fields in the header including the validation cache version field and the size of the length field.

The next four bytes encode the validation cache version, as described for `VkValidationCacheHeaderVersionEXT`. A consumer of the validation cache should use the cache version to interpret the remainder of the cache header.

If `pDataSize` is less than what is necessary to store this header, nothing will be written to `pData` and zero will be written to `pDataSize`.

### Valid Usage (Implicit)

- **VUID-vkGetValidationCacheDataEXT-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetValidationCacheDataEXT-validationCache-parameter**
  
  `validationCache` must be a valid `VkValidationCacheEXT` handle

- **VUID-vkGetValidationCacheDataEXT-pDataSize-parameter**
  
  `pDataSize` must be a valid pointer to a `size_t` value

- **VUID-vkGetValidationCacheDataEXT-pData-parameter**
  
  If the value referenced by `pDataSize` is not 0, and `pData` is not NULL, `pData` must be a valid pointer to an array of `pDataSize` bytes

- **VUID-vkGetValidationCacheDataEXT-validationCache-parent**
  
  `validationCache` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Possible values of the second group of four bytes in the header returned by `vkGetValidationCacheDataEXT`, encoding the validation cache version, are:

```c
// Provided by VK_EXT_validation_cache
typedef enum VkValidationCacheHeaderVersionEXT {
    VK_VALIDATION_CACHE_HEADER_VERSION_ONE_EXT = 1,
} VkValidationCacheHeaderVersionEXT;
```
To destroy a validation cache, call:

```c
// Provided by VK_EXT_validation_cache
void vkDestroyValidationCacheEXT(
    VkDevice                                    device,
    VkValidationCacheEXT                        validationCache,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the validation cache object.
- `validationCache` is the handle of the validation cache to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- **VUID-vkDestroyValidationCacheEXT-validationCache-01537**
  If `VkAllocationCallbacks` were provided when `validationCache` was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroyValidationCacheEXT-validationCache-01538**
  If no `VkAllocationCallbacks` were provided when `validationCache` was created, `pAllocator` must be `NULL`.

**Valid Usage (Implicit)**

- **VUID-vkDestroyValidationCacheEXT-device-parameter**
  `device` must be a valid `VkDevice` handle.

- **VUID-vkDestroyValidationCacheEXT-validationCache-parameter**
  If `validationCache` is not `VK_NULL_HANDLE`, `validationCache` must be a valid `VkValidationCacheEXT` handle.

- **VUID-vkDestroyValidationCacheEXT-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkDestroyValidationCacheEXT-validationCache-parent**
  If `validationCache` is a valid handle, it must have been created, allocated, or retrieved from `device`.

**Host Synchronization**

- Host access to `validationCache` must be externally synchronized.
Chapter 10. Pipelines

The following figure shows a block diagram of the Vulkan pipelines. Some Vulkan commands specify geometric objects to be drawn or computational work to be performed, while others specify state controlling how objects are handled by the various pipeline stages, or control data transfer between memory organized as images and buffers. Commands are effectively sent through a processing pipeline, either a graphics pipeline, a ray tracing pipeline, or a compute pipeline.

The graphics pipeline can be operated in two modes, as either primitive shading or mesh shading pipeline.

**Primitive Shading**

The first stage of the graphics pipeline (Input Assembler) assembles vertices to form geometric primitives such as points, lines, and triangles, based on a requested primitive topology. In the next stage (Vertex Shader) vertices can be transformed, computing positions and attributes for each vertex. If tessellation and/or geometry shaders are supported, they can then generate multiple primitives from a single input primitive, possibly changing the primitive topology or generating additional attribute data in the process.

**Mesh Shading**

When using the mesh shading pipeline input primitives are not assembled implicitly, but explicitly through the (Mesh Shader). The work on the mesh pipeline is initiated by the application drawing a set of mesh tasks.

If an optional (Task Shader) is active, each task triggers the execution of a task shader workgroup that will generate a new set of tasks upon completion. Each of these spawned tasks, or each of the original dispatched tasks if no task shader is present, triggers the execution of a mesh shader workgroup that produces an output mesh with a variable-sized number of primitives assembled from vertices stored in the output mesh.

**Common**

The final resulting primitives are clipped to a clip volume in preparation for the next stage, Rasterization. The rasterizer produces a series of fragments associated with a region of the framebuffer, from a two-dimensional description of a point, line segment, or triangle. These fragments are processed by fragment operations to determine whether generated values will be written to the framebuffer. fragment shading determines the values to be written to the framebuffer attachments. Framebuffer operations then read and write the color and depth/stencil attachments of the framebuffer for a given subpass of a render pass instance. The attachments can be used as input attachments in the fragment shader in a later subpass of the same render pass.

The compute pipeline is a separate pipeline from the graphics pipeline, which operates on one-, two-, or three-dimensional workgroups which can read from and write to buffer and image memory.

This ordering is meant only as a tool for describing Vulkan, not as a strict rule of how Vulkan is implemented, and we present it only as a means to organize the various operations of the pipelines.
Actual ordering guarantees between pipeline stages are explained in detail in the synchronization chapter.

Each pipeline is controlled by a monolithic object created from a description of all of the shader stages and any relevant fixed-function stages. Linking the whole pipeline together allows the optimization of shaders based on their input/outputs and eliminates expensive draw time state validation.

A pipeline object is bound to the current state using `vkCmdBindPipeline`. Any pipeline object state that is specified as dynamic is not applied to the current state when the pipeline object is bound, but is instead set by dynamic state setting commands.

No state, including dynamic state, is inherited from one command buffer to another.

Compute, ray tracing, and graphics pipelines are each represented by `VkPipeline` handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipeline)
```

### 10.1. Compute Pipelines

Compute pipelines consist of a single static compute shader stage and the pipeline layout.

The compute pipeline represents a compute shader and is created by calling `vkCreateComputePipelines` with `module` and `pName` selecting an entry point from a shader module, where that entry point defines a valid compute shader, in the `VkPipelineShaderStageCreateInfo` structure contained within the `VkComputePipelineCreateInfo` structure.

To create compute pipelines, call:

```cpp
""
// Provided by VK_VERSION_1_0
VkResult vkCreateComputePipelines(
    VkDevice                                    device,           
    VkPipelineCache                             pipelineCache,    
    uint32_t                                    createInfoCount, 
    const VkComputePipelineCreateInfo*          pCreateInfos,    
    const VkAllocationCallbacks*                pAllocator,       
    VkPipeline*                                 pPipelines);       

• device is the logical device that creates the compute pipelines.

• pipelineCache is either VK_NULL_HANDLE, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.

• createInfoCount is the length of the pCreateInfos and pPipelines arrays.

• pCreateInfos is a pointer to an array of VkComputePipelineCreateInfo structures.

• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

• pPipelines is a pointer to an array of VkPipeline handles in which the resulting compute pipeline objects are returned.

Valid Usage

• VUID-vkCreateComputePipelines-flags-00695
  If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and the basePipelineIndex member of that same element is not -1, basePipelineIndex must be less than the index into pCreateInfos that corresponds to that element

• VUID-vkCreateComputePipelines-flags-00696
  If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, the base pipeline must have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set

• VUID-vkCreateComputePipelines-pipelineCache-02873
  If pipelineCache was created with VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT, host access to pipelineCache must be externally synchronized
Valid Usage (Implicit)

- VUID-vkCreateComputePipelines-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCreateComputePipelines-pipelineCache-parameter
  If pipelineCache is not VK_NULL_HANDLE, pipelineCache must be a valid VkPipelineCache handle

- VUID-vkCreateComputePipelines-pCreateInfos-parameter
  pCreateInfos must be a valid pointer to an array of createInfoCount valid VkComputePipelineCreateInfo structures

- VUID-vkCreateComputePipelines-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateComputePipelines-pPipelines-parameter
  pPipelines must be a valid pointer to an array of createInfoCount VkPipeline handles

- VUID-vkCreateComputePipelines-createInfoCount-arraylength
  createInfoCount must be greater than 0

- VUID-vkCreateComputePipelines-pipelineCache-parent
  If pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_PIPELINE_COMPILE_REQUIRED_EXT

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_SHADER_NV

The VkComputePipelineCreateInfo structure is defined as:
// Provided by VK_VERSION_1_0

typedef struct VkComputePipelineCreateInfo {
    VkStructureType                    sType;
    const void*                        pNext;
    VkPipelineCreateFlags              flags;
    VkPipelineShaderStageCreateInfo    stage;
    VkPipelineLayout                   layout;
    VkPipeline                         basePipelineHandle;
    int32_t                            basePipelineIndex;
} VkComputePipelineCreateInfo;

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **flags** is a bitmask of **VkPipelineCreateFlagBits** specifying how the pipeline will be generated.
• **stage** is a **VkPipelineShaderStageCreateInfo** structure describing the compute shader.
• **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
• **basePipelineHandle** is a pipeline to derive from
• **basePipelineIndex** is an index into the **pCreateInfos** parameter to use as a pipeline to derive from

The parameters **basePipelineHandle** and **basePipelineIndex** are described in more detail in **Pipeline Derivatives**.
Valid Usage

- **VUID-VkComputePipelineCreateInfo-flags-00697**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` must be a valid handle to a compute `VkPipeline`.

- **VUID-VkComputePipelineCreateInfo-flags-00698**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` must be a valid index into the calling command's `pCreateInfos` parameter.

- **VUID-VkComputePipelineCreateInfo-flags-00699**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is not -1, `basePipelineHandle` must be `VK_NULL_HANDLE`.

- **VUID-VkComputePipelineCreateInfo-stage-00701**
  The `stage` member of `stage` must be `VK_SHADER_STAGE_COMPUTE_BIT`.

- **VUID-VkComputePipelineCreateInfo-stage-00702**
  The shader code for the entry point identified by `stage` and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter.

- **VUID-VkComputePipelineCreateInfo-layout-00703**
  `layout` must be consistent with the layout of the compute shader specified in `stage`.

- **VUID-VkComputePipelineCreateInfo-layout-01687**
  The number of resources in `layout` accessible to the compute shader stage must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`.

- **VUID-VkComputePipelineCreateInfo-flags-03364**
  `flags` must not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`.

- **VUID-VkComputePipelineCreateInfo-flags-03365**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`.

- **VUID-VkComputePipelineCreateInfo-flags-03366**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`.

- **VUID-VkComputePipelineCreateInfo-flags-03367**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`.

- **VUID-VkComputePipelineCreateInfo-flags-03368**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`.

- **VUID-VkComputePipelineCreateInfo-flags-03369**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`.

- **VUID-VkComputePipelineCreateInfo-flags-03370**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`.
Valid Usage (Implicit)

- **VUID-VkComputePipelineCreateInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_CREATE_INFO`

- **VUID-VkComputePipelineCreateInfo-pNext-pNext**
  - Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineCompilerControlCreateInfoAMD` or `VkPipelineCreationFeedbackCreateInfoEXT`.

- **VUID-VkComputePipelineCreateInfo-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkComputePipelineCreateInfo-flags-parameter**
  - `flags` must be a valid combination of `VkPipelineCreateFlagBits` values.

- **VUID-VkComputePipelineCreateInfo-stage-parameter**
  - `stage` must be a valid `VkPipelineShaderStageCreateInfo` structure.

- **VUID-VkComputePipelineCreateInfo-layout-parameter**
  - `layout` must be a valid `VkPipelineLayout` handle.

- **VUID-VkComputePipelineCreateInfo-commonparent**
  - Both of `basePipelineHandle`, and `layout` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

The `VkPipelineShaderStageCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineShaderStageCreateInfo {
    VkStructureType                     sType;
    const void*                         pNext;
    VkPipelineShaderStageCreateFlags    flags;
    VkShaderStageFlagBits               stage;
    VkShaderModule                      module;
    const char*                         pName;
    const VkSpecializationInfo*         pSpecializationInfo;
} VkPipelineShaderStageCreateInfo;
```
• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **flags** is a bitmask of **VkPipelineShaderStageCreateFlagBits** specifying how the pipeline shader stage will be generated.

• **stage** is a **VkShaderStageFlagBits** value specifying a single pipeline stage.

• **module** is a **VkShaderModule** object containing the shader for this stage.

• **pName** is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.

• **pSpecializationInfo** is a pointer to a **VkSpecializationInfo** structure, as described in **Specialization Constants**, or **NULL**.
Valid Usage

- VUID-VkPipelineShaderStageCreateInfo-stage-00704
  If the geometry shaders feature is not enabled, stage must not be `VK_SHADER_STAGE_GEOMETRY_BIT`

- VUID-VkPipelineShaderStageCreateInfo-stage-00705
  If the tessellation shaders feature is not enabled, stage must not be `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- VUID-VkPipelineShaderStageCreateInfo-stage-02091
  If the mesh shader feature is not enabled, stage must not be `VK_SHADER_STAGE_MESH_BIT_NV`

- VUID-VkPipelineShaderStageCreateInfo-stage-02092
  If the task shader feature is not enabled, stage must not be `VK_SHADER_STAGE_TASK_BIT_NV`

- VUID-VkPipelineShaderStageCreateInfo-maxClipDistances-00708
  If the identified entry point includes any variable in its interface that is declared with the ClipDistance BuiltIn decoration, that variable must not have an array size greater than `VkPhysicalDeviceLimits::maxClipDistances`

- VUID-VkPipelineShaderStageCreateInfo-maxCullDistances-00709
  If the identified entry point includes any variable in its interface that is declared with the CullDistance BuiltIn decoration, that variable must not have an array size greater than `VkPhysicalDeviceLimits::maxCullDistances`

- VUID-VkPipelineShaderStageCreateInfo-maxCombinedClipAndCullDistances-00710
  If the identified entry point includes any variables in its interface that are declared with the ClipDistance or CullDistance BuiltIn decoration, those variables must not have array sizes which sum to more than `VkPhysicalDeviceLimits::maxCombinedClipAndCullDistances`

- VUID-VkPipelineShaderStageCreateInfo-maxSampleMaskWords-00711
  If the identified entry point includes any variable in its interface that is declared with the SampleMask BuiltIn decoration, that variable must not have an array size greater than `VkPhysicalDeviceLimits::maxSampleMaskWords`

- VUID-VkPipelineShaderStageCreateInfo-stage-00712
  If stage is `VK_SHADER_STAGE_VERTEX_BIT`, the identified entry point must not include any input variable in its interface that is decorated with CullDistance

- VUID-VkPipelineShaderStageCreateInfo-stage-00713
  If stage is `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, and the identified entry point has an OpExecutionMode instruction that specifies a patch size with OutputVertices, the patch size must be greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`
If `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction that specifies a maximum output vertex count that is greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxGeometryOutputVertices`.

If `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction that specifies an invocation count that is greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxGeometryShaderInvocations`.

If `stage` is a vertex processing stage, and the identified entry point writes to `Layer` for any primitive, it **must** write the same value to `Layer` for all vertices of a given primitive.

If `stage` is a vertex processing stage, and the identified entry point writes to `ViewportIndex` for any primitive, it **must** write the same value to `ViewportIndex` for all vertices of a given primitive.

If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, the identified entry point **must** not include any output variables in its interface decorated with `CullDistance`.

If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragDepth` in any execution path, it **must** write to `FragDepth` in all execution paths.

If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragStencilRefEXT` in any execution path, it **must** write to `FragStencilRefEXT` in all execution paths.

If `stage` is `VK_SHADER_STAGE_MESH_BIT_NV`, the identified entry point **must** have an `OpExecutionMode` instruction that specifies a maximum output vertex count, `OutputVertices`, that is greater than 0 and less than or equal to `VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputVertices`.

If `stage` is `VK_SHADER_STAGE_MESH_BIT_NV`, the identified entry point **must** have an `OpExecutionMode` instruction that specifies a maximum output primitive count, `OutputPrimitivesNV`, that is greater than 0 and less than or equal to `VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputPrimitives`.

If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flag set, the `subgroupSizeControl` feature **must** be enabled.

If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` flag set, the `computeFullSubgroups` feature **must** be enabled.

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure is included in...
the `pNext` chain, `flags` must not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flag set.

- **VUID-VkPipelineShaderStageCreateInfo-pNext-02755**

  If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure is included in the `pNext` chain, the `subgroupSizeControl` feature must be enabled, and `stage` must be a valid bit specified in `requiredSubgroupSizeStages`.

- **VUID-VkPipelineShaderStageCreateInfo-pNext-02756**

  If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure is included in the `pNext` chain and `stage` is `VK_SHADER_STAGE_COMPUTE_BIT`, the local workgroup size of the shader must be less than or equal to the product of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT::requiredSubgroupSize` and `maxComputeWorkgroupSubgroups`.

- **VUID-VkPipelineShaderStageCreateInfo-flags-02757**

  If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure is included in the `pNext` chain, and `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` flag set, the local workgroup size in the X dimension of the pipeline must be a multiple of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT::requiredSubgroupSize`.

- **VUID-VkPipelineShaderStageCreateInfo-flags-02758**

  If `flags` has both the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` and `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flags set, the local workgroup size in the X dimension of the pipeline must be a multiple of `maxSubgroupSize`.

- **VUID-VkPipelineShaderStageCreateInfo-flags-02759**

  If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` flag set and `flags` does not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flag set and no `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure is included in the `pNext` chain, the local workgroup size in the X dimension of the pipeline must be a multiple of `subgroupSize`.

- **VUID-VkPipelineShaderStageCreateInfo-module-04145**

  The SPIR-V code that was used to create `module` must be valid as described by the Khronos SPIR-V Specification after applying the specializations provided in `pSpecializationInfo`, if any, and then converting all specialization constants into fixed constants.
Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO`
- **pNext** must be `NULL` or a pointer to a valid instance of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT`
- The **sType** value of each struct in the **pNext** chain must be unique
- **flags** must be a valid combination of `VkPipelineShaderStageCreateFlagBits` values
- **stage** must be a valid `VkShaderStageFlagBits` value
- **module** must be a valid `VkShaderModule` handle
- **pName** must be a null-terminated UTF-8 string
- If **pSpecializationInfo** is not `NULL`, **pSpecializationInfo** must be a valid pointer to a valid `VkSpecializationInfo` structure

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineShaderStageCreateFlags;
```

`VkPipelineShaderStageCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineShaderStageCreateFlagBits`.

Possible values of the **flags** member of `VkPipelineShaderStageCreateInfo` specifying how a pipeline shader stage is created, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineShaderStageCreateFlagBits {
    // Provided by VK_EXT_subgroup_size_control
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_subgroup_size_control
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT = 0x00000002,
} VkPipelineShaderStageCreateFlagBits;
```

- **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT** specifies that the **SubgroupSize** may vary in the shader stage.
- **VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT** specifies that the subgroup sizes must be launched with all invocations active in the compute stage.
Note

If `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` and `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` are specified and `minSubgroupSize` does not equal `maxSubgroupSize` and no required subgroup size is specified, then the only way to guarantee that the 'X' dimension of the local workgroup size is a multiple of `SubgroupSize` is to make it a multiple of `maxSubgroupSize`. Under these conditions, you are guaranteed full subgroups but not any particular subgroup size.

Commands and structures which need to specify one or more shader stages do so using a bitmask whose bits correspond to stages. Bits which can be set to specify shader stages are:
typedef enum VkShaderStageFlagBits {
    VK_SHADER_STAGE_VERTEX_BIT = 0x00000001,
    VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT = 0x00000002,
    VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT = 0x00000004,
    VK_SHADER_STAGE_GEOMETRY_BIT = 0x00000008,
    VK_SHADER_STAGE_FRAGMENT_BIT = 0x00000010,
    VK_SHADER_STAGE_COMPUTE_BIT = 0x00000020,
    VK_SHADER_STAGE_ALL_GRAPHICS = 0x0000001F,
    VK_SHADER_STAGE_ALL = 0x7FFFFFFF,
    // Provided by VK_KHR_rasterization_state
    VK_SHADER_STAGE_RAYGEN_BIT_KHR = 0x00000100,
    // Provided by VK_KHR_rasterization_state
    VK_SHADER_STAGE_ANY_HIT_BIT_KHR = 0x00000200,
    // Provided by VK_KHR_rasterization_state
    VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR = 0x00000400,
    // Provided by VK_KHR_rasterization_state
    VK_SHADER_STAGE_MISS_BIT_KHR = 0x00000800,
    // Provided by VK_KHR_rasterization_state
    VK_SHADER_STAGE_INTERSECTION_BIT_KHR = 0x00001000,
    // Provided by VK_KHR_rasterization_state
    VK_SHADER_STAGE_CALLABLE_BIT_KHR = 0x00002000,
    // Provided by VK_NV_mesh_shader
    VK_SHADER_STAGE_TASK_BIT_NV = 0x00000040,
    // Provided by VK_NV_mesh_shader
    VK_SHADER_STAGE_MESH_BIT_NV = 0x00000080,
    // Provided by VK_NV_rasterization_state
    VK_SHADER_STAGE_RAYGEN_BIT_NV = VK_SHADER_STAGE_RAYGEN_BIT_KHR,
    // Provided by VK_NV_rasterization_state
    VK_SHADER_STAGE_ANY_HIT_BIT_NV = VK_SHADER_STAGE_ANY_HIT_BIT_KHR,
    // Provided by VK_NV_rasterization_state
    VK_SHADER_STAGE_CLOSEST_HIT_BIT_NV = VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR,
    // Provided by VK_NV_rasterization_state
    VK_SHADER_STAGE_MISS_BIT_NV = VK_SHADER_STAGE_MISS_BIT_KHR,
    // Provided by VK_NV_rasterization_state
    VK_SHADER_STAGE_INTERSECTION_BIT_NV = VK_SHADER_STAGE_INTERSECTION_BIT_KHR,
    // Provided by VK_NV_rasterization_state
    VK_SHADER_STAGE_CALLABLE_BIT_NV = VK_SHADER_STAGE_CALLABLE_BIT_KHR,
} VkShaderStageFlagBits;

- **VK_SHADER_STAGE_VERTEX_BIT** specifies the vertex stage.
- **VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT** specifies the tessellation control stage.
- **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT** specifies the tessellation evaluation stage.
- **VK_SHADER_STAGE_GEOMETRY_BIT** specifies the geometry stage.
- **VK_SHADER_STAGE_FRAGMENT_BIT** specifies the fragment stage.
- **VK_SHADER_STAGE_COMPUTE_BIT** specifies the compute stage.
- **VK_SHADER_STAGE_ALL_GRAPHICS** is a combination of bits used as shorthand to specify all graphics.
stages defined above (excluding the compute stage).

- **VK_SHADER_STAGE_ALL** is a combination of bits used as shorthand to specify all shader stages supported by the device, including all additional stages which are introduced by extensions.
- **VK_SHADER_STAGE_TASK_BIT_NV** specifies the task stage.
- **VK_SHADER_STAGE_MESH_BIT_NV** specifies the mesh stage.
- **VK_SHADER_STAGE_RAYGEN_BIT_KHR** specifies the ray generation stage.
- **VK_SHADER_STAGE_ANY_HIT_BIT_KHR** specifies the any-hit stage.
- **VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR** specifies the closest hit stage.
- **VK_SHADER_STAGE_MISS_BIT_KHR** specifies the miss stage.
- **VK_SHADER_STAGE_INTERSECTION_BIT_KHR** specifies the intersection stage.
- **VK_SHADER_STAGE_CALLABLE_BIT_KHR** specifies the callable stage.

**Note**

**VK_SHADER_STAGE_ALL_GRAPHICS** only includes the original five graphics stages included in Vulkan 1.0, and not any stages added by extensions. Thus, it may not have the desired effect in all cases.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderStageFlags;
```

**VkShaderStageFlags** is a bitmask type for setting a mask of zero or more **VkShaderStageFlagBits**.

The **VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT** structure is defined as:

```c
// Provided by VK_EXT_subgroup_size_control
typedef struct VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           requiredSubgroupSize;
} VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **requiredSubgroupSize** is an unsigned integer value that specifies the required subgroup size for the newly created pipeline shader stage.
Valid Usage

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT-requiredSubgroupSize-02760
  \textit{requiredSubgroupSize} must be a power-of-two integer

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT-requiredSubgroupSize-02761
  \textit{requiredSubgroupSize} must be greater or equal to \textit{minSubgroupSize}

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT-requiredSubgroupSize-02762
  \textit{requiredSubgroupSize} must be less than or equal to \textit{maxSubgroupSize}

If a \texttt{VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT} structure is included in the \texttt{pNext} chain of \texttt{VkPipelineShaderStageCreateInfo}, it specifies that the pipeline shader stage being compiled has a required subgroup size.

Valid Usage (Implicit)

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT-sType-sType
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_REQUIRED_SUBGROUP_SIZE_CREATE_INFO_EXT}

10.2. Graphics Pipelines

Graphics pipelines consist of multiple shader stages, multiple fixed-function pipeline stages, and a pipeline layout.

To create graphics pipelines, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateGraphicsPipelines(
    VkDevice device,                     // Logical device
    VkPipelineCache pipelineCache,       // Pipeline cache
    uint32_t createInfoCount,            // Number of createInfos
    const VkGraphicsPipelineCreateInfo* pCreateInfo,    // Pointer to array of createInfos
    const VkAllocationCallbacks* pAllocator, // Controls host memory allocation
    VkPipeline* pPipelines);             // Pointer to array of pipelines
```

- \texttt{device} is the logical device that creates the graphics pipelines.
- \texttt{pipelineCache} is either \texttt{VK_NULL_HANDLE}, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- \texttt{createInfoCount} is the length of the \texttt{pCreateInfos} and \texttt{pPipelines} arrays.
- \texttt{pCreateInfos} is a pointer to an array of \texttt{VkGraphicsPipelineCreateInfo} structures.
- \texttt{pAllocator} controls host memory allocation as described in the Memory Allocation chapter.
- \texttt{pPipelines} is a pointer to an array of \texttt{VkPipeline} handles in which the resulting graphics
pipeline objects are returned.

The \texttt{VkGraphicsPipelineCreateInfo} structure includes an array of shader create info structures containing all the desired active shader stages, as well as creation info to define all relevant fixed-function stages, and a pipeline layout.

### Valid Usage

- **VUID-vkCreateGraphicsPipelines-flags-00720**
  If the \texttt{flags} member of any element of \texttt{pCreateInfos} contains the \texttt{VK_PIPELINE_CREATE_DERIVATIVE_BIT} flag, and the \texttt{basePipelineIndex} member of that same element is not \texttt{-1}, \texttt{basePipelineIndex} must be less than the index into \texttt{pCreateInfos} that corresponds to that element.

- **VUID-vkCreateGraphicsPipelines-flags-00721**
  If the \texttt{flags} member of any element of \texttt{pCreateInfos} contains the \texttt{VK_PIPELINE_CREATE_DERIVATIVE_BIT} flag, the base pipeline must have been created with the \texttt{VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT} flag set.

- **VUID-vkCreateGraphicsPipelines-pipelineCache-02876**
  If \texttt{pipelineCache} was created with \texttt{VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT}, host access to \texttt{pipelineCache} must be externally synchronized.

### Note

An implicit cache may be provided by the implementation or a layer. For this reason, it is still valid to set \texttt{VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT} on \texttt{flags} for any element of \texttt{pCreateInfos} while passing \texttt{VK_NULL_HANDLE} for \texttt{pipelineCache}. 
Valid Usage (Implicit)

- VUID-vkCreateGraphicsPipelines-device-parameter
  
  *device** must be a valid **VkDevice** handle

- VUID-vkCreateGraphicsPipelines-pipelineCache-parameter
  
  If **pipelineCache** is not **VK_NULL_HANDLE**, **pipelineCache** must be a valid **VkPipelineCache** handle

- VUID-vkCreateGraphicsPipelines-pCreateInfos-parameter
  
  **pCreateInfos** must be a valid pointer to an array of **createInfoCount** valid **VkGraphicsPipelineCreateInfo** structures

- VUID-vkCreateGraphicsPipelines-pAllocator-parameter
  
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkCreateGraphicsPipelines-pPipelines-parameter
  
  **pPipelines** must be a valid pointer to an array of **createInfoCount** **VkPipeline** handles

- VUID-vkCreateGraphicsPipelines-createInfoCount-arraylength
  
  **createInfoCount** must be greater than **0**

- VUID-vkCreateGraphicsPipelines-pipelineCache-parent
  
  If **pipelineCache** is a valid handle, it must have been created, allocated, or retrieved from **device**

Return Codes

Success

- **VK_SUCCESS**
- **VK_PIPELINE_COMPILE_REQUIRED_EXT**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_INVALID_SHADER_NV**

The **VkGraphicsPipelineCreateInfo** structure is defined as:
typedef struct VkGraphicsPipelineCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    const VkPipelineVertexInputStateCreateInfo* pVertexInputState;
    const VkPipelineInputAssemblyStateCreateInfo* pInputAssemblyState;
    const VkPipelineTessellationStateCreateInfo* pTessellationState;
    const VkPipelineViewportStateCreateInfo* pViewportState;
    const VkPipelineRasterizationStateCreateInfo* pRasterizationState;
    const VkPipelineMultisampleStateCreateInfo* pMultisampleState;
    const VkPipelineColorBlendStateCreateInfo* pColorBlendState;
    const VkPipelineDynamicStateCreateInfo* pDynamicState;
    VkPipelineLayout layout;
    VkRenderPass renderPass;
    uint32_t subpass;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkGraphicsPipelineCreateInfo;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array of `stageCount` `VkPipelineShaderStageCreateInfo` structures describing the set of the shader stages to be included in the graphics pipeline.
- `pVertexInputState` is a pointer to a `VkPipelineVertexInputStateCreateInfo` structure. It is ignored if the pipeline includes a mesh shader stage.
- `pInputAssemblyState` is a pointer to a `VkPipelineInputAssemblyStateCreateInfo` structure which determines input assembly behavior, as described in Drawing Commands. It is ignored if the pipeline includes a mesh shader stage.
- `pTessellationState` is a pointer to a `VkPipelineTessellationStateCreateInfo` structure, and is ignored if the pipeline does not include a tessellation control shader stage and tessellation evaluation shader stage.
- `pViewportState` is a pointer to a `VkPipelineViewportStateCreateInfo` structure, and is ignored if the pipeline has rasterization disabled.
- `pRasterizationState` is a pointer to a `VkPipelineRasterizationStateCreateInfo` structure.
- `pMultisampleState` is a pointer to a `VkPipelineMultisampleStateCreateInfo` structure, and is ignored if the pipeline has rasterization disabled.
- `pDepthStencilState` is a pointer to a `VkPipelineDepthStencilStateCreateInfo` structure, and is ignored if the pipeline has rasterization disabled or if the subpass of the render pass the
pipeline is created against does not use a depth/stencil attachment.

- **pColorBlendState** is a pointer to a `VkPipelineColorBlendStateCreateInfo` structure, and is ignored if the pipeline has rasterization disabled or if the subpass of the render pass the pipeline is created against does not use any color attachments.

- **pDynamicState** is a pointer to a `VkPipelineDynamicStateCreateInfo` structure, and is used to indicate which properties of the pipeline state object are dynamic and can be changed independently of the pipeline state. This can be `NULL`, which means no state in the pipeline is considered dynamic.

- **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.

- **renderPass** is a handle to a render pass object describing the environment in which the pipeline will be used; the pipeline must only be used with an instance of any render pass compatible with the one provided. See Render Pass Compatibility for more information.

- **subpass** is the index of the subpass in the render pass where this pipeline will be used.

- **basePipelineHandle** is a pipeline to derive from.

- **basePipelineIndex** is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters **basePipelineHandle** and **basePipelineIndex** are described in more detail in Pipeline Derivatives.

If any shader stage fails to compile, the compile log will be reported back to the application, and **VK_ERROR_INVALID_SHADER_NV** will be generated.
Valid Usage

- **VUID-VkGraphicsPipelineCreateInfo-flags-00722**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` must be a valid handle to a graphics `VkPipeline`

- **VUID-VkGraphicsPipelineCreateInfo-flags-00723**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` must be a valid index into the calling command’s `pCreateInfo` parameter.

- **VUID-VkGraphicsPipelineCreateInfo-flags-00724**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is not `VK_NULL_HANDLE`, `basePipelineIndex` must be -1.

- **VUID-VkGraphicsPipelineCreateInfo-stage-00726**
  The `stage` member of each element of `pStages` must be unique.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-02095**
  The geometric shader stages provided in `pStages` must be either from the mesh shading pipeline (`stage` is `VK_SHADER_STAGE_TASK_BIT_NV` or `VK_SHADER_STAGE_MESH_BIT_NV`) or from the primitive shading pipeline (`stage` is `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, or `VK_SHADER_STAGE_GEOMETRY_BIT`).

- **VUID-VkGraphicsPipelineCreateInfo-stage-02096**
  The `stage` member of one element of `pStages` must be either `VK_SHADER_STAGE_VERTEX_BIT` or `VK_SHADER_STAGE_MESH_BIT_NV`.

- **VUID-VkGraphicsPipelineCreateInfo-stage-00728**
  The `stage` member of each element of `pStages` must not be `VK_SHADER_STAGE_COMPUTE_BIT`.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00729**
  If `pStages` includes a tessellation control shader stage, it must include a tessellation evaluation shader stage.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00730**
  If `pStages` includes a tessellation evaluation shader stage, it must include a tessellation control shader stage.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00731**
  If `pStages` includes a tessellation control shader stage and a tessellation evaluation shader stage, `pTessellationState` must be a valid pointer to a valid `VkPipelineTessellationStateCreateInfo` structure.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00732**
  If `pStages` includes tessellation shader stages, the shader code of at least one stage must contain an `OpExecutionMode` instruction that specifies the type of subdivision in the pipeline.
• VUID-VkGraphicsPipelineCreateInfo-pStages-00733
If `pStages` includes tessellation shader stages, and the shader code of both stages contain an `OpExecutionMode` instruction that specifies the type of subdivision in the pipeline, they **must** both specify the same subdivision mode.

• VUID-VkGraphicsPipelineCreateInfo-pStages-00734
If `pStages` includes tessellation shader stages, the shader code of at least one stage **must** contain an `OpExecutionMode` instruction that specifies the output patch size in the pipeline.

• VUID-VkGraphicsPipelineCreateInfo-pStages-00735
If `pStages` includes tessellation shader stages, and the shader code of both contain an `OpExecutionMode` instruction that specifies the output patch size in the pipeline, they **must** both specify the same patch size.

• VUID-VkGraphicsPipelineCreateInfo-pStages-00736
If `pStages` includes tessellation shader stages, the `topology` member of `pInputAssembly` **must** be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`.

• VUID-VkGraphicsPipelineCreateInfo-topology-00737
If the `topology` member of `pInputAssembly` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, `pStages` **must** include tessellation shader stages.

• VUID-VkGraphicsPipelineCreateInfo-pStages-00738
If `pStages` includes a geometry shader stage, and does not include any tessellation shader stages, its shader code **must** contain an `OpExecutionMode` instruction that specifies an input primitive type that is compatible with the primitive topology specified in `pInputAssembly`.

• VUID-VkGraphicsPipelineCreateInfo-pStages-00739
If `pStages` includes a geometry shader stage, and also includes tessellation shader stages, its shader code **must** contain an `OpExecutionMode` instruction that specifies an input primitive type that is compatible with the primitive topology that is output by the tessellation stages.

• VUID-VkGraphicsPipelineCreateInfo-pStages-00740
If `pStages` includes a fragment shader stage and a geometry shader stage, and the fragment shader code reads from an input variable that is decorated with `PrimitiveID`, then the geometry shader code **must** write to a matching output variable, decorated with `PrimitiveID`, in all execution paths.

• VUID-VkGraphicsPipelineCreateInfo-pStages-00741
If `pStages` includes a fragment shader stage, its shader code **must** not read from any input attachment that is defined as `VK_ATTACHMENT_UNUSED` in `subpass`.

• VUID-VkGraphicsPipelineCreateInfo-pStages-00742
The shader code for the entry points identified by `pStages`, and the rest of the state identified by this structure **must** adhere to the pipeline linking rules described in the **Shader Interfaces** chapter.

• VUID-VkGraphicsPipelineCreateInfo-subpass-01756
If rasterization is not disabled and `subpass` uses a depth/stencil attachment in `renderPass` that has a layout of `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` in the `VkAttachmentReference` defined by `subpass`, the `depthWriteEnable` member of `pDepthStencilState` **must** be `VK_FALSE`.
If rasterization is not disabled and subpass uses a depth/stencil attachment in renderPass that has a layout of `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` in the VkAttachmentReference defined by subpass, the failOp, passOp and depthFailOp members of each of the front and back members of pDepthStencilState must be `VK_STENCIL_OP_KEEP`.

If rasterization is not disabled, then for each color attachment in the subpass, if the potential format features of the format of the corresponding attachment description do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be `VK_FALSE`.

If rasterization is not disabled and the subpass uses color attachments, the attachmentCount member of pColorBlendState must be equal to the colorAttachmentCount used to create subpass.

If no element of the pDynamicStates member of pDynamicState is `VK_DYNAMIC_STATE_VIEWPORT` or `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT`, the pViewports member of pViewportState must be a valid pointer to an array of pViewportState->viewportCount valid VkViewport structures.

If no element of the pDynamicStates member of pDynamicState is `VK_DYNAMIC_STATE_SCISSOR` or `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT`, the pScissors member of pViewportState must be a valid pointer to an array of pViewportState->scissorCount VkRect2D structures.

If the wide lines feature is not enabled, and no element of the pDynamicStates member of pDynamicState is `VK_DYNAMIC_STATE_LINE_WIDTH`, the lineWidth member of pRasterizationState must be 1.0.

If the rasterizerDiscardEnable member of pRasterizationState is `VK_FALSE`, or if the graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled, pViewportState must be a valid pointer to a valid VkPipelineViewportStateCreateInfo structure.

If the rasterizerDiscardEnable member of pRasterizationState is `VK_FALSE`, or if the graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled, pMultisampleState must be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure.

If the rasterizerDiscardEnable member of pRasterizationState is `VK_FALSE`, or if the graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled, and subpass uses a depth/stencil attachment, pDepthStencilState must be a valid pointer to a valid
If the `rasterizerDiscardEnable` member of `pRasterizationState` is `VK_FALSE`, or if the graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled, and `subpass` uses color attachments, `pColorBlendState` must be a valid pointer to a valid `VkPipelineColorBlendStateCreateInfo` structure.

If the `rasterizerDiscardEnable` member of `pRasterizationState` is `VK_FALSE`, or if the graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT` dynamic state enabled, `pColorBlendState->attachmentCount` must be greater than the index of all color attachments that are not `VK_ATTACHMENT_UNUSED` for the `subpass` index in `renderPass`.

If the depth bias clamping feature is not enabled, no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_DEPTH_BIAS`, and the `depthBiasEnable` member of `pRasterizationState` is `VK_TRUE`, the `depthBiasClamp` member of `pRasterizationState` must be 0.0.

If the `VK_EXT_depth_range_unrestricted` extension is not enabled and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_DEPTH_BOUNDS`, and the `depthBoundsTestEnable` member of `pDepthStencilState` is `VK_TRUE`, the `minDepthBounds` and `maxDepthBounds` members of `pDepthStencilState` must be between 0.0 and 1.0, inclusive.

If no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT`, and the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT` structure included in the `pNext` chain of `pMultisampleState` is `VK_TRUE`, `sampleLocationsInfo.sampleLocationGridSize.width` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`.

If no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT`, and the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT` structure included in the `pNext` chain of `pMultisampleState` is `VK_TRUE`, `sampleLocationsInfo.sampleLocationGridSize.height` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`.

If no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT`, and the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT` structure included in the `pNext` chain of `pMultisampleState` is `VK_TRUE`, `sampleLocationsInfo.sampleLocationsPerPixel` must equal `rasterizationSamples`.
If the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT` structure included in the `pNext` chain of `pMultisampleState` is `VK_TRUE`, the fragment shader code must not statically use the extended instruction `InterpolateAtSample`.

*layout* must be consistent with all shaders specified in `pStages`.

If neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, and if `subpass` uses color and/or depth/stencil attachments, then the `rasterizationSamples` member of `pMultisampleState` must be the same as the sample count for those subpass attachments.

If the `VK_AMD_mixed_attachment_samples` extension is enabled, and if `subpass` uses color and/or depth/stencil attachments, then the `rasterizationSamples` member of `pMultisampleState` must equal the maximum of the sample counts of those subpass attachments.

If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if `subpass` has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled, then the `rasterizationSamples` member of `pMultisampleState` must be the same as the sample count of the depth/stencil attachment.

If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if `subpass` has any color attachments, then the `rasterizationSamples` member of `pMultisampleState` must be greater than or equal to the sample count for those subpass attachments.

If the `VK_NV_coverage_reduction_mode` extension is enabled, the coverage reduction mode specified by `VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode`, the `rasterizationSamples` member of `pMultisampleState` and the sample counts for the color and depth/stencil attachments (if the subpass has them) must be a valid combination returned by `vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV`.

If `subpass` does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` member of `pMultisampleState` must follow the rules for a zero-attachment subpass.

*subpass* must be a valid subpass within `renderPass`.

If the `renderPass` has multiview enabled and `subpass` has more than one bit set in the view mask and `multiviewTessellationShader` is not enabled, then `pStages` must not include tessellation shaders.

If the `renderPass` has multiview enabled and `subpass` has more than one bit set in the view mask and `multiviewGeometryShader` is not enabled, then `pStages` must not include a
If the `renderPass` has multiview enabled and `subpass` has more than one bit set in the view mask, shaders in the pipeline must not write to the `Layer` built-in output.

If the `renderPass` has multiview enabled, then all shaders must not include variables decorated with the `Layer` built-in decoration in their interfaces.

Flags must not contain the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag.

If `pStages` includes a fragment shader stage and an input attachment was referenced by an `aspectMask` at `renderPass` creation time, its shader code must only read from the aspects that were specified for that input attachment.

The number of resources in `layout` accessible to each shader stage that is used by the pipeline must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`.

If no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV`, and the `viewportWScalingEnable` member of a `VkPipelineViewportWScalingStateCreateInfoNV` structure, included in the `pNext` chain of `pViewportState`, is `VK_TRUE`, the `pViewportWScalings` member of the `VkPipelineViewportWScalingStateCreateInfoNV` must be a pointer to an array of `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` valid `VkViewportWScalingNV` structures.

If no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV`, and if `pViewportState->pNext` chain includes a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure, and if its `exclusiveScissorCount` member is not 0, then its `pExclusiveScissors` member must be a valid pointer to an array of `exclusiveScissorCount` `VkRect2D` structures.

If no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV`, and if `pViewportState->pNext` chain includes a `VkPipelineViewportShadingRateImageStateCreateInfoNV` structure, then its `pShadingRatePalettes` member must be a valid pointer to an array of `viewportCount` valid `VkShadingRatePaletteNV` structures.

If no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT`, and if `pNext` chain includes a `VkPipelineDiscardRectangleStateCreateInfoEXT` structure, and if its `discardRectangleCount` member is not 0, then its `pDiscardRectangles` member must be a valid pointer to an array of `discardRectangleCount` `VkRect2D` structures.

If `pStages` includes a vertex shader stage, `pVertexInputState` must be a valid pointer to a
valid \texttt{VkPipelineVertexInputStateCreateInfo} structure

- VUID-VkGraphicsPipelineCreateInfo-pStages-02098
  If \texttt{pStages} includes a vertex shader stage, \texttt{pInputAssemblyState} must be a valid pointer to a valid \texttt{VkPipelineInputAssemblyStateCreateInfo} structure

- VUID-VkGraphicsPipelineCreateInfo-pStages-02317
  The \texttt{Xfb} execution mode can be specified by only one shader stage in \texttt{pStages}

- VUID-VkGraphicsPipelineCreateInfo-pStages-02318
  If any shader stage in \texttt{pStages} specifies \texttt{Xfb} execution mode it must be the last vertex processing stage

- VUID-VkGraphicsPipelineCreateInfo-rasterizationStream-02319
  If a \texttt{VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream} value other than zero is specified, all variables in the output interface of the entry point being compiled decorated with \texttt{Position}, \texttt{PointSize}, \texttt{ClipDistance}, or \texttt{CullDistance} must be decorated with identical \texttt{Stream} values that match the \texttt{rasterizationStream}

- VUID-VkGraphicsPipelineCreateInfo-rasterizationStream-02320
  If \texttt{VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream} is zero, or not specified, all variables in the output interface of the entry point being compiled decorated with \texttt{Position}, \texttt{PointSize}, \texttt{ClipDistance}, or \texttt{CullDistance} must be decorated with a \texttt{Stream} value of zero, or must not specify the \texttt{Stream} decoration

- VUID-VkGraphicsPipelineCreateInfo-geometryStreams-02321
  If the last vertex processing stage is a geometry shader, and that geometry shader uses the \texttt{GeometryStreams} capability, then \texttt{VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams feature} must be enabled

- VUID-VkGraphicsPipelineCreateInfo-None-02322
  If there are any mesh shader stages in the pipeline there must not be any shader stage in the pipeline with a \texttt{Xfb} execution mode

- VUID-VkGraphicsPipelineCreateInfo-lineRasterizationMode-02766
  If the \texttt{lineRasterizationMode} member of a \texttt{VkPipelineRasterizationLineStateCreateInfoEXT} structure included in the \texttt{pNext} chain of \texttt{pRasterizationState} is \texttt{VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT} or \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT} and if rasterization is enabled, then the \texttt{alphaToCoverageEnable}, \texttt{alphaToOneEnable}, and \texttt{sampleShadingEnable} members of \texttt{pMultisampleState} must all be \texttt{VK_FALSE}

- VUID-VkGraphicsPipelineCreateInfo-stippledLineEnable-02767
  If the \texttt{stippledLineEnable} member of \texttt{VkPipelineRasterizationLineStateCreateInfoEXT} is \texttt{VK_TRUE} and no element of the \texttt{pDynamicStates} member of \texttt{pDynamicState} is \texttt{VK_DYNAMIC_STATE_LINE_STIPPLE_EXT}, then the \texttt{lineStippleFactor} member of \texttt{VkPipelineRasterizationLineStateCreateInfoEXT} must be in the range \([1,256]\)

- VUID-VkGraphicsPipelineCreateInfo-flags-03371
  \texttt{flags} must not include \texttt{VK_PIPELINE_CREATE_LIBRARY_BIT_KHR}

- VUID-VkGraphicsPipelineCreateInfo-flags-03372
  \texttt{flags} must not include \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR}

- VUID-VkGraphicsPipelineCreateInfo-flags-03373
  \texttt{flags} must not include \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR}
flags **must not include** VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR

- VUID-VkGraphicsPipelineCreateInfo-flags-03374
- VUID-VkGraphicsPipelineCreateInfo-flags-03375
- VUID-VkGraphicsPipelineCreateInfo-flags-03376
- VUID-VkGraphicsPipelineCreateInfo-flags-03377
- VUID-VkGraphicsPipelineCreateInfo-flags-03378
- VUID-VkGraphicsPipelineCreateInfo-flags-03379
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04132
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04133
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04868
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04869
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04870

If the **extendedDynamicState** feature is not enabled, then **must** be no element of the pDynamicStates member of pDynamicState set to

- VK_DYNAMIC_STATE_CULL_MODE_EXT, VK_DYNAMIC_STATE_FRONT_FACE_EXT, VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT,
- VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT, VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT,
- VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT, VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE_EXT, VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE_EXT,
- VK_DYNAMIC_STATE_DEPTH_COMPARE_OP_EXT, VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE_EXT,
- VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE_EXT, or VK_DYNAMIC_STATE_STENCIL_OP_EXT

If **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT** is included in the pDynamicStates array then **viewportCount must be zero**

If **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT** is included in the pDynamicStates array then **scissorCount must be zero**

If **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT** is included in the pDynamicStates array then **VK_DYNAMIC_STATE_VIEWPORT must not be present**

If **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT** is included in the pDynamicStates array then **VK_DYNAMIC_STATE_SCISSOR must not be present**

If the **extendedDynamicState2** feature is not enabled, then **must** be no element of the pDynamicStates member of pDynamicState set to

- VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT, VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT, or
- VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT

If the **extendedDynamicState2LogicOp** feature is not enabled, then **must** be no element of the pDynamicStates member of pDynamicState set to **VK_DYNAMIC_STATE_LOGIC_OP_EXT**

Chapter 10. Pipelines | 549
If the extendedDynamicState2PatchControlPoints feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT.

- **VUID-VkGraphicsPipelineCreateInfo-flags-02877**
  
  If flags includes VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV, then the VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands feature must be enabled.

- **VUID-VkGraphicsPipelineCreateInfo-flags-02966**
  
  If flags includes VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV, then all stages must not specify Xfb execution mode.

- **VUID-VkGraphicsPipelineCreateInfo-pipelineCreationCacheControl-02878**
  
  If the pipelineCreationCacheControl feature is not enabled, flags must not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT or VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT_EXT.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04494**
  
  If VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width must be greater than or equal to 1.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04495**
  
  If VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height must be greater than or equal to 1.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04496**
  
  If VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width must be a power-of-two value.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04497**
  
  If VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height must be a power-of-two value.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04498**
  
  If VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width must be less than or equal to 4.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04499**
  
  If VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height must be less than or equal to 4.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04500**
  
  If VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the pipelineFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width and VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height must both be equal to 1.
If \( \text{VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR} \) is not included in \( \text{pDynamicState} \), and the \text{primitiveFragmentShadingRate} feature is not enabled, \( \text{vkPipelineFragmentShadingRateStateCreateInfoKHR} :: \text{combinerOps}[0] \) must be \( \text{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR} \).

If \( \text{VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR} \) is not included in \( \text{pDynamicState} \), and the \text{attachmentFragmentShadingRate} feature is not enabled, \( \text{vkPipelineFragmentShadingRateStateCreateInfoKHR} :: \text{combinerOps}[1] \) must be \( \text{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR} \).

If the \text{primitiveFragmentShadingRateWithMultipleViewports} limit is not supported, \( \text{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT} \) is not included in \( \text{pDynamicState} \), and \( \text{VkPipelineViewportStateCreateInfo} :: \text{viewportCount} \) is greater than 1, entry points specified in \( \text{pStages} \) must not write to the \text{PrimitiveShadingRateKHR} built-in.

If the \text{primitiveFragmentShadingRateWithMultipleViewports} limit is not supported, and entry points specified in \( \text{pStages} \) write to the \text{ViewportIndex} built-in, they must not also write to the \text{PrimitiveShadingRateKHR} built-in.

If the \text{primitiveFragmentShadingRateWithMultipleViewports} limit is not supported, and entry points specified in \( \text{pStages} \) write to the \text{ViewportMaskNV} built-in, they must not also write to the \text{PrimitiveShadingRateKHR} built-in.

If the \text{fragmentShadingRateNonTrivialCombinerOps} limit is not supported and \( \text{VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR} \) is not included in \( \text{pDynamicState} \), elements of \( \text{vkPipelineFragmentShadingRateStateCreateInfoKHR} :: \text{combinerOps} \) must be \( \text{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR} \) or \( \text{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR} \).

If \( \text{VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR} \) is not included in \( \text{pDynamicState} \), and the \text{fragmentShadingRateEnums} feature is not enabled, \( \text{VkPipelineFragmentShadingRateEnumStateCreateInfoNV} :: \text{shadingRateType} \) must be equal to \( \text{VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV} \).

If \( \text{VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR} \) is not included in \( \text{pDynamicState} \), and the \text{pipelineFragmentShadingRate} feature is not enabled, \( \text{VkPipelineFragmentShadingRateEnumStateCreateInfoNV} :: \text{shadingRate} \) must be equal to \( \text{VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV} \).

If \( \text{VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR} \) is not included in \( \text{pDynamicState} \), and the \text{primitiveFragmentShadingRate} feature is not enabled, \( \text{VkPipelineFragmentShadingRateEnumStateCreateInfoNV} :: \text{combinerOps}[0] \) must be \( \text{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR} \).
If \( \text{VK\_DYNAMIC\_STATE\_FRAGMENT\_SHADING\_RATE\_KHR} \) is not included in \( p\text{DynamicStates} \), and the \text{attachmentFragmentShadingRate} feature is not enabled, \( \text{VkPipelineFragmentShadingRateEnumStateCreateInfoNV}::\text{combinerOps}[1] \) \textbf{must} be \( \text{VK\_FRAGMENT\_SHADING\_RATE\_COMBINER\_OP\_KEEP\_KHR} \).

- **VUID-VkGraphicsPipelineCreateInfo-fragmentShadingRateNonTrivialCombinerOps-04573**
  If the \text{fragmentShadingRateNonTrivialCombinerOps} limit is not supported and \( \text{VK\_DYNAMIC\_STATE\_FRAGMENT\_SHADING\_RATE\_KHR} \) is not included in \( p\text{DynamicStates} \), elements of \( \text{VkPipelineFragmentShadingRateEnumStateCreateInfoNV}::\text{combinerOps} \) \textbf{must} be \( \text{VK\_FRAGMENT\_SHADING\_RATE\_COMBINER\_OP\_KEEP\_KHR} \) or \( \text{VK\_FRAGMENT\_SHADING\_RATE\_COMBINER\_OP\_REPLACE\_KHR} \).

- **VUID-VkGraphicsPipelineCreateInfo-None-04574**
  If the \text{supersampleFragmentShadingRates} feature is not enabled, \( \text{VkPipelineFragmentShadingRateEnumStateCreateInfoNV}::\text{shadingRate} \) \textbf{must} not be equal to \( \text{VK\_FRAGMENT\_SHADING\_RATE\_2\_INVOCATIONS\_PER\_PIXEL\_NV} \), \( \text{VK\_FRAGMENT\_SHADING\_RATE\_4\_INVOCATIONS\_PER\_PIXEL\_NV} \), \( \text{VK\_FRAGMENT\_SHADING\_RATE\_8\_INVOCATIONS\_PER\_PIXEL\_NV} \), or \( \text{VK\_FRAGMENT\_SHADING\_RATE\_16\_INVOCATIONS\_PER\_PIXEL\_NV} \).

- **VUID-VkGraphicsPipelineCreateInfo-None-04575**
  If the \text{noInvocationFragmentShadingRates} feature is not enabled, \( \text{VkPipelineFragmentShadingRateEnumStateCreateInfoNV}::\text{shadingRate} \) \textbf{must} not be equal to \( \text{VK\_FRAGMENT\_SHADING\_RATE\_NO\_INVOCATIONS\_NV} \).

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03578**
  All elements of the \( p\text{DynamicStates} \) member of \( p\text{DynamicState} \) \textbf{must} not be \( \text{VK\_DYNAMIC\_STATE\_RAY\_TRACING\_PIPELINE\_STACK\_SIZE\_KHR} \).

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04807**
  If the \text{vertexInputDynamicState} feature is not enabled, there \textbf{must} be no element of the \( p\text{DynamicStates} \) member of \( p\text{DynamicState} \) set to \( \text{VK\_DYNAMIC\_STATE\_VERTEX\_INPUT\_EXT} \).

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04808**
  If the \text{colorWriteEnable} feature is not enabled, there \textbf{must} be no element of the \( p\text{DynamicStates} \) member of \( p\text{DynamicState} \) set to \( \text{VK\_DYNAMIC\_STATE\_COLOR\_WRITE\_ENABLE\_EXT} \).
Valid Usage (Implicit)

• VUID-VkGraphicsPipelineCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO

• VUID-VkGraphicsPipelineCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkGraphicsPipelineShaderGroupsCreateInfoNV, VkPipelineCompilerControlCreateInfoAMD, VkPipelineCreationFeedbackCreateInfoEXT, VkPipelineDiscardRectangleStateCreateInfoEXT, VkPipelineFragmentShadingRateEnumStateCreateInfoNV, VkPipelineFragmentShadingRateStateCreateInfoKHR, or VkPipelineRepresentativeFragmentTestStateCreateInfoNV

• VUID-VkGraphicsPipelineCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkGraphicsPipelineCreateInfo-flags-parameter
  flags must be a valid combination of VkPipelineCreateFlagBits values

• VUID-VkGraphicsPipelineCreateInfo-pStages-parameter
  pStages must be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures

• VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-parameter
  pRasterizationState must be a valid pointer to a valid VkPipelineRasterizationStateCreateInfo structure

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-parameter
  If pDynamicState is not NULL, pDynamicState must be a valid pointer to a valid VkPipelineDynamicStateCreateInfo structure

• VUID-VkGraphicsPipelineCreateInfo-layout-parameter
  layout must be a valid VkPipelineLayout handle

• VUID-VkGraphicsPipelineCreateInfo-renderPass-parameter
  renderPass must be a valid VkRenderPass handle

• VUID-VkGraphicsPipelineCreateInfo-stageCount-arraylength
  stageCount must be greater than 0

• VUID-VkGraphicsPipelineCreateInfo-commonparent
  Each of basePipelineHandle, layout, and renderPass that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Possible values of the flags member of VkGraphicsPipelineCreateInfo, VkRayTracingPipelineCreateInfoKHR, VkRayTracingPipelineCreateInfoNV, and VkComputePipelineCreateInfo, specifying how a pipeline is created, are:
typedef enum VkPipelineCreateFlagBits {
    VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT = 0x00000001,
    VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT = 0x00000002,
    VK_PIPELINE_CREATE_DERIVATIVE_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_PIPELINE_CREATE_DISPATCH_BASE_BIT = 0x00000010,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR = 0x00004000,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR = 0x00008000,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR = 0x00010000,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR = 0x00020000,
    // Provided by VK_KHR_device_group
    VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT_KHR = 0x00000008,
    // Provided by VK_KHR_device_group
    VK_PIPELINE_CREATE_DISPATCH_BASE_KHR = VK_PIPELINE_CREATE_DISPATCH_BASE_BIT,
    // Provided by VK_KHR_device_group
    VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR = 0x00080000,
    // Provided by VK_NV_ray_tracing
    VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV = 0x00000020,
    // Provided by VK_KHR_pipeline_executable_properties
    VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR = 0x00000040,
    // Provided by VK_KHR_pipeline_executable_properties
    VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR = 0x00000080,
    // Provided by VK_NV_device_generated_commands
    VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV = 0x00040000,
    // Provided by VK_KHR_pipeline_library
    VK_PIPELINE_CREATE_LIBRARY_BIT_KHR = 0x00000800,
    // Provided by VK_EXT_pipeline_creation_cache_control
    VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT = 0x00000100,
    // Provided by VK_EXT_pipeline_creation_cache_control
    VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT_EXT = 0x00000200,
    VK_PIPELINE_CREATE_DISPATCH_BASE = VK_PIPELINE_CREATE_DISPATCH_BASE_BIT,
    // Provided by VK_KHR_device_group
    VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT_KHR = VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT,
    // Provided by VK_KHR_device_group
    VK_PIPELINE_CREATE_DISPATCH_BASE_KHR = VK_PIPELINE_CREATE_DISPATCH_BASE_KHR,
} VkPipelineCreateFlagBits;

• **VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT** specifies that the created pipeline will not be optimized. Using this flag may reduce the time taken to create the pipeline.

• **VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT** specifies that the pipeline to be created is allowed to
be the parent of a pipeline that will be created in a subsequent pipeline creation call.

- **VK_PIPELINE_CREATE_DERIVATIVE_BIT** specifies that the pipeline to be created will be a child of a previously created parent pipeline.

- **VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT** specifies that any shader input variables decorated as ViewIndex will be assigned values as if they were decorated as DeviceIndex.

- **VK_PIPELINE_CREATE_DISPATCH_BASE** specifies that a compute pipeline can be used with vkCmdDispatchBase with a non-zero base workgroup.

- **VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV** specifies that a pipeline is created with all shaders in the deferred state. Before using the pipeline the application must call vkCompileDeferredNV exactly once on each shader in the pipeline before using the pipeline.

- **VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR** specifies that the shader compiler should capture statistics for the executables produced by the compile process which can later be retrieved by calling vkGetPipelineExecutableStatisticsKHR. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time.

- **VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR** specifies that the shader compiler should capture the internal representations of executables produced by the compile process which can later be retrieved by calling vkGetPipelineExecutableInternalRepresentationsKHR. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time.

- **VK_PIPELINE_CREATE_LIBRARY_BIT_KHR** specifies that the pipeline cannot be used directly, and instead defines a pipeline library that can be combined with other pipelines using the VkPipelineLibraryCreateInfoKHR structure. This is available in ray tracing pipelines.

- **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR** specifies that an any-hit shader will always be present when an any-hit shader would be executed.

- **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR** specifies that a closest hit shader will always be present when a closest hit shader would be executed.

- **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR** specifies that a miss shader will always be present when a miss shader would be executed.

- **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR** specifies that an intersection shader will always be present when an intersection shader would be executed.

- **VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR** specifies that triangle primitives will be skipped during traversal using OpTraceRayKHR.

- **VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR** specifies that AABB primitives will be skipped during traversal using OpTraceRayKHR.

- **VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR** specifies that the shader group handles can be saved and reused on a subsequent run (e.g. for trace capture and replay).

- **VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV** specifies that the pipeline can be used in combination with Device-Generated Commands.

- **VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT** specifies that pipeline creation
will fail if a compile is required for creation of a valid `VkPipeline` object; `VK_PIPELINE_COMPILE_REQUIRED_EXT` will be returned by pipeline creation, and the `VkPipeline` will be set to `VK_NULL_HANDLE`.

- When creating multiple pipelines, `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT_EXT` specifies that control will be returned to the application on failure of the corresponding pipeline rather than continuing to create additional pipelines.

It is valid to set both `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` and `VK_PIPELINE_CREATE_DERIVATIVE_BIT`. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See Pipeline Derivatives for more information.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCreateFlags;
```

`VkPipelineCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineCreateFlagBits`.

The `VkPipelineDynamicStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDynamicStateCreateInfo {
    VkStructureType                      sType;  // is the type of this structure.
    const void*                          pNext;  // is NULL or a pointer to a structure extending this structure.
    VkPipelineDynamicStateCreateFlags    flags;  // is reserved for future use.
    uint32_t                             dynamicStateCount;  // is the number of elements in the pDynamicStates array.
    const VkDynamicState*                pDynamicStates;  // is a pointer to an array of VkDynamicState values specifying which pieces of pipeline state will use the values from dynamic state commands rather than from pipeline state creation info.
} VkPipelineDynamicStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `dynamicStateCount` is the number of elements in the `pDynamicStates` array.
- `pDynamicStates` is a pointer to an array of `VkDynamicState` values specifying which pieces of pipeline state will use the values from dynamic state commands rather than from pipeline state creation info.

**Valid Usage**

- `VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-01442` Each element of `pDynamicStates` must be unique
Valid Usage (Implicit)

- VUID-VkPipelineDynamicStateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_DYNAMIC_STATE_CREATE_INFO

- VUID-VkPipelineDynamicStateCreateInfo-pNext-pNext
  pNext must be NULL

- VUID-VkPipelineDynamicStateCreateInfo-flags-zerobitmask
  flags must be 0

- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-parameter
  If dynamicStateCount is not 0, pDynamicStates must be a valid pointer to an array of
dynamicStateCount valid VkDynamicState values

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDynamicStateCreateFlags;

VkPipelineDynamicStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for
future use.

The source of different pieces of dynamic state is specified by the
VkPipelineDynamicStateCreateInfo::pDynamicStates property of the currently active pipeline, each
of whose elements must be one of the values:

// Provided by VK_VERSION_1_0
typedef enum VkDynamicState {
    VK_DYNAMIC_STATE_VIEWPORT = 0,
    VK_DYNAMIC_STATE_SCISSOR = 1,
    VK_DYNAMIC_STATE_LINE_WIDTH = 2,
    VK_DYNAMIC_STATE_DEPTH_BIAS = 3,
    VK_DYNAMIC_STATE_BLEND_CONSTANTS = 4,
    VK_DYNAMIC_STATE_DEPTH_BOUNDS = 5,
    VK_DYNAMIC_STATE_STENCILCOMPAREMASK = 6,
    VK_DYNAMIC_STATE_STENCILWRITEMASK = 7,
    VK_DYNAMIC_STATE_STENCILREFERENCE = 8,
    // Provided by VK_NV_clip_space_w_scaling
    VK_DYNAMIC_STATE_VIEWPORTWSCALE_NV = 1000087000,
    // Provided by VK_EXT_discard_rectangles
    VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT = 1000099000,
    // Provided by VK_EXT_sample_locations
    VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT = 1000143000,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_DYNAMIC_STATE_RAY_TRACING_PIPELINESTACK_SIZE_KHR = 1000347000,
    // Provided by VK_NV_shading_rate_image
    VK_DYNAMIC_STATE_VIEWPORTSHADINGRATERATE_PALETTE_NV = 1000164004,
    // Provided by VK_NV_shading_rate_image
    VK_DYNAMIC_STATE_VIEWPORTCOARSE_SAMPLEORDER_NV = 1000164006,
    // Provided by VK_NV_scissor_exclusive
};
• **VK_DYNAMIC_STATE_VIEWPORT** specifies that the `pViewports` state in `VkPipelineViewportStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetViewport` before any draw commands. The number of viewports used by a pipeline is still specified by the `viewportCount` member of `VkPipelineViewportStateCreateInfo`.

• **VK_DYNAMIC_STATE_SCISSOR** specifies that the `pScissors` state in `VkPipelineViewportStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetScissor`. The number of viewports used by a pipeline is still specified by the `viewportCount` member of `VkPipelineViewportStateCreateInfo`.
**VkPipelineViewportStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetScissor** before any draw commands. The number of scissor rectangles used by a pipeline is still specified by the **scissorCount** member of **VkPipelineViewportStateCreateInfo**.

- **VK_DYNAMIC_STATE_LINE_WIDTH** specifies that the **lineWidth** state in **VkPipelineRasterizationStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetLineWidth** before any draw commands that generate line primitives for the rasterizer.

- **VK_DYNAMIC_STATE_DEPTH_BIAS** specifies that the **depthBiasConstantFactor**, **depthBiasClamp** and **depthBiasSlopeFactor** states in **VkPipelineRasterizationStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetDepthBias** before any draws are performed with **depthBiasEnable** in **VkPipelineRasterizationStateCreateInfo** set to **VK_TRUE**.

- **VK_DYNAMIC_STATE_BLEND_CONSTANTS** specifies that the **blendConstants** state in **VkPipelineColorBlendStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetBlendConstants** before any draws are performed with a pipeline state with **VkPipelineColorBlendAttachmentState** member **blendEnable** set to **VK_TRUE** and any of the blend functions using a constant blend color.

- **VK_DYNAMIC_STATE_DEPTH_BOUNDS** specifies that the **minDepthBounds** and **maxDepthBounds** states of **VkPipelineDepthStencilStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetDepthBounds** before any draws are performed with a pipeline state with **VkPipelineDepthStencilStateCreateInfo** member **depthBoundsTestEnable** set to **VK_TRUE**.

- **VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK** specifies that the **compareMask** state in **VkPipelineDepthStencilStateCreateInfo** for both **front** and **back** will be ignored and **must** be set dynamically with **vkCmdSetStencilCompareMask** before any draws are performed with a pipeline state with **VkPipelineDepthStencilStateCreateInfo** member **stencilTestEnable** set to **VK_TRUE**.

- **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** specifies that the **writeMask** state in **VkPipelineDepthStencilStateCreateInfo** for both **front** and **back** will be ignored and **must** be set dynamically with **vkCmdSetStencilWriteMask** before any draws are performed with a pipeline state with **VkPipelineDepthStencilStateCreateInfo** member **stencilTestEnable** set to **VK_TRUE**.

- **VK_DYNAMIC_STATE_STENCIL_REFERENCE** specifies that the **reference** state in **VkPipelineDepthStencilStateCreateInfo** for both **front** and **back** will be ignored and **must** be set dynamically with **vkCmdSetStencilReference** before any draws are performed with a pipeline state with **VkPipelineDepthStencilStateCreateInfo** member **stencilTestEnable** set to **VK_TRUE**.

- **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV** specifies that the **pViewportScalings** state in **VkPipelineViewportWScalingStateCreateInfoNV** will be ignored and **must** be set dynamically with **vkCmdSetViewportWScalingNV** before any draws are performed with a pipeline state with **VkPipelineViewportWScalingStateCreateInfoNV** member **viewportScalingEnable** set to **VK_TRUE**.

- **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT** specifies that the **pDiscardRectangles** state in **VkPipelineDiscardRectangleStateCreateInfoEXT** will be ignored and **must** be set dynamically with **vkCmdSetDiscardRectangleEXT** before any draw or clear commands. The **VkDiscardRectangleModeEXT** and the number of active discard rectangles is still specified by the **discardRectangleMode** and **discardRectangleCount** members of **VkPipelineDiscardRectangleStateCreateInfoEXT**.

- **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** specifies that the **sampleLocationsInfo** state in
VkPipelineSampleLocationsStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetSampleLocationsEXT before any draw or clear commands. Enabling custom sample locations is still indicated by the sampleLocationsEnable member of VkPipelineSampleLocationsStateCreateInfoEXT.

- **VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV** specifies that the pExclusiveScissors state in VkPipelineViewportExclusiveScissorStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetExclusiveScissorNV before any draw commands. The number of exclusive scissor rectangles used by a pipeline is still specified by the exclusiveScissorCount member of VkPipelineViewportExclusiveScissorStateCreateInfoNV.

- **VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV** specifies that the pShadingRatePalettes state in VkPipelineViewportShadingRateImageStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetViewportShadingRatePaletteNV before any draw commands.

- **VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV** specifies that the coarse sample order state in VkPipelineViewportCoarseSampleOrderStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetCoarseSampleOrderNV before any draw commands.

- **VK_DYNAMIC_STATE_LINE_STIPPLE_EXT** specifies that the lineStippleFactor and lineStipplePattern state in VkPipelineRasterizationLineStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetLineStippleEXT before any draws are performed with a pipeline state with VkPipelineRasterizationLineStateCreateInfoEXT member stippledLineEnable set to **VK_TRUE**.

- **VK_DYNAMIC_STATE_CULL_MODE_EXT** specifies that the cullMode state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetCullModeEXT before any draw commands.

- **VK_DYNAMIC_STATE_FRONT_FACE_EXT** specifies that the frontFace state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetFrontFaceEXT before any draw commands.

- **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT** specifies that the topology state in VkPipelineInputAssemblyStateCreateInfo only specifies the topology class, and the specific topology order and adjacency **must** be set dynamically with vkCmdSetPrimitiveTopologyEXT before any draw commands.

- **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT** specifies that the viewportCount and pViewports state in VkPipelineViewportStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetViewportWithCountEXT before any draw call.

- **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT** specifies that the scissorCount and pScissors state in VkPipelineViewportStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetScissorWithCountEXT before any draw call.

- **VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT** specifies that the stride state in VkVertexInputBindingDescription will be ignored and **must** be set dynamically with vkCmdBindVertexBuffers2EXT before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE_EXT** specifies that the depthTestEnable state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthTestEnableEXT before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE_EXT** specifies that the depthWriteEnable state in
VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with `vkCmdSetDepthWriteEnableEXT` before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_COMPARE_OP_EXT** specifies that the `depthCompareOp` state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with `vkCmdSetDepthCompareOpEXT` before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE_EXT** specifies that the `depthBoundsTestEnable` state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with `vkCmdSetDepthBoundsTestEnableEXT` before any draw call.

- **VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE_EXT** specifies that the `stencilTestEnable` state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with `vkCmdSetStencilTestEnableEXT` before any draw call.

- **VK_DYNAMIC_STATE_STENCIL_OP_EXT** specifies that the `failOp`, `passOp`, `depthFailOp`, and `compareOp` states in VkPipelineDepthStencilStateCreateInfo for both front and back will be ignored and **must** be set dynamically with `vkCmdSetStencilOpEXT` before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member `stencilTestEnable` set to **VK_TRUE**

- **VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT** specifies that the `patchControlPoints` state in VkPipelineTessellationStateCreateInfo will be ignored and **must** be set dynamically with `vkCmdSetPatchControlPointsEXT` before any draw commands.

- **VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT** specifies that the `rasterizerDiscardEnable` state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with `vkCmdSetRasterizerDiscardEnableEXT` before any draw commands.

- **VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT** specifies that the `depthBiasEnable` state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with `vkCmdSetDepthBiasEnableEXT` before any draw commands.

- **VK_DYNAMIC_STATE_LOGIC_OP_EXT** specifies that the `logicOp` state in VkPipelineColorBlendStateCreateInfo will be ignored and **must** be set dynamically with `vkCmdSetLogicOpEXT` before any draw commands.

- **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT** specifies that the `primitiveRestartEnable` state in VkPipelineInputAssemblyStateCreateInfo will be ignored and **must** be set dynamically with `vkCmdSetPrimitiveRestartEnableEXT` before any draw commands.

- **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** specifies that state in VkPipelineFragmentShadingRateStateCreateInfoKHR and VkPipelineFragmentShadingRateEnumStateCreateInfoNV will be ignored and **must** be set dynamically with `vkCmdSetFragmentShadingRateKHR` or `vkCmdSetFragmentShadingRateEnumNV` before any draw commands.

- **VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR** specifies that the default stack size computation for the pipeline will be ignored and **must** be set dynamically with `vkCmdSetRayTracingPipelineStackSizeKHR` before any ray tracing calls are performed.

- **VK_DYNAMIC_STATE_VERTEX_INPUT_EXT** specifies that the `pVertexInputState` states will be ignored and **must** be set dynamically with `vkCmdSetVertexInputEXT` before any draw commands.

- **VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT** specifies that the `pColorWriteEnables` state in VkPipelineColorWriteCreateInfoEXT will be ignored and **must** be set dynamically with
vkCmdSetColorWriteEnableEXT before any draw call.

### 10.2.1. Valid Combinations of Stages for Graphics Pipelines

The geometric primitive processing can either be handled on a per primitive basis by the vertex, tessellation, and geometry shader stages, or on a per mesh basis using task and mesh shader stages. If the pipeline includes a mesh shader stage, it uses the mesh pipeline, otherwise it uses the primitive pipeline.

If a task shader is omitted, the task shading stage is skipped.

If tessellation shader stages are omitted, the tessellation shading and fixed-function stages of the pipeline are skipped.

If a geometry shader is omitted, the geometry shading stage is skipped.

If a fragment shader is omitted, fragment color outputs have undefined values, and the fragment depth value is unmodified. This can be useful for depth-only rendering.

Presence of a shader stage in a pipeline is indicated by including a valid `VkPipelineShaderStageCreateInfo` with `module` and `pName` selecting an entry point from a shader module, where that entry point is valid for the stage specified by `stage`.

Presence of some of the fixed-function stages in the pipeline is implicitly derived from enabled shaders and provided state. For example, the fixed-function tessellator is always present when the pipeline has valid Tessellation Control and Tessellation Evaluation shaders.

*For example:*

- Depth/stencil-only rendering in a subpass with no color attachments
  - Active Pipeline Shader Stages
    - Vertex Shader
  - Required: Fixed-Function Pipeline Stages
    - `VkPipelineVertexInputStateCreateInfo`
    - `VkPipelineInputAssemblyStateCreateInfo`
    - `VkPipelineViewportStateCreateInfo`
    - `VkPipelineRasterizationStateCreateInfo`
    - `VkPipelineMultisampleStateCreateInfo`
    - `VkPipelineDepthStencilStateCreateInfo`

- Color-only rendering in a subpass with no depth/stencil attachment
  - Active Pipeline Shader Stages
    - Vertex Shader
    - Fragment Shader
  - Required: Fixed-Function Pipeline Stages
    - `VkPipelineVertexInputStateCreateInfo`
• Rendering pipeline with tessellation and geometry shaders
  ◦ Active Pipeline Shader Stages
    • Vertex Shader
    • Tessellation Control Shader
    • Tessellation Evaluation Shader
    • Geometry Shader
    • Fragment Shader
  ◦ Required: Fixed-Function Pipeline Stages
    • VkPipelineVertexInputStateCreateInfo
    • VkPipelineInputAssemblyStateCreateInfo
    • VkPipelineTessellationStateCreateInfo
    • VkPipelineViewportStateCreateInfo
    • VkPipelineRasterizationStateCreateInfo
    • VkPipelineMultisampleStateCreateInfo
    • VkPipelineColorBlendStateCreateInfo

• Rendering pipeline with task and mesh shaders
  ◦ Active Pipeline Shader Stages
    • Task Shader
    • Mesh Shader
    • Fragment Shader
  ◦ Required: Fixed-Function Pipeline Stages
    • VkPipelineViewportStateCreateInfo
    • VkPipelineRasterizationStateCreateInfo
    • VkPipelineMultisampleStateCreateInfo
    • VkPipelineDepthStencilStateCreateInfo
    • VkPipelineColorBlendStateCreateInfo

10.2.2. Graphics Pipeline Shader Groups

Graphics pipelines can contain multiple shader groups that can be bound individually. Each shader
group behaves as if it was a pipeline using the shader group’s state. When the pipeline is bound by regular means, it behaves as if the state of group 0 is active, use vkCmdBindPipelineShaderGroupNV to bind an individual shader group.

The primary purpose of shader groups is allowing the device to bind different pipeline state using Device-Generated Commands. The VkGraphicsPipelineShaderGroupsCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkGraphicsPipelineShaderGroupsCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t groupCount;
    const VkGraphicsShaderGroupCreateInfoNV* pGroups;
    uint32_t pipelineCount;
    const VkPipeline* pPipelines;
} VkGraphicsPipelineShaderGroupsCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `groupCount` is the number of elements in the `pGroups` array.
- `pGroups` is an array of VkGraphicsShaderGroupCreateInfoNV values specifying which state of the original VkGraphicsPipelineCreateInfo each shader group overrides.
- `pipelineCount` is the number of elements in the `pPipelines` array.
- `pPipelines` is an array of graphics VkPipeline, which are referenced within the created pipeline, including all their shader groups.

When referencing shader groups by index, groups defined in the referenced pipelines are treated as if they were defined as additional entries in `pGroups`. They are appended in the order they appear in the `pPipelines` array and in the `pGroups` array when those pipelines were defined.

The application must maintain the lifetime of all such referenced pipelines based on the pipelines that make use of them.
Valid Usage

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-groupCount-02879
  
  \textit{groupCount} \textbf{must} \textbf{be at least} \textbf{1} \textbf{and as maximum} \textbf{VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxGraphicsShaderGroupCount}

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-groupCount-02880
  
  The sum of \textit{groupCount} including those groups added from referenced \textit{pPipelines} \textbf{must also be as maximum} \textbf{VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxGraphicsShaderGroupCount}

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02881
  
  The state of the first element of \textit{pGroups} \textbf{must match its equivalent within the parent’s VkGraphicsPipelineCreateInfo}

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02882
  
  Each element of \textit{pGroups} \textbf{must in combination with the rest of the pipeline state yield a valid state configuration}

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02884
  
  All elements of \textit{pGroups} \textbf{must use the same shader stage combinations unless any mesh shader stage is used, then either combination of task and mesh or just mesh shader is valid}

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02885
  
  Mesh and regular primitive shading stages cannot be mixed across \textit{pGroups}

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pPipelines-02886
  
  Each element of \textit{pPipelines} \textbf{must have been created with identical state to the pipeline currently created except the state that can be overridden by VkGraphicsShaderGroupCreateInfoNV}

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-deviceGeneratedCommands-02887
  
  The \textbf{VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands feature must be enabled}

Valid Usage (Implicit)

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-sType-sType
  
  \textit{sType} \textbf{must be} \textbf{VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_SHADER_GROUPS_CREATE_INFO_NV}

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-parameter
  
  \textit{pGroups} \textbf{must be a valid pointer to an array of} \textbf{groupCount} \textbf{valid VkGraphicsShaderGroupCreateInfoNV structures}

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pPipelines-parameter
  
  If \textit{pipelineCount} is not 0, \textit{pPipelines} \textbf{must be a valid pointer to an array of} \textbf{pipelineCount} \textbf{valid VkPipeline handles}

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-groupCount-arraylength
  
  \textit{groupCount} \textbf{must be greater than 0}
The `VkGraphicsShaderGroupCreateInfoNV` structure provides the state overrides for each shader group. Each shader group behaves like a pipeline that was created from its state as well as the remaining parent’s state. It is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkGraphicsShaderGroupCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    const VkPipelineVertexInputStateCreateInfo* pVertexInputState;
    const VkPipelineTessellationStateCreateInfo* pTessellationState;
} VkGraphicsShaderGroupCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is an array of size `stageCount` structures of type `VkPipelineShaderStageCreateInfo` describing the set of the shader stages to be included in this shader group.
- `pVertexInputState` is a pointer to an instance of the `VkPipelineVertexInputStateCreateInfo` structure.
- `pTessellationState` is a pointer to an instance of the `VkPipelineTessellationStateCreateInfo` structure, and is ignored if the shader group does not include a tessellation control shader stage and tessellation evaluation shader stage.

**Valid Usage**

- `VUID-VkGraphicsShaderGroupCreateInfoNV-stageCount-02888`
  - For `stageCount`, the same restrictions as in `VkGraphicsPipelineCreateInfo::stageCount` apply

- `VUID-VkGraphicsShaderGroupCreateInfoNV-pStages-02889`
  - For `pStages`, the same restrictions as in `VkGraphicsPipelineCreateInfo::pStages` apply

- `VUID-VkGraphicsShaderGroupCreateInfoNV-pVertexInputState-02890`
  - For `pVertexInputState`, the same restrictions as in `VkGraphicsPipelineCreateInfo::pVertexInputState` apply

- `VUID-VkGraphicsShaderGroupCreateInfoNV-pTessellationState-02891`
  - For `pTessellationState`, the same restrictions as in `VkGraphicsPipelineCreateInfo::pTessellationState` apply
Valid Usage (Implicit)

- VUID-VkGraphicsShaderGroupCreateInfoNV-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_GRAPHICS_SHADER_GROUP_CREATE_INFO_NV**

- VUID-VkGraphicsShaderGroupCreateInfoNV-pNext-pNext
  
  **pNext** must be **NULL**

- VUID-VkGraphicsShaderGroupCreateInfoNV-pStages-parameter
  
  **pStages** must be a valid pointer to an array of **stageCount** valid **VkPipelineShaderStageCreateInfo** structures

- VUID-VkGraphicsShaderGroupCreateInfoNV-stageCount-arraylength
  
  **stageCount** must be greater than **0**

10.3. Ray Tracing Pipelines

Ray tracing pipelines consist of multiple shader stages, fixed-function traversal stages, and a pipeline layout.

To create ray tracing pipelines, call:

```c
// Provided by VK_NV_ray_tracing
VkResult vkCreateRayTracingPipelinesNV(
    VkDevice                                    device, 
    VkPipelineCache                             pipelineCache, 
    uint32_t                                    createInfoCount, 
    const                                        VkRayTracingPipelineCreateInfoNV*     pCreateInfos, 
    const                                        VkAllocationCallbacks*                pAllocator, 
    VkPipeline*                                 pPipelines); 
```

- **device** is the logical device that creates the ray tracing pipelines.

- **pipelineCache** is either **VK_NULL_HANDLE**, indicating that pipeline caching is disabled, or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.

- **createInfoCount** is the length of the **pCreateInfos** and **pPipelines** arrays.

- **pCreateInfos** is a pointer to an array of **VkRayTracingPipelineCreateInfoNV** structures.

- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

- **pPipelines** is a pointer to an array in which the resulting ray tracing pipeline objects are returned.
Valid Usage

• VUID-vkCreateRayTracingPipelinesNV-flags-03415
  If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and the basePipelineIndex member of that same element is not -1, basePipelineIndex must be less than the index into pCreateInfos that corresponds to that element

• VUID-vkCreateRayTracingPipelinesNV-flags-03416
  If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, the base pipeline must have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set

• VUID-vkCreateRayTracingPipelinesNV-flags-03816
  flags must not contain the VK_PIPELINE_CREATE_DISPATCH_BASE flag

• VUID-vkCreateRayTracingPipelinesNV-pipelineCache-02903
  If pipelineCache was created with VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT, host access to pipelineCache must be externally synchronized

Valid Usage (Implicit)

• VUID-vkCreateRayTracingPipelinesNV-device-parameter
device must be a valid VkDevice handle

• VUID-vkCreateRayTracingPipelinesNV-pipelineCache-parameter
If pipelineCache is not VK_NULL_HANDLE, pipelineCache must be a valid VkPipelineCache handle

• VUID-vkCreateRayTracingPipelinesNV-pCreateInfos-parameter
pCreateInfos must be a valid pointer to an array of createInfoCount valid VkRayTracingPipelineCreateInfoNV structures

• VUID-vkCreateRayTracingPipelinesNV-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateRayTracingPipelinesNV-pPipelines-parameter
pPipelines must be a valid pointer to an array of createInfoCount VkPipeline handles

• VUID-vkCreateRayTracingPipelinesNV-createInfoCount-arraylength
createInfoCount must be greater than 0

• VUID-vkCreateRayTracingPipelinesNV-pipelineCache-parent
If pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device
### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_PIPELINE_COMPILE_REQUIRED_EXT`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_SHADER_NV`

To create ray tracing pipelines, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkCreateRayTracingPipelinesKHR(
    VkDevice                                    device,
    VkDeferredOperationKHR                      deferredOperation,
    VkPipelineCache                             pipelineCache,
    uint32_t                                    createInfoCount,
    const VkRayTracingPipelineCreateInfoKHR*    pCreateInfos,
    const VkAllocationCallbacks*                pAllocator,
    VkPipeline*                                 pPipelines);
```

- `device` is the logical device that creates the ray tracing pipelines.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `pipelineCache` is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled, or the handle of a valid `pipeline cache` object, in which case use of that cache is enabled for the duration of the command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of `VkRayTracingPipelineCreateInfoKHR` structures.
- `pAllocator` controls host memory allocation as described in the `Memory Allocation` chapter.
- `pPipelines` is a pointer to an array in which the resulting ray tracing pipeline objects are returned.

The `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS` error is returned if the implementation is unable to re-use the shader group handles provided in `VkRayTracingShaderGroupCreateInfoKHR` ::`pShaderGroupCaptureReplayHandle` when `VkPhysicalDeviceRayTracingPipelineFeaturesKHR` ::`rayTracingPipelineShaderGroupHandleCaptureReplay` is enabled.
Valid Usage

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03415**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the `basePipelineIndex` member of that same element is not `-1`, `basePipelineIndex` must be less than the index into `pCreateInfos` that corresponds to that element.

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03416**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline must have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set.

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03816**
  `flags` must not contain the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag.

- **VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-02903**
  If `pipelineCache` was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT`, host access to `pipelineCache` must be externally synchronized.

- **VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03677**
  If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object.

- **VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03678**
  Any previous deferred operation that was associated with `deferredOperation` must be complete.

- **VUID-vkCreateRayTracingPipelinesKHR-rayTracingPipeline-03586**
  The `rayTracingPipeline` feature must be enabled.

- **VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03587**
  If `deferredOperation` is not `VK_NULL_HANDLE`, the `flags` member of elements of `pCreateInfos` must not include `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT_EXT`.
Valid Usage (Implicit)

- **VUID-vkCreateRayTracingPipelinesKHR-device-parameter**
  
  device must be a valid VkDevice handle

- **VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-parameter**
  
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

- **VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-parameter**
  
  If pipelineCache is not VK_NULL_HANDLE, pipelineCache must be a valid VkPipelineCache handle

- **VUID-vkCreateRayTracingPipelinesKHR-pCreateInfos-parameter**
  
  pCreateInfos must be a valid pointer to an array of createInfoCount valid VkRayTracingPipelineCreateInfoKHR structures

- **VUID-vkCreateRayTracingPipelinesKHR-pAllocator-parameter**
  
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- **VUID-vkCreateRayTracingPipelinesKHR-pPipelines-parameter**
  
  pPipelines must be a valid pointer to an array of createInfoCount VkPipeline handles

- **VUID-vkCreateRayTracingPipelinesKHR-createInfoCount-arraylength**
  
  createInfoCount must be greater than 0

- **VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-parent**
  
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

- **VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-parent**
  
  If pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR
- VK_PIPELINE_COMPILE_REQUIRED_EXT

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS

The VkRayTracingPipelineCreateInfoNV structure is defined as:
typedef struct VkRayTracingPipelineCreateInfoNV {
    VkStructureType                               sType;
    const void*                                   pNext;
    VkPipelineCreateFlags                         flags;
    uint32_t                                      stageCount;
    const VkPipelineShaderStageCreateInfo*        pStages;
    uint32_t                                      groupCount;
    const VkRayTracingShaderGroupCreateInfoNV*    pGroups;
    uint32_t                                      maxRecursionDepth;
    VkPipelineLayout                              layout;
    VkPipeline                                    basePipelineHandle;
    int32_t                                       basePipelineIndex;
} VkRayTracingPipelineCreateInfoNV;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkPipelineCreateFlagBits** specifying how the pipeline will be generated.
- **stageCount** is the number of entries in the **pStages** array.
- **pStages** is an array of size **stageCount** structures of type **VkPipelineShaderStageCreateInfo** describing the set of the shader stages to be included in the ray tracing pipeline.
- **groupCount** is the number of entries in the **pGroups** array.
- **pGroups** is an array of size **groupCount** structures of type **VkRayTracingShaderGroupCreateInfoNV** describing the set of the shader stages to be included in each shader group in the ray tracing pipeline.
- **maxRecursionDepth** is the maximum recursion depth of shaders executed by this pipeline.
- **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- **basePipelineHandle** is a pipeline to derive from.
- **basePipelineIndex** is an index into the **pCreateInfos** parameter to use as a pipeline to derive from.

The parameters **basePipelineHandle** and **basePipelineIndex** are described in more detail in **Pipeline Derivatives**.
Valid Usage

- VUID-VkRayTracingPipelineCreateInfoNV-flags-03421
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` must be a valid handle to a ray tracing `VkPipeline`.

- VUID-VkRayTracingPipelineCreateInfoNV-flags-03422
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` must be a valid index into the calling command's `pCreateInfos` parameter.

- VUID-VkRayTracingPipelineCreateInfoNV-flags-03423
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is not -1, `basePipelineHandle` must be `VK_NULL_HANDLE`.

- VUID-VkRayTracingPipelineCreateInfoNV-flags-03424
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is not `VK_NULL_HANDLE`, `basePipelineIndex` must be -1.

- VUID-VkRayTracingPipelineCreateInfoNV-pStages-03426
  The shader code for the entry points identified by `pStages`, and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter.

- VUID-VkRayTracingPipelineCreateInfoNV-layout-03427
  `layout` must be consistent with all shaders specified in `pStages`.

- VUID-VkRayTracingPipelineCreateInfoNV-layout-03428
  The number of resources in `layout` accessible to each shader stage that is used by the pipeline must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`.

- VUID-VkRayTracingPipelineCreateInfoNV-flags-03429
  `flags` must not include `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`.

- VUID-VkRayTracingPipelineCreateInfoNV-pipelineCreationCacheControl-03424
  If the `pipelineCreationCacheControl` feature is not enabled, `flags` must not include `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT` or `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT_EXT`.

- VUID-VkRayTracingPipelineCreateInfoNV-stage-03425
  The `stage` member of at least one element of `pStages` must be `VK_SHADER_STAGE_RAYGEN_KHR`.

- VUID-VkRayTracingPipelineCreateInfoNV-flags-03426
  `flags` must not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`.

- VUID-VkRayTracingPipelineCreateInfoNV-maxRecursionDepth-03427
  `maxRecursionDepth` must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxRecursionDepth`.

- VUID-VkRayTracingPipelineCreateInfoNV-flags-03428
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`.

- VUID-VkRayTracingPipelineCreateInfoNV-flags-03429
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`.

Chapter 10. Pipelines | 573
- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03460**
  flags must not include `VK_PIPELINE_CREATERAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03461**
  flags must not include `VK_PIPELINE_CREATERAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03462**
  flags must not include `VK_PIPELINE_CREATERAY_TRACING_SKIP_AABBSBIT_KHR`

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03463**
  flags must not include `VK_PIPELINE_CREATERAY_TRACING_SKIP_TRIANGLES_BIT_KHR`

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03588**
  flags must not include `VK_PIPELINE_CREATERAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-02957**
  flags must not include both `VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV` and `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT` at the same time
Valid Usage (Implicit)

- **VUID-VkRayTracingPipelineCreateInfoNV-sType-sType**
  
  \textbf{sType must be} VK\_STRUCTURE\_TYPE\_RAY\_TRACING\_PIPELINE\_CREATE\_INFO\_NV

- **VUID-VkRayTracingPipelineCreateInfoNV-pNext-pNext**
  
  \textbf{pNext must be} NULL or a pointer to a valid instance of VkPipelineCreationFeedbackCreateInfoEXT

- **VUID-VkRayTracingPipelineCreateInfoNV-sType-unique**
  
  The \textbf{sType} value of each struct in the \textbf{pNext} chain \textbf{must be unique}

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-parameter**
  
  \textbf{flags must be} a valid combination of VkPipelineCreateFlagBits values

- **VUID-VkRayTracingPipelineCreateInfoNV-pStages-parameter**
  
  \textbf{pStages must be} a valid pointer to an array of \textbf{stageCount} valid VkPipelineShaderStageCreateInfo structures

- **VUID-VkRayTracingPipelineCreateInfoNV-pGroups-parameter**
  
  \textbf{pGroups must be} a valid pointer to an array of \textbf{groupCount} valid VkRayTracingShaderGroupCreateInfoNV structures

- **VUID-VkRayTracingPipelineCreateInfoNV-layout-parameter**
  
  \textbf{layout must be} a valid VkPipelineLayout handle

- **VUID-VkRayTracingPipelineCreateInfoNV-stageCount-arraylength**
  
  \textbf{stageCount must be} greater than 0

- **VUID-VkRayTracingPipelineCreateInfoNV-groupCount-arraylength**
  
  \textbf{groupCount must be} greater than 0

- **VUID-VkRayTracingPipelineCreateInfoNV-commonparent**
  
  Both of basePipelineHandle, and layout that are valid handles of non-ignored parameters \textbf{must} have been created, allocated, or retrieved from the same VkDevice

The VkRayTracingPipelineCreateInfoKHR structure is defined as:
typedef struct VkRayTracingPipelineCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    uint32_t groupCount;
    const VkRayTracingShaderGroupCreateInfoKHR* pGroups;
    uint32_t maxPipelineRayRecursionDepth;
    const VkPipelineLibraryCreateInfoKHR* pLibraryInfo;
    const VkRayTracingPipelineInterfaceCreateInfoKHR* pLibraryInterface;
    const VkPipelineDynamicStateCreateInfo* pDynamicState;
    VkPipelineLayout layout;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkRayTracingPipelineCreateInfoKHR;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkPipelineCreateFlagBits** specifying how the pipeline will be generated.
- **stageCount** is the number of entries in the **pStages** array.
- **pStages** is a pointer to an array of stageCount **VkPipelineShaderStageCreateInfo** structures describing the set of the shader stages to be included in the ray tracing pipeline.
- **groupCount** is the number of entries in the **pGroups** array.
- **pGroups** is a pointer to an array of groupCount **VkRayTracingShaderGroupCreateInfoKHR** structures describing the set of the shader stages to be included in each shader group in the ray tracing pipeline.
- **maxPipelineRayRecursionDepth** is the maximum recursion depth of shaders executed by this pipeline.
- **pLibraryInfo** is a pointer to a **VkPipelineLibraryCreateInfoKHR** structure defining pipeline libraries to include.
- **pLibraryInterface** is a pointer to a **VkRayTracingPipelineInterfaceCreateInfoKHR** structure defining additional information when using pipeline libraries.
- **pDynamicState** is a pointer to a **VkPipelineDynamicStateCreateInfo** structure, and is used to indicate which properties of the pipeline state object are dynamic and can be changed independently of the pipeline state. This can be **NULL**, which means no state in the pipeline is considered dynamic.
- **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- **basePipelineHandle** is a pipeline to derive from.
- **basePipelineIndex** is an index into the **pCreateInfos** parameter to use as a pipeline to derive from.
The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in Pipeline Derivatives.

When `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` is specified, this pipeline defines a pipeline library which **cannot** be bound as a ray tracing pipeline directly. Instead, pipeline libraries define common shaders and shader groups which **can** be included in future pipeline creation.

If pipeline libraries are included in `pLibraryInfo`, shaders defined in those libraries are treated as if they were defined as additional entries in `pStages`, appended in the order they appear in the `pLibraries` array and in the `pStages` array when those libraries were defined.

When referencing shader groups in order to obtain a shader group handle, groups defined in those libraries are treated as if they were defined as additional entries in `pGroups`, appended in the order they appear in the `pLibraries` array and in the `pGroups` array when those libraries were defined. The shaders these groups reference are set when the pipeline library is created, referencing those specified in the pipeline library, not in the pipeline that includes it.

The default stack size for a pipeline if `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` is not provided is computed as described in Ray Tracing Pipeline Stack.
Valid Usage

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-03421**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is `-1`, `basePipelineHandle` must be a valid handle to a ray tracing `VkPipeline`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-03422**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` must be a valid index into the calling command’s `pCreateInfos` parameter.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-03423**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is not `-1`, `basePipelineHandle` must be `VK_NULL_HANDLE`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-03424**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is not `VK_NULL_HANDLE`, `basePipelineIndex` must be `-1`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pStages-03426**
  The shader code for the entry points identified by `pStages`, and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter.

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-03427**
  `layout` must be consistent with all shaders specified in `pStages`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-03428**
  The number of resources in `layout` accessible to each shader stage that is used by the pipeline must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-02904**
  `flags` must not include `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pipelineCreationCacheControl-02905**
  If the `pipelineCreationCacheControl` feature is not enabled, `flags` must not include `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT` or `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT_EXT`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-stage-03425**
  If `flags` does not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`, the `stage` member of at least one element of `pStages`, including those implicitly added by `pLibraryInfo`, must be `VK_SHADER_STAGE_RAYGEN_BIT_KHR`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-maxPipelineRayRecursionDepth-03589**
  `maxPipelineRayRecursionDepth` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayRecursionDepth`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-03465**
  If `flags` includes `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`, `pLibraryInterface` must not be `NULL`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03590**
  If `pLibraryInfo` is not `NULL` and its `libraryCount` member is greater than `0`, its `pLibraryInterface` member must not be `NULL`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pLibraries-03591**
Each element of the `pLibraries` member of `pLibraryInfo` must have been created with the value of `maxPipelineRayRecursionDepth` equal to that in this pipeline.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03592**
  If `pLibraryInfo` is not `NULL`, each element of its `pLibraries` member must have been created with a layout that is compatible with the layout in this pipeline.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03593**
  If `pLibraryInfo` is not `NULL`, each element of its `pLibraries` member must have been created with values of the `maxPipelineRayPayloadSize` and `maxPipelineRayHitAttributeSize` members of `pLibraryInterface` equal to those in this pipeline.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-03594**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`, each element of the `pLibraries` member of `libraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR` bit set.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04718**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`, each element of the `pLibraries` member of `libraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR` bit set.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04719**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`, each element of the `pLibraries` member of `libraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR` bit set.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04720**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, each element of the `pLibraries` member of `libraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR` bit set.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04721**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, each element of the `pLibraries` member of `libraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR` bit set.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04722**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, each element of the `pLibraries` member of `libraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR` bit set.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04723**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`, each element of the `pLibraries` member of `libraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR` bit set.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03595**
  If the `VK_KHR_pipeline_library` extension is not enabled, `pLibraryInfo` and `pLibraryInterface` must be `NULL`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-03470**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, for
any element of `pGroups` with a type of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, the anyHitShader of that element must not be `VK_SHADER_UNUSED_KHR`

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-03471**
  If flags includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, for any element of `pGroups` with a type of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, the closestHitShader of that element must not be `VK_SHADER_UNUSED_KHR`

- **VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03596**
  If the rayTraversalPrimitiveCulling feature is not enabled, flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`

- **VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03597**
  If the rayTraversalPrimitiveCulling feature is not enabled, flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-03598**
  If flags includes `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`, rayTracingPipelineShaderGroupHandleCaptureReplay must be enabled

- **VUID-VkRayTracingPipelineCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03599**
  If `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay` is `VK_TRUE` and the pShaderGroupCaptureReplayHandle member of any element of `pGroups` is not NULL, flags must include `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`

- **VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03600**
  If `pLibraryInfo` is not NULL and its libraryCount is 0, stageCount must not be 0

- **VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03601**
  If `pLibraryInfo` is not NULL and its libraryCount is 0, groupCount must not be 0

- **VUID-VkRayTracingPipelineCreateInfoKHR-pDynamicStates-03602**
  Any element of the pDynamicStates member of `pDynamicState` must be `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR`
Valid Usage (Implicit)

- **VUID-VkRayTracingPipelineCreateInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CREATE_INFO_KHR`

- **VUID-VkRayTracingPipelineCreateInfoKHR-pNext-pNext**
  
  `pNext` must be `NULL` or a pointer to a valid instance of `VkPipelineCreationFeedbackCreateInfoEXT`

- **VUID-VkRayTracingPipelineCreateInfoKHR-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-parameter**
  
  `flags` must be a valid combination of `VkPipelineCreateFlagBits` values

- **VUID-VkRayTracingPipelineCreateInfoKHR-pStages-parameter**
  
  If `stageCount` is not 0, `pStages` must be a valid pointer to an array of `stageCount` valid `VkPipelineShaderStageCreateInfo` structures

- **VUID-VkRayTracingPipelineCreateInfoKHR-pGroups-parameter**
  
  If `groupCount` is not 0, `pGroups` must be a valid pointer to an array of `groupCount` valid `VkRayTracingShaderGroupCreateInfoKHR` structures

- **VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-parameter**
  
  If `pLibraryInfo` is not `NULL`, `pLibraryInfo` must be a valid pointer to a valid `VkPipelineLibraryCreateInfoKHR` structure

- **VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInterface-parameter**
  
  If `pLibraryInterface` is not `NULL`, `pLibraryInterface` must be a valid pointer to a valid `VkRayTracingPipelineInterfaceCreateInfoKHR` structure

- **VUID-VkRayTracingPipelineCreateInfoKHR-pDynamicState-parameter**
  
  If `pDynamicState` is not `NULL`, `pDynamicState` must be a valid pointer to a valid `VkPipelineDynamicStateCreateInfo` structure

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-parameter**
  
  `layout` must be a valid `VkPipelineLayout` handle

- **VUID-VkRayTracingPipelineCreateInfoKHR-commonparent**
  
  Both of `basePipelineHandle`, and `layout` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

The `VkRayTracingShaderGroupCreateInfoNV` structure is defined as:
// Provided by VK_NV_ray_tracing

typedef struct VkRayTracingShaderGroupCreateInfoNV {
    VkStructureType                   sType;
    const void*                       pNext;
    VkRayTracingShaderGroupTypeKHR    type;
    uint32_t                          generalShader;
    uint32_t                          closestHitShader;
    uint32_t                          anyHitShader;
    uint32_t                          intersectionShader;
} VkRayTracingShaderGroupCreateInfoNV;

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **type** is the type of hit group specified in this structure.
- **generalShader** is the index of the ray generation, miss, or callable shader from `VkRayTracingPipelineCreateInfoNV::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV`, and `VK_SHADER_UNUSED_NV` otherwise.
- **closestHitShader** is the optional index of the closest hit shader from `VkRayTracingPipelineCreateInfoNV::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV`, and `VK_SHADER_UNUSED_NV` otherwise.
- **anyHitShader** is the optional index of the any-hit shader from `VkRayTracingPipelineCreateInfoNV::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV`, and `VK_SHADER_UNUSED_NV` otherwise.
- **intersectionShader** is the index of the intersection shader from `VkRayTracingPipelineCreateInfoNV::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV`, and `VK_SHADER_UNUSED_NV` otherwise.
Valid Usage

- VUID-VkRayTracingShaderGroupCreateInfoNV-type-02413
  If type is VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV then generalShader must be a valid index into VkRayTracingPipelineCreateInfoNV::pStages referring to a shader of VK_SHADER_STAGE_RAYGEN_BIT_NV, VK_SHADER_STAGE_MISS_BIT_NV, or VK_SHADER_STAGE_CALLABLE_BIT_NV

- VUID-VkRayTracingShaderGroupCreateInfoNV-type-02414
  If type is VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV then closestHitShader, anyHitShader, and intersectionShader must be VK_SHADER_UNUSED_NV

- VUID-VkRayTracingShaderGroupCreateInfoNV-type-02415
  If type is VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV then intersectionShader must be a valid index into VkRayTracingPipelineCreateInfoNV::pStages referring to a shader of VK_SHADER_STAGE_INTERSECTION_BIT_NV

- VUID-VkRayTracingShaderGroupCreateInfoNV-type-02416
  If type is VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV then intersectionShader must be VK_SHADER_UNUSED_NV

- VUID-VkRayTracingShaderGroupCreateInfoNV-closestHitShader-02417
  closestHitShader must be either VK_SHADER_UNUSED_NV or a valid index into VkRayTracingPipelineCreateInfoNV::pStages referring to a shader of VK_SHADER_STAGE_CLOSEST_HIT_BIT_NV

- VUID-VkRayTracingShaderGroupCreateInfoNV-anyHitShader-02418
  anyHitShader must be either VK_SHADER_UNUSED_NV or a valid index into VkRayTracingPipelineCreateInfoNV::pStages referring to a shader of VK_SHADER_STAGE_ANY_HIT_BIT_NV

Valid Usage (Implicit)

- VUID-VkRayTracingShaderGroupCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_NV

- VUID-VkRayTracingShaderGroupCreateInfoNV-pNext-pNext
  pNext must be NULL

- VUID-VkRayTracingShaderGroupCreateInfoNV-type-parameter
  type must be a valid VkRayTracingShaderGroupTypeKHR value

The VkRayTracingShaderGroupCreateInfoKHR structure is defined as:
typedef struct VkRayTracingShaderGroupCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkRayTracingShaderGroupTypeKHR type;
    uint32_t generalShader;
    uint32_t closestHitShader;
    uint32_t anyHitShader;
    uint32_t intersectionShader;
    const void* pShaderGroupCaptureReplayHandle;
} VkRayTracingShaderGroupCreateInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **type** is the type of hit group specified in this structure.
- **generalShader** is the index of the ray generation, miss, or callable shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- **closestHitShader** is the optional index of the closest hit shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- **anyHitShader** is the optional index of the any-hit shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- **intersectionShader** is the index of the intersection shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- **pShaderGroupCaptureReplayHandle** is an optional pointer to replay information for this shader group. Ignored if `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay` is `VK_FALSE`. 
Valid Usage

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03474**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR` then `generalShader` must be a valid index into `VkRayTracingPipelineCreateInfoKHR::pStages` referring to a shader of `VK_SHADER_STAGE_RAYGEN_BIT_KHR`, `VK_SHADER_STAGE_MISS_BIT_KHR`, or `VK_SHADER_STAGE_CALLABLE_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03475**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR` then `closestHitShader`, `anyHitShader`, and `intersectionShader` must be `VK_SHADER_UNUSED_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03476**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR` then `intersectionShader` must be a valid index into `VkRayTracingPipelineCreateInfoKHR::pStages` referring to a shader of `VK_SHADER_STAGE_INTERSECTION_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03477**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` then `intersectionShader` must be `VK_SHADER_UNUSED_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-closestHitShader-03478**
  `closestHitShader` must be either `VK_SHADER_UNUSED_KHR` or a valid index into `VkRayTracingPipelineCreateInfoKHR::pStages` referring to a shader of `VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-anyHitShader-03479**
  `anyHitShader` must be either `VK_SHADER_UNUSED_KHR` or a valid index into `VkRayTracingPipelineCreateInfoKHR::pStages` referring to a shader of `VK_SHADER_STAGE_ANY_HIT_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03603**
  If `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplayMixed` is `VK_FALSE` then `pShaderGroupCaptureReplayHandle` must not be provided if it has not been provided on a previous call to ray tracing pipeline creation.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03604**
  If `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplayMixed` is `VK_FALSE` then the caller must guarantee that no ray tracing pipeline creation commands with `pShaderGroupCaptureReplayHandle` provided execute simultaneously with ray tracing pipeline creation commands without `pShaderGroupCaptureReplayHandle` provided.
Valid Usage (Implicit)

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_KHR`

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-parameter**
  
  `type` must be a valid `VkRayTracingShaderGroupTypeKHR` value

Possible values of `type` in `VkRayTracingShaderGroupCreateInfoKHR` are:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef enum VkRayTracingShaderGroupTypeKHR {
    VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR = 0,
    VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR = 1,
    VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR = 2,
    // Provided by VK_NV_ray_tracing
    VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV =
    VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV =
    VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV =
} VkRayTracingShaderGroupTypeKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkRayTracingShaderGroupTypeKHR VkRayTracingShaderGroupTypeNV;
```

- **VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR** indicates a shader group with a single `VK_SHADER_STAGE_RAYGEN_BIT_KHR`, `VK_SHADER_STAGE_MISS_BIT_KHR`, or `VK_SHADER_STAGE_CALLABLE_BIT_KHR` shader in it.

- **VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR** specifies a shader group that only hits triangles and must not contain an intersection shader, only closest hit and any-hit shaders.

- **VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR** specifies a shader group that only intersects with custom geometry and must contain an intersection shader and may contain closest hit and any-hit shaders.
For current group types, the hit group type could be inferred from the presence or absence of the intersection shader, but we provide the type explicitly for future hit groups that do not have that property.

The `VkRayTracingPipelineInterfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingPipelineInterfaceCreateInfoKHR {
    VkStructureType  sType;
    const void*      pNext;
    uint32_t          maxPipelineRayPayloadSize;
    uint32_t          maxPipelineRayHitAttributeSize;
} VkRayTracingPipelineInterfaceCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxPipelineRayPayloadSize` is the maximum payload size in bytes used by any shader in the pipeline.
- `maxPipelineRayHitAttributeSize` is the maximum attribute structure size in bytes used by any shader in the pipeline.

`maxPipelineRayPayloadSize` is calculated as the maximum number of bytes used by any block declared in the `RayPayloadKHR` or `IncomingRayPayloadKHR` storage classes. `maxPipelineRayHitAttributeSize` is calculated as the maximum number of bytes used by any block declared in the `HitAttributeKHR` storage class. As variables in these storage classes do not have explicit offsets, the size should be calculated as if each variable has a scalar alignment equal to the largest scalar alignment of any of the block’s members.

There is no explicit upper limit for `maxPipelineRayPayloadSize`, but in practice it should be kept as small as possible. Similar to invocation local memory, it must be allocated for each shader invocation and for devices which support many simultaneous invocations, this storage can rapidly be exhausted, resulting in failure.

Valid Usage

- `VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-maxPipelineRayHitAttributeSize-03605` `maxPipelineRayHitAttributeSize` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayHitAttributeSize`
Valid Usage (Implicit)

- **VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-sType-sType**
  
  *sType* must be **VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_INTERFACE_CREATE_INFO_KHR**

- **VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-pNext-pNext**
  
  *pNext* must be **NULL**

To query the opaque handles of shaders in the ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkGetRayTracingShaderGroupHandlesKHR(
    VkDevice                                    device,
    VkPipeline                                  pipeline,
    uint32_t                                    firstGroup,
    uint32_t                                    groupCount,
    size_t                                      dataSize,
    void*                                       pData);
```

or the equivalent command

```c
// Provided by VK_NV_ray_tracing
VkResult vkGetRayTracingShaderGroupHandlesNV(
    VkDevice                                    device,
    VkPipeline                                  pipeline,
    uint32_t                                    firstGroup,
    uint32_t                                    groupCount,
    size_t                                      dataSize,
    void*                                       pData);
```

- **device** is the logical device containing the ray tracing pipeline.
- **pipeline** is the ray tracing pipeline object containing the shaders.
- **firstGroup** is the index of the first group to retrieve a handle for from the **VkRayTracingPipelineCreateInfoKHR::pGroups** or **VkRayTracingPipelineCreateInfoNV::pGroups** array.
- **groupCount** is the number of shader handles to retrieve.
- **dataSize** is the size in bytes of the buffer pointed to by **pData**.
- **pData** is a pointer to a user-allocated buffer where the results will be written.
Valid Usage

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-04619
  pipeline must be a ray tracing pipeline

- VUID-vkGetRayTracingShaderGroupHandlesKHR-firstGroup-04050
  firstGroup must be less than the number of shader groups in pipeline

- VUID-vkGetRayTracingShaderGroupHandlesKHR-firstGroup-02419
  The sum of firstGroup and groupCount must be less than or equal to the number of shader groups in pipeline

- VUID-vkGetRayTracingShaderGroupHandlesKHR-dataSize-02420
  dataSize must be at least VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleSize × groupCount

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-03482
  pipeline must have not been created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR

Valid Usage (Implicit)

- VUID-vkGetRayTracingShaderGroupHandlesKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parameter
  pipeline must be a valid VkPipeline handle

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pData-parameter
  pData must be a valid pointer to an array of dataSize bytes

- VUID-vkGetRayTracingShaderGroupHandlesKHR-dataSize-arraylength
  dataSize must be greater than 0

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parent
  pipeline must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query the optional capture handle information of shaders in the ray tracing pipeline, call:
Provided by VK_KHR_ray_tracing_pipeline

```c
VkResult vkGetRayTracingCaptureReplayShaderGroupHandlesKHR(
    VkDevice                                    device,
    VkPipeline                                  pipeline,
    uint32_t                                    firstGroup,
    uint32_t                                    groupCount,
    size_t                                      dataSize,
    void*                                       pData);
```

- **device** is the logical device containing the ray tracing pipeline.
- **pipeline** is the ray tracing pipeline object containing the shaders.
- **firstGroup** is the index of the first group to retrieve a handle for from the `VkRayTracingPipelineCreateInfoKHR::pGroups` array.
- **groupCount** is the number of shader handles to retrieve.
- **dataSize** is the size in bytes of the buffer pointed to by `pData`.
- **pData** is a pointer to a user-allocated buffer where the results will be written.

### Valid Usage

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-04620
  - pipeline must be a ray tracing pipeline

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-04051
  - firstGroup must be less than the number of shader groups in pipeline

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-03483
  - The sum of `firstGroup` and `groupCount` must be less than or equal to the number of shader groups in pipeline

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-03484
  - dataSize must be at least `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleCaptureReplaySize` × `groupCount`

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03606
  - `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay` must be enabled to call this function

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-03607
  -pipeline must have been created with a flags that included `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`
Valid Usage (Implicit)

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-device-parameter
  
  *device* must be a valid *VkDevice* handle

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-parameter
  
  *pipeline* must be a valid *VkPipeline* handle

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pData-parameter
  
  *pData* must be a valid pointer to an array of *dataSize* bytes

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-arraylength
  
  *dataSize* must be greater than 0

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-parent
  
  *pipeline* must have been created, allocated, or retrieved from *device*

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

Ray tracing pipelines can contain more shaders than a graphics or compute pipeline, so to allow parallel compilation of shaders within a pipeline, an application can choose to defer compilation until a later point in time.

To compile a deferred shader in a pipeline call:

```c
// Provided by VK_NV_ray_tracing
VkResult vkCompileDeferredNV(
    VkDevice device,
    VkPipeline pipeline,
    uint32_t shader);
```

- *device* is the logical device containing the ray tracing pipeline.
- *pipeline* is the ray tracing pipeline object containing the shaders.
- *shader* is the index of the shader to compile.
Valid Usage

- VUID-vkCompileDeferredNV-pipeline-04621
  pipeline must be a ray tracing pipeline

- VUID-vkCompileDeferredNV-pipeline-02237
  pipeline must have been created with VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV

- VUID-vkCompileDeferredNV-shader-02238
  shader must not have been called as a deferred compile before

Valid Usage (Implicit)

- VUID-vkCompileDeferredNV-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCompileDeferredNV-pipeline-parameter
  pipeline must be a valid VkPipeline handle

- VUID-vkCompileDeferredNV-pipeline-parent
  pipeline must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query the pipeline stack size of shaders in a shader group in the ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkDeviceSize vkGetRayTracingShaderGroupStackSizeKHR(
    VkDevice                                    device,
    VkPipeline                                  pipeline,
    uint32_t                                    group,
    VkShaderGroupShaderKHR                      groupShader);
```

- **device** is the logical device containing the ray tracing pipeline.
- **pipeline** is the ray tracing pipeline object containing the shaders groups.
- **group** is the index of the shader group to query.
- **groupShader** is the type of shader from the group to query.
The return value is the ray tracing pipeline stack size in bytes for the specified shader as called from the specified shader group.

### Valid Usage

- **VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-04622**
  
  *pipeline must be a ray tracing pipeline*

- **VUID-vkGetRayTracingShaderGroupStackSizeKHR-group-03608**
  
  *The value of group must be less than the number of shader groups in pipeline*

- **VUID-vkGetRayTracingShaderGroupStackSizeKHR-groupShader-03609**
  
  *The shader identified by groupShader in group must not be VK_SHADER_UNUSED_KHR*

### Valid Usage (Implicit)

- **VUID-vkGetRayTracingShaderGroupStackSizeKHR-device-parameter**
  
  *device must be a valid VkDevice handle*

- **VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-parameter**
  
  *pipeline must be a valid VkPipeline handle*

- **VUID-vkGetRayTracingShaderGroupStackSizeKHR-groupShader-parameter**
  
  *groupShader must be a valid VkShaderGroupShaderKHR value*

- **VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-parent**
  
  *pipeline must have been created, allocated, or retrieved from device*

Possible values of groupShader in vkGetRayTracingShaderGroupStackSizeKHR are:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef enum VkShaderGroupShaderKHR {
    VK_SHADER_GROUP_SHADER_GENERAL_KHR = 0,
    VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR = 1,
    VK_SHADER_GROUP_SHADER_ANY_HIT_KHR = 2,
    VK_SHADER_GROUP_SHADER_INTERSECTION_KHR = 3,
} VkShaderGroupShaderKHR;
```

- **VK_SHADER_GROUP_SHADER_GENERAL_KHR** uses the shader specified in the group with VkRayTracingShaderGroupCreateInfoKHR::generalShader

- **VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR** uses the shader specified in the group with VkRayTracingShaderGroupCreateInfoKHR::closestHitShader

- **VK_SHADER_GROUP_SHADER_ANY_HIT_KHR** uses the shader specified in the group with VkRayTracingShaderGroupCreateInfoKHR::anyHitShader

- **VK_SHADER_GROUP_SHADER_INTERSECTION_KHR** uses the shader specified in the group with VkRayTracingShaderGroupCreateInfoKHR::intersectionShader
To set the dynamic stack size for a ray tracing pipeline call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdSetRayTracingPipelineStackSizeKHR(
    VkCommandBuffer commandBuffer,
    uint32_t pipelineStackSize);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineStackSize` is the stack size to use for subsequent ray tracing trace commands.

See [Ray Tracing Pipeline Stack](#) for more on computing `pipelineStackSize`.

### Valid Usage

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-pipelineStackSize-03610
  `pipelineStackSize` **must** be large enough for any dynamic execution through the shaders in the ray tracing pipeline used by a subsequent trace call

### Valid Usage (Implicit)

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-renderpass
  This command **must** only be called outside of a render pass instance

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
### Command Properties

<table>

### 10.4. Pipeline Destruction

To destroy a graphics or compute pipeline, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipeline(
    VkDevice device,
    VkPipeline pipeline,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the pipeline.
- **pipeline** is the handle of the pipeline to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyPipeline-pipeline-00765**
  
  All submitted commands that refer to pipeline must have completed execution

- **VUID-vkDestroyPipeline-pipeline-00766**
  
  If VkAllocationCallbacks were provided when pipeline was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyPipeline-pipeline-00767**
  
  If no VkAllocationCallbacks were provided when pipeline was created, pAllocator must be NULL
Valid Usage (Implicit)

- VUID-vkDestroyPipeline-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroyPipeline-pipeline-parameter
If pipeline is not VK_NULL_HANDLE, pipeline must be a valid VkPipeline handle

- VUID-vkDestroyPipeline-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyPipeline-pipeline-parent
If pipeline is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to pipeline must be externally synchronized

10.5. Multiple Pipeline Creation

Multiple pipelines can be created simultaneously by passing an array of VkGraphicsPipelineCreateInfo, VkRayTracingPipelineCreateInfoKHR, VkRayTracingPipelineCreateInfoNV, or VkComputePipelineCreateInfo structures into the vkCreateGraphicsPipelines, vkCreateRayTracingPipelinesKHR, vkCreateRayTracingPipelinesNV, and vkCreateComputePipelines commands, respectively. Applications can group together similar pipelines to be created in a single call, and implementations are encouraged to look for reuse opportunities within a group-create.

When an application attempts to create many pipelines in a single command, it is possible that some subset may fail creation. In that case, the corresponding entries in the pPipelines output array will be filled with VK_NULL_HANDLE values. If any pipeline fails creation despite valid arguments (for example, due to out of memory errors), the VkResult code returned by vkCreate*Pipelines will indicate why. The implementation will attempt to create all pipelines, and only return VK_NULL_HANDLE values for those that actually failed.

If creation fails for a pipeline that had VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT_EXT set, pipelines at an index in the pPipelines array greater than or equal to that of the failing pipeline must be set to VK_NULL_HANDLE.

10.6. Pipeline Derivatives

A pipeline derivative is a child pipeline created from a parent pipeline, where the child and parent are expected to have much commonality. The goal of derivative pipelines is that they be cheaper to create using the parent as a starting point, and that it be more efficient (on either host or device) to switch/bind between children of the same parent.
A derivative pipeline is created by setting the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag in the VkPipelineCreateInfo structure. If this is set, then exactly one of basePipelineHandle or basePipelineIndex members of the structure must have a valid handle/index, and specifies the parent pipeline. If basePipelineHandle is used, the parent pipeline must have already been created. If basePipelineIndex is used, then the parent is being created in the same command. VK_NULL_HANDLE acts as the invalid handle for basePipelineHandle, and -1 is the invalid index for basePipelineIndex. If basePipelineIndex is used, the base pipeline must appear earlier in the array. The base pipeline must have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set.

## 10.7. Pipeline Cache

Pipeline cache objects allow the result of pipeline construction to be reused between pipelines and between runs of an application. Reuse between pipelines is achieved by passing the same pipeline cache object when creating multiple related pipelines. Reuse across runs of an application is achieved by retrieving pipeline cache contents in one run of an application, saving the contents, and using them to preinitialize a pipeline cache on a subsequent run. The contents of the pipeline cache objects are managed by the implementation. Applications can manage the host memory consumed by a pipeline cache object and control the amount of data retrieved from a pipeline cache object.

Pipeline cache objects are represented by VkPipelineCache handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineCache)
```

To create pipeline cache objects, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineCache(
  VkDevice device,
  const VkPipelineCacheCreateInfo* pCreateInfo,
  const VkAllocationCallbacks* pAllocator,
  VkPipelineCache* pPipelineCache);
```

- **device** is the logical device that creates the pipeline cache object.
- **pCreateInfo** is a pointer to a VkPipelineCacheCreateInfo structure containing initial parameters for the pipeline cache object.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pPipelineCache** is a pointer to a VkPipelineCache handle in which the resulting pipeline cache object is returned.
Note
Applications **can** track and manage the total host memory size of a pipeline cache object using the `pAllocator`. Applications **can** limit the amount of data retrieved from a pipeline cache object in `vkGetPipelineCacheData`. Implementations **should** not internally limit the total number of entries added to a pipeline cache object or the total host memory consumed.

Once created, a pipeline cache **can** be passed to the `vkCreateGraphicsPipelines`, `vkCreateRayTracingPipelinesKHR`, `vkCreateRayTracingPipelinesNV`, and `vkCreateComputePipelines` commands. If the pipeline cache passed into these commands is not `VK_NULL_HANDLE`, the implementation will query it for possible reuse opportunities and update it with new content. The use of the pipeline cache object in these commands is internally synchronized, and the same pipeline cache object **can** be used in multiple threads simultaneously.

If **flags** of `pCreateInfo` includes `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT`, all commands that modify the returned pipeline cache object **must** be externally synchronized.

Note
Implementations **should** make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the duration of the `vkCreate*Pipelines` commands.

### Valid Usage (Implicit)

- **VUID-vkCreatePipelineCache-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkCreatePipelineCache-pCreateInfo-parameter**
  
  `pCreateInfo` must be a valid pointer to a valid `VkPipelineCacheCreateInfo` structure

- **VUID-vkCreatePipelineCache-pAllocator-parameter**
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreatePipelineCache-pPipelineCache-parameter**
  
  `pPipelineCache` must be a valid pointer to a `VkPipelineCache` handle

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
The `VkPipelineCacheCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineCacheCreateInfo {
    VkStructureType               sType;
    const void*                   pNext;
    VkPipelineCacheCreateFlags    flags;
    size_t                        initialDataSize;
    const void*                   pInitialData;
} VkPipelineCacheCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkPipelineCacheCreateFlagBits` specifying the behavior of the pipeline cache.
- **initialDataSize** is the number of bytes in `pInitialData`. If `initialDataSize` is zero, the pipeline cache will initially be empty.
- **pInitialData** is a pointer to previously retrieved pipeline cache data. If the pipeline cache data is incompatible (as defined below) with the device, the pipeline cache will be initially empty. If `initialDataSize` is zero, `pInitialData` is ignored.

### Valid Usage

- **VUID-VkPipelineCacheCreateInfo-initialDataSize-00768**
  If `initialDataSize` is not 0, it **must** be equal to the size of `pInitialData`, as returned by `vkGetPipelineCacheData` when `pInitialData` was originally retrieved.

- **VUID-VkPipelineCacheCreateInfo-initialDataSize-00769**
  If `initialDataSize` is not 0, `pInitialData` **must** have been retrieved from a previous call to `vkGetPipelineCacheData`.

- **VUID-VkPipelineCacheCreateInfo-pipelineCreationCacheControl-02892**
  If the `pipelineCreationCacheControl` feature is not enabled, **flags** **must** not include `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT`
Valid Usage (Implicit)

- **VUID-VkPipelineCacheCreateInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_CACHE_CREATE_INFO`

- **VUID-VkPipelineCacheCreateInfo-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkPipelineCacheCreateInfo-flags-parameter**
  
  `flags` must be a valid combination of `VkPipelineCacheCreateFlagBits` values

- **VUID-VkPipelineCacheCreateInfo-initialData-parameter**
  
  If `initialDataSize` is not 0, `pInitialData` must be a valid pointer to an array of `initialDataSize` bytes

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCacheCreateFlags;
```

`VkPipelineCacheCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineCacheCreateFlagBits` values.

Possible values of the `flags` member of `VkPipelineCacheCreateInfo`, specifying the behavior of the pipeline cache, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCacheCreateFlagBits {
    // Provided by VK_EXT_pipeline_creation_cache_control
    VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT = 0x00000001,
} VkPipelineCacheCreateFlagBits;
```

- `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT` specifies that all commands that modify the created `VkPipelineCache` will be externally synchronized. When set, the implementation may skip any unnecessary processing needed to support simultaneous modification from multiple threads where allowed.

Pipeline cache objects can be merged using the command:

```
// Provided by VK_VERSION_1_0
VkResult vkMergePipelineCaches(
    VkDevice                                    device,
    VkPipelineCache                             dstCache,
    uint32_t                                    srcCacheCount,
    const VkPipelineCache*                      pSrcCaches);
```

- `device` is the logical device that owns the pipeline cache objects.
- `dstCache` is the handle of the pipeline cache to merge results into.
• `srcCacheCount` is the length of the `pSrcCaches` array.
• `pSrcCaches` is a pointer to an array of pipeline cache handles, which will be merged into `dstCache`. The previous contents of `dstCache` are included after the merge.

**Note**
The details of the merge operation are implementation dependent, but implementations **should** merge the contents of the specified pipelines and prune duplicate entries.

---

**Valid Usage**

- VUID-vkMergePipelineCaches-dstCache-00770
  - `dstCache` must not appear in the list of source caches

---

**Valid Usage (Implicit)**

- VUID-vkMergePipelineCaches-device-parameter
  - `device` must be a valid `VkDevice` handle

- VUID-vkMergePipelineCaches-dstCache-parameter
  - `dstCache` must be a valid `VkPipelineCache` handle

- VUID-vkMergePipelineCaches-pSrcCaches-parameter
  - `pSrcCaches` must be a valid pointer to an array of `srcCacheCount` valid `VkPipelineCache` handles

- VUID-vkMergePipelineCaches-srcCacheCount-arraylength
  - `srcCacheCount` must be greater than 0

- VUID-vkMergePipelineCaches-dstCache-parent
  - `dstCache` must have been created, allocated, or retrieved from `device`

- VUID-vkMergePipelineCaches-pSrcCaches-parent
  - Each element of `pSrcCaches` must have been created, allocated, or retrieved from `device`

---

**Host Synchronization**

- Host access to `dstCache` must be externally synchronized
Data can be retrieved from a pipeline cache object using the command:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetPipelineCacheData(
    VkDevice device,            // Logical device
    VkPipelineCache pipelineCache, // Pipeline cache
    size_t* pDataSize,            // Pointer to value related to amount of data
    void* pData);                 // Buffer or NULL
```

- `device` is the logical device that owns the pipeline cache.
- `pipelineCache` is the pipeline cache to retrieve data from.
- `pDataSize` is a pointer to a `size_t` value related to the amount of data in the pipeline cache, as described below.
- `pData` is either `NULL` or a pointer to a buffer.

If `pData` is `NULL`, then the maximum size of the data that can be retrieved from the pipeline cache, in bytes, is returned in `pDataSize`. Otherwise, `pDataSize` must point to a variable set by the user to the size of the buffer, in bytes, pointed to by `pData`, and on return the variable is overwritten with the amount of data actually written to `pData`. If `pDataSize` is less than the maximum size that can be retrieved by the pipeline cache, at most `pDataSize` bytes will be written to `pData`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all of the pipeline cache was returned.

Any data written to `pData` is valid and can be provided as the `pInitialData` member of the `VkPipelineCacheCreateInfo` structure passed to `vkCreatePipelineCache`.

Two calls to `vkGetPipelineCacheData` with the same parameters must retrieve the same data unless a command that modifies the contents of the cache is called between them.

Applications can store the data retrieved from the pipeline cache, and use these data, possibly in a future run of the application, to populate new pipeline cache objects. The results of pipeline compiles, however, may depend on the vendor ID, device ID, driver version, and other details of the device. To enable applications to detect when previously retrieved data is incompatible with the device, the initial bytes written to `pData` must be a header consisting of the following members:

Table 13. Layout for pipeline cache header version `VK_PIPELINE_CACHE_HEADER_VERSION_ONE`
<table>
<thead>
<tr>
<th>Offset</th>
<th>Size</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>4</td>
<td>length in bytes of the entire pipeline cache header written as a stream of bytes, with the least significant byte first</td>
</tr>
<tr>
<td>4</td>
<td>4</td>
<td>a <code>VkPipelineCacheHeaderVersion</code> value written as a stream of bytes, with the least significant byte first</td>
</tr>
<tr>
<td>8</td>
<td>4</td>
<td>a vendor ID equal to <code>VkPhysicalDeviceProperties::vendorID</code> written as a stream of bytes, with the least significant byte first</td>
</tr>
<tr>
<td>12</td>
<td>4</td>
<td>a device ID equal to <code>VkPhysicalDeviceProperties::deviceID</code> written as a stream of bytes, with the least significant byte first</td>
</tr>
<tr>
<td>16</td>
<td><code>VK_UUID_SIZE</code></td>
<td>a pipeline cache ID equal to <code>VkPhysicalDeviceProperties::pipelineCacheUUID</code></td>
</tr>
</tbody>
</table>

The first four bytes encode the length of the entire pipeline cache header, in bytes. This value includes all fields in the header including the pipeline cache version field and the size of the length field.

The next four bytes encode the pipeline cache version, as described for `VkPipelineCacheHeaderVersion`. A consumer of the pipeline cache should use the cache version to interpret the remainder of the cache header.

If `pDataSize` is less than what is necessary to store this header, nothing will be written to `pData` and zero will be written to `pDataSize`.

### Valid Usage (Implicit)

- **VUID-vkGetPipelineCacheData-device-parameter**
  
  *device* must be a valid `VkDevice` handle

- **VUID-vkGetPipelineCacheData-pipelineCache-parameter**
  
  *pipelineCache* must be a valid `VkPipelineCache` handle

- **VUID-vkGetPipelineCacheData-pDataSize-parameter**
  
  *pDataSize* must be a valid pointer to a `size_t` value

- **VUID-vkGetPipelineCacheData-pData-parameter**
  
  If the value referenced by `pDataSize` is not 0, and `pData` is not NULL, `pData` must be a valid pointer to an array of `pDataSize` bytes

- **VUID-vkGetPipelineCacheData-pipelineCache-parent**
  
  *pipelineCache* must have been created, allocated, or retrieved from *device*
Return Codes

**Success**

- VK_SUCCESS
- VK_INCOMPLETE

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

Possible values of the second group of four bytes in the header returned by `vkGetPipelineCacheData`, encoding the pipeline cache version, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCacheHeaderVersion {
    VK_PIPELINE_CACHE_HEADER_VERSION_ONE = 1,
} VkPipelineCacheHeaderVersion;
```

- **VK_PIPELINE_CACHE_HEADER_VERSION_ONE** specifies version one of the pipeline cache.

To destroy a pipeline cache, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipelineCache(
    VkDevice device,                  // Provided by VK_VERSION_1_0
    VkPipelineCache pipelineCache,   // Provided by VK_VERSION_1_0
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the pipeline cache object.
- **pipelineCache** is the handle of the pipeline cache to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- **VUID-vkDestroyPipelineCache-pipelineCache-00771**
  If `VkAllocationCallbacks` were provided when `pipelineCache` was created, a compatible set of callbacks **must** be provided here.
- **VUID-vkDestroyPipelineCache-pipelineCache-00772**
  If no `VkAllocationCallbacks` were provided when `pipelineCache` was created, `pAllocator` **must** be `NULL`. 
Valid Usage (Implicit)

- **VUID-vkDestroyPipelineCache-device-parameter**
  
  *device* must be a valid *VkDevice* handle

- **VUID-vkDestroyPipelineCache-pipelineCache-parameter**
  
  If *pipelineCache* is not *VK_NULL_HANDLE*, *pipelineCache* must be a valid *VkPipelineCache* handle

- **VUID-vkDestroyPipelineCache-pAllocator-parameter**
  
  If *pAllocator* is not *NULL*, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure

- **VUID-vkDestroyPipelineCache-pipelineCache-parent**
  
  If *pipelineCache* is a valid handle, it must have been created, allocated, or retrieved from *device*

Host Synchronization

- Host access to *pipelineCache* must be externally synchronized

10.8. Specialization Constants

Specialization constants are a mechanism whereby constants in a SPIR-V module can have their constant value specified at the time the *VkPipeline* is created. This allows a SPIR-V module to have constants that can be modified while executing an application that uses the Vulkan API.

**Note**

Specialization constants are useful to allow a compute shader to have its local workgroup size changed at runtime by the user, for example.

Each *VkPipelineShaderStageCreateInfo* structure contains a *pSpecializationInfo* member, which can be *NULL* to indicate no specialization constants, or point to a *VkSpecializationInfo* structure.

The *VkSpecializationInfo* structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationInfo {
    uint32_t           mapEntryCount;
    const VkSpecializationMapEntry* pMapEntries;
    size_t             dataSize;
    const void*        pData;
} VkSpecializationInfo;
```

- **mapEntryCount** is the number of entries in the *pMapEntries* array.
- **pMapEntries** is a pointer to an array of *VkSpecializationMapEntry* structures which map constant
IDs to offsets in `pData`.

- `dataSize` is the byte size of the `pData` buffer.
- `pData` contains the actual constant values to specialize with.

`pMapEntries` is a pointer to a `VkSpecializationMapEntry` structure.

### Valid Usage

- **VUID-VkSpecializationInfo-offset-00773**
  The offset member of each element of `pMapEntries` **must** be less than `dataSize`

- **VUID-VkSpecializationInfo-pMapEntries-00774**
  The size member of each element of `pMapEntries` **must** be less than or equal to `dataSize` minus offset

### Valid Usage (Implicit)

- **VUID-VkSpecializationInfo-pMapEntries-parameter**
  If `mapEntryCount` is not 0, `pMapEntries` **must** be a valid pointer to an array of `mapEntryCount` valid `VkSpecializationMapEntry` structures

- **VUID-VkSpecializationInfo-pData-parameter**
  If `dataSize` is not 0, `pData` **must** be a valid pointer to an array of `dataSize` bytes

The `VkSpecializationMapEntry` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationMapEntry {
    uint32_t constantID;
    uint32_t offset;
    size_t size;
} VkSpecializationMapEntry;
```

- `constantID` is the ID of the specialization constant in SPIR-V.
- `offset` is the byte offset of the specialization constant value within the supplied data buffer.
- `size` is the byte size of the specialization constant value within the supplied data buffer.

If a `constantID` value is not a specialization constant ID used in the shader, that map entry does not affect the behavior of the pipeline.
Valid Usage

- VUID-VkSpecializationMapEntry-constantID-00776

For a constantID specialization constant declared in a shader, size must match the byte size of the constantID. If the specialization constant is of type boolean, size must be the byte size of VkBool32

In human readable SPIR-V:

```
OpDecorate %x SpecId 13 ; decorate .x component of WorkgroupSize with ID 13
OpDecorate %y SpecId 42 ; decorate .y component of WorkgroupSize with ID 42
OpDecorate %z SpecId 3 ; decorate .z component of WorkgroupSize with ID 3
OpDecorate %wgsize BuiltIn WorkgroupSize ; decorate WorkgroupSize onto constant
%32 = OpTypeInt 32 0 ; declare an unsigned 32-bit type
%uvec3 = OpTypeVector %32 3 ; declare a 3 element vector type of unsigned 32-bit
%x = OpSpecConstant %32 1 ; declare the .x component of WorkgroupSize
%y = OpSpecConstant %32 1 ; declare the .y component of WorkgroupSize
%z = OpSpecConstant %32 1 ; declare the .z component of WorkgroupSize
%wgsize = OpSpecConstantComposite %uvec3 %x %y %z ; declare WorkgroupSize
```

From the above we have three specialization constants, one for each of the x, y & z elements of the WorkgroupSize vector.

Now to specialize the above via the specialization constants mechanism:
```c
const VkSpecializationMapEntry entries[] = {
    {
        13, // constantID
        0 * sizeof(uint32_t), // offset
        sizeof(uint32_t) // size
    },
    {
        42, // constantID
        1 * sizeof(uint32_t), // offset
        sizeof(uint32_t) // size
    },
    {
        3, // constantID
        2 * sizeof(uint32_t), // offset
        sizeof(uint32_t) // size
    }
};

const uint32_t data[] = { 16, 8, 4 }; // our workgroup size is 16x8x4

const VkSpecializationInfo info = {
    3, // mapEntryCount
    entries, // pMapEntries
    3 * sizeof(uint32_t), // dataSize
    data, // pData
};
```

Then when calling `vkCreateComputePipelines`, and passing the `VkSpecializationInfo` we defined as the `pSpecializationInfo` parameter of `VkPipelineShaderStageCreateInfo`, we will create a compute pipeline with the runtime specified local workgroup size.

Another example would be that an application has a SPIR-V module that has some platform-dependent constants they wish to use.

In human readable SPIR-V:

```
OpDecorate %1 SpecId 0 ; decorate our signed 32-bit integer constant
OpDecorate %2 SpecId 12 ; decorate our 32-bit floating-point constant
%32 = OpTypeInt 32 1 ; declare a signed 32-bit type
%float = OpTypeFloat 32 ; declare a 32-bit floating-point type
%1 = OpSpecConstant %i32 -1 ; some signed 32-bit integer constant
%2 = OpSpecConstant %float 0.5 ; some 32-bit floating-point constant
```

From the above we have two specialization constants, one is a signed 32-bit integer and the second is a 32-bit floating-point value.
Now to specialize the above via the specialization constants mechanism:

```c
struct SpecializationData {
    int32_t data0;
    float data1;
};

const VkSpecializationMapEntry entries[] = {
    { 0, offsetof(SpecializationData, data0), sizeof(SpecializationData::data0) },
    { 12, offsetof(SpecializationData, data1), sizeof(SpecializationData::data1) }
};

SpecializationData data;
data.data0 = -42; // set the data for the 32-bit integer
data.data1 = 42.0f; // set the data for the 32-bit floating-point

const VkSpecializationInfo info = {
    2, entries, sizeof(data), &data,
};
```

It is legal for a SPIR-V module with specializations to be compiled into a pipeline where no specialization info was provided. SPIR-V specialization constants contain default values such that if a specialization is not provided, the default value will be used. In the examples above, it would be valid for an application to only specialize some of the specialization constants within the SPIR-V module, and let the other constants use their default values encoded within the OpSpecConstant declarations.

### 10.9. Pipeline Libraries

A pipeline library is a special pipeline that was created using the `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` and cannot be bound, instead it defines a set of pipeline state which can be linked into other pipelines. For ray tracing pipelines this includes shaders and shader groups. The application must maintain the lifetime of pipeline libraries based on the pipelines that link with it. A pipeline library is considered in-use, as long as one of the linking pipelines is in-use.

This linkage is achieved by using the following structure within the appropriate creation
mechanisms:

The `VkPipelineLibraryCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_library
typedef struct VkPipelineLibraryCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t libraryCount;
    const VkPipeline* pLibraries;
} VkPipelineLibraryCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `libraryCount` is the number of pipeline libraries in `pLibraries`.
- `pLibraries` is an array of pipeline libraries to use when creating a pipeline.

**Valid Usage**

- VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-03381
  
  Each element of `pLibraries` must have been created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`.

**Valid Usage (Implicit)**

- VUID-VkPipelineLibraryCreateInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_LIBRARY_CREATE_INFO_KHR`.

- VUID-VkPipelineLibraryCreateInfoKHR-pNext-pNext
  
  `pNext` must be `NULL`.

- VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-parameter
  
  If `libraryCount` is not 0, `pLibraries` must be a valid pointer to an array of `libraryCount` valid `VkPipeline` handles.

### 10.10. Pipeline Binding

Once a pipeline has been created, it can be bound to the command buffer using the command:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindPipeline(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipeline pipeline);
```
• **commandBuffer** is the command buffer that the pipeline will be bound to.

• **pipelineBindPoint** is a **VkPipelineBindPoint** value specifying to which bind point the pipeline is bound. Binding one does not disturb the others.

• **pipeline** is the pipeline to be bound.

Once bound, a pipeline binding affects subsequent commands that interact with the given pipeline type in the command buffer until a different pipeline of the same type is bound to the bind point. Commands that do not interact with the given pipeline type **must** not be affected by the pipeline state.

• The pipeline bound to **VK_PIPELINE_BIND_POINT_COMPUTE** controls the behavior of all dispatching commands.

• The pipeline bound to **VK_PIPELINE_BIND_POINT_GRAPHICS** controls the behavior of all drawing commands.

• The pipeline bound to **VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR** controls the behavior of **vkCmdTraceRaysKHR** and **vkCmdTraceRaysIndirectKHR**.
Valid Usage

- VUID-vkCmdBindPipeline-pipelineBindPoint-00777
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE`, the `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.

- VUID-vkCmdBindPipeline-pipelineBindPoint-00778
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdBindPipeline-pipelineBindPoint-00779
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE`, pipeline must be a compute pipeline.

- VUID-vkCmdBindPipeline-pipelineBindPoint-00780
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, pipeline must be a graphics pipeline.

- VUID-vkCmdBindPipeline-pipelineBindPoint-00781
  If the variable multisample rate feature is not supported, pipeline is a graphics pipeline, the current subpass uses no attachments, and this is not the first call to this function with a graphics pipeline after transitioning to the current subpass, then the sample count specified by this pipeline must match that set in the previous pipeline.

- VUID-vkCmdBindPipeline-variableSampleLocations-01525
  If `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE`, and pipeline is a graphics pipeline created with a `VkPipelineSampleLocationsStateCreateInfoEXT` structure having its `sampleLocationsEnable` member set to `VK_TRUE` but without `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` enabled then the current render pass instance must have been begun by specifying a `VkRenderPassSampleLocationsBeginInfoEXT` structure whose `pPostSubpassSampleLocations` member contains an element with a `subpassIndex` matching the current subpass index and the `sampleLocationsInfo` member of that element must match the `sampleLocationsInfo` specified in `VkPipelineSampleLocationsStateCreateInfoEXT` when the pipeline was created.

- VUID-vkCmdBindPipeline-None-02323
  This command must not be recorded when transform feedback is active.

- VUID-vkCmdBindPipeline-pipelineBindPoint-02391
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, the `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.

- VUID-vkCmdBindPipeline-pipelineBindPoint-02392
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, the pipeline must be a ray tracing pipeline.

- VUID-vkCmdBindPipeline-pipeline-03382
  The pipeline must not have been created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` set.

- VUID-vkCmdBindPipeline-commandBuffer-04808
  If `commandBuffer` is a secondary command buffer with `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled and...
pipelineBindPoint is VK_PIPELINE_BIND_POINT_GRAPHICS, then the pipeline must have been created with VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT or VK_DYNAMIC_STATE_VIEWPORT, and VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT or VK_DYNAMIC_STATE_SCISSOR enabled.

- VUID-vkCmdBindPipeline-commandBuffer-04809
  If commandBuffer is a secondary command buffer with VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D enabled and pipelineBindPoint is VK_PIPELINE_BIND_POINT_GRAPHICS and pipeline was created with VkPipelineDiscardRectangleStateCreateInfoEXT structure and its discardRectangleCount member is not 0, then the pipeline must have been created with VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT enabled.

- VUID-vkCmdBindPipeline-pipelineBindPoint-04881
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_GRAPHICS and the provokingVertexModePerPipeline limit is VK_FALSE, then pipeline's VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode must be the same as that of any other pipelines previously bound to this bind point within the current renderpass instance, including any pipeline already bound when beginning the renderpass instance.

**Valid Usage (Implicit)**

- VUID-vkCmdBindPipeline-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBindPipeline-pipelineBindPoint-parameter
pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-vkCmdBindPipeline-pipeline-parameter
pipeline must be a valid VkPipeline handle

- VUID-vkCmdBindPipeline-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdBindPipeline-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdBindPipeline-commonparent
Both of commandBuffer, and pipeline must have been created, allocated, or retrieved from the same VkDevice

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
Possible values of `vkCmdBindPipeline::pipelineBindPoint`, specifying the bind point of a pipeline object, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineBindPoint {
    VK_PIPELINE_BIND_POINT_GRAPHICS = 0,
    VK_PIPELINE_BIND_POINT_COMPUTE = 1,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR = 1000165000,
    // Provided by VK_NV_ray_tracing
    VK_PIPELINE_BIND_POINT_RAY_TRACING_NV = VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR,
} VkPipelineBindPoint;
```

- `VK_PIPELINE_BIND_POINT_COMPUTE` specifies binding as a compute pipeline.
- `VK_PIPELINE_BIND_POINT_GRAPHICS` specifies binding as a graphics pipeline.
- `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR` specifies binding as a ray tracing pipeline.

For pipelines that were created with the support of multiple shader groups (see Graphics Pipeline Shader Groups), the regular `vkCmdBindPipeline` command will bind Shader Group 0. To explicitly bind a shader group use:

```c
// Provided by VK_NV_device_generated_commands
void vkCmdBindPipelineShaderGroupNV(
    VkCommandBuffer commandBuffer,           
    VkPipelineBindPoint pipelineBindPoint,   
    VkPipeline pipeline,                     
    uint32_t groupIndex);
```

- `commandBuffer` is the command buffer that the pipeline will be bound to.
- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying the bind point to which the pipeline will be bound.
- `pipeline` is the pipeline to be bound.
- `groupIndex` is the shader group to be bound.
Valid Usage

- VUID-vkCmdBindPipelineShaderGroupNV-groupIndex-02893
  
  \texttt{groupIndex} must be \(0\) or less than the effective \texttt{VkGraphicsPipelineShaderGroupsCreateInfoNV::groupCount} including the referenced pipelines.

- VUID-vkCmdBindPipelineShaderGroupNV-pipelineBindPoint-02894
  
  The \texttt{pipelineBindPoint} must be \texttt{VK_PIPELINE_BIND_POINT_GRAPHICS}.

- VUID-vkCmdBindPipelineShaderGroupNV-groupIndex-02895
  
  The same restrictions as \texttt{vkCmdBindPipeline} apply as if the bound pipeline was created only with the Shader Group from the \texttt{groupIndex} information.

- VUID-vkCmdBindPipelineShaderGroupNV-deviceGeneratedCommands-02896
  
  The \texttt{VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands} feature must be enabled.

Valid Usage (Implicit)

- VUID-vkCmdBindPipelineShaderGroupNV-commandBuffer-parameter
  
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle.

- VUID-vkCmdBindPipelineShaderGroupNV-pipelineBindPoint-parameter
  
  \texttt{pipelineBindPoint} must be a valid \texttt{VkPipelineBindPoint} value.

- VUID-vkCmdBindPipelineShaderGroupNV-pipeline-parameter
  
  \texttt{pipeline} must be a valid \texttt{VkPipeline} handle.

- VUID-vkCmdBindPipelineShaderGroupNV-commandBuffer-recording
  
  \texttt{commandBuffer} must be in the \texttt{recording} state.

- VUID-vkCmdBindPipelineShaderGroupNV-commandBuffer-cmdpool
  
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics, or compute operations.

- VUID-vkCmdBindPipelineShaderGroupNV-commonparent
  
  Both of \texttt{commandBuffer}, and \texttt{pipeline} must have been created, allocated, or retrieved from the same \texttt{VkDevice}.

Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized.

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized.
10.11. Dynamic State

When a pipeline object is bound, any pipeline object state that is not specified as dynamic is applied to the command buffer state. Pipeline object state that is specified as dynamic is not applied to the command buffer state at this time. Instead, dynamic state can be modified at any time and persists for the lifetime of the command buffer, or until modified by another dynamic state setting command or another pipeline bind.

When a pipeline object is bound, the following applies to each state parameter:

- If the state is not specified as dynamic in the new pipeline object, then that command buffer state is overwritten by the state in the new pipeline object. Before any draw or dispatch call with this pipeline there must not have been any call to any of the corresponding dynamic state setting commands after this pipeline was bound.

- If the state is specified as dynamic in the new pipeline object, then that command buffer state is not disturbed. Before any draw or dispatch call with this pipeline there must have been at least one call to each of the corresponding dynamic state setting commands since the command buffer recording was begun, or the last bound pipeline object with that state specified as static, whichever was the latter.

Dynamic state that does not affect the result of operations can be left undefined.

Note

For example, if blending is disabled by the pipeline object state then the dynamic color blend constants do not need to be specified in the command buffer, even if this state is specified as dynamic in the pipeline object.

10.12. Pipeline Shader Information

When a pipeline is created, its state and shaders are compiled into zero or more device-specific executables, which are used when executing commands against that pipeline. To query the properties of these executables, call:
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutablePropertiesKHR(
    VkDevice device,
    const VkPipelineInfoKHR* pPipelineInfo,
    uint32_t* pExecutableCount,
    VkPipelineExecutablePropertiesKHR* pProperties);

*device* is the device that created the pipeline.

*pPipelineInfo* describes the pipeline being queried.

*pExecutableCount* is a pointer to an integer related to the number of pipeline executables available or queried, as described below.

*pProperties* is either NULL or a pointer to an array of VkPipelineExecutablePropertiesKHR structures.

If *pProperties* is NULL, then the number of executables associated with the pipeline is returned in *pExecutableCount*. Otherwise, *pExecutableCount* must point to a variable set by the user to the number of elements in the *pProperties* array, and on return the variable is overwritten with the number of structures actually written to *pProperties*. If *pExecutableCount* is less than the number of executables associated with the pipeline, at most *pExecutableCount* structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available properties were returned.

---

### Valid Usage

- **VUID-vkGetPipelineExecutablePropertiesKHR-pipelineExecutableInfo-03270**
  pipelineExecutableInfo must be enabled

- **VUID-vkGetPipelineExecutablePropertiesKHR-pipeline-03271**
  pipeline member of *pPipelineInfo* must have been created with *device*

### Valid Usage (Implicit)

- **VUID-vkGetPipelineExecutablePropertiesKHR-device-parameter**
  *device* must be a valid VkDevice handle

- **VUID-vkGetPipelineExecutablePropertiesKHR-pPipelineInfo-parameter**
  *pPipelineInfo* must be a valid pointer to a valid VkPipelineInfoKHR structure

- **VUID-vkGetPipelineExecutablePropertiesKHR-pExecutableCount-parameter**
  *pExecutableCount* must be a valid pointer to a uint32_t value

- **VUID-vkGetPipelineExecutablePropertiesKHR-pProperties-parameter**
  If the value referenced by *pExecutableCount* is not 0, and *pProperties* is not NULL, *pProperties* must be a valid pointer to an array of *pExecutableCount* VkPipelineExecutablePropertiesKHR structures
Return Codes

Success

• VK_SUCCESS
• VK_INCOMPLETE

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkPipelineInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkPipeline         pipeline;
} VkPipelineInfoKHR;
```

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `pipeline` is a `VkPipeline` handle.

Valid Usage (Implicit)

• VUID-VkPipelineInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_INFO_KHR`

• VUID-VkPipelineInfoKHR-pNext-pNext
  `pNext` must be `NULL`

• VUID-VkPipelineInfoKHR-pipeline-parameter
  `pipeline` must be a valid `VkPipeline` handle

The `VkPipelineExecutablePropertiesKHR` structure is defined as:
// Provided by VK_KHR_pipeline_executable_properties

typedef struct VkPipelineExecutablePropertiesKHR {
    VkStructureType       sType;
    void*                 pNext;
    VkShaderStageFlags    stages;
    char                   name[VK_MAX_DESCRIPTION_SIZE];
    char                   description[VK_MAX_DESCRIPTION_SIZE];
    uint32_t              subgroupSize;
} VkPipelineExecutablePropertiesKHR;

• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **stages** is a bitmask of **VkShaderStageFlagBits** indicating which shader stages (if any) were principally used as inputs to compile this pipeline executable.

• **name** is an array of **VK_MAX_DESCRIPTION_SIZE** char containing a null-terminated UTF-8 string which is a short human readable name for this executable.

• **description** is an array of **VK_MAX_DESCRIPTION_SIZE** char containing a null-terminated UTF-8 string which is a human readable description for this executable.

• **subgroupSize** is the subgroup size with which this executable is dispatched.

The **stages** field **may** be zero or it **may** contain one or more bits describing the stages principally used to compile this pipeline. Not all implementations have a 1:1 mapping between shader stages and pipeline executables and some implementations **may** reduce a given shader stage to fixed function hardware programming such that no executable is available. No guarantees are provided about the mapping between shader stages and pipeline executables and **stages should** be considered a best effort hint. Because the application **cannot** rely on the **stages** field to provide an exact description, **name** and **description** provide a human readable name and description which more accurately describes the given pipeline executable.

**Valid Usage (Implicit)**

- VUID-VkPipelineExecutablePropertiesKHR-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_PROPERTIES_KHR**

- VUID-VkPipelineExecutablePropertiesKHR-pNext-pNext
  
  **pNext** must be **NULL**

Each pipeline executable **may** have a set of statistics associated with it that are generated by the pipeline compilation process. These statistics **may** include things such as instruction counts, amount of spilling (if any), maximum number of simultaneous threads, or anything else which **may** aid developers in evaluating the expected performance of a shader. To query the compile-time statistics associated with a pipeline executable, call:
// Provided by VK_KHR_pipeline_executable_properties

VkResult vkGetPipelineExecutableStatisticsKHR(
    VkDevice device, 
    const VkPipelineExecutableInfoKHR* pExecutableInfo, 
    uint32_t* pStatisticCount, 
    VkPipelineExecutableStatisticKHR* pStatistics);

- **device** is the device that created the pipeline.
- **pExecutableInfo** describes the pipeline executable being queried.
- **pStatisticCount** is a pointer to an integer related to the number of statistics available or queried, as described below.
- **pStatistics** is either NULL or a pointer to an array of VkPipelineExecutableStatisticKHR structures.

If **pStatistics** is NULL, then the number of statistics associated with the pipeline executable is returned in **pStatisticCount**. Otherwise, **pStatisticCount** must point to a variable set by the user to the number of elements in the **pStatistics** array, and on return the variable is overwritten with the number of structures actually written to **pStatistics**. If **pStatisticCount** is less than the number of statistics associated with the pipeline executable, at most **pStatisticCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available statistics were returned.

### Valid Usage

- **VUID-vkGetPipelineExecutableStatisticsKHR-pipelineExecutableInfo-03272**
  **pipelineExecutableInfo** must be enabled

- **VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03273**
  **pipeline** member of **pExecutableInfo** must have been created with **device**

- **VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03274**
  **pipeline** member of **pExecutableInfo** must have been created with **VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR**
**Valid Usage (Implicit)**

- **VUID-vkGetPipelineExecutableStatisticsKHR-device-parameter**
  
  *device must be a valid VkDevice handle*

- **VUID-vkGetPipelineExecutableStatisticsKHR-pExecutableInfo-parameter**
  
  *pExecutableInfo must be a valid pointer to a valid VkPipelineExecutableInfoKHR structure*

- **VUID-vkGetPipelineExecutableStatisticsKHR-pStatisticCount-parameter**
  
  *pStatisticCount must be a valid pointer to a uint32_t value*

- **VUID-vkGetPipelineExecutableStatisticsKHR-pStatistics-parameter**
  
  If the value referenced by pStatisticCount is not 0, and pStatistics is not NULL, pStatistics must be a valid pointer to an array of pStatisticCount VkPipelineExecutableStatisticKHR structures

**Return Codes**

**Success**

- VK_SUCCESS
- VK_INCOMPLETE

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkPipelineExecutableInfoKHR structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipeline pipeline;
    uint32_t executableIndex;
} VkPipelineExecutableInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pipeline` is the pipeline to query.
- `executableIndex` is the index of the executable to query in the array of executable properties returned by vkGetPipelineExecutablePropertiesKHR.
Valid Usage

- VUID-VkPipelineExecutableInfoKHR-executableIndex-03275
  executableIndex must be less than the number of executables associated with pipeline as returned in the pExecutableCount parameter of vkGetPipelineExecutablePropertiesKHR

Valid Usage (Implicit)

- VUID-VkPipelineExecutableInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INFO_KHR

- VUID-VkPipelineExecutableInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkPipelineExecutableInfoKHR-pipeline-parameter
  pipeline must be a valid VkPipeline handle

The VkPipelineExecutableStatisticKHR structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableStatisticKHR {
    VkStructureType sType;
    void* pNext;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
    VkPipelineExecutableStatisticFormatKHR format;
    VkPipelineExecutableStatisticValueKHR value;
} VkPipelineExecutableStatisticKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **name** is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a short human readable name for this statistic.
- **description** is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a human readable description for this statistic.
- **format** is a VkPipelineExecutableStatisticFormatKHR value specifying the format of the data found in **value**.
- **value** is the value of this statistic.
Valid Usage (Implicit)

- **VUID-VkPipelineExecutableStatisticKHR-sType-sType**
  
  Must be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_STATISTIC_KHR`

- **VUID-VkPipelineExecutableStatisticKHR-pNext-pNext**
  
  Must be NULL

The `VkPipelineExecutableStatisticFormatKHR` enum is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef enum VkPipelineExecutableStatisticFormatKHR {
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR = 0,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR = 1,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR = 2,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR = 3,
} VkPipelineExecutableStatisticFormatKHR;
```

- **VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR** specifies that the statistic is returned as a 32-bit boolean value which **must** be either `VK_TRUE` or `VK_FALSE` and **should** be read from the `b32` field of `VkPipelineExecutableStatisticValueKHR`.

- **VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR** specifies that the statistic is returned as a signed 64-bit integer and **should** be read from the `i64` field of `VkPipelineExecutableStatisticValueKHR`.

- **VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR** specifies that the statistic is returned as an unsigned 64-bit integer and **should** be read from the `u64` field of `VkPipelineExecutableStatisticValueKHR`.

- **VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR** specifies that the statistic is returned as a 64-bit floating-point value and **should** be read from the `f64` field of `VkPipelineExecutableStatisticValueKHR`.

The `VkPipelineExecutableStatisticValueKHR` union is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef union VkPipelineExecutableStatisticValueKHR {
    VkBool32    b32;
    int64_t     i64;
    uint64_t    u64;
    double      f64;
} VkPipelineExecutableStatisticValueKHR;
```

- **b32** is the 32-bit boolean value if the `VkPipelineExecutableStatisticFormatKHR` is `VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR`.

- **i64** is the signed 64-bit integer value if the `VkPipelineExecutableStatisticFormatKHR` is `VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR`.

Chapter 10. Pipelines | 623
• **u64** is the unsigned 64-bit integer value if the `VkPipelineExecutableStatisticFormatKHR` is `VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR`.

• **f64** is the 64-bit floating-point value if the `VkPipelineExecutableStatisticFormatKHR` is `VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR`.

Each pipeline executable may have one or more text or binary internal representations associated with it which are generated as part of the compile process. These may include the final shader assembly, a binary form of the compiled shader, or the shader compiler's internal representation at any number of intermediate compile steps. To query the internal representations associated with a pipeline executable, call:

```c
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutableInternalRepresentationsKHR(
    VkDevice                                    device,
    const VkPipelineExecutableInfoKHR*          pExecutableInfo,  
    uint32_t*                                   pInternalRepresentationCount,  
    VkPipelineExecutableInternalRepresentationKHR* pInternalRepresentations);
```

• **device** is the device that created the pipeline.

• **pExecutableInfo** describes the pipeline executable being queried.

• **pInternalRepresentationCount** is a pointer to an integer related to the number of internal representations available or queried, as described below.

• **pInternalRepresentations** is either **NULL** or a pointer to an array of `VkPipelineExecutableInternalRepresentationKHR` structures.

If `pInternalRepresentations` is **NULL**, then the number of internal representations associated with the pipeline executable is returned in `pInternalRepresentationCount`. Otherwise, `pInternalRepresentationCount` must point to a variable set by the user to the number of elements in the `pInternalRepresentations` array, and on return the variable is overwritten with the number of structures actually written to `pInternalRepresentations`. If `pInternalRepresentationCount` is less than the number of internal representations associated with the pipeline executable, at most `pInternalRepresentationCount` structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available representations were returned.

While the details of the internal representations remain implementation dependent, the implementation should order the internal representations in the order in which they occur in the compile pipeline with the final shader assembly (if any) last.
Valid Usage

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipelineExecutableInfo-03276
  `pipelineExecutableInfo must be enabled`

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipeline-03277
  `pipeline member of pExecutableInfo must have been created with device`

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipeline-03278
  `pipeline member of pExecutableInfo must have been created with
  VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`

Valid Usage (Implicit)

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-device-parameter
  `device must be a valid VkDevice handle`

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pExecutableInfo-parameter
  `pExecutableInfo must be a valid pointer to a valid VkPipelineExecutableInfoKHR
  structure`

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pInternalRepresentationCount-parameter
  `pInternalRepresentationCount must be a valid pointer to a uint32_t value`

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pInternalRepresentations-parameter
  `If the value referenced by pInternalRepresentationCount is not 0, and
  pInternalRepresentations is not NULL, pInternalRepresentations must be a valid pointer to
  an array of pInternalRepresentationCount
  VkPipelineExecutableInternalRepresentationKHR structures`

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkPipelineExecutableInternalRepresentationKHR` structure is defined as:
// Provided by VK_KHR_pipeline_executable_properties

typedef struct VkPipelineExecutableInternalRepresentationKHR {
    VkStructureType    sType;
    void*              pNext;
    char               name[VK_MAX_DESCRIPTION_SIZE];
    char               description[VK_MAX_DESCRIPTION_SIZE];
    VkBool32           isText;
    size_t             dataSize;
    void*              pData;
} VkPipelineExecutableInternalRepresentationKHR;

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- name is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a short human readable name for this internal representation.
- description is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a human readable description for this internal representation.
- isText specifies whether the returned data is text or opaque data. If isText is VK_TRUE then the data returned in pData is text and is guaranteed to be a null-terminated UTF-8 string.
- dataSize is an integer related to the size, in bytes, of the internal representation data, as described below.
- pData is either NULL or a pointer to an block of data into which the implementation will write the textual form of the internal representation.

If pData is NULL, then the size, in bytes, of the internal representation data is returned in dataSize. Otherwise, dataSize must be the size of the buffer, in bytes, pointed to by pData and on return dataSize is overwritten with the number of bytes of data actually written to pData including any trailing null character. If dataSize is less than the size, in bytes, of the internal representation data, at most dataSize bytes of data will be written to pData, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available representation was returned.

If isText is VK_TRUE and pData is not NULL and dataSize is not zero, the last byte written to pData will be a null character.

Valid Usage (Implicit)

- VUID-VkPipelineExecutableInternalRepresentationKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INTERNAL_REPRESENTATION_KHR

- VUID-VkPipelineExecutableInternalRepresentationKHR-pNext-pNext
  pNext must be NULL

Information about a particular shader that has been compiled as part of a pipeline object can be extracted by calling:
// Provided by VK_AMD_shader_info

VkResult vkGetShaderInfoAMD(
    VkDevice device,                  
    VkPipeline pipeline,              
    VkShaderStageFlagBits shaderStage,
    VkShaderInfoTypeAMD infoType,     
    size_t* pInfoSize,                
    void* pInfo);

- **device** is the device that created **pipeline**.
- **pipeline** is the target of the query.
- **shaderStage** identifies the particular shader within the pipeline about which information is being queried.
- **infoType** describes what kind of information is being queried.
- **pInfoSize** is a pointer to a value related to the amount of data the query returns, as described below.
- **pInfo** is either **NULL** or a pointer to a buffer.

If **pInfo** is **NULL**, then the maximum size of the information that **can** be retrieved about the shader, in bytes, is returned in **pInfoSize**. Otherwise, **pInfoSize** must point to a variable set by the user to the size of the buffer, in bytes, pointed to by **pInfo**, and on return the variable is overwritten with the amount of data actually written to **pInfo**. If **pInfoSize** is less than the maximum size that **can** be retrieved by the pipeline cache, then at most **pInfoSize** bytes will be written to **pInfo**, and **VK_INCOMPLETE** will be returned, instead of **VK_SUCCESS**, to indicate that not all required of the pipeline cache was returned.

Not all information is available for every shader and implementations may not support all kinds of information for any shader. When a certain type of information is unavailable, the function returns **VK_ERROR_FEATURE_NOT_PRESENT**.

If information is successfully and fully queried, the function will return **VK_SUCCESS**.

For **infoType** **VK_SHADER_INFO_TYPE_STATISTICS_AMD**, a **VkShaderStatisticsInfoAMD** structure will be written to the buffer pointed to by **pInfo**. This structure will be populated with statistics regarding the physical device resources used by that shader along with other miscellaneous information and is described in further detail below.

For **infoType** **VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD**, **pInfo** is a pointer to a UTF-8 null-terminated string containing human-readable disassembly. The exact formatting and contents of the disassembly string are vendor-specific.

The formatting and contents of all other types of information, including **infoType** **VK_SHADER_INFO_TYPE_BINARY_AMD**, are left to the vendor and are not further specified by this extension.
Valid Usage (Implicit)

- VUID-vkGetShaderInfoAMD-device-parameter
  
  `device must be a valid VkDevice handle`

- VUID-vkGetShaderInfoAMD-pipeline-parameter
  
  `pipeline must be a valid VkPipeline handle`

- VUID-vkGetShaderInfoAMD-shaderStage-parameter
  
  `shaderStage must be a valid VkShaderStageFlagBits value`

- VUID-vkGetShaderInfoAMD-infoType-parameter
  
  `infoType must be a valid VkShaderInfoTypeAMD value`

- VUID-vkGetShaderInfoAMD-pInfoSize-parameter
  
  `pInfoSize must be a valid pointer to a size_t value`

- VUID-vkGetShaderInfoAMD-pInfo-parameter
  
  If the value referenced by `pInfoSize` is not 0, and `pInfo` is not NULL, `pInfo must be a valid pointer to an array of pInfoSize bytes`

- VUID-vkGetShaderInfoAMD-pipeline-parent
  
  `pipeline must have been created, allocated, or retrieved from device`

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_FEATURE_NOT_PRESENT
- VK_ERROR_OUT_OF_HOST_MEMORY

Possible values of `vkGetShaderInfoAMD::infoType`, specifying the information being queried from a shader, are:

```c
// Provided by VK_AMD_shader_info
typedef enum VkShaderInfoTypeAMD {
    VK_SHADER_INFO_TYPE_STATISTICS_AMD = 0,
    VK_SHADER_INFO_TYPE_BINARY_AMD = 1,
    VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD = 2,
} VkShaderInfoTypeAMD;
```

- `VK_SHADER_INFO_TYPE_STATISTICS_AMD` specifies that device resources used by a shader will be queried.
- `VK_SHADER_INFO_TYPE_BINARY_AMD` specifies that implementation-specific information will be
queried.

- **VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD** specifies that human-readable disassembly of a shader.

The **VkShaderStatisticsInfoAMD** structure is defined as:

```c
// Provided by VK_AMD_shader_info
typedef struct VkShaderStatisticsInfoAMD {
    VkShaderStageFlags          shaderStageMask;
    VkShaderResourceUsageAMD    resourceUsage;
    uint32_t                    numPhysicalVgprs;
    uint32_t                    numPhysicalSgprs;
    uint32_t                    numAvailableVgprs;
    uint32_t                    numAvailableSgprs;
    uint32_t                    computeWorkGroupSize[3];
} VkShaderStatisticsInfoAMD;
```

- **shaderStageMask** are the combination of logical shader stages contained within this shader.
- **resourceUsage** is a **VkShaderResourceUsageAMD** structure describing internal physical device resources used by this shader.
- **numPhysicalVgprs** is the maximum number of vector instruction general-purpose registers (VGPRs) available to the physical device.
- **numPhysicalSgprs** is the maximum number of scalar instruction general-purpose registers (SGPRs) available to the physical device.
- **numAvailableVgprs** is the maximum limit of VGPRs made available to the shader compiler.
- **numAvailableSgprs** is the maximum limit of SGPRs made available to the shader compiler.
- **computeWorkGroupSize** is the local workgroup size of this shader in { X, Y, Z } dimensions.

Some implementations may merge multiple logical shader stages together in a single shader. In such cases, **shaderStageMask** will contain a bitmask of all of the stages that are active within that shader. Consequently, if specifying those stages as input to **vkGetShaderInfoAMD**, the same output information may be returned for all such shader stage queries.

The number of available VGPRs and SGPRs (**numAvailableVgprs** and **numAvailableSgprs** respectively) are the shader-addressable subset of physical registers that is given as a limit to the compiler for register assignment. These values may further be limited by implementations due to performance optimizations where register pressure is a bottleneck.

The **VkShaderResourceUsageAMD** structure is defined as:
typedef struct VkShaderResourceUsageAMD {
    uint32_t numUsedVgprs;
    uint32_t numUsedSgprs;
    uint32_t ldsSizePerLocalWorkGroup;
    size_t ldsUsageSizeInBytes;
    size_t scratchMemUsageInBytes;
} VkShaderResourceUsageAMD;

- `numUsedVgprs` is the number of vector instruction general-purpose registers used by this shader.
- `numUsedSgprs` is the number of scalar instruction general-purpose registers used by this shader.
- `ldsSizePerLocalWorkGroup` is the maximum local data store size per work group in bytes.
- `ldsUsageSizeInBytes` is the LDS usage size in bytes per work group by this shader.
- `scratchMemUsageInBytes` is the scratch memory usage in bytes by this shader.

10.13. Pipeline Compiler Control

The compilation of a pipeline can be tuned by adding a `VkPipelineCompilerControlCreateInfoAMD` structure to the `pNext` chain of `VkGraphicsPipelineCreateInfo` or `VkComputePipelineCreateInfo`.

typedef struct VkPipelineCompilerControlCreateInfoAMD {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCompilerControlFlagsAMD compilerControlFlags;
} VkPipelineCompilerControlCreateInfoAMD;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `compilerControlFlags` is a bitmask of `VkPipelineCompilerControlFlagBitsAMD` affecting how the pipeline will be compiled.

Valid Usage (Implicit)

- VUID-VkPipelineCompilerControlCreateInfoAMD-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COMPILER_CONTROL_CREATE_INFO_AMD`

- VUID-VkPipelineCompilerControlCreateInfoAMD-compilerControlFlags-zerobitmask
  `compilerControlFlags` must be `0`

There are currently no available flags for this extension; flags will be added by future versions of this extension.
typedef enum VkPipelineCompilerControlFlagBitsAMD {
} VkPipelineCompilerControlFlagBitsAMD;

typedef VkFlags VkPipelineCompilerControlFlagsAMD;

VkPipelineCompilerControlFlagsAMD is a bitmask type for setting a mask of zero or more VkPipelineCompilerControlFlagBitsAMD.

10.14. Pipeline Creation Feedback

Feedback about the creation of a particular pipeline object can be obtained by adding a VkPipelineCreationFeedbackCreateInfoEXT structure to the pNext chain of VkGraphicsPipelineCreateInfo, VkRayTracingPipelineCreateInfoKHR, VkRayTracingPipelineCreateInfoNV, or VkComputePipelineCreateInfo. The VkPipelineCreationFeedbackCreateInfoEXT structure is defined as:

typedef struct VkPipelineCreationFeedbackCreateInfoEXT {
    VkStructureType                   sType;
    const void*                       pNext;
    VkPipelineCreationFeedbackEXT*    pPipelineCreationFeedback;
    uint32_t                          pipelineStageCreationFeedbackCount;
    VkPipelineCreationFeedbackEXT*    pPipelineStageCreationFeedbacks;
} VkPipelineCreationFeedbackCreateInfoEXT;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• pPipelineCreationFeedback is a pointer to a VkPipelineCreationFeedbackEXT structure.
• pipelineStageCreationFeedbackCount is the number of elements in pPipelineStageCreationFeedbacks.
• pPipelineStageCreationFeedbacks is a pointer to an array of pipelineStageCreationFeedbackCount VkPipelineCreationFeedbackEXT structures.

An implementation should write pipeline creation feedback to pPipelineCreationFeedback and may write pipeline stage creation feedback to pPipelineStageCreationFeedbacks. An implementation must set or clear the VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT_EXT in VkPipelineCreationFeedbackEXT::flags for pPipelineCreationFeedback and every element of pPipelineStageCreationFeedbacks.
**Note**

One common scenario for an implementation to skip per-stage feedback is when `VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT_EXT` is set in `pPipelineCreationFeedback`.

When chained to `VkRayTracingPipelineCreateInfoKHR`, `VkRayTracingPipelineCreateInfoNV`, or `VkGraphicsPipelineCreateInfo`, the `i` element of `pPipelineStageCreationFeedbacks` corresponds to the `i` element of ` VkRayTracingPipelineCreateInfoKHR::pStages`, ` VkRayTracingPipelineCreateInfoNV::pStages`, or `VkGraphicsPipelineCreateInfo::pStages`. When chained to `VkComputePipelineCreateInfo`, the first element of `pPipelineStageCreationFeedbacks` corresponds to `VkComputePipelineCreateInfo::stage`.

### Valid Usage

- **VUID-VkPipelineCreationFeedbackCreateInfoEXT-pipelineStageCreationFeedbackCount-02668**
  
  When chained to `VkGraphicsPipelineCreateInfo`, `VkPipelineCreationFeedbackEXT::pipelineStageCreationFeedbackCount` must equal `VkGraphicsPipelineCreateInfo::stageCount`

- **VUID-VkPipelineCreationFeedbackCreateInfoEXT-pipelineStageCreationFeedbackCount-02669**
  
  When chained to `VkComputePipelineCreateInfo`, `VkPipelineCreationFeedbackEXT::pipelineStageCreationFeedbackCount` must equal 1

- **VUID-VkPipelineCreationFeedbackCreateInfoEXT-pipelineStageCreationFeedbackCount-02670**
  
  When chained to `VkRayTracingPipelineCreateInfoKHR`, `VkPipelineCreationFeedbackEXT::pipelineStageCreationFeedbackCount` must equal `VkRayTracingPipelineCreateInfoKHR::stageCount`

- **VUID-VkPipelineCreationFeedbackCreateInfoEXT-pipelineStageCreationFeedbackCount-02969**
  
  When chained to `VkRayTracingPipelineCreateInfoNV`, `VkPipelineCreationFeedbackEXT::pipelineStageCreationFeedbackCount` must equal `VkRayTracingPipelineCreateInfoNV::stageCount`

### Valid Usage (Implicit)

- **VUID-VkPipelineCreationFeedbackCreateInfoEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_CREATION_FEEDBACK_CREATE_INFO_EXT`

- **VUID-VkPipelineCreationFeedbackCreateInfoEXT-pPipelineCreationFeedback-parameter**
  
  `pPipelineCreationFeedback` must be a valid pointer to a `VkPipelineCreationFeedbackEXT` structure

- **VUID-VkPipelineCreationFeedbackCreateInfoEXT-pPipelineStageCreationFeedbacks-parameter**
  
  `pPipelineStageCreationFeedbacks` must be a valid pointer to an array of `VkPipelineCreationFeedbackEXT` structures

- **VUID-VkPipelineCreationFeedbackCreateInfoEXT-pipelineStageCreationFeedbackCount-arraylength**
  
  `pipelineStageCreationFeedbackCount` must be greater than 0
The `VkPipelineCreationFeedbackEXT` structure is defined as:

```c
// Provided by VK_EXT_pipeline_creation_feedback
typedef struct VkPipelineCreationFeedbackEXT {
    VkPipelineCreationFeedbackFlagsEXT flags;
    uint64_t duration;
} VkPipelineCreationFeedbackEXT;
```

- `flags` is a bitmask of `VkPipelineCreationFeedbackFlagBitsEXT` providing feedback about the creation of a pipeline or of a pipeline stage.
- `duration` is the duration spent creating a pipeline or pipeline stage in nanoseconds.

If the `VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT_EXT` is not set in `flags`, an implementation must not set any other bits in `flags`, and the values of all other `VkPipelineCreationFeedbackEXT` data members are undefined.

Possible values of the `flags` member of `VkPipelineCreationFeedbackEXT` are:

```c
// Provided by VK_EXT_pipeline_creation_feedback
typedef enum VkPipelineCreationFeedbackFlagBitsEXT {
    VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT_EXT = 0x00000001,
    VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT_EXT = 0x00000002,
    VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT_EXT = 0x00000004,
} VkPipelineCreationFeedbackFlagBitsEXT;
```

- `VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT_EXT` indicates that the feedback information is valid.
- `VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT_EXT` indicates that a readily usable pipeline or pipeline stage was found in the `pipelineCache` specified by the application in the pipeline creation command.

An implementation should set the `VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT_EXT` bit if it was able to avoid the large majority of pipeline or pipeline stage creation work by using the `pipelineCache` parameter of `vkCreateGraphicsPipelines`, `vkCreateRayTracingPipelinesKHR`, `vkCreateRayTracingPipelinesNV`, or `vkCreateComputePipelines`. When an implementation sets this bit for the entire pipeline, it may leave it unset for any stage.

**Note**

Implementations are encouraged to provide a meaningful signal to applications using this bit. The intention is to communicate to the application that the pipeline or pipeline stage was created "as fast as it gets" using the pipeline cache provided by the application. If an implementation uses an internal cache, it is discouraged from setting this bit as the feedback would be unactionable.

- `VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT_EXT` indicates that the base
pipeline specified by the `basePipelineHandle` or `basePipelineIndex` member of the `Vk*PipelineCreateInfo` structure was used to accelerate the creation of the pipeline.

An implementation should set the `VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT_EXT` bit if it was able to avoid a significant amount of work by using the base pipeline.

**Note**

While "significant amount of work" is subjective, implementations are encouraged to provide a meaningful signal to applications using this bit. For example, a 1% reduction in duration may not warrant setting this bit, while a 50% reduction would.

```c
// Provided by VK_EXT_pipeline_creation_feedback
typedef VkFlags VkPipelineCreationFeedbackFlagsEXT;
```

`VkPipelineCreationFeedbackFlagsEXT` is a bitmask type for providing zero or more `VkPipelineCreationFeedbackFlagBitsEXT`. 
Chapter 11. Memory Allocation

Vulkan memory is broken up into two categories, *host memory* and *device memory*.

### 11.1. Host Memory

Host memory is memory needed by the Vulkan implementation for non-device-visible storage.

#### Note

This memory may be used to store the implementation’s representation and state of Vulkan objects.

Vulkan provides applications the opportunity to perform host memory allocations on behalf of the Vulkan implementation. If this feature is not used, the implementation will perform its own memory allocations. Since most memory allocations are off the critical path, this is not meant as a performance feature. Rather, this can be useful for certain embedded systems, for debugging purposes (e.g. putting a guard page after all host allocations), or for memory allocation logging.

Allocators are provided by the application as a pointer to a `VkAllocationCallbacks` structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkAllocationCallbacks {
    void* pUserData;
    PFN_vkAllocationFunction pfnAllocation;
    PFN_vkReallocationFunction pfnReallocation;
    PFN_vkFreeFunction pfnFree;
    PFN_vkInternalAllocationNotification pfnInternalAllocation;
    PFN_vkInternalFreeNotification pfnInternalFree;
} VkAllocationCallbacks;
```

- `pUserData` is a value to be interpreted by the implementation of the callbacks. When any of the callbacks in `VkAllocationCallbacks` are called, the Vulkan implementation will pass this value as the first parameter to the callback. This value can vary each time an allocator is passed into a command, even when the same object takes an allocator in multiple commands.

- `pfnAllocation` is a `PFN_vkAllocationFunction` pointer to an application-defined memory allocation function.

- `pfnReallocation` is a `PFN_vkReallocationFunction` pointer to an application-defined memory reallocation function.

- `pfnFree` is a `PFN_vkFreeFunction` pointer to an application-defined memory free function.

- `pfnInternalAllocation` is a `PFN_vkInternalAllocationNotification` pointer to an application-defined function that is called by the implementation when the implementation makes internal allocations.

- `pfnInternalFree` is a `PFN_vkInternalFreeNotification` pointer to an application-defined function that is called by the implementation when the implementation frees internal allocations.
Valid Usage

- VUID-VkAllocationCallbacks-pfnAllocation-00632
  \textit{pfnAllocation} must be a valid pointer to a valid user-defined \texttt{PFN_vkAllocationFunction}

- VUID-VkAllocationCallbacks-pfnReallocation-00633
  \textit{pfnReallocation} must be a valid pointer to a valid user-defined \texttt{PFN_vkReallocationFunction}

- VUID-VkAllocationCallbacks-pfnFree-00634
  \textit{pfnFree} must be a valid pointer to a valid user-defined \texttt{PFN_vkFreeFunction}

- VUID-VkAllocationCallbacks-pfnInternalAllocation-00635
  If either of \textit{pfnInternalAllocation} or \textit{pfnInternalFree} is not NULL, both must be valid callbacks

The type of \textit{pfnAllocation} is:

\begin{verbatim}
// Provided by VK_VERSION_1_0
typedef void* (VKAPI_PTR *PFN_vkAllocationFunction)(
    void* pUserData,
    size_t size,
    size_t alignment,
    VkSystemAllocationScope allocationScope);
\end{verbatim}

- \texttt{pUserData} is the value specified for \texttt{VkAllocationCallbacks::pUserData} in the allocator specified by the application.
- \texttt{size} is the size in bytes of the requested allocation.
- \texttt{alignment} is the requested alignment of the allocation in bytes and must be a power of two.
- \texttt{allocationScope} is a \texttt{VkSystemAllocationScope} value specifying the allocation scope of the lifetime of the allocation, as described here.

If \textit{pfnAllocation} is unable to allocate the requested memory, it must return \texttt{NULL}. If the allocation was successful, it must return a valid pointer to memory allocation containing at least \texttt{size} bytes, and with the pointer value being a multiple of \texttt{alignment}.

\textbf{Note}

Correct Vulkan operation cannot be assumed if the application does not follow these rules.

For example, \textit{pfnAllocation} (or \textit{pfnReallocation}) could cause termination of running Vulkan instance(s) on a failed allocation for debugging purposes, either directly or indirectly. In these circumstances, it cannot be assumed that any part of any affected \texttt{VkInstance} objects are going to operate correctly (even \texttt{vkDestroyInstance}), and the application must ensure it cleans up properly via other means (e.g. process termination).
If pfnAllocation returns NULL, and if the implementation is unable to continue correct processing of the current command without the requested allocation, it must treat this as a runtime error, and generate VK_ERROR_OUT_OF_HOST_MEMORY at the appropriate time for the command in which the condition was detected, as described in Return Codes.

If the implementation is able to continue correct processing of the current command without the requested allocation, then it may do so, and must not generate VK_ERROR_OUT_OF_HOST_MEMORY as a result of this failed allocation.

The type of pfnReallocation is:

```c
// Provided by VK_VERSION_1_0
typedef void* (VKAPI_PTR *PFN_vkReallocationFunction)(
    void* pData,
    void* pOriginal,
    size_t size,
    size_t alignment,
    VkSystemAllocationScope allocationScope);
```

- pData is the value specified for VkAllocationCallbacks::pUserData in the allocator specified by the application.
- pOriginal must be either NULL or a pointer previously returned by pfnReallocation or pfnAllocation of a compatible allocator.
- size is the size in bytes of the requested allocation.
- alignment is the requested alignment of the allocation in bytes and must be a power of two.
- allocationScope is a VkSystemAllocationScope value specifying the allocation scope of the lifetime of the allocation, as described here.

pfnReallocation must return an allocation with enough space for size bytes, and the contents of the original allocation from bytes zero to \text{min}(original size, new size) - 1 must be preserved in the returned allocation. If size is larger than the old size, the contents of the additional space are undefined. If satisfying these requirements involves creating a new allocation, then the old allocation should be freed.

If pOriginal is NULL, then pfnReallocation must behave equivalently to a call to PFN_vkAllocationFunction with the same parameter values (without pOriginal).

If size is zero, then pfnReallocation must behave equivalently to a call to PFN_vkFreeFunction with the same pData parameter value, and pMemory equal to pOriginal.

If pOriginal is non-NULL, the implementation must ensure that alignment is equal to the alignment used to originally allocate pOriginal.

If this function fails and pOriginal is non-NULL the application must not free the old allocation.

pfnReallocation must follow the same rules for return values as PFN_vkAllocationFunction.

The type of pfnFree is:
**typedef void (VKAPI_PTR *PFN_vkFreeFunction)(
    void* pUserData,
    void* pMemory);**

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `pMemory` is the allocation to be freed.

`pMemory` **may** be `NULL`, which the callback **must** handle safely. If `pMemory` is non-`NULL`, it **must** be a pointer previously allocated by `pfnAllocation` or `pfnReallocation`. The application **should** free this memory.

The type of `PFN_vkFreeFunction` is:

**typedef void (VKAPI_PTR *PFN_vkInternalAllocationNotification)(
    void* pUserData,
    size_t size,
    VkInternalAllocationType allocationType,
    VkSystemAllocationScope allocationScope);**

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `size` is the requested size of an allocation.
- `allocationType` is a `VkInternalAllocationType` value specifying the requested type of an allocation.
- `allocationScope` is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described [here](#).

This is a purely informational callback.

The type of `PFN_vkInternalAllocationNotification` is:

**typedef void (VKAPI_PTR *PFN_vkInternalFreeNotification)(
    void* pUserData,
    size_t size,
    VkInternalAllocationType allocationType,
    VkSystemAllocationScope allocationScope);**

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `size` is the requested size of an allocation.
• allocationType is a `VkInternalAllocationType` value specifying the requested type of an allocation.

• allocationScope is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described here.

Each allocation has an allocation scope defining its lifetime and which object it is associated with. Possible values passed to the allocationScope parameter of the callback functions specified by `VkAllocationCallbacks`, indicating the allocation scope, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSystemAllocationScope {
    VK_SYSTEM_ALLOCATION_SCOPE_COMMAND = 0,
    VK_SYSTEM_ALLOCATION_SCOPE_OBJECT = 1,
    VK_SYSTEM_ALLOCATION_SCOPE_CACHE = 2,
    VK_SYSTEM_ALLOCATION_SCOPE_DEVICE = 3,
    VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE = 4,
} VkSystemAllocationScope;
```

• `VK_SYSTEM_ALLOCATION_SCOPE_COMMAND` specifies that the allocation is scoped to the duration of the Vulkan command.

• `VK_SYSTEM_ALLOCATION_SCOPE_OBJECT` specifies that the allocation is scoped to the lifetime of the Vulkan object that is being created or used.

• `VK_SYSTEM_ALLOCATION_SCOPE_CACHE` specifies that the allocation is scoped to the lifetime of a `VkPipelineCache` or `VkValidationCacheEXT` object.

• `VK_SYSTEM_ALLOCATION_SCOPE_DEVICE` specifies that the allocation is scoped to the lifetime of the Vulkan device.

• `VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE` specifies that the allocation is scoped to the lifetime of the Vulkan instance.

Most Vulkan commands operate on a single object, or there is a sole object that is being created or manipulated. When an allocation uses an allocation scope of `VK_SYSTEM_ALLOCATION_SCOPE_OBJECT` or `VK_SYSTEM_ALLOCATION_SCOPE_CACHE`, the allocation is scoped to the object being created or manipulated.

When an implementation requires host memory, it will make callbacks to the application using the most specific allocator and allocation scope available:

• If an allocation is scoped to the duration of a command, the allocator will use the `VK_SYSTEM_ALLOCATION_SCOPE_COMMAND` allocation scope. The most specific allocator available is used: if the object being created or manipulated has an allocator, that object's allocator will be used, else if the parent `VkDevice` has an allocator it will be used, else if the parent `VkInstance` has an allocator it will be used. Else,

• If an allocation is associated with a `VkValidationCacheEXT` or `VkPipelineCache` object, the allocator will use the `VK_SYSTEM_ALLOCATION_SCOPE_CACHE` allocation scope. The most specific allocator available is used (cache, else device, else instance). Else,
• If an allocation is scoped to the lifetime of an object, that object is being created or manipulated by the command, and that object's type is not VkDevice or VkInstance, the allocator will use an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_OBJECT. The most specific allocator available is used (object, else device, else instance). Else,

• If an allocation is scoped to the lifetime of a device, the allocator will use an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_DEVICE. The most specific allocator available is used (device, else instance). Else,

• If the allocation is scoped to the lifetime of an instance and the instance has an allocator, its allocator will be used with an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE.

• Otherwise an implementation will allocate memory through an alternative mechanism that is unspecified.

Objects that are allocated from pools do not specify their own allocator. When an implementation requires host memory for such an object, that memory is sourced from the object's parent pool's allocator.

The application is not expected to handle allocating memory that is intended for execution by the host due to the complexities of differing security implementations across multiple platforms. The implementation will allocate such memory internally and invoke an application provided informational callback when these internal allocations are allocated and freed. Upon allocation of executable memory, pfnInternalAllocation will be called. Upon freeing executable memory, pfnInternalFree will be called. An implementation will only call an informational callback for executable memory allocations and frees.

The allocationType parameter to the pfnInternalAllocation and pfnInternalFree functions may be one of the following values:

```c
// Provided by VK_VERSION_1_0
typedef enum VkInternalAllocationType {
    VK_INTERNAL_ALLOCATION_TYPE_EXECUTABLE = 0,
} VkInternalAllocationType;
```

• VK_INTERNAL_ALLOCATION_TYPE_EXECUTABLE specifies that the allocation is intended for execution by the host.

An implementation must only make calls into an application-provided allocator during the execution of an API command. An implementation must only make calls into an application-provided allocator from the same thread that called the provoking API command. The implementation should not synchronize calls to any of the callbacks. If synchronization is needed, the callbacks must provide it themselves. The informational callbacks are subject to the same restrictions as the allocation callbacks.

If an implementation intends to make calls through a VkAllocationCallbacks structure between the time a vkCreate* command returns and the time a corresponding vkDestroy* command begins, that implementation must save a copy of the allocator before the vkCreate* command returns. The callback functions and any data structures they rely upon must remain valid for the lifetime of the object they are associated with.
If an allocator is provided to a `vkCreate*` command, a compatible allocator **must** be provided to the corresponding `vkDestroy*` command. Two `VkAllocationCallbacks` structures are compatible if memory allocated with `pfnAllocation` or `pfnReallocation` in each **can** be freed with `pfnReallocation` or `pfnFree` in the other. An allocator **must** not be provided to a `vkDestroy*` command if an allocator was not provided to the corresponding `vkCreate*` command.

If a non-NULL allocator is used, the `pfnAllocation`, `pfnReallocation` and `pfnFree` members **must** be non-NULL and point to valid implementations of the callbacks. An application **can** choose to not provide informational callbacks by setting both `pfnInternalAllocation` and `pfnInternalFree` to `NULL`. `pfnInternalAllocation` and `pfnInternalFree` **must** either both be `NULL` or both be non-NULL.

If `pfnAllocation` or `pfnReallocation` fail, the implementation **may** fail object creation and/or generate a `VK_ERROR_OUT_OF_HOST_MEMORY` error, as appropriate.

Allocation callbacks **must** not call any Vulkan commands.

The following sets of rules define when an implementation is permitted to call the allocator callbacks.

`pfnAllocation` or `pfnReallocation` **may** be called in the following situations:

- Allocations scoped to a `VkDevice` or `VkInstance` **may** be allocated from any API command.
- Allocations scoped to a command **may** be allocated from any API command.
- Allocations scoped to a `VkPipelineCache` **may** only be allocated from:
  - `vkCreatePipelineCache`
  - `vkMergePipelineCaches` for `dstCache`
  - `vkCreateGraphicsPipelines` for `pipelineCache`
  - `vkCreateComputePipelines` for `pipelineCache`
- Allocations scoped to a `VkValidationCacheEXT` **may** only be allocated from:
  - `vkCreateValidationCacheEXT`
  - `vkMergeValidationCachesEXT` for `dstCache`
  - `vkCreateShaderModule` for `validationCache` in `VkShaderModuleValidationCacheCreateInfoEXT`
- Allocations scoped to a `VkDescriptorPool` **may** only be allocated from:
  - any command that takes the pool as a direct argument
  - `vkAllocateDescriptorSets` for the `descriptorPool` member of its `pAllocateInfo` parameter
  - `vkCreateDescriptorPool`
- Allocations scoped to a `VkCommandPool` **may** only be allocated from:
  - any command that takes the pool as a direct argument
  - `vkCreateCommandPool`
  - `vkAllocateCommandBuffers` for the `commandPool` member of its `pAllocateInfo` parameter
  - any `vkCmd*` command whose `commandBuffer` was allocated from that `VkCommandPool`
• Allocations scoped to any other object may only be allocated in that object's `vkCreate*` command.

`PFNFree`, or `PFNReallocation` with zero size, may be called in the following situations:

• Allocations scoped to a `VkDevice` or `VkInstance` may be freed from any API command.
• Allocations scoped to a command must be freed by any API command which allocates such memory.
• Allocations scoped to a `VkPipelineCache` may be freed from `vkDestroyPipelineCache`.
• Allocations scoped to a `VkValidationCacheEXT` may be freed from `vkDestroyValidationCacheEXT`.
• Allocations scoped to a `VkDescriptorPool` may be freed from
  ◦ any command that takes the pool as a direct argument
• Allocations scoped to a `VkCommandPool` may be freed from:
  ◦ any command that takes the pool as a direct argument
  ◦ `vkResetCommandBuffer` whose `commandBuffer` was allocated from that `VkCommandPool`
• Allocations scoped to any other object may be freed in that object's `vkDestroy*` command.
• Any command that allocates host memory may also free host memory of the same scope.

### 11.2. Device Memory

Device memory is memory that is visible to the device — for example the contents of the image or buffer objects, which can be natively used by the device.

Memory properties of a physical device describe the memory heaps and memory types available.

To query memory properties, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceMemoryProperties(
    VkPhysicalDevice                            physicalDevice,
    VkPhysicalDeviceMemoryProperties*           pMemoryProperties);
```

• `physicalDevice` is the handle to the device to query.
• `pMemoryProperties` is a pointer to a `VkPhysicalDeviceMemoryProperties` structure in which the properties are returned.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceMemoryProperties-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceMemoryProperties-pMemoryProperties-parameter
  pMemoryProperties must be a valid pointer to a VkPhysicalDeviceMemoryProperties structure

The VkPhysicalDeviceMemoryProperties structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceMemoryProperties {
    uint32_t memoryTypeCount;
    VkMemoryType memoryTypes[VK_MAX_MEMORY_TYPES];
    uint32_t memoryHeapCount;
    VkMemoryHeap memoryHeaps[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryProperties;
```

- memoryTypeCount is the number of valid elements in the memoryTypes array.
- memoryTypes is an array of VK_MAX_MEMORY_TYPES VkMemoryType structures describing the memory types that can be used to access memory allocated from the heaps specified by memoryHeaps.
- memoryHeapCount is the number of valid elements in the memoryHeaps array.
- memoryHeaps is an array of VK_MAX_MEMORY_HEAPS VkMemoryHeap structures describing the memory heaps from which memory can be allocated.

The VkPhysicalDeviceMemoryProperties structure describes a number of memory heaps as well as a number of memory types that can be used to access memory allocated in those heaps. Each heap describes a memory resource of a particular size, and each memory type describes a set of memory properties (e.g. host cached vs uncached) that can be used with a given memory heap. Allocations using a particular memory type will consume resources from the heap indicated by that memory type’s heap index. More than one memory type may share each heap, and the heaps and memory types provide a mechanism to advertise an accurate size of the physical memory resources while allowing the memory to be used with a variety of different properties.

The number of memory heaps is given by memoryHeapCount and is less than or equal to VK_MAX_MEMORY_HEAPS. Each heap is described by an element of the memoryHeaps array as a VkMemoryHeap structure. The number of memory types available across all memory heaps is given by memoryTypeCount and is less than or equal to VK_MAX_MEMORY_TYPES. Each memory type is described by an element of the memoryTypes array as a VkMemoryType structure.

At least one heap must include VK_MEMORY_HEAP_DEVICE_LOCAL_BIT in VkMemoryHeap::flags. If there are multiple heaps that all have similar performance characteristics, they may all include VK_MEMORY_HEAP_DEVICE_LOCAL_BIT. In a unified memory architecture (UMA) system there is often only a single memory heap which is considered to be equally “local” to the host and to the device,
and such an implementation **must** advertise the heap as device-local.

Each memory type returned by `vkGetPhysicalDeviceMemoryProperties` **must** have its `propertyFlags` set to one of the following values:

- 0
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORYPROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORY_PROPERTY_HOST_CACHED_BIT`
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORY_PROPERTY_HOST_CACHED_BIT` | `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` | `VK_MEMORYPROPERTY_HOST_VISIBLE_BIT`
- `VK_MEMORYPROPERTYDEVICE_LOCAL_BIT` | `VK_MEMORYPROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORYPROPERTY_HOST_CACHED_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` | `VK_MEMORYPROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORYPROPERTY_HOST_CACHED_BIT` | `VK_MEMORYPROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORYPROPERTYDEVICE_LOCAL_BIT` | `VK_MEMORYPROPERTYHOST_VISIBLE_BIT` | `VK_MEMORYPROPERTYHOST_CACHED_BIT` | `VK_MEMORYPROPERTYHOST_COHERENT_BIT` | `VK_MEMORYPROPERTYDEVICE_COHERENT_BIT_AMD`
- `VK_MEMORY_PROPERTY_PROTECTED_BIT`
- `VK_MEMORY_PROPERTY_PROTECTED_BIT` | `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT`
- `VK_MEMORYPROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORYPROPERTY_HOST_COHERENT_BIT` | `VK_MEMORYPROPERTYDEVICE_COHERENT_BIT_AMD`
- `VK_MEMORYPROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORYPROPERTY_HOST_CACHED_BIT` | `VK_MEMORYPROPERTY_HOST_COHERENT_BIT` | `VK_MEMORYPROPERTYDEVICE_COHERENT_BIT_AMD`
- `VK_MEMORYPROPERTYDEVICE_LOCAL_BIT` | `VK_MEMORYPROPERTYDEVICE_COHERENT_BIT_AMD`
- `VK_MEMORYPROPERTYDEVICE_LOCAL_BIT` | `VK_MEMORYPROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORYPROPERTY_HOST_COHERENT_BIT` | `VK_MEMORYPROPERTYDEVICE_COHERENT_BIT_AMD`
- `VK_MEMORYPROPERTYDEVICE_LOCAL_BIT` | `VK_MEMORYPROPERTYDEVICE_COHERENT_BIT_AMD`
There must be at least one memory type with both the `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` and `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` bits set in its `propertyFlags`. There must be at least one memory type with the `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` bit set in its `propertyFlags`. If the `deviceCoherentMemory` feature is enabled, there must be at least one memory type with the `VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD` bit set in its `propertyFlags`.

For each pair of elements \(X\) and \(Y\) returned in `memoryTypes`, \(X\) must be placed at a lower index position than \(Y\) if:

- the set of bit flags returned in the `propertyFlags` member of \(X\) is a strict subset of the set of bit flags returned in the `propertyFlags` member of \(Y\); or
- the `propertyFlags` members of \(X\) and \(Y\) are equal, and \(X\) belongs to a memory heap with greater performance (as determined in an implementation-specific manner); or
- the `propertyFlags` members of \(Y\) includes `VK_MEMORY_PROPERTYDEVICE_COHERENT_BIT_AMD` or `VK_MEMORY_PROPERTYDEVICE_UNCACHED_BIT_AMD` and \(X\) does not
**Note**

There is no ordering requirement between X and Y elements for the case their `propertyFlags` members are not in a subset relation. That potentially allows more than one possible way to order the same set of memory types. Notice that the list of all allowed memory property flag combinations is written in a valid order. But if instead `VK_MEMORYPROPERTYDEVICELOCALBIT` was before `VK_MEMORYPROPERTYHOSTVISIBLEBIT | VK_MEMORYPROPERTYHOSTCOHERENTBIT`, the list would still be in a valid order.

There may be a performance penalty for using device coherent or uncached device memory types, and using these accidentally is undesirable. In order to avoid this, memory types with these properties always appear at the end of the list; but are subject to the same rules otherwise.

This ordering requirement enables applications to use a simple search loop to select the desired memory type along the lines of:
Find a memory in `memoryTypeBitsRequirement` that includes all of `requiredProperties`:

```c
int32_t findProperties(const VkPhysicalDeviceMemoryProperties* pMemoryProperties,
                        uint32_t memoryTypeBitsRequirement,
                        VkMemoryPropertyFlags requiredProperties) {
  const uint32_t memoryCount = pMemoryProperties->memoryTypeCount;
  for (uint32_t memoryIndex = 0; memoryIndex < memoryCount; ++memoryIndex) {
    const uint32_t memoryTypeBits = (1 << memoryIndex);
    const bool isRequiredMemoryType = memoryTypeBitsRequirement & memoryTypeBits;
    const VkMemoryPropertyFlags properties = pMemoryProperties->memoryTypes[memoryIndex].propertyFlags;
    const bool hasRequiredProperties = (properties & requiredProperties) == requiredProperties;
    if (isRequiredMemoryType && hasRequiredProperties)
      return static_cast<int32_t>(memoryIndex);
  }

  // failed to find memory type
  return -1;
}
```

Try to find an optimal memory type, or if it does not exist try fallback memory type:

- `device` is the VkDevice
- `image` is the VkImage that requires memory to be bound
- `memoryProperties` properties as returned by `vkGetPhysicalDeviceMemoryProperties`
- `requiredProperties` are the property flags that must be present
- `optimalProperties` are the property flags that are preferred by the application

```c
VkMemoryRequirements memoryRequirements;
vkGetImageMemoryRequirements(device, image, &memoryRequirements);
int32_t memoryType = findProperties(&memoryProperties, memoryRequirements.memoryTypeBits,
                                      optimalProperties);
if (memoryType == -1) // not found; try fallback properties
  memoryType = findProperties(&memoryProperties, memoryRequirements.memoryTypeBits,
                               requiredProperties);
```

To query memory properties, call:

```c
void vkGetPhysicalDeviceMemoryProperties2(VkPhysicalDevice physicalDevice,
                                          VkPhysicalDeviceMemoryProperties2* pMemoryProperties);
```

or the equivalent command
```c
void vkGetPhysicalDeviceMemoryProperties2KHR(  
    VkPhysicalDevice                            physicalDevice,  
    VkPhysicalDeviceMemoryProperties2*          pMemoryProperties);
```

- `physicalDevice` is the handle to the device to query.
- `pMemoryProperties` is a pointer to a `VkPhysicalDeviceMemoryProperties2` structure in which the properties are returned.

`vkGetPhysicalDeviceMemoryProperties2` behaves similarly to `vkGetPhysicalDeviceMemoryProperties`, with the ability to return extended information in a `pNext` chain of output structures.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceMemoryProperties2-physicalDevice-parameter  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceMemoryProperties2-pMemoryProperties-parameter  
  `pMemoryProperties` must be a valid pointer to a `VkPhysicalDeviceMemoryProperties2` structure

The `VkPhysicalDeviceMemoryProperties2` structure is defined as:

```c
// Provided by VK_VERSION_1_1  
typedef struct VkPhysicalDeviceMemoryProperties2 {  
    VkStructureType                     sType;  
    void*                               pNext;  
    VkPhysicalDeviceMemoryProperties    memoryProperties;  
} VkPhysicalDeviceMemoryProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceMemoryProperties2 VkPhysicalDeviceMemoryProperties2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryProperties` is a `VkPhysicalDeviceMemoryProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceMemoryProperties`.

648 | Chapter 11. Memory Allocation
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMemoryProperties2-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_PROPERTIES_2

- VUID-VkPhysicalDeviceMemoryProperties2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of
  VkPhysicalDeviceMemoryBudgetPropertiesEXT

- VUID-VkPhysicalDeviceMemoryProperties2-sType-unique
  The sType value of each struct in the pNext chain must be unique

The VkMemoryHeap structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryHeap {
    VkDeviceSize size;
    VkMemoryHeapFlags flags;
} VkMemoryHeap;
```

- size is the total memory size in bytes in the heap.
- flags is a bitmask of VkMemoryHeapFlagBits specifying attribute flags for the heap.

Bits which may be set in VkMemoryHeap::flags, indicating attribute flags for the heap, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkMemoryHeapFlagBits {
    VK_MEMORY_HEAP_DEVICE_LOCAL_BIT = 0x00000001,
    // Provided by VK_VERSION_1_1
    VK_MEMORY_HEAP_MULTI_INSTANCE_BIT = 0x00000002,
    // Provided by VK_KHR_device_group_creation
    VK_MEMORY_HEAP_MULTI_INSTANCE_BIT_KHR = VK_MEMORY_HEAP_MULTI_INSTANCE_BIT,
} VkMemoryHeapFlagBits;
```

- VK_MEMORY_HEAP_DEVICE_LOCAL_BIT specifies that the heap corresponds to device local memory. Device local memory may have different performance characteristics than host local memory, and may support different memory property flags.
- VK_MEMORY_HEAP_MULTI_INSTANCE_BIT specifies that in a logical device representing more than one physical device, there is a per-physical device instance of the heap memory. By default, an allocation from such a heap will be replicated to each physical device's instance of the heap.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryHeapFlags;
```

VkMemoryHeapFlags is a bitmask type for setting a mask of zero or more VkMemoryHeapFlagBits.
The `VkMemoryType` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryType {
    VkMemoryPropertyFlags propertyFlags;
    uint32_t heapIndex;
} VkMemoryType;
```

- `heapIndex` describes which memory heap this memory type corresponds to, and **must** be less than `memoryHeapCount` from the `VkPhysicalDeviceMemoryProperties` structure.
- `propertyFlags` is a bitmask of `VkMemoryPropertyFlagBits` of properties for this memory type.

Bits which **may** be set in `VkMemoryType::propertyFlags`, indicating properties of a memory heap, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkMemoryPropertyFlagBits {
    VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT = 0x00000001,
    VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT = 0x00000002,
    VK_MEMORY_PROPERTY_HOST_COHERENT_BIT = 0x00000004,
    VK_MEMORY_PROPERTY_HOST_CACHED_BIT = 0x00000008,
    VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_MEMORY_PROPERTY_PROTECTED_BIT = 0x00000020,
    // Provided by VK_AMD_device_coherent_memory
    VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD = 0x00000040,
    // Provided by VK_AMD_device_coherent_memory
    VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD = 0x00000080,
} VkMemoryPropertyFlagBits;
```

- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` bit specifies that memory allocated with this type is the most efficient for device access. This property will be set if and only if the memory type belongs to a heap with the `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` set.
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` bit specifies that memory allocated with this type **can** be mapped for host access using `vkMapMemory`.
- `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` bit specifies that the host cache management commands `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges` are not needed to flush host writes to the device or make device writes visible to the host, respectively.
- `VK_MEMORY_PROPERTY_HOST_CACHED_BIT` bit specifies that memory allocated with this type is cached on the host. Host memory accesses to uncached memory are slower than to cached memory, however uncached memory is always host coherent.
- `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit specifies that the memory type only allows device access to the memory. Memory types **must** not have both `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` and `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` set. Additionally, the object’s backing memory **may** be provided by the implementation lazily as
specified in *Lazily Allocated Memory*.

- **VK_MEMORYPROPERTY_PROTECTED_BIT** bit specifies that the memory type only allows device access to the memory, and allows protected queue operations to access the memory. Memory types **must not have** **VK_MEMORYPROPERTY_PROTECTED_BIT** set and any of **VK_MEMORYPROPERTY_HOSTVISIBLE_BIT** set, or **VK_MEMORYPROPERTYHOSTCOHERENT_BIT** set, or **VK_MEMORYPROPERTYHOSTCACHED_BIT** set.

- **VK_MEMORYPROPERTYDEVICECOHERENT_BIT_AMD** bit specifies that device accesses to allocations of this memory type are automatically made available and visible.

- **VK_MEMORYPROPERTYDEVICEUNCACHED_BIT_AMD** bit specifies that memory allocated with this type is not cached on the device. Uncached device memory is always device coherent.

For any memory allocated with both the **VK_MEMORYPROPERTYHOSTCOHERENT_BIT** and the **VK_MEMORYPROPERTYDEVICECOHERENT_BIT_AMD**, host or device accesses also perform automatic memory domain transfer operations, such that writes are always automatically available and visible to both host and device memory domains.

**Note**

Device coherence is a useful property for certain debugging use cases (e.g. crash analysis, where performing separate coherence actions could mean values are not reported correctly). However, device coherent accesses may be slower than equivalent accesses without device coherence, particularly if they are also device uncached. For device uncached memory in particular, repeated accesses to the same or neighbouring memory locations over a short time period (e.g. within a frame) may be slower than it would be for the equivalent cached memory type. As such, it is generally inadvisable to use device coherent or device uncached memory except when really needed.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryPropertyFlags;
```

**VkMemoryPropertyFlags** is a bitmask type for setting a mask of zero or more **VkMemoryPropertyFlagBits**.

If the **VkPhysicalDeviceMemoryBudgetPropertiesEXT** structure is included in the **pNext** chain of **VkPhysicalDeviceMemoryProperties2**, it is filled with the current memory budgets and usages.

The **VkPhysicalDeviceMemoryBudgetPropertiesEXT** structure is defined as:

```c
// Provided by VK_EXT_memory_budget
typedef struct VkPhysicalDeviceMemoryBudgetPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize heapBudget[VK_MAX_MEMORY_HEAPS];
    VkDeviceSize heapUsage[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryBudgetPropertiesEXT;
```
• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **heapBudget** is an array of **VK_MAX_MEMORY_HEAPS** **VkDeviceSize** values in which memory budgets are returned, with one element for each memory heap. A heap’s budget is a rough estimate of how much memory the process can allocate from that heap before allocations may fail or cause performance degradation. The budget includes any currently allocated device memory.

• **heapUsage** is an array of **VK_MAX_MEMORY_HEAPS** **VkDeviceSize** values in which memory usages are returned, with one element for each memory heap. A heap’s usage is an estimate of how much memory the process is currently using in that heap.

The values returned in this structure are not invariant. The **heapBudget** and **heapUsage** values must be zero for array elements greater than or equal to **VkPhysicalDeviceMemoryProperties::memoryHeapCount**. The **heapBudget** value must be non-zero for array elements less than **VkPhysicalDeviceMemoryProperties::memoryHeapCount**. The **heapBudget** value must be less than or equal to **VkMemoryHeap::size** for each heap.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMemoryBudgetPropertiesEXT-sType-sType

  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_BUDGET_PROPERTIES_EXT**

A Vulkan device operates on data in device memory via memory objects that are represented in the API by a **VkDeviceMemory** handle:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeviceMemory)
```

To allocate memory objects, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateMemory(
    VkDevice device,
    const VkMemoryAllocateInfo* pAllocateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDeviceMemory* pMemory);
```

- **device** is the logical device that owns the memory.

- **pAllocateInfo** is a pointer to a **VkMemoryAllocateInfo** structure describing parameters of the allocation. A successful returned allocation must use the requested parameters—no substitution is permitted by the implementation.

- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

- **pMemory** is a pointer to a **VkDeviceMemory** handle in which information about the allocated memory is returned.
Allocations returned by `vkAllocateMemory` are guaranteed to meet any alignment requirement of the implementation. For example, if an implementation requires 128 byte alignment for images and 64 byte alignment for buffers, the device memory returned through this mechanism would be 128-byte aligned. This ensures that applications can correctly suballocate objects of different types (with potentially different alignment requirements) in the same memory object.

When memory is allocated, its contents are undefined with the following constraint:

- The contents of unprotected memory must not be a function of data protected memory objects, even if those memory objects were previously freed.

The contents of memory allocated by one application should not be a function of data from protected memory objects of another application, even if those memory objects were previously freed.

The maximum number of valid memory allocations that can exist simultaneously within a `VkDevice` may be restricted by implementation- or platform-dependent limits. The `maxMemoryAllocationCount` feature describes the number of allocations that can exist simultaneously before encountering these internal limits.

For historical reasons, if `maxMemoryAllocationCount` is exceeded, some implementations may return `VK_ERROR_TOO_MANY_OBJECTS`. Exceeding this limit will result in undefined behavior, and an application should not rely on the use of the returned error code in order to identify when the limit is reached.

Some platforms may have a limit on the maximum size of a single allocation. For example, certain systems may fail to create allocations with a size greater than or equal to 4GB. Such a limit is implementation-dependent, and if such a failure occurs then the error `VK_ERROR_OUT_OF_DEVICE_MEMORY` must be returned. This limit is advertised in `VkPhysicalDeviceMaintenance3Properties::maxMemoryAllocationSize`.

The cumulative memory size allocated to a heap can be limited by the size of the specified heap. In such cases, allocated memory is tracked on a per-device and per-heap basis. Some platforms allow overallocation into other heaps. The overallocation behavior can be specified through the `VK_AMD_memory_overallocation_behavior` extension.
Valid Usage

- **VUID-vkAllocateMemory-pAllocateInfo-01713**
  \[
  \text{pAllocateInfo->allocationSize} \text{ must be less than or equal toVkPhysicalDeviceMemoryProperties::memoryHeaps[memindex].size where memindex = VkPhysicalDeviceMemoryProperties::memoryTypes[pAllocateInfo->memoryTypeIndex].heapIndex as returned by } \text{vkGetPhysicalDeviceMemoryProperties for the } \text{VkPhysicalDevice that } \text{device} \text{ was created from.}
  \]

- **VUID-vkAllocateMemory-pAllocateInfo-01714**
  \[
  \text{pAllocateInfo->memoryTypeIndex must be less than VkPhysicalDeviceMemoryProperties::memoryTypeCount as returned by } \text{vkGetPhysicalDeviceMemoryProperties for the } \text{VkPhysicalDevice that } \text{device} \text{ was created from.}
  \]

- **VUID-vkAllocateMemory-deviceCoherentMemory-02790**
  If the \text{deviceCoherentMemory} feature is not enabled, \text{pAllocateInfo->memoryTypeIndex must not identify a memory type supporting VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD.}

- **VUID-vkAllocateMemory-maxMemoryAllocationCount-04101**
  There must be less than VkPhysicalDeviceLimits::maxMemoryAllocationCount device memory allocations currently allocated on the device.

Valid Usage (Implicit)

- **VUID-vkAllocateMemory-device-parameter**
  \text{device must be a valid VkDevice handle}

- **VUID-vkAllocateMemory-pAllocateInfo-parameter**
  \text{pAllocateInfo must be a valid pointer to a valid VkMemoryAllocateInfo structure}

- **VUID-vkAllocateMemory-pAllocator-parameter**
  If \text{pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure}

- **VUID-vkAllocateMemory-pMemory-parameter**
  \text{pMemory must be a valid pointer to a VkDeviceMemory handle}
Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The `VkMemoryAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryAllocateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceSize       allocationSize;
    uint32_t           memoryTypeIndex;
} VkMemoryAllocateInfo;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `allocationSize` is the size of the allocation in bytes.
- `memoryTypeIndex` is an index identifying a memory type from the `memoryTypes` array of the `VkPhysicalDeviceMemoryProperties` structure.

The internal data of an allocated device memory object must include a reference to implementation-specific resources, referred to as the memory object's payload. Applications can also import and export that internal data to and from device memory objects to share data between Vulkan instances and other compatible APIs. A `VkMemoryAllocateInfo` structure defines a memory import operation if its `pNext` chain includes one of the following structures:

- `VkImportMemoryWin32HandleInfoKHR` with a non-zero `handleType` value
- `VkImportMemoryFdInfoKHR` with a non-zero `handleType` value
- `VkImportMemoryHostPointerInfoEXT` with a non-zero `handleType` value
- `VkImportAndroidHardwareBufferInfoANDROID` with a non-NULL `buffer` value
- `VkImportMemoryZirconHandleInfoFUCHSIA` with a non-zero `handleType` value

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, `allocationSize` is ignored. The implementation
must query the size of these allocations from the OS.

Whether device memory objects constructed via a memory import operation hold a reference to their payload depends on the properties of the handle type used to perform the import, as defined below for each valid handle type. Importing memory must not modify the content of the memory. Implementations must ensure that importing memory does not enable the importing Vulkan instance to access any memory or resources in other Vulkan instances other than that corresponding to the memory object imported. Implementations must also ensure accessing imported memory which has not been initialized does not allow the importing Vulkan instance to obtain data from the exporting Vulkan instance or vice-versa.

Note

How exported and imported memory is isolated is left to the implementation, but applications should be aware that such isolation may prevent implementations from placing multiple exportable memory objects in the same physical or virtual page. Hence, applications should avoid creating many small external memory objects whenever possible.

Importing memory must not increase overall heap usage within a system. However, they must affect the following per-process values:

* VkPhysicalDeviceMaintenance3Properties::maxMemoryAllocationCount
* VkPhysicalDeviceMemoryBudgetPropertiesEXT::heapUsage

When performing a memory import operation, it is the responsibility of the application to ensure the external handles and their associated payloads meet all valid usage requirements. However, implementations must perform sufficient validation of external handles and payloads to ensure that the operation results in a valid memory object which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its allocation parameters. If the external handle provided does not meet these requirements, the implementation must fail the memory import operation with the error code VK_ERROR_INVALID_EXTERNAL_HANDLE.
Valid Usage

- **VUID-VkMemoryAllocateInfo-pNext-00639**
  
  If the pNext chain includes a VkExportMemoryAllocateInfo structure, and any of the handle types specified in VkExportMemoryAllocateInfo::handleTypes require a dedicated allocation, as reported by vkGetPhysicalDeviceImageFormatProperties2 in VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures or VkExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures, the pNext chain must include a VkMemoryDedicatedAllocateInfo or VkDedicatedAllocationMemoryAllocateInfoNV structure with either its image or buffer member set to a value other than VK_NULL_HANDLE.

- **VUID-VkMemoryAllocateInfo-pNext-00640**
  
  If the pNext chain includes a VkExportMemoryAllocateInfo structure, it must not include a VkExportMemoryAllocateInfoNV or VkExportMemoryWin32HandleInfoNV structure.

- **VUID-VkMemoryAllocateInfo-pNext-00641**
  
  If the pNext chain includes a VkImportMemoryWin32HandleInfoKHR structure, it must not include a VkImportMemoryWin32HandleInfoNV structure.

- **VUID-VkMemoryAllocateInfo-allocationSize-01742**
  
  If the parameters define an import operation, the external handle specified was created by the Vulkan API, and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT_KHR, then the values of allocationSize and memoryTypeIndex must match those specified when the payload being imported was created.

- **VUID-VkMemoryAllocateInfo-None-00643**
  
  If the parameters define an import operation and the external handle specified was created by the Vulkan API, the device mask specified by VkMemoryAllocateFlagsInfo must match that specified when the payload being imported was allocated.

- **VUID-VkMemoryAllocateInfo-None-00644**
  
  If the parameters define an import operation and the external handle specified was created by the Vulkan API, the list of physical devices that comprise the logical device passed to vkAllocateMemory must match the list of physical devices that comprise the logical device on which the payload was originally allocated.

- **VUID-VkMemoryAllocateInfo-memoryTypeIndex-00645**
  
  If the parameters define an import operation and the external handle is an NT handle or a global share handle created outside of the Vulkan API, the value of memoryTypeIndex must be one of those returned by vkGetMemoryWin32HandlePropertiesKHR.

- **VUID-VkMemoryAllocateInfo-allocationSize-01743**
  
  If the parameters define an import operation, the external handle was created by the Vulkan API, and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR or VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_KHR, then the values of allocationSize and memoryTypeIndex must match those specified when the payload being imported was created.

- **VUID-VkMemoryAllocateInfo-allocationSize-00647**

Chapter 11. Memory Allocation | 657
If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, allocationSize must match the size specified when creating the Direct3D 12 heap from which the payload was extracted.

- **VUID-VkMemoryAllocateInfo-memoryTypeIndex-00648**
  If the parameters define an import operation and the external handle is a POSIX file descriptor created outside of the Vulkan API, the value of `memoryTypeIndex` must be one of those returned by `vkGetMemoryFdPropertiesKHR`.

- **VUID-VkMemoryAllocateInfo-memoryTypeIndex-01872**
  If the protected memory feature is not enabled, the `VkMemoryAllocateInfo::memoryTypeIndex` must not indicate a memory type that reports `VK_MEMORYPROPERTY_PROTECTED_BIT`.

- **VUID-VkMemoryAllocateInfo-memoryTypeIndex-01744**
  If the parameters define an import operation and the external handle is a host pointer, the value of `memoryTypeIndex` must be one of those returned by `vkGetMemoryHostPointerPropertiesEXT`.

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORYHANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, allocationSize must be the size returned by `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer.

- **VUID-VkMemoryAllocateInfo-memoryTypeIndex-02385**
  If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORYHANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, `memoryTypeIndex` must be one of those returned by `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer.

- **VUID-VkMemoryAllocateInfo-pNext-01874**
  If the parameters define an import operation and the external handle is a host pointer, `pNext` chain must not include a `VkDedicatedAllocationMemoryAllocateInfoNV` structure with either its `image` or `buffer` field set to a value other than `VK_NULL_HANDLE`.

- **VUID-VkMemoryAllocateInfo-pNext-02806**
  If the parameters define an import operation and the external handle is a host pointer, `pNext` chain must not include a `VkMemoryDedicatedAllocateInfo` structure with either its `image` or `buffer` field set to a value other than `VK_NULL_HANDLE`.

- **VUID-VkMemoryAllocateInfo-allocationSize-02383**
  If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORYHANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, allocationSize must be the size returned by `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer.

- **VUID-VkMemoryAllocateInfo-allocationSize-02384**
  If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORYHANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, and the `pNext` chain does not include a `VkMemoryDedicatedAllocateInfo` structure or `VkMemoryDedicatedAllocateInfo::image` is `VK_NULL_HANDLE`, the Android hardware buffer must have a `AHardwareBuffer_Desc::format` of `AHARDWAREBUFFER_FORMAT_BLOB` and a `AHardwareBuffer_Desc::usage` that includes `AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER`.

- **VUID-VkMemoryAllocateInfo-memoryTypeIndex-02386**
  If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORYHANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, `memoryTypeIndex` must be one of those returned by `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer.
If the parameters do not define an import operation, and the `pNext` chain includes a `VkExportMemoryAllocateInfo` structure with `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID` included in its `handleTypes` member, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `image` not equal to `VK_NULL_HANDLE`, then `allocationSize` must be 0, otherwise `allocationSize` must be greater than 0.

- VUID-VkMemoryAllocateInfo-pNext-02386
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` with `image` that is not `VK_NULL_HANDLE`, the Android hardware buffer's `AHardwareBuffer::usage` must include at least one of `AHARDWAREBUFFER_USAGE_GPU_FRAMEBUFFER` or `AHARDWAREBUFFER_USAGE_GPU_SAMPLED_IMAGE`.

- VUID-VkMemoryAllocateInfo-pNext-02387
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` with `image` that is not `VK_NULL_HANDLE`, the format of `image` must be `VK_FORMAT_UNDEFINED` or the format returned by `vkGetAndroidHardwareBufferPropertiesANDROID` in `VkAndroidHardwareBufferFormatPropertiesANDROID::format` for the Android hardware buffer.

- VUID-VkMemoryAllocateInfo-pNext-02388
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `image` that is not `VK_NULL_HANDLE`, the width, height, and array layer dimensions of `image` and the Android hardware buffer's `AHardwareBuffer_Desc` must be identical.

- VUID-VkMemoryAllocateInfo-pNext-02389
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `image` that is not `VK_NULL_HANDLE`, and the Android hardware buffer's `AHardwareBuffer::usage` includes `AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE`, the `image` must have a complete mipmap chain.

- VUID-VkMemoryAllocateInfo-pNext-02586
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `image` that is not `VK_NULL_HANDLE`, and the Android hardware buffer's `AHardwareBuffer::usage` does not include `AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE`, the `image` must have exactly one mipmap level.

- VUID-VkMemoryAllocateInfo-pNext-02390
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `image` that is not `VK_NULL_HANDLE`, each bit set in the usage of `image` must be listed in `AHardwareBuffer Usage Equivalence`, and if there is a corresponding `AHARDWAREBUFFER_USAGE` bit listed that bit must be included in the Android hardware buffer's `AHardwareBuffer_Desc::usage`.

- VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03329
  If `VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress` is not zero,
VkMemoryAllocateFlagsInfo::flags must include VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT

- VUID-VkMemoryAllocateInfo-flags-03330
  If VkMemoryAllocateFlagsInfo::flags includes VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, the bufferDeviceAddressCaptureReplay feature must be enabled

- VUID-VkMemoryAllocateInfo-flags-03331
  If VkMemoryAllocateFlagsInfo::flags includes VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT, the bufferDeviceAddress feature must be enabled

- VUID-VkMemoryAllocateInfo-pNext-03332
  If the pNext chain includes a VkImportMemoryHostPointerInfoEXT structure, VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress must be zero

- VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03333
  If the parameters define an import operation, VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress must be zero

- VUID-VkMemoryAllocateInfo-None-04749
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the value of memoryTypeIndex must be an index identifying a memory type from the memoryTypeBits field of the VkMemoryZirconHandlePropertiesFUCHSIA structure populated by a call to vkGetMemoryZirconHandlePropertiesFUCHSIA.

- VUID-VkMemoryAllocateInfo-allocationSize-04750
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the value of allocationSize must be greater than 0 and must be less than or equal to the size of the VMO as determined by zx_vmo_get_size(handle) where handle is the VMO handle to the imported external memory.
Valid Usage (Implicit)

- **VUID-VkMemoryAllocateInfo-sType-sType**
  
  *sType must be VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO*

- **VUID-VkMemoryAllocateInfo-pNext-pNext**
  
  Each *pNext* member of any structure (including this one) in the *pNext* chain *must* be either NULL or a pointer to a valid instance of VkDedicatedAllocationMemoryAllocateInfoNV, VkExportMemoryAllocateInfo, VkExportMemoryWin32HandleInfoKHR, VkExportMemoryWin32HandleInfoNV, VkExportMemoryWin32HandleInfoNV, VkExportMemoryWin32HandleInfoKHR, VkImportAndroidHardwareBufferInfoANDROID, VkImportMemoryFdInfoKHR, VkImportMemoryHostPointerInfoEXT, VkImportMemoryZirconHandleInfoFUCHSIA, VkMemoryAllocateFlagsInfo, VkMemoryDedicatedAllocateInfo, VkMemoryOpaqueCaptureAddressAllocateInfo, or VkMemoryPriorityAllocateInfoEXT

- **VUID-VkMemoryAllocateInfo-sType-unique**
  
  The *sType* value of each struct in the *pNext* chain *must* be unique

If the *pNext* chain includes a VkMemoryDedicatedAllocateInfo structure, then that structure includes a handle of the sole buffer or image resource that the memory can be bound to.

The VkMemoryDedicatedAllocateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedAllocateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkImage            image;
    VkBuffer           buffer;
} VkMemoryDedicatedAllocateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dedicated_allocation
typedef VkMemoryDedicatedAllocateInfo VkMemoryDedicatedAllocateInfoKHR;
```

- *sType* is the type of this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- *image* is VK_NULL_HANDLE or a handle of an image which this memory will be bound to.
- *buffer* is VK_NULL_HANDLE or a handle of a buffer which this memory will be bound to.
Valid Usage

- **VUID-VkMemoryDedicatedAllocateInfo-image-01432**
  At least one of `image` and `buffer` must be `VK_NULL_HANDLE`

- **VUID-VkMemoryDedicatedAllocateInfo-image-02964**
  If `image` is not `VK_NULL_HANDLE` and the memory is not an imported Android Hardware Buffer, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the image

- **VUID-VkMemoryDedicatedAllocateInfo-image-01434**
  If `image` is not `VK_NULL_HANDLE`, `image` must have been created without `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` set in `VkImageCreateInfo::flags`

- **VUID-VkMemoryDedicatedAllocateInfo-buffer-02965**
  If `buffer` is not `VK_NULL_HANDLE` and the memory is not an imported Android Hardware Buffer, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the buffer

- **VUID-VkMemoryDedicatedAllocateInfo-buffer-01436**
  If `buffer` is not `VK_NULL_HANDLE`, `buffer` must have been created without `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` set in `VkBufferCreateInfo::flags`

- **VUID-VkMemoryDedicatedAllocateInfo-image-01876**
  If `image` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation with handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, and the external handle was created by the Vulkan API, then the memory being imported must also be a dedicated image allocation and `image` must be identical to the image associated with the imported memory

- **VUID-VkMemoryDedicatedAllocateInfo-buffer-01877**
  If `buffer` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation with handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, and the external handle was created by the Vulkan API, then the memory being imported must also be a dedicated buffer allocation and `buffer` must be identical to the buffer associated with the imported memory

- **VUID-VkMemoryDedicatedAllocateInfo-image-01878**
  If `image` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation with handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT`, the memory being imported must also be a dedicated image allocation and `image` must be identical to the image associated with the imported memory
If buffer is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory.

If image is not VK_NULL_HANDLE, image must not have been created with VK_IMAGE_CREATE_DISJOINT_BIT set in VkImageCreateInfo::flags.

If image is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the memory being imported must also be a dedicated image allocation and image must be identical to the image associated with the imported memory.

If buffer is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory.

Valid Usage (Implicit)

- **sType** must be VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO
- If image is not VK_NULL_HANDLE, image must be a valid VkImage handle
- If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle
- Both of buffer, and image that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

If the pNext chain includes a VkDedicatedAllocationMemoryAllocateInfoNV structure, then that structure includes a handle of the sole buffer or image resource that the memory can be bound to.

The VkDedicatedAllocationMemoryAllocateInfoNV structure is defined as:

```c
// Provided by VK_NV_dedicated_allocation
typedef struct VkDedicatedAllocationMemoryAllocateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkBuffer buffer;
} VkDedicatedAllocationMemoryAllocateInfoNV;
```
• **sType** is the type of this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **image** is `VK_NULL_HANDLE` or a handle of an image which this memory will be bound to.
• **buffer** is `VK_NULL_HANDLE` or a handle of a buffer which this memory will be bound to.

### Valid Usage

- [VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00649](#)
  - At least one of **image** and **buffer** must be `VK_NULL_HANDLE`
- [VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00650](#)
  - If **image** is not `VK_NULL_HANDLE`, the image must have been created with `VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation` equal to `VK_TRUE`
- [VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-00651](#)
  - If **buffer** is not `VK_NULL_HANDLE`, the buffer must have been created with `VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation` equal to `VK_TRUE`
- [VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00652](#)
  - If **image** is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the image
- [VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-00653](#)
  - If **buffer** is not `VK_NULL_HANDLE`, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the buffer
- [VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00654](#)
  - If **image** is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation, the memory being imported must also be a dedicated image allocation and **image** must be identical to the image associated with the imported memory
- [VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-00655](#)
  - If **buffer** is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation, the memory being imported must also be a dedicated buffer allocation and **buffer** must be identical to the buffer associated with the imported memory

### Valid Usage (Implicit)

- [VUID-VkDedicatedAllocationMemoryAllocateInfoNV-sType-sType](#)
  - **sType** must be `VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_MEMORY_ALLOCATE_INFO_NV`
- [VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-parameter](#)
  - If **image** is not `VK_NULL_HANDLE`, **image** must be a valid `VkImage` handle
- [VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-parameter](#)
  - If **buffer** is not `VK_NULL_HANDLE`, **buffer** must be a valid `VkBuffer` handle
- [VUID-VkDedicatedAllocationMemoryAllocateInfoNV-commonparent](#)
  - Both of **buffer**, and **image** that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`
If the `pNext` chain includes a `VkMemoryPriorityAllocateInfoEXT` structure, then that structure includes a priority for the memory.

The `VkMemoryPriorityAllocateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_memory_priority
typedef struct VkMemoryPriorityAllocateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    float priority;
} VkMemoryPriorityAllocateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `priority` is a floating-point value between 0 and 1, indicating the priority of the allocation relative to other memory allocations. Larger values are higher priority. The granularity of the priorities is implementation-dependent.

Memory allocations with higher priority may be more likely to stay in device-local memory when the system is under memory pressure.

If this structure is not included, it is as if the `priority` value were 0.5.

**Valid Usage**

- VUID-VkMemoryPriorityAllocateInfoEXT-priority-02602
  
  `priority` must be between 0 and 1, inclusive

**Valid Usage (Implicit)**

- VUID-VkMemoryPriorityAllocateInfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_PRIORITY_ALLOCATE_INFO_EXT`

When allocating memory whose payload may be exported to another process or Vulkan instance, add a `VkExportMemoryAllocateInfo` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure, specifying the handle types that may be exported.

The `VkExportMemoryAllocateInfo` structure is defined as:
or the equivalent

```c
// Provided by VK_KHR_external_memory
typedef VkExportMemoryAllocateInfo VkExportMemoryAllocateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more memory handle types the application can export from the resulting allocation. The application can request multiple handle types for the same allocation.

### Valid Usage

- VUID-VkExportMemoryAllocateInfo-handleTypes-00656
  The bits in `handleTypes` must be supported and compatible, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`

### Valid Usage (Implicit)

- VUID-VkExportMemoryAllocateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO`

- VUID-VkExportMemoryAllocateInfo-handleTypes-parameter
  `handleTypes` must be a valid combination of `VkExternalMemoryHandleTypeFlagBits` values

To specify additional attributes of NT handles exported from a memory object, add a `VkExportMemoryWin32HandleInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkExportMemoryWin32HandleInfoKHR` structure is defined as:
typedef struct VkExportMemoryWin32HandleInfoKHR {
    VkStructureType       sType;
    const void*           pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD                  dwAccess;
    LPCWSTR                name;
} VkExportMemoryWin32HandleInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pAttributes** is a pointer to a Windows SECURITY_ATTRIBUTES structure specifying security attributes of the handle.
- **dwAccess** is a DWORD specifying access rights of the handle.
- **name** is a null-terminated UTF-16 string to associate with the payload referenced by NT handles exported from the created memory.

If **VkExportMemoryAllocateInfo** is not present in the same **pNext** chain, this structure is ignored.

If **VkExportMemoryAllocateInfo** is present in the **pNext** chain of **VkMemoryAllocateInfo** with a Windows **handleType**, but either **VkExportMemoryWin32HandleInfoKHR** is not present in the **pNext** chain, or if it is but **pAttributes** is set to NULL, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”\(^1\). Further, if the structure is not present, the access rights used depend on the handle type.

For handles of the following types:

```
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT
```

The implementation **must** ensure the access rights allow read and write access to the memory.

For handles of the following types:

```
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT
```

The access rights **must be:**

```
GENERIC_ALL
```

Valid Usage

• VUID-VkExportMemoryWin32HandleInfoKHR-handleTypes-00657

If `VkExportMemoryAllocateInfo::handleTypes` does not include `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT, or VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, a `VkExportMemoryWin32HandleInfoKHR` structure must not be included in the `pNext` chain of `VkMemoryAllocateInfo`.

Valid Usage (Implicit)

• VUID-VkExportMemoryWin32HandleInfoKHR-sType-sType

  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_KHR`

• VUID-VkExportMemoryWin32HandleInfoKHR-pAttributes-parameter

  If `pAttributes` is not `NULL`, `pAttributes` must be a valid pointer to a valid `SECURITY_ATTRIBUTES` value.

To import memory from a Windows handle, add a `VkImportMemoryWin32HandleInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure.

The `VkImportMemoryWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkImportMemoryWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportMemoryWin32HandleInfoKHR;
```

• `sType` is the type of this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `handleType` specifies the type of `handle` or `name`.

• `handle` is the external handle to import, or `NULL`.

• `name` is a null-terminated UTF-16 string naming the payload to import, or `NULL`.

Importing memory object payloads from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release handle ownership using the `CloseHandle` system call when the handle is no longer needed. For handle types defined as NT handles, the imported memory object holds a reference to its payload.
**Non-NT handle import operations do not add a reference to their associated payload. If the original object owning the payload is destroyed, all resources and handles sharing that payload will become invalid.**

Applications **can** import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation **must** create a distinct `VkDeviceMemory` object.

### Valid Usage

- **VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00658**
  - *If `handleType` is not 0, it must be supported for import, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`*

- **VUID-VkImportMemoryWin32HandleInfoKHR-handle-00659**
  - *The memory from which `handle` was exported, or the memory named by `name` must have been created on the same underlying physical device as `device`*

- **VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00660**
  - *If `handleType` is not 0, it must be defined as an NT handle or a global share handle*

- **VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01439**
  - *If `handleType` is not `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, `name` must be NULL*

- **VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01440**
  - *If `handleType` is not 0 and `handle` is NULL, `name` must name a valid memory resource of the type specified by `handleType`*

- **VUID-VkImportMemoryWin32HandleInfoKHR-handle-01441**
  - *If `handle` is not NULL, `name` must be NULL*

- **VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01518**
  - *If `handle` is not NULL, it must obey any requirements listed for `handleType` in external memory handle types compatibility*

- **VUID-VkImportMemoryWin32HandleInfoKHR-name-01519**
  - *If `name` is not NULL, it must obey any requirements listed for `handleType` in external memory handle types compatibility*
Valid Usage (Implicit)

- VUID-VkImportMemoryWin32HandleInfoKHR-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_KHR

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-parameter
  
  If handleType is not 0, handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

To export a Windows handle representing the payload of a Vulkan device memory object, call:

```c
// Provided by VK_KHR_external_memory_win32
VkResult vkGetMemoryWin32HandleKHR(
    VkDevice device, 
    const VkMemoryGetWin32HandleInfoKHR* pGetWin32HandleInfo, 
    HANDLE* pHandle);
```

- device is the logical device that created the device memory being exported.
- pGetWin32HandleInfo is a pointer to a VkMemoryGetWin32HandleInfoKHR structure containing parameters of the export operation.
- pHandle will return the Windows handle representing the payload of the device memory object.

For handle types defined as NT handles, the handles returned by vkGetMemoryWin32HandleKHR are owned by the application and hold a reference to their payload. To avoid leaking resources, the application must release ownership of them using the CloseHandle system call when they are no longer needed.

**Note**

Non-NT handle types do not add a reference to their associated payload. If the original object owning the payload is destroyed, all resources and handles sharing that payload will become invalid.

Valid Usage (Implicit)

- VUID-vkGetMemoryWin32HandleKHR-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkGetMemoryWin32HandleKHR-pGetWin32HandleInfo-parameter
  
  pGetWin32HandleInfo must be a valid pointer to a valid VkMemoryGetWin32HandleInfoKHR structure

- VUID-vkGetMemoryWin32HandleKHR-pHandle-parameter
  
  pHandle must be a valid pointer to a HANDLE value
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkMemoryGetWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkMemoryGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetWin32HandleInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` is the memory object from which the handle will be exported.
- `handleType` is the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalMemoryHandleTypeFlagBits` for a description of the properties of the defined external memory handle types.

Valid Usage

- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00662
  `handleType` must have been included in `VkExportMemoryAllocateInfo::handleTypes` when `memory` was created

- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00663
  If `handleType` is defined as an NT handle, `vkGetMemoryWin32HandleKHR` must be called no more than once for each valid unique combination of `memory` and `handleType`

- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00664
  `handleType` must be defined as an NT handle or a global share handle
Valid Usage (Implicit)

- **VUID-VkMemoryGetWin32HandleInfoKHR-sType-sType**
  
  sType must be VK_STRUCTURE_TYPE_MEMORY_GET_WIN32_HANDLE_INFO_KHR

- **VUID-VkMemoryGetWin32HandleInfoKHR-pNext-pNext**
  
  pNext must be NULL

- **VUID-VkMemoryGetWin32HandleInfoKHR-memory-parameter**
  
  memory must be a valid VkDeviceMemory handle

- **VUID-VkMemoryGetWin32HandleInfoKHR-handleType-parameter**
  
  handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

Windows memory handles compatible with Vulkan may also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```c
// Provided by VK_KHR_external_memory_win32
VkResult vkGetMemoryWin32HandlePropertiesKHR(
    VkDevice                                    device,
    VkExternalMemoryHandleTypeFlagBits          handleType,
    HANDLE                                      handle,
    VkMemoryWin32HandlePropertiesKHR*           pMemoryWin32HandleProperties);
```

- **device** is the logical device that will be importing handle.
- **handleType** is the type of the handle handle.
- **handle** is the handle which will be imported.
- **pMemoryWin32HandleProperties** will return properties of handle.

Valid Usage

- **VUID-vkGetMemoryWin32HandlePropertiesKHR-handle-00665**
  
  handle must be an external memory handle created outside of the Vulkan API

- **VUID-vkGetMemoryWin32HandlePropertiesKHR-handleType-00666**
  
  handleType must not be one of the handle types defined as opaque
Valid Usage (Implicit)

- VUID-vkGetMemoryWin32HandlePropertiesKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetMemoryWin32HandlePropertiesKHR-handleType-parameter
  handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

- VUID-vkGetMemoryWin32HandlePropertiesKHR-pMemoryWin32HandleProperties-parameter
  pMemoryWin32HandleProperties must be a valid pointer to a
  VkMemoryWin32HandlePropertiesKHR structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkMemoryWin32HandlePropertiesKHR structure returned is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkMemoryWin32HandlePropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           memoryTypeBits;
} VkMemoryWin32HandlePropertiesKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **memoryTypeBits** is a bitmask containing one bit set for every memory type which the specified windows handle can be imported as.

Valid Usage (Implicit)

- VUID-VkMemoryWin32HandlePropertiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_WIN32_HANDLE_PROPERTIES_KHR

- VUID-VkMemoryWin32HandlePropertiesKHR-pNext-pNext
  pNext must be NULL

To import memory from a POSIX file descriptor handle, add a VkImportMemoryFdInfoKHR structure to the pNext chain of the VkMemoryAllocateInfo structure. The VkImportMemoryFdInfoKHR
structure is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkImportMemoryFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    int fd;
} VkImportMemoryFdInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` specifies the handle type of `fd`.
- `fd` is the external handle to import.

Importing memory from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application must not perform any operations on the file descriptor after a successful import. The imported memory object holds a reference to its payload.

Applications can import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation must create a distinct `VkDeviceMemory` object.

### Valid Usage

- **VUID-VkImportMemoryFdInfoKHR-handleType-00667**  
  If `handleType` is not `0`, it must be supported for import, as reported by  
  `VkExternalImageFormatProperties` or `VkExternalBufferProperties`.

- **VUID-VkImportMemoryFdInfoKHR-fd-00668**  
  The memory from which `fd` was exported must have been created on the same underlying physical device as `device`.

- **VUID-VkImportMemoryFdInfoKHR-handleType-00669**  
  If `handleType` is not `0`, it must be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT`.

- **VUID-VkImportMemoryFdInfoKHR-handleType-00670**  
  If `handleType` is not `0`, `fd` must be a valid POSIX file descriptor handle.

- **VUID-VkImportMemoryFdInfoKHR-fd-01746**  
  The memory represented by `fd` must have been created from a physical device and driver that is compatible with `device` and `handleType`, as described in External memory handle types compatibility.

- **VUID-VkImportMemoryFdInfoKHR-fd-01520**  
  `fd` must obey any requirements listed for `handleType` in external memory handle types compatibility.
To export a POSIX file descriptor referencing the payload of a Vulkan device memory object, call:

```c
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdKHR(
    VkDevice                                    device,
    const VkMemoryGetFdInfoKHR*                 pGetFdInfo,
    int*                                        pFd);
```

- `device` is the logical device that created the device memory being exported.
- `pGetFdInfo` is a pointer to a `VkMemoryGetFdInfoKHR` structure containing parameters of the export operation.
- `pFd` will return a file descriptor referencing the payload of the device memory object.

Each call to `vkGetMemoryFdKHR` must create a new file descriptor holding a reference to the memory object’s payload and transfer ownership of the file descriptor to the application. To avoid leaking resources, the application must release ownership of the file descriptor using the `close` system call when it is no longer needed, or by importing a Vulkan memory object from it. Where supported by the operating system, the implementation must set the file descriptor to be closed automatically when an `execve` system call is made.

---

**Valid Usage (Implicit)**

- VUID-vkGetMemoryFdKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetMemoryFdKHR-pGetFdInfo-parameter
  - `pGetFdInfo` must be a valid pointer to a valid `VkMemoryGetFdInfoKHR` structure
- VUID-vkGetMemoryFdKHR-pFd-parameter
  - `pFd` must be a valid pointer to an `int` value
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkMemoryGetFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkMemoryGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetFdInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` is the memory object from which the handle will be exported.
- `handleType` is the type of handle requested.

The properties of the file descriptor exported depend on the value of `handleType`. See `VkExternalMemoryHandleTypeFlagBits` for a description of the properties of the defined external memory handle types.

**Note**
The size of the exported file **may** be larger than the size requested by `VkMemoryAllocateInfo::allocationSize`. If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT`, then the application **can** query the file’s actual size with `lseek(2)`.

Valid Usage

- VUID-VkMemoryGetFdInfoKHR-handleType-00671
  - `handleType` must have been included in `VkExportMemoryAllocateInfo::handleTypes` when `memory` was created

- VUID-VkMemoryGetFdInfoKHR-handleType-00672
  - `handleType` must be defined as a POSIX file descriptor handle
Valid Usage (Implicit)

- VUID-VkMemoryGetFdInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_GET_FD_INFO_KHR

- VUID-VkMemoryGetFdInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkMemoryGetFdInfoKHR-memory-parameter
  memory must be a valid VkDeviceMemory handle

- VUID-VkMemoryGetFdInfoKHR-handleType-parameter
  handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

POSIX file descriptor memory handles compatible with Vulkan may also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```c
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdPropertiesKHR(
    VkDevice                                    device,         
    VkExternalMemoryHandleTypeFlagBits          handleType,    
    int                                        fd,           
    VkMemoryFdPropertiesKHR*                    pMemoryFdProperties);
```

- `device` is the logical device that will be importing `fd`.
- `handleType` is the type of the handle `fd`.
- `fd` is the handle which will be imported.
- `pMemoryFdProperties` is a pointer to a VkMemoryFdPropertiesKHR structure in which the properties of the handle `fd` are returned.

Valid Usage

- VUID-vkGetMemoryFdPropertiesKHR-fd-00673
  `fd` must be an external memory handle created outside of the Vulkan API

- VUID-vkGetMemoryFdPropertiesKHR-handleType-00674
  `handleType` must not be VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT_KHR
Valid Usage (Implicit)

- VUID-vkGetMemoryFdPropertiesKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetMemoryFdPropertiesKHR-handleType-parameter
dhandleType must be a valid VkExternalMemoryHandleTypeFlagBits value

- VUID-vkGetMemoryFdPropertiesKHR-pMemoryFdProperties-parameter
pMemoryFdProperties must be a valid pointer to a VkMemoryFdPropertiesKHR structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkMemoryFdPropertiesKHR structure returned is defined as:

```cpp
// Provided by VK_KHR_external_memory_fd
typedef struct VkMemoryFdPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           memoryTypeBits;
} VkMemoryFdPropertiesKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memoryTypeBits is a bitmask containing one bit set for every memory type which the specified file descriptor can be imported as.

Valid Usage (Implicit)

- VUID-VkMemoryFdPropertiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_FD_PROPERTIES_KHR

- VUID-VkMemoryFdPropertiesKHR-pNext-pNext
  pNext must be NULL

To import memory from a host pointer, add a VkImportMemoryHostPointerInfoEXT structure to the pNext chain of the VkMemoryAllocateInfo structure. The VkImportMemoryHostPointerInfoEXT structure is defined as:
// Provided by VK_EXT_external_memory_host

typedef struct VkImportMemoryHostPointerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    void* pHostPointer;
} VkImportMemoryHostPointerInfoEXT;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **handleType** specifies the handle type.
- **pHostPointer** is the host pointer to import from.

Importing memory from a host pointer shares ownership of the memory between the host and the Vulkan implementation. The application can continue to access the memory through the host pointer but it is the application’s responsibility to synchronize device and non-device access to the payload as defined in Host Access to Device Memory Objects.

Applications can import the same payload into multiple instances of Vulkan and multiple times into a given Vulkan instance. However, implementations may fail to import the same payload multiple times into a given physical device due to platform constraints.

Importing memory from a particular host pointer may not be possible due to additional platform-specific restrictions beyond the scope of this specification in which case the implementation must fail the memory import operation with the error code VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR.

Whether device memory objects imported from a host pointer hold a reference to their payload is undefined. As such, the application must ensure that the imported memory range remains valid and accessible for the lifetime of the imported memory object.
Valid Usage

- **VUID-VkImportMemoryHostPointerInfoEXT-handleType-01747**
  If `handleType` is not 0, it **must** be supported for import, as reported in `VkExternalMemoryProperties`

- **VUID-VkImportMemoryHostPointerInfoEXT-handleType-01748**
  If `handleType` is not 0, it **must** be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`

- **VUID-VkImportMemoryHostPointerInfoEXT-pHostPointer-01749**
  `pHostPointer` **must** be a pointer aligned to an integer multiple of `VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment`

- **VUID-VkImportMemoryHostPointerInfoEXT-handleType-01750**
  If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT`, `pHostPointer` **must** be a pointer to `allocationSize` number of bytes of host memory, where `allocationSize` is the member of the `VkMemoryAllocateInfo` structure this structure is chained to

- **VUID-VkImportMemoryHostPointerInfoEXT-handleType-01751**
  If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`, `pHostPointer` **must** be a pointer to `allocationSize` number of bytes of host mapped foreign memory, where `allocationSize` is the member of the `VkMemoryAllocateInfo` structure this structure is chained to

Valid Usage (Implicit)

- **VUID-VkImportMemoryHostPointerInfoEXT-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_HOST_POINTER_INFO_EXT`

- **VUID-VkImportMemoryHostPointerInfoEXT-handleType-parameter**
  `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

To determine the correct parameters to use when importing host pointers, call:

```c
VkResult vkGetMemoryHostPointerPropertiesEXT(
    VkDevice                                    device,
    VkExternalMemoryHandleTypeFlagBits          handleType,
    const void*                                 pHostPointer,
    VkMemoryHostPointerPropertiesEXT*           pMemoryHostPointerProperties);
```

- `device` is the logical device that will be importing `pHostPointer`
- `handleType` is the type of the handle `pHostPointer`
- `pHostPointer` is the host pointer to import from
- `pMemoryHostPointerProperties` is a pointer to a `VkMemoryHostPointerPropertiesEXT` structure in
which the host pointer properties are returned.

**Valid Usage**

- **VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01752**
  
  *handleType must be* VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT

- **VUID-vkGetMemoryHostPointerPropertiesEXT-pHostPointer-01753**
  
  *pHostPointer must be a pointer aligned to an integer multiple of VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment*

- **VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01754**
  
  *If handleType is VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT, pHostPointer must be a pointer to host memory*

- **VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01755**
  
  *If handleType is VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT, pHostPointer must be a pointer to host mapped foreign memory*

**Valid Usage (Implicit)**

- **VUID-vkGetMemoryHostPointerPropertiesEXT-device-parameter**
  
  *device must be a valid VkDevice handle*

- **VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-parameter**
  
  *handleType must be a valid VkExternalMemoryHandleTypeFlagBits value*

- **VUID-vkGetMemoryHostPointerPropertiesEXT-pMemoryHostPointerProperties-parameter**
  
  *pMemoryHostPointerProperties must be a valid pointer to a VkMemoryHostPointerPropertiesEXT structure*

**Return Codes**

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkMemoryHostPointerPropertiesEXT structure is defined as:
typedef struct VkMemoryHostPointerPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
} VkMemoryHostPointerPropertiesEXT;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **memoryTypeBits** is a bitmask containing one bit set for every memory type which the specified host pointer can be imported as.

The value returned by `memoryTypeBits` must only include bits that identify memory types which are host visible.

**Valid Usage (Implicit)**

- VUID-VkMemoryHostPointerPropertiesEXT-sType-sType
  - **sType** must be `VK_STRUCTURE_TYPE_MEMORY_HOST_POINTER_PROPERTIES_EXT`
- VUID-VkMemoryHostPointerPropertiesEXT-pNext-pNext
  - **pNext** must be NULL

To import memory created outside of the current Vulkan instance from an Android hardware buffer, add a `VkImportAndroidHardwareBufferInfoANDROID` structure to the pNext chain of the `VkMemoryAllocateInfo` structure. The `VkImportAndroidHardwareBufferInfoANDROID` structure is defined as:

typedef struct VkImportAndroidHardwareBufferInfoANDROID {
    VkStructureType sType;
    const void* pNext;
    struct AHardwareBuffer* buffer;
} VkImportAndroidHardwareBufferInfoANDROID;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **buffer** is the Android hardware buffer to import.

If the `vkAllocateMemory` command succeeds, the implementation must acquire a reference to the imported hardware buffer, which it must release when the device memory object is freed. If the command fails, the implementation must not retain a reference.
Valid Usage

• VUID-VkImportAndroidHardwareBufferInfoANDROID-buffer-01880
  If buffer is not NULL, Android hardware buffers must be supported for import, as reported by VkExternalImageFormatProperties or VkExternalBufferProperties.

• VUID-VkImportAndroidHardwareBufferInfoANDROID-buffer-01881
  If buffer is not NULL, it must be a valid Android hardware buffer object with AHardwareBuffer_Desc::usage compatible with Vulkan as described in Android Hardware Buffers.

Valid Usage (Implicit)

• VUID-VkImportAndroidHardwareBufferInfoANDROID-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMPORT_ANDROID_HARDWARE_BUFFER_INFO_ANDROID.

• VUID-VkImportAndroidHardwareBufferInfoANDROID-buffer-parameter
  buffer must be a valid pointer to an AHardwareBuffer value.

To export an Android hardware buffer referencing the payload of a Vulkan device memory object, call:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
VkResult vkGetMemoryAndroidHardwareBufferANDROID(
    VkDevice device,
    const VkMemoryGetAndroidHardwareBufferInfoANDROID* pInfo,
    struct AHardwareBuffer** pBuffer);
```

• device is the logical device that created the device memory being exported.

• pInfo is a pointer to a VkMemoryGetAndroidHardwareBufferInfoANDROID structure containing parameters of the export operation.

• pBuffer will return an Android hardware buffer referencing the payload of the device memory object.

Each call to vkGetMemoryAndroidHardwareBufferANDROID must return an Android hardware buffer with a new reference acquired in addition to the reference held by the VkDeviceMemory. To avoid leaking resources, the application must release the reference by calling AHardwareBuffer_release when it is no longer needed. When called with the same handle in VkMemoryGetAndroidHardwareBufferInfoANDROID::memory, vkGetMemoryAndroidHardwareBufferANDROID must return the same Android hardware buffer object. If the device memory was created by importing an Android hardware buffer, vkGetMemoryAndroidHardwareBufferANDROID must return that same Android hardware buffer object.
Valid Usage (Implicit)

- **VUID-vkGetMemoryAndroidHardwareBufferANDROID-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetMemoryAndroidHardwareBufferANDROID-pInfo-parameter**
  
  `pInfo` must be a valid pointer to a valid `VkMemoryGetAndroidHardwareBufferInfoANDROID` structure

- **VUID-vkGetMemoryAndroidHardwareBufferANDROID-pBuffer-parameter**
  
  `pBuffer` must be a valid pointer to a valid pointer to an `AHardwareBuffer` value

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkMemoryGetAndroidHardwareBufferInfoANDROID` structure is defined as:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkMemoryGetAndroidHardwareBufferInfoANDROID {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
} VkMemoryGetAndroidHardwareBufferInfoANDROID;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` is the memory object from which the Android hardware buffer will be exported.

Valid Usage

- **VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-handleTypes-01882**
  
  `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID` must have been included in `VkExportMemoryAllocateInfo::handleTypes` when `memory` was created

- **VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-pNext-01883**
  
  If the `pNext` chain of the `VkMemoryAllocateInfo` used to allocate `memory` included a `VkMemoryDedicatedAllocateInfo` with non-`NULL` image member, then that `image` must already be bound to `memory`
Valid Usage (Implicit)

- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_GET_ANDROID_HARDWARE_BUFFER_INFO_ANDROID

- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-pNext-pNext
  pNext must be NULL

- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-memory-parameter
  memory must be a valid VkDeviceMemory handle

To determine the memory parameters to use when importing an Android hardware buffer, call:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
VkResult vkGetAndroidHardwareBufferPropertiesANDROID(
    VkDevice                                    device,
    const struct AHardwareBuffer*               buffer,
    VkAndroidHardwareBufferPropertiesANDROID*   pProperties);
```

- device is the logical device that will be importing buffer.
- buffer is the Android hardware buffer which will be imported.
- pProperties is a pointer to a VkAndroidHardwareBufferPropertiesANDROID structure in which the properties of buffer are returned.

Valid Usage

- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-buffer-01884
  buffer must be a valid Android hardware buffer object with at least one of the
  AHWAREBUFFER_USAGE_GPU_* flags in its AHardwareBuffer_Desc::usage

Valid Usage (Implicit)

- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-buffer-parameter
  buffer must be a valid pointer to a valid AHardwareBuffer value

- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-pProperties-parameter
  pProperties must be a valid pointer to a VkAndroidHardwareBufferPropertiesANDROID structure
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR

The `VkAndroidHardwareBufferPropertiesANDROID` structure returned is defined as:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef structVkAndroidHardwareBufferPropertiesANDROID {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize       allocationSize;
    uint32_t           memoryTypeBits;
} VkAndroidHardwareBufferPropertiesANDROID;
```

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `allocationSize` is the size of the external memory
• `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified Android hardware buffer can be imported as.

Valid Usage (Implicit)

• `VUID-VkAndroidHardwareBufferPropertiesANDROID-sType-sType`
  `sType` must be `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_PROPERTIESANDROID`

• `VUID-VkAndroidHardwareBufferPropertiesANDROID-pNext-pNext`
  `pNext` must be `NULL` or a pointer to a valid instance of `VkAndroidHardwareBufferFormatPropertiesANDROID`

• `VUID-VkAndroidHardwareBufferPropertiesANDROID-sType-unique`
  The `sType` value of each struct in the `pNext` chain must be unique

To obtain format properties of an Android hardware buffer, include a `VkAndroidHardwareBufferFormatPropertiesANDROID` structure in the `pNext` chain of the `VkAndroidHardwareBufferPropertiesANDROID` structure passed to `vkGetAndroidHardwareBufferPropertiesANDROID`. This structure is defined as:
typedef struct VkAndroidHardwareBufferFormatPropertiesANDROID {
    VkStructureType sType;
    void* pNext;
    VkFormat format;
    uint64_t externalFormat;
    VkFormatFeatureFlags formatFeatures;
    VkComponentMapping samplerYcbcrConversionComponents;
    VkSamplerYcbcrModelConversion suggestedYcbcrModel;
    VkSamplerYcbcrRange suggestedYcbcrRange;
    VkChromaLocation suggestedXChromaOffset;
    VkChromaLocation suggestedYChromaOffset;
} VkAndroidHardwareBufferFormatPropertiesANDROID;

• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **format** is the Vulkan format corresponding to the Android hardware buffer’s format, or **VK_FORMAT_UNDEFINED** if there is not an equivalent Vulkan format.

• **externalFormat** is an implementation-defined external format identifier for use with **VkExternalFormatANDROID**. It **must** not be zero.

• **formatFeatures** describes the capabilities of this external format when used with an image bound to memory imported from **buffer**.

• **samplerYcbcrConversionComponents** is the component swizzle that **should** be used in **VkSamplerYcbcrConversionCreateInfo**.

• **suggestedYcbcrModel** is a suggested color model to use in the **VkSamplerYcbcrConversionCreateInfo**.

• **suggestedYcbcrRange** is a suggested numerical value range to use in **VkSamplerYcbcrConversionCreateInfo**.

• **suggestedXChromaOffset** is a suggested X chroma offset to use in **VkSamplerYcbcrConversionCreateInfo**.

• **suggestedYChromaOffset** is a suggested Y chroma offset to use in **VkSamplerYcbcrConversionCreateInfo**.

If the Android hardware buffer has one of the formats listed in the **Format Equivalence table**, then **format** must have the equivalent Vulkan format listed in the table. Otherwise, **format** may be **VK_FORMAT_UNDEFINED**, indicating the Android hardware buffer can only be used with an external format.

The **formatFeatures** member **must** include **VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT** and at least one of **VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT** or **VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT**, and **should** include **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT** and **VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT**.
Note

The `formatFeatures` member only indicates the features available when using an **external-format image** created from the Android hardware buffer. Images from Android hardware buffers with a format other than `VK_FORMAT_UNDEFINED` are subject to the format capabilities obtained from `vkGetPhysicalDeviceFormatProperties2` and `vkGetPhysicalDeviceImageFormatProperties2` with appropriate parameters. These sets of features are independent of each other, e.g. the external format will support sampler YCbCr conversion even if the non-external format does not, and writing to non-external format images is possible but writing to external format images is not.

Android hardware buffers with the same external format must have the same support for `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`, `VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT`, `VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT`, `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT`, `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT`, and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT` in `formatFeatures`. Other format features may differ between Android hardware buffers that have the same external format. This allows applications to use the same `VkSamplerYcbcrConversion` object (and samplers and pipelines created from them) for any Android hardware buffers that have the same external format.

If `format` is not `VK_FORMAT_UNDEFINED`, then the value of `samplerYcbcrConversionComponents` must be valid when used as the `components` member of `VkSamplerYcbcrConversionCreateInfo` with that format. If `format` is `VK_FORMAT_UNDEFINED`, all members of `samplerYcbcrConversionComponents` must be the identity swizzle.

Implementations may not always be able to determine the color model, numerical range, or chroma offsets of the image contents, so the values in `VkAndroidHardwareBufferFormatPropertiesANDROID` are only suggestions. Applications should treat these values as sensible defaults to use in the absence of more reliable information obtained through some other means. If the underlying physical device is also usable via OpenGL ES with the `GL_OES_EGL_image_external` extension, the implementation should suggest values that will produce similar sampled values as would be obtained by sampling the same external image via `samplerExternalOES` in OpenGL ES using equivalent sampler parameters.

Note

Since `GL_OES_EGL_image_external` does not require the same sampling and conversion calculations as Vulkan does, achieving identical results between APIs may not be possible on some implementations.

**Valid Usage (Implicit)**

- `VUID-VkAndroidHardwareBufferFormatPropertiesANDROID-sType-sType` sType must be `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_FORMAT_PROPERTIES_ANDROID`
When allocating memory that **may** be exported to another process or Vulkan instance, add a `VkExportMemoryAllocateInfoNV` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure, specifying the handle types that **may** be exported.

The `VkExportMemoryAllocateInfoNV` structure is defined as:

```c
// Provided by VK_NV_external_memory
typedef struct VkExportMemoryAllocateInfoNV {
    VkStructureType                      sType;
    const void*                          pNext;
    VkExternalMemoryHandleTypeFlagsNV    handleTypes;
} VkExportMemoryAllocateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBitsNV` specifying one or more memory handle types that **may** be exported. Multiple handle types **may** be requested for the same allocation as long as they are compatible, as reported by `vkGetPhysicalDeviceExternalImageFormatPropertiesNV`.

### Valid Usage (Implicit)

- VUID-VkExportMemoryAllocateInfoNV-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO_NV`.

- VUID-VkExportMemoryAllocateInfoNV-handleTypes-parameter
  
  `handleTypes` **must** be a valid combination of `VkExternalMemoryHandleTypeFlagBitsNV` values.

When `VkExportMemoryAllocateInfoNV::handleTypes` includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV`, add a `VkExportMemoryWin32HandleInfoNV` structure to the `pNext` chain of the `VkExportMemoryAllocateInfoNV` structure to specify security attributes and access rights for the memory object's external handle.

The `VkExportMemoryWin32HandleInfoNV` structure is defined as:

```c
// Provided by VK_NV_external_memory_win32
typedef struct VkExportMemoryWin32HandleInfoNV {
    VkStructureType               sType;
    const void*                   pNext;
    const SECURITY_ATTRIBUTES*    pAttributes;
    DWORD                         dwAccess;
} VkExportMemoryWin32HandleInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• **pAttributes** is a pointer to a Windows **SECURITY_ATTRIBUTES** structure specifying security attributes of the handle.

• **dwAccess** is a DWORD specifying access rights of the handle.

If this structure is not present, or if **pAttributes** is set to **NULL**, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights will be

**DXGI_SHARED_RESOURCE_READ | DXGI_SHARED_RESOURCE_WRITE**

1

---

**Valid Usage (Implicit)**

• VUID-VkExportMemoryWin32HandleInfoNV-sType-sType
  
  sType must be **VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_NV**

• VUID-VkExportMemoryWin32HandleInfoNV-pAttributes-parameter
  
  If **pAttributes** is not **NULL**, **pAttributes** must be a valid pointer to a valid **SECURITY_ATTRIBUTES** value

To import memory created on the same physical device but outside of the current Vulkan instance, add a **VkImportMemoryWin32HandleInfoNV** structure to the **pNext** chain of the **VkMemoryAllocateInfo** structure, specifying a handle to and the type of the memory.

The **VkImportMemoryWin32HandleInfoNV** structure is defined as:

```c
// Provided by VK_NV_external_memory_win32
typedef struct VkImportMemoryWin32HandleInfoNV {
    VkStructureType                      sType;
    const void*                          pNext;
    VkExternalMemoryHandleTypeFlagsNV    handleType;
    HANDLE                               handle;
} VkImportMemoryWin32HandleInfoNV;
```

• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **handleType** is **0** or a **VkExternalMemoryHandleTypeFlagBitsNV** value specifying the type of memory handle in **handle**.

• **handle** is a Windows **HANDLE** referring to the memory.

If **handleType** is **0**, this structure is ignored by consumers of the **VkMemoryAllocateInfo** structure it is chained from.
Valid Usage

- VUID-VkImportMemoryWin32HandleInfoNV-handleType-01327
  handleType must not have more than one bit set

- VUID-VkImportMemoryWin32HandleInfoNV-handle-01328
  handle must be a valid handle to memory, obtained as specified by handleType

Valid Usage (Implicit)

- VUID-VkImportMemoryWin32HandleInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_NV

- VUID-VkImportMemoryWin32HandleInfoNV-handleType-parameter
  handleType must be a valid combination of VkExternalMemoryHandleTypeFlagBitsNV values

Bits which can be set in handleType are:

Possible values of VkImportMemoryWin32HandleInfoNV::handleType, specifying the type of an external memory handle, are:

```cpp
// Provided by VK_NV_external_memory_capabilities
typedef enum VkExternalMemoryHandleTypeFlagBitsNV {
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV = 0x00000001,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_NV = 0x00000002,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_BIT_NV = 0x00000004,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_KMT_BIT_NV = 0x00000008,
} VkExternalMemoryHandleTypeFlagBitsNV;
```

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_NV** specifies a handle to memory returned by vkGetMemoryWin32HandleNV.

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV** specifies a handle to memory returned by vkGetMemoryWin32HandleNV, or one duplicated from such a handle using DuplicateHandle().

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_BIT_NV** specifies a valid NT handle to memory returned by IDXGIResource1::CreateSharedHandle, or a handle duplicated from such a handle using DuplicateHandle().

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_KMT_BIT_NV** specifies a handle to memory returned by IDXGIResource::GetSharedHandle().

```cpp
// Provided by VK_NV_external_memory_capabilities
typedef VkFlags VkExternalMemoryHandleTypeFlagsNV;
```

VkExternalMemoryHandleTypeFlagsNV is a bitmask type for setting a mask of zero or more...
VkExternalMemoryHandleTypeFlagBitsNV.

To retrieve the handle corresponding to a device memory object created with VkExportMemoryAllocateInfoNV::handleTypes set to include VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV or VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_NV, call:

```c
// Provided by VK_NV_external_memory_win32
VkResult vkGetMemoryWin32HandleNV(
    VkDevice                                    device,
    VkDeviceMemory                              memory,
    VkExternalMemoryHandleTypeFlagsNV           handleType,
    HANDLE*                                     pHandle);
```

- **device** is the logical device that owns the memory.
- **memory** is the VkDeviceMemory object.
- **handleType** is a bitmask of VkExternalMemoryHandleTypeFlagBitsNV containing a single bit specifying the type of handle requested.
- **handle** is a pointer to a Windows HANDLE in which the handle is returned.

## Valid Usage

- VUID-vkGetMemoryWin32HandleNV-handleType-01326
  **handleType** must be a flag specified in VkExportMemoryAllocateInfoNV::handleTypes when allocating memory

## Valid Usage (Implicit)

- VUID-vkGetMemoryWin32HandleNV-device-parameter
  **device** must be a valid VkDevice handle

- VUID-vkGetMemoryWin32HandleNV-memory-parameter
  **memory** must be a valid VkDeviceMemory handle

- VUID-vkGetMemoryWin32HandleNV-handleType-parameter
  **handleType** must be a valid combination of VkExternalMemoryHandleTypeFlagBitsNV values

- VUID-vkGetMemoryWin32HandleNV-handleType-required bitmask
  **handleType** must not be 0

- VUID-vkGetMemoryWin32HandleNV-pHandle-parameter
  **pHandle** must be a valid pointer to a HANDLE value

- VUID-vkGetMemoryWin32HandleNV-memory-parent
  **memory** must have been created, allocated, or retrieved from **device**

#### 11.2.1. Fuchsia External Memory

On Fuchsia, when allocating memory that may be imported from another device, process or Vulkan instance, add a `VkImportMemoryZirconHandleInfoFUCHSIA` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure.

External memory on Fuchsia is imported and exported using VMO handles of type `zx_handle_t`. VMO handles to external memory are canonically obtained from Fuchsia’s Sysmem service or from syscalls such as `zx_vmo_create()`. VMO handles for import can also be obtained by exporting them from another Vulkan instance as described in exporting fuchsia device memory.

Importing VMO handles to the Vulkan instance transfers ownership of the handle to the instance from the application. The application **must** not perform any operations on the handle after successful import.

Applications **can** import the same underlying memory into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation **must** create a distinct `VkDeviceMemory` object.

**Importing Fuchsia External Memory**

The `VkImportMemoryZirconHandleInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_external_memory
typedef struct VkImportMemoryZirconHandleInfoFUCHSIA {
    VkStructureType                      sType;
    const void*                          pNext;
    VkExternalMemoryHandleTypeFlagBits   handleType;
    zx_handle_t                          handle;
} VkImportMemoryZirconHandleInfoFUCHSIA;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is the type of `handle`.
- `handle` is a `zx_handle_t` (Zircon) handle to the external memory.
Valid Usage

- **VUID-VkImportMemoryZirconHandleInfoFUCHSIA-handleType-04771**
  
  handleType must be **VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA**.

- **VUID-VkImportMemoryZirconHandleInfoFUCHSIA-handle-04772**
  
  handle must be a valid VMO handle.

Valid Usage (Implicit)

- **VUID-VkImportMemoryZirconHandleInfoFUCHSIA-sType-sType**
  
  sType must be **VK_STRUCTURE_TYPE_IMPORT_MEMORY_ZIRCON_HANDLE_INFO_FUCHSIA**

- **VUID-VkImportMemoryZirconHandleInfoFUCHSIA-handleType-parameter**
  
  If handleType is not 0, handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

To obtain the memoryTypeIndex for the VkMemoryAllocateInfo structure, call vkGetMemoryZirconHandlePropertiesFUCHSIA:

```c
// Provided by VK_FUCHSIA_external_memory
VkResult vkGetMemoryZirconHandlePropertiesFUCHSIA(
    VkDevice                                    device,
    VkExternalMemoryHandleTypeFlagBits          handleType,
    zx_handle_t                                 zirconHandle,
    VkMemoryZirconHandlePropertiesFUCHSIA*      pMemoryZirconHandleProperties);
```

- **device** is the VkDevice.

- **handleType** is the type of zirconHandle

- **zirconHandle** is a zx_handle_t (Zircon) handle to the external resource.

- **pMemoryZirconHandleProperties** is a pointer to a VkMemoryZirconHandlePropertiesFUCHSIA structure in which the result will be stored.

Valid Usage

- **VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-handleType-04773**
  
  handleType must be **VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA**.

- **VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-zirconHandle-04774**
  
  zirconHandle must reference a valid VMO.
Valid Usage (Implicit)

- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-handleType-parameter
  handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-pMemoryZirconHandleProperties-parameter
  pMemoryZirconHandleProperties must be a valid pointer to a VkMemoryZirconHandlePropertiesFUCHSIA structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkMemoryZirconHandlePropertiesFUCHSIA structure is defined as:

```c
// Provided by VK_FUCHSIA_external_memory
typedef struct VkMemoryZirconHandlePropertiesFUCHSIA {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
} VkMemoryZirconHandlePropertiesFUCHSIA;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `memoryTypeBits` a bitmask containing one bit set for every memory type which the specified handle can be imported as.

Valid Usage (Implicit)

- VUID-VkMemoryZirconHandlePropertiesFUCHSIA-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_ZIRCON_HANDLE_PROPERTIES_FUCHSIA

- VUID-VkMemoryZirconHandlePropertiesFUCHSIA-pNext-pNext
  pNext must be NULL

With pMemoryZirconHandleProperties now successfully populated by vkGetMemoryZirconHandlePropertiesFUCHSIA, assign the VkMemoryAllocateInfo memoryTypeIndex field to a memory type which has a bit set in the
VkMemoryZirconHandlePropertiesFUCHSIA memoryTypeBits field.

Exporting Fuchsia Device Memory

Similar to importing, exporting a VMO handle from Vulkan transfers ownership of the handle from the Vulkan instance to the application. The application is responsible for closing the handle with `zx_handle_close()` when it is no longer in use.

To export device memory as a Zircon handle that can be used by another instance, device, or process, the handle to the `VkDeviceMemory` must be retrieved using `vkGetMemoryZirconHandleFUCHSIA`:

```c
// Provided by VK_FUCHSIA_external_memory
VkResult vkGetMemoryZirconHandleFUCHSIA(
    VkDevice                                    device,
    const VkMemoryGetZirconHandleInfoFUCHSIA*   pGetZirconHandleInfo,
    zx_handle_t*                                pZirconHandle);
```

- `device` is the `VkDevice`.
- `pGetZirconHandleInfo` is a pointer to a `VkMemoryGetZirconHandleInfoFUCHSIA` structure.
- `pZirconHandle` is a pointer to a `zx_handle_t` which holds the resulting Zircon handle.

### Valid Usage (Implicit)

- VUID-vkGetMemoryZirconHandleFUCHSIA-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkGetMemoryZirconHandleFUCHSIA-pGetZirconHandleInfo-parameter
  
  `pGetZirconHandleInfo` must be a valid pointer to a valid `VkMemoryGetZirconHandleInfoFUCHSIA` structure

- VUID-vkGetMemoryZirconHandleFUCHSIA-pZirconHandle-parameter
  
  `pZirconHandle` must be a valid pointer to a `zx_handle_t` value

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

`VkMemoryGetZirconHandleInfoFUCHSIA` is defined as:
typedef struct VkMemoryGetZirconHandleInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_FLAG_BITS_FUCHSIA handleType;
} VkMemoryGetZirconHandleInfoFUCHSIA;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **memory** the **VkDeviceMemory** being exported.
- **handleType** is the type of the handle pointed to by **pZirconHandle** as retrieved by the call to **vkGetMemoryZirconHandleFUCHSIA**.

### Valid Usage

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-handleType-04775
  - **handleType** must be **VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA**.
- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-handleType-04776
  - **handleType** must have been included in the **handleTypes** field of the **VkExportMemoryAllocateInfo** structure when the external memory was allocated.

### Valid Usage (Implicit)

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-sType-sType
  - **sType** must be **VK_STRUCTURE_TYPE_MEMORY_GET_ZIRCON_HANDLE_INFO_FUCHSIA**
- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-pNext-pNext
  - **pNext** must be **NULL**
- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-memory-parameter
  - **memory** must be a valid **VkDeviceMemory** handle
- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-handleType-parameter
  - **handleType** must be a valid **VkExternalMemoryHandleTypeFlagBits** value

With the result **pZirconHandle** now obtained, the memory properties for the handle can be retrieved using **vkGetMemoryZirconHandlePropertiesFUCHSIA** as documented above substituting the dereferenced, retrieved **pZirconHandle** in for the **zirconHandle** argument.

If the **pNext** chain of **VkMemoryAllocateInfo** includes a **VkMemoryAllocateFlagsInfo** structure, then that structure includes flags and a device mask controlling how many instances of the memory will be allocated.

The **VkMemoryAllocateFlagsInfo** structure is defined as:
typedef struct VkMemoryAllocateFlagsInfo {
    VkStructureType sType;
    const void* pNext;
    VkMemoryAllocateFlags flags;
    uint32_t deviceMask;
} VkMemoryAllocateFlagsInfo;

or the equivalent

typedef VkMemoryAllocateFlagsInfo VkMemoryAllocateFlagsInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkMemoryAllocateFlagBits` controlling the allocation.
- **deviceMask** is a mask of physical devices in the logical device, indicating that memory **must** be allocated on each device in the mask, if `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set in `flags`.

If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is not set, the number of instances allocated depends on whether `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is set in the memory heap. If `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is set, then memory is allocated for every physical device in the logical device (as if `deviceMask` has bits set for all device indices). If `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is not set, then a single instance of memory is allocated (as if `deviceMask` is set to one).

On some implementations, allocations from a multi-instance heap **may** consume memory on all physical devices even if the `deviceMask` excludes some devices. If `VkPhysicalDeviceGroupProperties::subsetAllocation` is `VK_TRUE`, then memory is only consumed for the devices in the device mask.

**Note**
In practice, most allocations on a multi-instance heap will be allocated across all physical devices. Unicast allocation support is an optional optimization for a minority of allocations.

**Valid Usage**

- **VUID-VkMemoryAllocateFlagsInfo-deviceMask-00675**
  If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set, `deviceMask` **must** be a valid device mask
- **VUID-VkMemoryAllocateFlagsInfo-deviceMask-00676**
  If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set, `deviceMask` **must** not be zero
Valid Usage (Implicit)

- VUID-VkMemoryAllocateFlagsInfo-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_FLAGS_INFO

- VUID-VkMemoryAllocateFlagsInfo-flags-parameter
  
  flags must be a valid combination of VkMemoryAllocateFlagBits values

Bits which can be set in VkMemoryAllocateFlagsInfo::flags, controlling device memory allocation, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkMemoryAllocateFlagBits {
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT = 0x00000001,
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT = 0x00000002,
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000004,
    // Provided by VK_KHR_device_group
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT,
    // Provided by VK_KHR_buffer_device_address
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT,
    // Provided by VK_KHR_buffer_device_address
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT,
} VkMemoryAllocateFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkMemoryAllocateFlagBits VkMemoryAllocateFlagBitsKHR;
```

- VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT specifies that memory will be allocated for the devices in VkMemoryAllocateFlagsInfo::deviceMask.

- VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT specifies that the memory can be attached to a buffer object created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT bit set in usage, and that the memory handle can be used to retrieve an opaque address via vkGetDeviceMemoryOpaqueCaptureAddress.

- VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT specifies that the memory's address can be saved and reused on a subsequent run (e.g. for trace capture and replay), see VkBufferOpaqueCaptureAddressCreateInfo for more detail.

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkMemoryAllocateFlags;
```

or the equivalent
VkMemoryAllocateFlags is a bitmask type for setting a mask of zero or more VkMemoryAllocateFlagBits.

To request a specific device address for a memory allocation, add a VkMemoryOpaqueCaptureAddressAllocateInfo structure to the pNext chain of the VkMemoryAllocateInfo structure. The VkMemoryOpaqueCaptureAddressAllocateInfo structure is defined as:

```c
typedef struct VkMemoryOpaqueCaptureAddressAllocateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint64_t           opaqueCaptureAddress;
} VkMemoryOpaqueCaptureAddressAllocateInfo;
```

or the equivalent

```c
typedef VkMemoryOpaqueCaptureAddressAllocateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `opaqueCaptureAddress` is the opaque capture address requested for the memory allocation.

If `opaqueCaptureAddress` is zero, no specific address is requested.

If `opaqueCaptureAddress` is not zero, it **should** be an address retrieved from `vkGetDeviceMemoryOpaqueCaptureAddress` on an identically created memory allocation on the same implementation.

**Note**

In most cases, it is expected that a non-zero `opaqueAddress` is an address retrieved from `vkGetDeviceMemoryOpaqueCaptureAddress` on an identically created memory allocation. If this is not the case, it likely that `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS` errors will occur.

This is, however, not a strict requirement because trace capture/replay tools may need to adjust memory allocation parameters for imported memory.

If this structure is not present, it is as if `opaqueCaptureAddress` is zero.
Valid Usage (Implicit)

- VUID-VkMemoryOpaqueCaptureAddressAllocateInfo-sType-sType
  
  sType **must** be VK_STRUCTURE_TYPE_MEMORY_OPAQUE_CAPTURE_ADDRESS_ALLOCATE_INFO

To free a memory object, call:

```c
// Provided by VK_VERSION_1_0
void vkFreeMemory(
    VkDevice device,
    VkDeviceMemory memory,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that owns the memory.
- **memory** is the **VkDeviceMemory** object to be freed.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

Before freeing a memory object, an application **must** ensure the memory object is no longer in use by the device—for example by command buffers in the **pending state**. Memory **can** be freed whilst still bound to resources, but those resources **must** not be used afterwards. Freeing a memory object releases the reference it held, if any, to its payload. If there are still any bound images or buffers, the memory object’s payload **may** not be immediately released by the implementation, but **must** be released by the time all bound images and buffers have been destroyed. Once all references to a payload are released, it is returned to the heap from which it was allocated.

How memory objects are bound to Images and Buffers is described in detail in the Resource Memory Association section.

If a memory object is mapped at the time it is freed, it is implicitly unmapped.

**Note**

As described **below**, host writes are not implicitly flushed when the memory object is unmapped, but the implementation **must** guarantee that writes that have not been flushed do not affect any other memory.

Valid Usage

- VUID-vkFreeMemory-memory-00677
  
  All submitted commands that refer to **memory** (via images or buffers) **must** have completed execution
Valid Usage (Implicit)

- VUID-vkFreeMemory-device-parameter
  \textit{device} \textbf{must} be a valid \texttt{VkDevice} handle

- VUID-vkFreeMemory-memory-parameter
  If \textit{memory} is not \texttt{VK_NULL_HANDLE}, \textit{memory} \textbf{must} be a valid \texttt{VkDeviceMemory} handle

- VUID-vkFreeMemory-pAllocator-parameter
  If \textit{pAllocator} is not \texttt{NULL}, \textit{pAllocator} \textbf{must} be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure

- VUID-vkFreeMemory-memory-parent
  If \textit{memory} is a valid handle, it \textbf{must} have been created, allocated, or retrieved from \texttt{device}

Host Synchronization

- Host access to \textit{memory} \textbf{must} be externally synchronized

11.2.2. Host Access to Device Memory Objects

Memory objects created with \texttt{vkAllocateMemory} are not directly host accessible.

Memory objects created with the memory property \texttt{VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT} are considered \textit{mappable}. Memory objects \textbf{must} be mappable in order to be successfully mapped on the host.

To retrieve a host virtual address pointer to a region of a mappable memory object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkMapMemory(
    VkDevice device,  // Provided by VK_VERSION_1_0
    VkDeviceMemory memory,  // Provided by VK_VERSION_1_0
    VkDeviceSize offset,  // Provided by VK_VERSION_1_0
    VkDeviceSize size,  // Provided by VK_VERSION_1_0
    VkMemoryMapFlags flags,  // Provided by VK_VERSION_1_0
    void** ppData);  // Provided by VK_VERSION_1_0
```

- \texttt{device} is the logical device that owns the memory.
- \texttt{memory} is the \texttt{VkDeviceMemory} object to be mapped.
- \texttt{offset} is a zero-based byte offset from the beginning of the memory object.
- \texttt{size} is the size of the memory range to map, or \texttt{VK_WHOLE_SIZE} to map from \texttt{offset} to the end of the allocation.
- \texttt{flags} is reserved for future use.
- \texttt{ppData} is a pointer to a \texttt{void *} variable in which is returned a host-accessible pointer to the
beginning of the mapped range. This pointer minus offset must be aligned to at least 
\( \text{VkPhysicalDeviceLimits}::\text{minMemoryMapAlignment} \).

After a successful call to \texttt{vkMapMemory} the memory object \textit{memory} is considered to be currently \textit{host mapped}.

\begin{itemize}
  \item[Note] It is an application error to call \texttt{vkMapMemory} on a memory object that is already \textit{host mapped}.
  \item[Note] \texttt{vkMapMemory} will fail if the implementation is unable to allocate an appropriately sized contiguous virtual address range, e.g. due to virtual address space fragmentation or platform limits. In such cases, \texttt{vkMapMemory} must return \texttt{VK_ERROR_MEMORY_MAP_FAILED}. The application can improve the likelihood of success by reducing the size of the mapped range and/or removing unneeded mappings using \texttt{vkUnmapMemory}.
\end{itemize}

\texttt{vkMapMemory} does not check whether the device memory is currently in use before returning the host-accessible pointer. The application must guarantee that any previously submitted command that writes to this range has completed before the host reads from or writes to that range, and that any previously submitted command that reads from that range has completed before the host writes to that region (see here for details on fulfilling such a guarantee). If the device memory was allocated without the \texttt{VK_MEMORY_PROPERTY_HOST_COHERENT_BIT} set, these guarantees must be made for an extended range: the application must round down the start of the range to the nearest multiple of \texttt{VkPhysicalDeviceLimits::nonCoherentAtomSize}, and round the end of the range up to the nearest multiple of \texttt{VkPhysicalDeviceLimits::nonCoherentAtomSize}.

While a range of device memory is host mapped, the application is responsible for synchronizing both device and host access to that memory range.

\begin{itemize}
  \item[Note] It is important for the application developer to become meticulously familiar with all of the mechanisms described in the chapter on \textit{Synchronization and Cache Control} as they are crucial to maintaining memory access ordering.
\end{itemize}
Valid Usage

- VUID-vkMapMemory-memory-00678
  memory must not be currently host mapped

- VUID-vkMapMemory-offset-00679
  offset must be less than the size of memory

- VUID-vkMapMemory-size-00680
  If size is not equal to VK_WHOLE_SIZE, size must be greater than 0

- VUID-vkMapMemory-size-00681
  If size is not equal to VK_WHOLE_SIZE, size must be less than or equal to the size of the memory minus offset

- VUID-vkMapMemory-memory-00682
  memory must have been created with a memory type that reports VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT

- VUID-vkMapMemory-memory-00683
  memory must not have been allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkMapMemory-device-parameter
  device must be a valid VkDevice handle

- VUID-vkMapMemory-memory-parameter
  memory must be a valid VkDeviceMemory handle

- VUID-vkMapMemory-flags-zerobitmask
  flags must be 0

- VUID-vkMapMemory-ppData-parameter
  pData must be a valid pointer to a pointer value

- VUID-vkMapMemory-memory-parent
  memory must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to memory must be externally synchronized
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_MEMORY_MAP_FAILED

// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryMapFlags;

VkMemoryMapFlags is a bitmask type for setting a mask, but is currently reserved for future use.

Two commands are provided to enable applications to work with non-coherent memory allocations: vkFlushMappedMemoryRanges and vkInvalidateMappedMemoryRanges.

Note
If the memory object was created with the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT set, vkFlushMappedMemoryRanges and vkInvalidateMappedMemoryRanges are unnecessary and may have a performance cost. However, availability and visibility operations still need to be managed on the device. See the description of host access types for more information.

Note
While memory objects imported from a handle type of VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT are inherently mapped to host address space, they are not considered to be host mapped device memory unless they are explicitly host mapped using vkMapMemory. That means flushing or invalidating host caches with respect to host accesses performed on such memory through the original host pointer specified at import time is the responsibility of the application and must be performed with appropriate synchronization primitives provided by the platform which are outside the scope of Vulkan. vkFlushMappedMemoryRanges and vkInvalidateMappedMemoryRanges, however, can still be used on such memory objects to synchronize host accesses performed through the host pointer of the host mapped device memory range returned by vkMapMemory.

To flush ranges of non-coherent memory from the host caches, call:
// Provided by VK_VERSION_1_0
VkResult vkFlushMappedMemoryRanges(
    VkDevice device,                  // device is the logical device that owns the memory ranges.
    uint32_t memoryRangeCount,       // memoryRangeCount is the length of the pMemoryRanges array.
    const VkMappedMemoryRange* pMemoryRanges);  // pMemoryRanges is a pointer to an array of VkMappedMemoryRange structures describing the memory ranges to flush.

vkFlushMappedMemoryRanges guarantees that host writes to the memory ranges described by pMemoryRanges are made available to the host memory domain, such that they can be made available to the device memory domain via memory domain operations using the VK_ACCESS_HOST_WRITE_BIT access type.

Within each range described by pMemoryRanges, each set of nonCoherentAtomSize bytes in that range is flushed if any byte in that set has been written by the host since it was first host mapped, or the last time it was flushed. If pMemoryRanges includes sets of nonCoherentAtomSize bytes where no bytes have been written by the host, those bytes must not be flushed.

Unmapping non-coherent memory does not implicitly flush the host mapped memory, and host writes that have not been flushed may not ever be visible to the device. However, implementations must ensure that writes that have not been flushed do not become visible to any other memory.

Note

The above guarantee avoids a potential memory corruption in scenarios where host writes to a mapped memory object have not been flushed before the memory is unmapped (or freed), and the virtual address range is subsequently reused for a different mapping (or memory allocation).

Valid Usage (Implicit)

• VUID-vkFlushMappedMemoryRanges-device-parameter
  device must be a valid VkDevice handle

• VUID-vkFlushMappedMemoryRanges-pMemoryRanges-parameter
  pMemoryRanges must be a valid pointer to an array of memoryRangeCount valid VkMappedMemoryRange structures

• VUID-vkFlushMappedMemoryRanges-memoryRangeCount-arraylength
  memoryRangeCount must be greater than 0
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To invalidate ranges of non-coherent memory from the host caches, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkInvalidateMappedMemoryRanges(
    VkDevice                                    device,
    uint32_t                                    memoryRangeCount,
    const VkMappedMemoryRange*                  pMemoryRanges);
```

- device is the logical device that owns the memory ranges.
- memoryRangeCount is the length of the pMemoryRanges array.
- pMemoryRanges is a pointer to an array of VkMappedMemoryRange structures describing the memory ranges to invalidate.

vkInvalidateMappedMemoryRanges guarantees that device writes to the memory ranges described by pMemoryRanges, which have been made available to the host memory domain using the VK_ACCESS_HOST_WRITE_BIT and VK_ACCESS_HOST_READ_BIT access types, are made visible to the host. If a range of non-coherent memory is written by the host and then invalidated without first being flushed, its contents are undefined.

Within each range described by pMemoryRanges, each set of nonCoherentAtomSize bytes in that range is invalidated if any byte in that set has been written by the device since it was first host mapped, or the last time it was invalidated.

Note
Mapping non-coherent memory does not implicitly invalidate that memory.
Valid Usage (Implicit)

- VUID-vkInvalidateMappedMemoryRanges-device-parameter
  
  **device** must be a valid **VkDevice** handle

- VUID-vkInvalidateMappedMemoryRanges-pMemoryRanges-parameter
  
  **pMemoryRanges** must be a valid pointer to an array of **memoryRangeCount** valid **VkMappedMemoryRange** structures

- VUID-vkInvalidateMappedMemoryRanges-memoryRangeCount-arraylength
  
  **memoryRangeCount** must be greater than 0

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The **VkMappedMemoryRange** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMappedMemoryRange {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceMemory     memory;
    VkDeviceSize       offset;
    VkDeviceSize       size;
} VkMappedMemoryRange;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **memory** is the memory object to which this range belongs.
- **offset** is the zero-based byte offset from the beginning of the memory object.
- **size** is either the size of range, or **VK_WHOLE_SIZE** to affect the range from **offset** to the end of the current mapping of the allocation.
Valid Usage

- VUID-VkMappedMemoryRange-memory-00684
  - memory must be currently host mapped

- VUID-VkMappedMemoryRange-size-00685
  - If size is not equal to VK_WHOLE_SIZE, offset and size must specify a range contained within the currently mapped range of memory

- VUID-VkMappedMemoryRange-size-00686
  - If size is equal to VK_WHOLE_SIZE, offset must be within the currently mapped range of memory

- VUID-VkMappedMemoryRange-offset-00687
  - offset must be a multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize

- VUID-VkMappedMemoryRange-size-01389
  - If size is equal to VK_WHOLE_SIZE, the end of the current mapping of memory must either be a multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize bytes from the beginning of the memory object, or be equal to the end of the memory object

- VUID-VkMappedMemoryRange-size-01390
  - If size is not equal to VK_WHOLE_SIZE, size must either be a multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize, or offset plus size must equal the size of memory

Valid Usage (Implicit)

- VUID-VkMappedMemoryRange-sType-sType
  - sType must be VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE

- VUID-VkMappedMemoryRange-pNext-pNext
  - pNext must be NULL

- VUID-VkMappedMemoryRange-memory-parameter
  - memory must be a valid VkDeviceMemory handle

To unmap a memory object once host access to it is no longer needed by the application, call:

```c
// Provided by VK_VERSION_1_0
void vkUnmapMemory(
    VkDevice device,  // device is the logical device that owns the memory.
    VkDeviceMemory memory);  // memory is the memory object to be unmapped.
```
Valid Usage

- VUID-vkUnmapMemory-memory-00689
  memory must be currently host mapped

Valid Usage (Implicit)

- VUID-vkUnmapMemory-device-parameter
device must be a valid VkDevice handle
- VUID-vkUnmapMemory-memory-parameter
  memory must be a valid VkDeviceMemory handle
- VUID-vkUnmapMemory-memory-parent
  memory must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to memory must be externally synchronized

11.2.3. Lazily Allocated Memory

If the memory object is allocated from a heap with the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit set, that object's backing memory may be provided by the implementation lazily. The actual committed size of the memory may initially be as small as zero (or as large as the requested size), and monotonically increases as additional memory is needed.

A memory type with this flag set is only allowed to be bound to a VkImage whose usage flags include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT.

Note

Using lazily allocated memory objects for framebuffer attachments that are not needed once a render pass instance has completed may allow some implementations to never allocate memory for such attachments.

To determine the amount of lazily-allocated memory that is currently committed for a memory object, call:

```
// Provided by VK_VERSION_1_0
void vkGetDeviceMemoryCommitment(
    VkDevice device,
    VkDeviceMemory memory,
    VkDeviceSize* pCommittedMemoryInBytes);
```

- device is the logical device that owns the memory.
• *memory* is the memory object being queried.
• *pCommittedMemoryInBytes* is a pointer to a *VkDeviceSize* value in which the number of bytes currently committed is returned, on success.

The implementation *may* update the commitment at any time, and the value returned by this query *may* be out of date.

The implementation guarantees to allocate any committed memory from the *heapIndex* indicated by the memory type that the memory object was created with.

### Valid Usage

- **VUID-vkGetDeviceMemoryCommitment-memory-00690**
  - *memory* must have been created with a memory type that reports *VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT*

### Valid Usage (Implicit)

- **VUID-vkGetDeviceMemoryCommitment-device-parameter**
  - *device* must be a valid *VkDevice* handle
- **VUID-vkGetDeviceMemoryCommitment-memory-parameter**
  - *memory* must be a valid *VkDeviceMemory* handle
- **VUID-vkGetDeviceMemoryCommitment-pCommittedMemoryInBytes-parameter**
  - *pCommittedMemoryInBytes* must be a valid pointer to a *VkDeviceSize* value
- **VUID-vkGetDeviceMemoryCommitment-memory-parent**
  - *memory* must have been created, allocated, or retrieved from *device*

### 11.2.4. Protected Memory

*Protected memory* divides device memory into protected device memory and unprotected device memory.

Protected memory adds the following concepts:

- **Memory:**
  - Unprotected device memory, which *can* be visible to the device and *can* be visible to the host
  - Protected device memory, which *can* be visible to the device but *must* not be visible to the host
- **Resources:**
  - Unprotected images and unprotected buffers, to which unprotected memory *can* be bound
  - Protected images and protected buffers, to which protected memory *can* be bound
- **Command buffers:**
Unprotected command buffers, which can be submitted to a device queue to execute unprotected queue operations

Protected command buffers, which can be submitted to a protected-capable device queue to execute protected queue operations

• Device queues:
  ◦ Unprotected device queues, to which unprotected command buffers can be submitted
  ◦ Protected-capable device queues, to which unprotected command buffers or protected command buffers can be submitted

• Queue submissions
  ◦ Unprotected queue submissions, through which unprotected command buffers can be submitted
  ◦ Protected queue submissions, through which protected command buffers can be submitted

• Queue operations
  ◦ Unprotected queue operations
  ◦ Protected queue operations

Protected Memory Access Rules

If VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault is VK_FALSE, applications must not perform any of the following operations:

• Write to unprotected memory within protected queue operations.
• Access protected memory within protected queue operations other than in framebuffer-space pipeline stages, the compute shader stage, or the transfer stage.
• Perform a query within protected queue operations.
• Execute an indirect command within protected queue operations.

If VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault is VK_TRUE, these operations are valid, but reads will return undefined values, and writes will either be dropped or store undefined values.

Whether these operations are valid or not, or if any other invalid usage is performed, the implementation must guarantee that:

• Protected device memory must never be visible to the host.
• Values written to unprotected device memory must not be a function of values from protected memory.

11.2.5. External Memory Handle Types

Android Hardware Buffer

Android’s NDK defines AHardwareBuffer objects, which represent device memory that is shareable across processes and that can be accessed by a variety of media APIs and the hardware used to
implement them. These Android hardware buffer objects may be imported into VkDeviceMemory objects for access via Vulkan, or exported from Vulkan. An VkImage or VkBuffer can be bound to the imported or exported VkDeviceMemory object if it is created with VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID.

To remove an unnecessary compile-time dependency, an incomplete type definition of AHardwareBuffer is provided in the Vulkan headers:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
struct AHardwareBuffer;
```

The actual AHardwareBuffer type is defined in Android NDK headers.

**Note**
The NDK format, usage, and size/dimensions of an AHardwareBuffer object can be obtained with the AHardwareBuffer_describe function. While Android hardware buffers can be imported to or exported from Vulkan without using that function, valid usage and implementation behavior is defined in terms of the AHardwareBuffer_Desc properties it returns.

Android hardware buffer objects are reference-counted using Android NDK functions outside of the scope of this specification. A VkDeviceMemory imported from an Android hardware buffer or that can be exported to an Android hardware buffer must acquire a reference to its AHardwareBuffer object, and must release this reference when the device memory is freed. During the host execution of a Vulkan command that has an Android hardware buffer as a parameter (including indirect parameters viapNext chains), the application must not decrement the Android hardware buffer's reference count to zero.

Android hardware buffers can be mapped and unmapped for CPU access using the NDK functions. These lock and unlock APIs are considered to acquire and release ownership of the Android hardware buffer, and applications must follow the rules described in External Resource Sharing to transfer ownership between the Vulkan instance and these native APIs.

Android hardware buffers can be shared with external APIs and Vulkan instances on the same device, and also with foreign devices. When transferring ownership of the Android hardware buffer, the external and foreign special queue families described in Queue Family Ownership Transfer are not identical. All APIs which produce or consume Android hardware buffers are considered to use foreign devices, except OpenGL ES contexts and Vulkan logical devices that have matching device and driver UUIDs. Implementations may treat a transfer to or from the foreign queue family as if it were a transfer to or from the external queue family when the Android hardware buffer's usage only permits it to be used on the same physical device.

**Android Hardware Buffer Optimal Usages**

Vulkan buffer and image usage flags do not correspond exactly to Android hardware buffer usage flags. When allocating Android hardware buffers with non-Vulkan APIs, if any AHARDWAREBUFFER_USAGE_GPU_* usage bits are included, by default the allocator must allocate the memory in such a way that it supports Vulkan usages and creation flags in the usage equivalence
table which do not have Android hardware buffer equivalents.

An `VkAndroidHardwareBufferUsageANDROID` structure can be included in the `pNext` chain of a `VkImageFormatProperties2` instance passed to `vkGetPhysicalDeviceImageFormatProperties2` to obtain optimal Android hardware buffer usage flags for specific Vulkan resource creation parameters. Some usage flags returned by these commands are required based on the input parameters, but additional vendor-specific usage flags (`AHARDWAREBUFFER_USAGE_VENDOR_*`) may also be returned. Any Android hardware buffer allocated with these vendor-specific usage flags and imported to Vulkan must only be bound to resources created with parameters that are a subset of the parameters used to obtain the Android hardware buffer usage, since the memory may have been allocated in a way incompatible with other parameters. If an Android hardware buffer is successfully allocated with additional non-vendor-specific usage flags in addition to the recommended usage, it must support being used in the same ways as an Android hardware buffer allocated with only the recommended usage, and also in ways indicated by the additional usage.

**Android Hardware Buffer External Formats**

Android hardware buffers may represent images using implementation-specific formats, layouts, color models, etc., which do not have Vulkan equivalents. Such external formats are commonly used by external image sources such as video decoders or cameras. Vulkan can import Android hardware buffers that have external formats, but since the image contents are in an undiscoverable and possibly proprietary representation, images with external formats must only be used as sampled images, must only be sampled with a sampler that has Y’CbCr conversion enabled, and must have optimal tiling.

Images that will be backed by an Android hardware buffer can use an external format by setting `VkImageCreateInfo::format` to `VK_FORMAT_UNDEFINED` and including a `VkExternalFormatANDROID` structure in the `pNext` chain. Images can be created with an external format even if the Android hardware buffer has a format which has an equivalent Vulkan format to enable consistent handling of images from sources that might use either category of format. However, all images created with an external format are subject to the valid usage requirements associated with external formats, even if the Android hardware buffer's format has a Vulkan equivalent. The external format of an Android hardware buffer can be obtained by passing a `VkAndroidHardwareBufferFormatPropertiesANDROID` structure to `vkGetAndroidHardwareBufferPropertiesANDROID`.

**Android Hardware Buffer Image Resources**

Android hardware buffers have intrinsic width, height, format, and usage properties, so Vulkan images bound to memory imported from an Android hardware buffer must use dedicated allocations: `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` must be `VK_TRUE` for images created with `VkExternalMemoryImageCreateInfo::handleTypes` that includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`. When creating an image that will be bound to an imported Android hardware buffer, the image creation parameters must be equivalent to the `AHardwareBuffer` properties as described by the valid usage of `VkMemoryAllocateInfo`. Similarly, device memory allocated for a dedicated image must not be exported to an Android hardware buffer until it has been bound to that image, and the implementation must return an Android hardware buffer with properties derived from the image:
• The width and height members of AHardwareBuffer_Desc must be the same as the width and height members of VkImageCreateInfo::extent, respectively.

• The layers member of AHardwareBuffer_Desc must be the same as the arrayLayers member of VkImageCreateInfo.

• The format member of AHardwareBuffer_Desc must be equivalent to VkImageCreateInfo::format as defined by AHardwareBuffer Format Equivalence.

• The usage member of AHardwareBuffer_Desc must include bits corresponding to bits included in VkImageCreateInfo::usage and VkImageCreateInfo::flags where such a correspondence exists according to AHardwareBuffer Usage Equivalence. It may also include additional usage bits, including vendor-specific usages. Presence of vendor usage bits may make the Android hardware buffer only usable in ways indicated by the image creation parameters, even when used outside Vulkan, in a similar way that allocating the Android hardware buffer with usage returned in VkAndroidHardwareBufferUsageANDROID does.

Implementations may support fewer combinations of image creation parameters for images with Android hardware buffer external handle type than for non-external images. Support for a given set of parameters can be determined by passing VkExternalImageFormatProperties to vkGetPhysicalDeviceImageFormatProperties2 with handleType set to VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID. Any Android hardware buffer successfully allocated outside Vulkan with usage that includes AHWAREBUFFER_USAGE_GPU_* must be supported when using equivalent Vulkan image parameters. If a given choice of image parameters are supported for import, they can also be used to create an image and memory that will be exported to an Android hardware buffer.

</tbody>
</table>

1. Vulkan does not differentiate between `AHARDWAREBUFFER_FORMAT_R8G8B8A8_UNORM` and `AHARDWAREBUFFER_FORMAT_R8G8B8X8_UNORM`: they both behave as `VK_FORMAT_R8G8B8A8_UNORM`. After an external entity writes to a `AHARDWAREBUFFER_FORMAT_R8G8B8X8_UNORM` Android hardware buffer, the values read by Vulkan from the X/A channel are undefined. To emulate the traditional behavior of the X channel during sampling or blending, applications should use `VK_COMPONENT_SWIZZLE_ONE` in image view component mappings and `VK_BLEND_FACTOR_ONE` in color blend factors. There is no way to avoid copying these undefined values when copying from such an image to another image or buffer.

2. The `AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE` flag does not correspond to a Vulkan image usage or creation flag. Instead, its presence indicates that the Android hardware buffer contains a complete mipmap chain, and its absence indicates that the Android hardware buffer contains only a single mip level.

3. Only image usages valid for the format are valid. It would be invalid to take a Android Hardware Buffer with a format of `AHARDWAREBUFFER_FORMAT_R8G8B8A8_UNORM` that has a `AHARDWAREBUFFER_USAGE_GPU_FRAMEBUFFER` usage and try to create an image with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

Note

When using `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` with Android hardware buffer images, applications should use `VkImageFormatListCreateInfo` to inform the implementation which view formats will be used with the image. For some common sets of format, this allows some implementations to provide significantly better performance when accessing the image via Vulkan.

Android Hardware Buffer Buffer Resources

Android hardware buffers with a format of `AHARDWAREBUFFER_FORMAT_BLOB` and usage that includes `AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER` can be used as the backing store for `VkBuffer` objects. Such Android hardware buffers have a size in bytes specified by their `width`; `height` and `layers` are both 1.
Unlike images, buffer resources backed by Android hardware buffers do not require dedicated allocations.

Exported AHardwareBuffer objects that do not have dedicated images must have a format of AHARDWAREBUFFER_FORMAT_BLOB, usage must include AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER, width must equal the device memory allocation size, and height and layers must be 1.

11.2.6. Peer Memory Features

Peer memory is memory that is allocated for a given physical device and then bound to a resource and accessed by a different physical device, in a logical device that represents multiple physical devices. Some ways of reading and writing peer memory may not be supported by a device.

To determine how peer memory can be accessed, call:

```c
// Provided by VK_VERSION_1_1
void vkGetDeviceGroupPeerMemoryFeatures(
    VkDevice device,
    uint32_t heapIndex,
    uint32_t localDeviceIndex,
    uint32_t remoteDeviceIndex,
    VkPeerMemoryFeatureFlags* pPeerMemoryFeatures);
```
or the equivalent command

```c
// Provided by VK_KHR_device_group
void vkGetDeviceGroupPeerMemoryFeaturesKHR(
    VkDevice device,
    uint32_t heapIndex,
    uint32_t localDeviceIndex,
    uint32_t remoteDeviceIndex,
    VkPeerMemoryFeatureFlags* pPeerMemoryFeatures);
```

- **device** is the logical device that owns the memory.
- **heapIndex** is the index of the memory heap from which the memory is allocated.
- **localDeviceIndex** is the device index of the physical device that performs the memory access.
- **remoteDeviceIndex** is the device index of the physical device that the memory is allocated for.
- **pPeerMemoryFeatures** is a pointer to a VkPeerMemoryFeatureFlags bitmask indicating which types of memory accesses are supported for the combination of heap, local, and remote devices.
Valid Usage

- VUID-vkGetDeviceGroupPeerMemoryFeatures-heapIndex-00691
  heapIndex must be less than memoryHeapCount
- VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00692
  localDeviceIndex must be a valid device index
- VUID-vkGetDeviceGroupPeerMemoryFeatures-remoteDeviceIndex-00693
  remoteDeviceIndex must be a valid device index
- VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00694
  localDeviceIndex must not equal remoteDeviceIndex

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupPeerMemoryFeatures-device-parameter
  device must be a valid VkDevice handle
- VUID-vkGetDeviceGroupPeerMemoryFeatures-pPeerMemoryFeatures-parameter
  pPeerMemoryFeatures must be a valid pointer to a VkPeerMemoryFeatureFlags value

Bits which may be set in the value returned for `vkGetDeviceGroupPeerMemoryFeatures::pPeerMemoryFeatures`, indicating the supported peer memory features, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkPeerMemoryFeatureFlagBits {
    VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT = 0x00000001,
    VK_PEER_MEMORY_FEATURE_COPY_DST_BIT = 0x00000002,
    VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT = 0x00000004,
    VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT = 0x00000008,
    // Provided by VK_KHR_device_group
    VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT_KHR = VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT,
    // Provided by VK_KHR_device_group
    VK_PEER_MEMORY_FEATURE_COPY_DST_BIT_KHR = VK_PEER_MEMORY_FEATURE_COPY_DST_BIT,
    // Provided by VK_KHR_device_group
    VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT_KHR = VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT,
    // Provided by VK_KHR_device_group
    VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT_KHR = VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT,
} VkPeerMemoryFeatureFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkPeerMemoryFeatureFlagBits VkPeerMemoryFeatureFlagBitsKHR;
```
• **VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT** specifies that the memory can be accessed as the source of any `vkCmdCopy*` command.

• **VK_PEER_MEMORY_FEATURE_COPY_DST_BIT** specifies that the memory can be accessed as the destination of any `vkCmdCopy*` command.

• **VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT** specifies that the memory can be read as any memory access type.

• **VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT** specifies that the memory can be written as any memory access type. Shader atomics are considered to be writes.

```
Note
The peer memory features of a memory heap also apply to any accesses that may be performed during image layout transitions.
```

**VK_PEER_MEMORY_FEATURE_COPY_DST_BIT** must be supported for all host local heaps and for at least one device local heap.

If a device does not support a peer memory feature, it is still valid to use a resource that includes both local and peer memory bindings with the corresponding access type as long as only the local bindings are actually accessed. For example, an application doing split-frame rendering would use framebuffer attachments that include both local and peer memory bindings, but would scissor the rendering to only update local memory.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkPeerMemoryFeatureFlags;
```

or the equivalent

```
// Provided by VK_KHR_device_group
typedef VkPeerMemoryFeatureFlags VkPeerMemoryFeatureFlagsKHR;
```

**VkPeerMemoryFeatureFlags** is a bitmask type for setting a mask of zero or more **VkPeerMemoryFeatureFlagBits**.

To query a 64-bit opaque capture address value from a memory object, call:

```
// Provided by VK_KHR_buffer_device_address
uint64_t vkGetDeviceMemoryOpaqueCaptureAddressKHR(
    VkDevice device,
    const VkDeviceMemoryOpaqueCaptureAddressInfo* pInfo);
```

• **device** is the logical device that the memory object was allocated on.

• **pInfo** is a pointer to a **VkDeviceMemoryOpaqueCaptureAddressInfo** structure specifying the memory object to retrieve an address for.
The 64-bit return value is an opaque address representing the start of pInfo->memory.

If the memory object was allocated with a non-zero value of VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress, the return value must be the same address.

Note
The expected usage for these opaque addresses is only for trace capture/replay tools to store these addresses in a trace and subsequently specify them during replay.

Valid Usage

• VUID-vkGetDeviceMemoryOpaqueCaptureAddress-None-03334
  The bufferDeviceAddress feature must be enabled

• VUID-vkGetDeviceMemoryOpaqueCaptureAddress-device-03335
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled

Valid Usage (Implicit)

• VUID-vkGetDeviceMemoryOpaqueCaptureAddress-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetDeviceMemoryOpaqueCaptureAddress-pInfo-parameter
  pInfo must be a valid pointer to a valid VkDeviceMemoryOpaqueCaptureAddressInfo structure

The VkDeviceMemoryOpaqueCaptureAddressInfo structure is defined as:

```c
typedef struct VkDeviceMemoryOpaqueCaptureAddressInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceMemory     memory;
} VkDeviceMemoryOpaqueCaptureAddressInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkDeviceMemoryOpaqueCaptureAddressInfo
    VkDeviceMemoryOpaqueCaptureAddressInfoKHR;
```

• sType is the type of this structure.

• pNext is NULL or a pointer to a structure extending this structure.
• `memory` specifies the memory whose address is being queried.

### Valid Usage

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-03336  
  `memory` must have been allocated with `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT`

### Valid Usage (Implicit)

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-sType-sType  
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_MEMORY_OPAQUE_CAPTURE_ADDRESS_INFO`

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-pNext-pNext  
  `pNext` must be `NULL`

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-parameter  
  `memory` must be a valid `VkDeviceMemory` handle
Chapter 12. Resource Creation

Vulkan supports two primary resource types: buffers and images. Resources are views of memory with associated formatting and dimensionality. Buffers are essentially unformatted arrays of bytes whereas images contain format information, can be multidimensional and may have associated metadata.

12.1. Buffers

Buffers represent linear arrays of data which are used for various purposes by binding them to a graphics or compute pipeline via descriptor sets or via certain commands, or by directly specifying them as parameters to certain commands.

Buffers are represented by VkBuffer handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBuffer)
```

To create buffers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateBuffer(
    VkDevice device,
    const VkBufferCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkBuffer* pBuffer);
```

- `device` is the logical device that creates the buffer object.
- `pCreateInfo` is a pointer to a VkBufferCreateInfo structure containing parameters affecting creation of the buffer.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pBuffer` is a pointer to a VkBuffer handle in which the resulting buffer object is returned.

Valid Usage

- VUID-vkCreateBuffer-flags-00911
  If the flags member of pCreateInfo includes VK_BUFFER_CREATE_SPARSE_BINDING_BIT, creating this VkBuffer must not cause the total required sparse memory for all currently valid sparse resources on the device to exceed VkPhysicalDeviceLimits::sparseAddressSpaceSize
Valid Usage (Implicit)

- **VUID-vkCreateBuffer-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkCreateBuffer-pCreateInfo-parameter**
  - `pCreateInfo` must be a valid pointer to a valid `VkBufferCreateInfo` structure

- **VUID-vkCreateBuffer-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateBuffer-pBuffer-parameter**
  - `pBuffer` must be a valid pointer to a `VkBuffer` handle

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The `VkBufferCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferCreateInfo {
    VkStructureType        sType;
    const void*            pNext;
    VkBufferCreateFlags    flags;
    VkDeviceSize           size;
    VkBufferUsageFlags     usage;
    VkSharingMode          sharingMode;
    uint32_t               queueFamilyIndexCount;
    const uint32_t*        pQueueFamilyIndices;
} VkBufferCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkBufferCreateFlagBits` specifying additional parameters of the buffer.
- `size` is the size in bytes of the buffer to be created.
- `usage` is a bitmask of `VkBufferUsageFlagBits` specifying allowed usages of the buffer.
• **sharingMode** is a [VkSharingMode](https://registry.vulkan.org/rpc/vulkan/structures/VkSharingMode) value specifying the sharing mode of the buffer when it will be accessed by multiple queue families.

• **queueFamilyIndexCount** is the number of entries in the `pQueueFamilyIndices` array.

• **pQueueFamilyIndices** is a list of queue families that will access this buffer (ignored if `sharingMode` is not `VK_SHARING_MODE_CONCURRENT`).
Valid Usage

- VUID-VkBufferCreateInfo-size-00912
  
  `size` must be greater than 0

- VUID-VkBufferCreateInfo-sharingMode-00913
  
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `pQueueFamilyIndices` must be a valid pointer to an array of `queueFamilyIndexCount` `uint32_t` values

- VUID-VkBufferCreateInfo-sharingMode-00914
  
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `queueFamilyIndexCount` must be greater than 1

- VUID-VkBufferCreateInfo-sharingMode-01419
  
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` must be unique and must be less than `pQueueFamilyPropertyCount` returned by either `vkGetPhysicalDeviceQueueFamilyProperties` or `vkGetPhysicalDeviceQueueFamilyProperties2` for the `physicalDevice` that was used to create device

- VUID-VkBufferCreateInfo-flags-00915
  
  If the `sparse bindings` feature is not enabled, `flags` must not contain `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`

- VUID-VkBufferCreateInfo-flags-00916
  
  If the `sparse buffer residency` feature is not enabled, `flags` must not contain `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`

- VUID-VkBufferCreateInfo-flags-00917
  
  If the `sparse aliased residency` feature is not enabled, `flags` must not contain `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT`

- VUID-VkBufferCreateInfo-flags-00918
  
  If `flags` contains `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` or `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT`, it must also contain `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`

- VUID-VkBufferCreateInfo-pNext-00920
  
  If the `pNext` chain includes a `VkExternalMemoryBufferCreateInfo` structure, its `handleTypes` member must only contain bits that are also in `VkExternalBufferProperties::externalMemoryProperties.compatibleHandleTypes`, as returned by `vkGetPhysicalDeviceExternalBufferProperties` with `pExternalBufferInfo->handleType` equal to any one of the handle types specified in `VkExternalMemoryBufferCreateInfo::handleTypes`

- VUID-VkBufferCreateInfo-flags-01887
  
  If the protected memory feature is not enabled, `flags` must not contain `VK_BUFFER_CREATE_PROTECTED_BIT`

- VUID-VkBufferCreateInfo-None-01888
  
  If any of the bits `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`, `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` are set, `VK_BUFFER_CREATE_PROTECTED_BIT` must not also be set

- VUID-VkBufferCreateInfo-pNext-01571
If the `pNext` chain includes a `VkDedicatedAllocationBufferCreateInfoNV` structure, and the `dedicatedAllocation` member of the chained structure is `VK_TRUE`, then `flags` must not include `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`, `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT`.

- **VUID-VkBufferCreateInfo-deviceAddress-02604**
  If `VkBufferDeviceAddressCreateInfoEXT::deviceAddress` is not zero, `flags` must include `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`

- **VUID-VkBufferCreateInfo-opaqueCaptureAddress-03337**
  If `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress` is not zero, `flags` must include `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`

- **VUID-VkBufferCreateInfo-flags-03338**
  If `flags` includes `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`, the `bufferDeviceAddressCaptureReplay` or `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::bufferDeviceAddressCaptureReplay` feature must be enabled

- **VUID-VkBufferCreateInfo-usage-04813**
  If `usage` includes `VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR`, `VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR`, then the `pNext` chain must include a valid `VkVideoProfilesKHR` structure which includes at least one `VkVideoProfileKHR` with a decode codec-operation.

- **VUID-VkBufferCreateInfo-usage-04814**
  If `usage` includes `VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`, `VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR`, then the `pNext` chain must include a valid `VkVideoProfilesKHR` structure which includes at least one `VkVideoProfileKHR` with an encode codec-operation.
Valid Usage (Implicit)

- **VUID-VkBufferCreateInfo-sType-sType**
  
  *sType must be VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO*

- **VUID-VkBufferCreateInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkBufferDeviceAddressCreateInfoEXT`, `VkBufferOpaqueCaptureAddressCreateInfo`, `VkDedicatedAllocationBufferCreateInfoNV`, `VkExternalMemoryBufferCreateInfo`, `VkVideoProfileKHR`, or `VkVideoProfilesKHR`.

- **VUID-VkBufferCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkBufferCreateInfo-flags-parameter**
  
  *flags must be a valid combination of `VkBufferCreateFlagBits` values*

- **VUID-VkBufferCreateInfo-usage-parameter**
  
  *usage must be a valid combination of `VkBufferUsageFlagBits` values*

- **VUID-VkBufferCreateInfo-usage-required bitmask**
  
  *usage must not be 0*

- **VUID-VkBufferCreateInfo-sharingMode-parameter**
  
  *sharingMode must be a valid `VkSharingMode` value*

Bits which **can** be set in `VkBufferCreateInfo::usage`, specifying usage behavior of a buffer, are:
typedef enum VkBufferUsageFlagBits {
    VK_BUFFER_USAGE_TRANSFER_SRC_BIT = 0x00000001,
    VK_BUFFER_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT = 0x00000004,
    VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT = 0x00000008,
    VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT = 0x00000010,
    VK_BUFFER_USAGE_STORAGE_BUFFER_BIT = 0x00000020,
    VK_BUFFER_USAGE_INDEX_BUFFER_BIT = 0x00000040,
    VK_BUFFER_USAGE_VERTEX_BUFFER_BIT = 0x00000080,
    VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT = 0x00000100,
    VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT = 0x00020000,
    VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR = 0x00002000,
    VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR = 0x00004000,
    VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR = 0x00008000,
    VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR = 0x00010000,
    VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT = 0x00000800,
    VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT = 0x00001000,
    VK_BUFFER_USAGE_CONDITIONAL_RENDERING_BIT_EXT = 0x00000200,
    VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR = 0x00080000,
    VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR = 0x00100000,
    VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR = 0x00000400,
    VK_BUFFER_USAGE_RAY_TRACING_BIT_NV = VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR,
    VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_EXT = VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT,
    VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_KHR = VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT,
} VkBufferUsageFlagBits;
• **VK_BUFFER_USAGE_TRANSFER_SRC_BIT** specifies that the buffer can be used as the source of a transfer command (see the definition of **VK_PIPELINE_STAGE_TRANSFER_BIT**).

• **VK_BUFFER_USAGE_TRANSFER_DST_BIT** specifies that the buffer can be used as the destination of a transfer command.

• **VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT** specifies that the buffer can be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type **VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER**.

• **VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT** specifies that the buffer can be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER**.

• **VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT** specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER** or **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC**.

• **VK_BUFFER_USAGE_STORAGE_BUFFER_BIT** specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER** or **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC**.

• **VK_BUFFER_USAGE_INDEX_BUFFER_BIT** specifies that the buffer is suitable for passing as the buffer parameter to vkCmdBindIndexBuffer.

• **VK_BUFFER_USAGE_VERTEX_BUFFER_BIT** specifies that the buffer is suitable for passing as an element of the pBuffers array to vkCmdBindVertexBuffers.

• **VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT** specifies that the buffer is suitable for passing as the buffer parameter to vkCmdDrawIndirect, vkCmdDrawIndexedIndirect, vkCmdDrawMeshTasksIndirectNV, vkCmdDrawMeshTasksIndirectCountNV, or vkCmdDispatchIndirect. It is also suitable for passing as the buffer member of VkIndirectCommandsStreamNV, or sequencesCountBuffer or sequencesIndexBuffer or preprocessedBuffer member of VkGeneratedCommandsInfoNV.

• **VK_BUFFER_USAGE_CONDITIONAL_RENDERING_BIT_EXT** specifies that the buffer is suitable for passing as the buffer parameter to vkCmdBeginConditionalRenderingEXT.

• **VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT** specifies that the buffer is suitable for using for binding as a transform feedback buffer with vkCmdBindTransformFeedbackBuffersEXT.

• **VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT** specifies that the buffer is suitable for using as a counter buffer with vkCmdBeginTransformFeedbackEXT and vkCmdEndTransformFeedbackEXT.

• **VK_BUFFER_USAGE_RAY_TRACING_BIT_NV** specifies that the buffer is suitable for use in vkCmdTraceRaysNV.

• **VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR** specifies that the buffer is suitable for use as a Shader Binding Table.

• **VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR** specifies that the buffer is suitable for use as a read-only input to an acceleration structure build.

• **VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR** specifies that the buffer is suitable for storage space for a VkAccelerationStructureKHR.

• **VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT** specifies that the buffer can be used to retrieve a
buffer device address via `vkGetBufferDeviceAddress` and use that address to access the buffer’s memory from a shader.

- `VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR` specifies that the buffer can be used as the source bitstream buffer in a video decode operation.
- `VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR` specifies that the buffer can be used as the destination status buffer in a video decode operation.
- `VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR` specifies that the buffer can be used as the destination bitstream buffer in a video encode operation.
- `VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR` specifies that the buffer can be used as the destination status buffer in a video encode operation.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferUsageFlags;

VkBufferUsageFlags is a bitmask type for setting a mask of zero or more `VkBufferUsageFlagBits`.

Bits which can be set in `VkBufferCreateInfo::flags`, specifying additional parameters of a buffer, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkBufferCreateFlagBits {
    VK_BUFFER_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_BUFFER_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_BUFFER_CREATE_PROTECTED_BIT = 0x00000008,
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000010,
    // Provided by VK_EXT_buffer_device_address
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT = VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT,
    // Provided by VK_KHR_buffer_device_address
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT,
} VkBufferCreateFlagBits;
```

- `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` specifies that the buffer will be backed using sparse memory binding.
- `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` specifies that the buffer can be partially backed using sparse memory binding. Buffers created with this flag **must** also be created with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` flag.
- `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` specifies that the buffer will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another buffer (or another portion of the same buffer). Buffers created with this flag **must** also be created with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` flag.

---

730 | Chapter 12. Resource Creation
• **VK_BUFFER_CREATE_PROTECTED_BIT** specifies that the buffer is a protected buffer.

• **VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT** specifies that the buffer’s address *can* be saved and reused on a subsequent run (e.g. for trace capture and replay), see `VkBufferOpaqueCaptureAddressCreateInfo` for more detail.

See Sparse Resource Features and Physical Device Features for details of the sparse memory features supported on a device.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferCreateFlags;
```

**VkBufferCreateFlags** is a bitmask type for setting a mask of zero or more **VkBufferCreateFlagBits**.

If the `pNext` chain includes a `VkDedicatedAllocationBufferCreateInfoNV` structure, then that structure includes an enable controlling whether the buffer will have a dedicated memory allocation bound to it.

The **VkDedicatedAllocationBufferCreateInfoNV** structure is defined as:

```c
// Provided by VK_NV_dedicated_allocation
typedef struct VkDedicatedAllocationBufferCreateInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           dedicatedAllocation;
} VkDedicatedAllocationBufferCreateInfoNV;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **dedicatedAllocation** specifies whether the buffer will have a dedicated allocation bound to it.

**Valid Usage (Implicit)**

```c
• VUID-VkDedicatedAllocationBufferCreateInfoNV-sType-sType
    sType must be VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_BUFFER_CREATE_INFO_NV
```

To define a set of external memory handle types that *may* be used as backing store for a buffer, add a **VkExternalMemoryBufferCreateInfo** structure to the `pNext` chain of the **VkBufferCreateInfo** structure. The **VkExternalMemoryBufferCreateInfo** structure is defined as:
```c
typedef struct VkExternalMemoryBufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExternalMemoryBufferCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_memory
typedef VkExternalMemoryBufferCreateInfo VkExternalMemoryBufferCreateInfoKHR;
```

Note

A `VkExternalMemoryBufferCreateInfo` structure with a non-zero `handleTypes` field must be included in the creation parameters for a buffer that will be bound to memory that is either exported or imported.

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **handleTypes** is zero, or a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more external memory handle types.

### Valid Usage (Implicit)

- VUID-VkExternalMemoryBufferCreateInfo-sType-sType
  **sType** must be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_BUFFER_CREATE_INFO`

- VUID-VkExternalMemoryBufferCreateInfo-handleTypes-parameter
  **handleTypes** must be a valid combination of `VkExternalMemoryHandleTypeFlagBits` values

To request a specific device address for a buffer, add a `VkBufferOpaqueCaptureAddressCreateInfo` structure to the `pNext` chain of the `VkBufferCreateInfo` structure. The `VkBufferOpaqueCaptureAddressCreateInfo` structure is defined as:

```c
typedef struct VkBufferOpaqueCaptureAddressCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint64_t opaqueCaptureAddress;
} VkBufferOpaqueCaptureAddressCreateInfo;
```

or the equivalent
// Provided by VK_KHR_buffer_device_address
typedef VkBufferOpaqueCaptureAddressCreateInfo
VkBufferOpaqueCaptureAddressCreateInfoKHR;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **opaqueCaptureAddress** is the opaque capture address requested for the buffer.

If **opaqueCaptureAddress** is zero, no specific address is requested.

If **opaqueCaptureAddress** is not zero, then it **should** be an address retrieved from
**vkGetBufferOpaqueCaptureAddress** for an identically created buffer on the same implementation.

If this structure is not present, it is as if **opaqueCaptureAddress** is zero.

Apps **should** avoid creating buffers with app-provided addresses and implementation-provided
addresses in the same process, to reduce the likelihood of **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS**
errors.

**Note**
The expected usage for this is that a trace capture/replay tool will add the
**VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT** flag to all buffers that use
**VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT**, and during capture will save the
queried opaque device addresses in the trace. During replay, the buffers will be
created specifying the original address so any address values stored in the trace
data will remain valid.

Implementations are expected to separate such buffers in the GPU address space
so normal allocations will avoid using these addresses. Apps/tools should avoid
mixing app-provided and implementation-provided addresses for buffers created
with **VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT**, to avoid address space
allocation conflicts.

**Valid Usage (Implicit)**

• VUID-VkBufferOpaqueCaptureAddressCreateInfo-sType-sType
  sType must be **VK_STRUCTURE_TYPE_BUFFER_OPAQUE_CAPTURE_ADDRESS_CREATE_INFO**

Alternatively, to request a specific device address for a buffer, add a
**VkBufferDeviceAddressCreateInfoEXT** structure to the **pNext** chain of the **VkBufferCreateInfo**
structure. The **VkBufferDeviceAddressCreateInfoEXT** structure is defined as:
typedef struct VkBufferDeviceAddressCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceAddress deviceAddress;
} VkBufferDeviceAddressCreateInfoEXT;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **deviceAddress** is the device address requested for the buffer.

If **deviceAddress** is zero, no specific address is requested.

If **deviceAddress** is not zero, then it must be an address retrieved from an identically created buffer on the same implementation. The buffer must also be bound to an identically created VkDeviceMemory object.

If this structure is not present, it is as if **deviceAddress** is zero.

Apps should avoid creating buffers with app-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of **VK_ERROR_INVALID_DEVICE_ADDRESS_EXT** errors.

Valid Usage (Implicit)

• VUID-VkBufferDeviceAddressCreateInfoEXT-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_CREATE_INFO_EXT**

To destroy a buffer, call:

void vkDestroyBuffer(
    VkDevice device,
    VkBuffer buffer,
    const VkAllocationCallbacks* pAllocator);

• **device** is the logical device that destroys the buffer.
• **buffer** is the buffer to destroy.
• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
12.2. Buffer Views

A buffer view represents a contiguous range of a buffer and a specific format to be used to interpret the data. Buffer views are used to enable shaders to access buffer contents interpreted as formatted data. In order to create a valid buffer view, the buffer must have been created with at least one of the following usage flags:

- VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT
- VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT

Buffer views are represented by VkBufferView handles:
To create a buffer view, call:

```c
VKResult vkCreateBufferView(
    VkDevice device,
    const VkBufferViewCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkBufferView* pView);
```

- **device** is the logical device that creates the buffer view.
- **pCreateInfo** is a pointer to a `VkBufferViewCreateInfo` structure containing parameters to be used to create the buffer.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pView** is a pointer to a `VkBufferView` handle in which the resulting buffer view object is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateBufferView-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkCreateBufferView-pCreateInfo-parameter**
  `pCreateInfo` must be a valid pointer to a valid `VkBufferViewCreateInfo` structure

- **VUID-vkCreateBufferView-pAllocator-parameter**
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateBufferView-pView-parameter**
  `pView` must be a valid pointer to a `VkBufferView` handle

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkBufferViewCreateInfo` structure is defined as:
typedef struct VkBufferViewCreateInfo {
    VkStructureType            sType;
    const void*                pNext;
    VkBufferViewCreateFlags    flags;
    VkBuffer                   buffer;
    VkFormat                   format;
    VkDeviceSize               offset;
    VkDeviceSize               range;
} VkBufferViewCreateInfo;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `buffer` is a `VkBuffer` on which the view will be created.
- `format` is a `VkFormat` describing the format of the data elements in the buffer.
- `offset` is an offset in bytes from the base address of the buffer. Accesses to the buffer view from shaders use addressing that is relative to this starting offset.
- `range` is a size in bytes of the buffer view. If `range` is equal to `VK_WHOLE_SIZE`, the range from `offset` to the end of the buffer is used. If `VK_WHOLE_SIZE` is used and the remaining size of the buffer is not a multiple of the texel block size of `format`, the nearest smaller multiple is used.
Valid Usage

- **VUID-VkBufferViewCreateInfo-offset-00925**
  
  *offset must be less than the size of buffer*

- **VUID-VkBufferViewCreateInfo-range-00928**
  
  If *range* is not equal to *VK_WHOLE_SIZE*, *range must be greater than 0*

- **VUID-VkBufferViewCreateInfo-range-00929**
  
  If *range* is not equal to *VK_WHOLE_SIZE*, *range must be an integer multiple of the texel block size of format*

- **VUID-VkBufferViewCreateInfo-range-00930**
  
  If *range* is not equal to *VK_WHOLE_SIZE*, the number of texel buffer elements given by \( \left\lfloor \frac{\text{range}}{\text{texel block size}} \right\rfloor \times \text{texels per block} \) where texel block size and texels per block are as defined in the Compatible Formats table for *format*, *must* be less than or equal to *VkPhysicalDeviceLimits::maxTexelBufferElements*

- **VUID-VkBufferViewCreateInfo-offset-00931**
  
  If *range* is not equal to *VK_WHOLE_SIZE*, the sum of *offset* and *range must be less than or equal to the size of buffer*

- **VUID-VkBufferViewCreateInfo-range-04059**
  
  If *range* is equal to *VK_WHOLE_SIZE*, the number of texel buffer elements given by \( \left\lfloor \frac{\text{(size} - \text{offset})}{\text{texel block size}} \right\rfloor \times \text{texels per block} \) where *size* is the size of *buffer*, and texel block size and texels per block are as defined in the Compatible Formats table for *format*, *must* be less than or equal to *VkPhysicalDeviceLimits::maxTexelBufferElements*

- **VUID-VkBufferViewCreateInfo-buffer-00932**
  
  *buffer must have been created with a usage value containing at least one of VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT or VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT*

- **VUID-VkBufferViewCreateInfo-buffer-00933**
  
  If *buffer* was created with usage containing VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT, *format must be supported for uniform texel buffers, as specified by the VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT flag inVkFormatProperties::bufferFeatures returned by vkGetPhysicalDeviceFormatProperties*

- **VUID-VkBufferViewCreateInfo-buffer-00934**
  
  If *buffer* was created with usage containing VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT, *format must be supported for storage texel buffers, as specified by the VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT flag in VkFormatProperties::bufferFeatures returned by vkGetPhysicalDeviceFormatProperties*

- **VUID-VkBufferViewCreateInfo-buffer-00935**
  
  If *buffer* is non-sparse then it *must be bound completely and contiguously to a single VkDeviceMemory object*

- **VUID-VkBufferViewCreateInfo-offset-02749**
  
  If the texelBufferAlignment feature is not enabled, *offset must be a multiple of VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment*

- **VUID-VkBufferViewCreateInfo-buffer-02750**
  
  If the texelBufferAlignment feature is enabled and if *buffer* was created with usage
containing `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`, offset must be a multiple of the lesser of `VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT::storageTexelBufferOffsetAlignmentBytes` or, if `VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT::storageTexelBufferOffsetSingleTexelAlignment` is `VK_TRUE`, the size of a texel of the requested format. If the size of a texel is a multiple of three bytes, then the size of a single component of format is used instead.

- **VUID-VkBufferViewCreateInfo-buffer-02751**

  If the texelBufferAlignment feature is enabled and if buffer was created with usage containing `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT`, offset must be a multiple of the lesser of `VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT::uniformTexelBufferOffsetAlignmentBytes` or, if `VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT::uniformTexelBufferOffsetSingleTexelAlignment` is `VK_TRUE`, the size of a texel of the requested format. If the size of a texel is a multiple of three bytes, then the size of a single component of format is used instead.

### Valid Usage (Implicit)

- **VUID-VkBufferViewCreateInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_VIEW_CREATE_INFO`

- **VUID-VkBufferViewCreateInfo-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkBufferViewCreateInfo-flags-zero bitmask**
  
  `flags` must be `0`

- **VUID-VkBufferViewCreateInfo-buffer-parameter**
  
  `buffer` must be a valid `VkBuffer` handle

- **VUID-VkBufferViewCreateInfo-format-parameter**
  
  `format` must be a valid `VkFormat` value

---

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferViewCreateFlags;
```

`VkBufferViewCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a buffer view, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyBufferView(
    VkDevice device, 
    VkBufferView bufferView, 
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the buffer view.
• `bufferView` is the buffer view to destroy.

• `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyBufferView-bufferView-00936**
  All submitted commands that refer to `bufferView` must have completed execution

- **VUID-vkDestroyBufferView-bufferView-00937**
  If `VkAllocationCallbacks` were provided when `bufferView` was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyBufferView-bufferView-00938**
  If no `VkAllocationCallbacks` were provided when `bufferView` was created, `pAllocator` must be `NULL`

### Valid Usage (Implicit)

- **VUID-vkDestroyBufferView-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkDestroyBufferView-bufferView-parameter**
  If `bufferView` is not `VK_NULL_HANDLE`, `bufferView` must be a valid `VkBufferView` handle

- **VUID-vkDestroyBufferView-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyBufferView-bufferView-parent**
  If `bufferView` is a valid handle, it must have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `bufferView` must be externally synchronized

### 12.3. Images

Images represent multidimensional - up to 3 - arrays of data which can be used for various purposes (e.g. attachments, textures), by binding them to a graphics or compute pipeline via descriptor sets, or by directly specifying them as parameters to certain commands.

Images are represented by `VkImage` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImage)
```
To create images, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateImage(
    VkDevice device,
    const VkImageCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkImage* pImage);
```

- **device** is the logical device that creates the image.
- **pCreateInfo** is a pointer to a `VkImageCreateInfo` structure containing parameters to be used to create the image.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pImage** is a pointer to a `VkImage` handle in which the resulting image object is returned.

### Valid Usage

- **VUID-vkCreateImage-flags-00939**
  If the `flags` member of `pCreateInfo` includes `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, creating this `VkImage` must not cause the total required sparse memory for all currently valid sparse resources on the device to exceed `VkPhysicalDeviceLimits::sparseAddressSpaceSize`

### Valid Usage (Implicit)

- **VUID-vkCreateImage-device-parameter**
  **device** must be a valid `VkDevice` handle

- **VUID-vkCreateImage-pCreateInfo-parameter**
  **pCreateInfo** must be a valid pointer to a valid `VkImageCreateInfo` structure

- **VUID-vkCreateImage-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateImage-pImage-parameter**
  **pImage** must be a valid pointer to a `VkImage` handle
**Return Codes**

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkImageCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageCreateFlags flags;
    VkImageType imageType;
    VkFormat format;
    VkExtent3D extent;
    uint32_t mipLevels;
    uint32_t arrayLayers;
    VkSampleCountFlagBits samples;
    VkImageTiling tiling;
    VkImageUsageFlags usage;
    VkSharingMode sharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
    VkImageLayout initialLayout;
} VkImageCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkImageCreateFlagBits` describing additional parameters of the image.
- `imageType` is a `VkImageType` value specifying the basic dimensionality of the image. Layers in array textures do not count as a dimension for the purposes of the image type.
- `format` is a `VkFormat` describing the format and type of the texel blocks that will be contained in the image.
- `extent` is a `VkExtent3D` describing the number of data elements in each dimension of the base level.
- `mipLevels` describes the number of levels of detail available for minified sampling of the image.
- `arrayLayers` is the number of layers in the image.
- `samples` is a `VkSampleCountFlagBits` specifying the number of samples per texel.
- `tiling` is a `VkImageTiling` value specifying the tiling arrangement of the texel blocks in memory.
- **usage** is a bitmask of *VkImageUsageFlagBits* describing the intended usage of the image.
- **sharingMode** is a *VkSharingMode* value specifying the sharing mode of the image when it will be accessed by multiple queue families.
- **queueFamilyIndexCount** is the number of entries in the *pQueueFamilyIndices* array.
- **pQueueFamilyIndices** is a list of queue families that will access this image (ignored if **sharingMode** is not *VK_SHARING_MODE_CONCURRENT*).
- **initialLayout** is a *VkImageLayout* value specifying the initial *VkImageLayout* of all image subresources of the image. See Image Layouts.

Images created with **tiling** equal to **VK_IMAGE_TILING_LINEAR** have further restrictions on their limits and capabilities compared to images created with **tiling** equal to **VK_IMAGE_TILING_OPTIMAL**. Creation of images with **tiling** **VK_IMAGE_TILING_LINEAR** may not be supported unless other parameters meet all of the constraints:

- **imageType** is **VK_IMAGE_TYPE_2D**
- **format** is not a depth/stencil format
- **mipLevels** is 1
- **arrayLayers** is 1
- **samples** is **VK_SAMPLE_COUNT_1_BIT**
- **usage** only includes **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** and/or **VK_IMAGE_USAGE_TRANSFER_DST_BIT**

Images created with a **format** from one of those listed in Formats requiring sampler **Y’C_bC_R** conversion for **VK_IMAGE_ASPECT_COLOR_BIT** image views have further restrictions on their limits and capabilities compared to images created with other formats. Creation of images with a format requiring **Y’C_bC_R** conversion may not be supported unless other parameters meet all of the constraints:

- **imageType** is **VK_IMAGE_TYPE_2D**
- **mipLevels** is 1
- **arrayLayers** is 1
- **samples** is **VK_SAMPLE_COUNT_1_BIT**

Implementations may support additional limits and capabilities beyond those listed above.

To determine the set of valid usage bits for a given format, call **vkGetPhysicalDeviceFormatProperties**.

If the size of the resultant image would exceed **maxResourceSize**, then **vkCreateImage** must fail and return **VK_ERROR_OUT_OF_DEVICE_MEMORY**. This failure **may** occur even when all image creation parameters satisfy their valid usage requirements.
Note
For images created without `VK_IMAGE_CREATE_EXTENDED_USAGE_BIT` a usage bit is valid if it is supported for the format the image is created with.

For images created with `VK_IMAGE_CREATE_EXTENDED_USAGE_BIT` a usage bit is valid if it is supported for at least one of the formats a `VkImageView` created from the image can have (see Image Views for more detail).
Image Creation Limits

Valid values for some image creation parameters are limited by a numerical upper bound or by inclusion in a bitset. For example, `VkImageCreateInfo::arrayLayers` is limited by `imageCreateMaxArrayLayers`, defined below; and `VkImageCreateInfo::samples` is limited by `imageCreateSampleCounts`, also defined below.

Several limiting values are defined below, as well as assisting values from which the limiting values are derived. The limiting values are referenced by the relevant valid usage statements of `VkImageCreateInfo`.

- Let `uint64_t imageCreateDrmFormatModifiers[]` be the set of Linux DRM format modifiers that the resultant image may have.
  - If tiling is not `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `imageCreateDrmFormatModifiers` is empty.
  - If `VkImageCreateInfo::pNext` contains `VkImageDrmFormatModifierExplicitCreateInfoEXT`, then `imageCreateDrmFormatModifiers` contains exactly one modifier, `VkImageDrmFormatModifierExplicitCreateInfoEXT::drmFormatModifier`.
  - If `VkImageCreateInfo::pNext` contains `VkImageDrmFormatModifierListCreateInfoEXT`, then `imageCreateDrmFormatModifiers` contains the entire array `VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers`.

- Let `VkBool32 imageCreateMaybeLinear` indicate if the resultant image may be linear.
  - If tiling is `VK_IMAGE_TILING_LINEAR`, then `imageCreateMaybeLinear` is true.
  - If tiling is `VK_IMAGE_TILING_OPTIMAL`, then `imageCreateMaybeLinear` is false.
  - If tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `imageCreateMaybeLinear` is true if and only if `imageCreateDrmFormatModifiers` contains `DRM_FORMAT_MOD_LINEAR`.

- Let `VkFormatFeatureFlags imageCreateFormatFeatures` be the set of valid format features available during image creation.
  - If tiling is `VK_IMAGE_TILING_LINEAR`, then `imageCreateFormatFeatures` is the value of `VkFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` with parameter `format` equal to `VkImageCreateInfo::format`.
  - If tiling is `VK_IMAGE_TILING_OPTIMAL`, and if the `pNext` chain includes no `VkExternalFormatANDROID` structure with non-zero `externalFormat`, then `imageCreateFormatFeatures` is value of `VkFormatProperties::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` with parameter `format` equal to `VkImageCreateInfo::format`.
  - If tiling is `VK_IMAGE_TILING_OPTIMAL`, and if the `pNext` chain includes a `VkExternalFormatANDROID` structure with non-zero `externalFormat`, then `imageCreateFormatFeatures` is the value of `VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures` obtained by calling `vkGetAndroidHardwareBufferPropertiesANDROID` with a matching `externalFormat`.
value.

- If tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the value of `imageCreateFormatFeatures` is found by calling `vkGetPhysicalDeviceFormatProperties2` with `VkImageFormatProperties::format` equal to `VkImageCreateInfo::format` and with `VkDrmFormatModifierPropertiesListEXT` chained into `VkImageFormatProperties2`; by collecting all members of the returned array `VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties` whose `drmFormatModifier` belongs to `imageCreateDrmFormatModifiers`; and by taking the bitwise intersection, over the collected array members, of `drmFormatModifierTilingFeatures`. (The resultant `imageCreateFormatFeatures` may be empty).

- Let `VkImageFormatProperties2 imageCreateImageFormatPropertiesList[]` be defined as follows.

  - If `VkImageCreateInfo::pNext` contains no `VkExternalFormatANDROID` structure with non-zero `externalFormat`, then `imageCreateImageFormatPropertiesList` is the list of structures obtained by calling `vkGetPhysicalDeviceImageFormatProperties2`, possibly multiple times, as follows:

    - The parameters `VkPhysicalDeviceImageFormatInfo2::format`, `imageType`, `tiling`, `usage`, and `flags` must be equal to those in `VkImageCreateInfo`.

    - If `VkImageCreateInfo::pNext` contains a `VkExternalMemoryImageCreateInfo` structure whose `handleTypes` is not 0, then `VkPhysicalDeviceImageFormatInfo2::pNext` must contain a `VkPhysicalDeviceExternalImageFormatInfo` structure whose `handleType` is not 0; and `vkGetPhysicalDeviceImageFormatProperties2` must be called for each handle type in `VkExternalMemoryImageCreateInfo::handleTypes`, successively setting `VkPhysicalDeviceExternalImageFormatInfo::handleType` on each call.

    - If `VkImageCreateInfo::pNext` contains no `VkExternalMemoryImageCreateInfo` structure, or contains a structure whose `handleTypes` is 0, then `VkPhysicalDeviceImageFormatInfo2::pNext` must either contain no `VkPhysicalDeviceExternalImageFormatInfo` structure, or contain a structure whose `handleType` is 0.

    - If tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `VkPhysicalDeviceImageFormatInfo2::pNext` must contain a `VkPhysicalDeviceImageDrmFormatModifierInfoEXT` structure where `sharingMode` is equal to `VkImageCreateInfo::sharingMode`; and, if `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, then `queueFamilyIndexCount` and `pQueueFamilyIndices` must be equal to those in `VkImageCreateInfo`; and, if `flags` contains `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, then the `VkImageFormatListCreateInfo` structure included in the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2::pNext` must be equivalent to the one included in the `pNext` chain of `VkImageCreateInfo`; and `vkGetPhysicalDeviceImageFormatProperties2` must be called for each modifier in `imageCreateDrmFormatModifiers`, successively setting `VkPhysicalDeviceImageDrmFormatModifierInfoEXT::drmFormatModifier` on each call.

    - If tiling is not `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `VkPhysicalDeviceImageFormatInfo2::pNext` must contain no
VkPhysicalDeviceImageDrmFormatModifierInfoEXT structure.

- If any call to `vkGetPhysicalDeviceImageFormatProperties2` returns an error, then `imageCreateImageFormatPropertiesList` is defined to be the empty list.
- If `VkImageCreateInfo::pNext` contains a `VkExternalFormatANDROID` structure with non-zero `externalFormat`, then `imageCreateImageFormatPropertiesList` contains a single element where:
  - `VkImageFormatProperties::maxMipLevels` is \( \lfloor \log_2(\max(\text{extent.width, extent.height, extent.depth})) \rfloor + 1 \).
  - `VkImageFormatProperties::maxArrayLayers` is `VkPhysicalDeviceLimits::maxImageArrayLayers`.
  - Each component of `VkImageFormatProperties::maxExtent` is `VkPhysicalDeviceLimits::maxImageDimension2D`.
  - `VkImageFormatProperties::sampleCounts` contains exactly `VK_SAMPLE_COUNT_1_BIT`.

- Let `uint32_t imageCreateMaxMipLevels` be the minimum value of `VkImageFormatProperties::maxMipLevels` in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.
- Let `uint32_t imageCreateMaxArrayLayers` be the minimum value of `VkImageFormatProperties::maxArrayLayers` in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.
- Let `VkExtent3D imageCreateMaxExtent` be the component-wise minimum over all `VkImageFormatProperties::maxExtent` values in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.
- Let `VkSampleCountFlags imageCreateSampleCounts` be the intersection of each `VkImageFormatProperties::sampleCounts` in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.
Valid Usage

- **VUID-VkImageCreateInfo-imageCreateMaxMipLevels-02251**
  Each of the following values (as described in Image Creation Limits) **must** not be undefined imageCreateMaxMipLevels, imageCreateMaxArrayLayers, imageCreateMaxExtent, and imageCreateSampleCounts

- **VUID-VkImageCreateInfo-sharingMode-00941**
  If sharingMode is VK_SHARING_MODE_CONCURRENT, pQueueFamilyIndices **must** be a valid pointer to an array of queueFamilyIndexCount uint32_t values

- **VUID-VkImageCreateInfo-sharingMode-00942**
  If sharingMode is VK_SHARING_MODE_CONCURRENT, queueFamilyIndexCount **must** be greater than 1

- **VUID-VkImageCreateInfo-sharingMode-01420**
  If sharingMode is VK_SHARING_MODE_CONCURRENT, each element of pQueueFamilyIndices **must** be unique and **must** be less than pQueueFamilyPropertyCount returned by either vkGetPhysicalDeviceQueueFamilyProperties or vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to create device

- **VUID-VkImageCreateInfo-pNext-01974**
  If the pNext chain includes a VkExternalFormatANDROID structure, and its externalFormat member is non-zero the format **must** be VK_FORMAT_UNDEFINED

- **VUID-VkImageCreateInfo-pNext-01975**
  If the pNext chain does not include a VkExternalFormatANDROID structure, or does and its externalFormat member is 0, the format **must** not be VK_FORMAT_UNDEFINED

- **VUID-VkImageCreateInfo-extent-00944**
  extent.width **must** be greater than 0

- **VUID-VkImageCreateInfo-extent-00945**
  extent.height **must** be greater than 0

- **VUID-VkImageCreateInfo-extent-00946**
  extent.depth **must** be greater than 0

- **VUID-VkImageCreateInfo-mipLevels-00947**
  mipLevels **must** be greater than 0

- **VUID-VkImageCreateInfo-arrayLayers-00948**
  arrayLayers **must** be greater than 0

- **VUID-VkImageCreateInfo-flags-00949**
  If flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, imageType **must** be VK_IMAGE_TYPE_2D

- **VUID-VkImageCreateInfo-flags-02557**
  If flags contains VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT, imageType **must** be VK_IMAGE_TYPE_2D

- **VUID-VkImageCreateInfo-flags-00950**
  If flags contains VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT, imageType **must** be VK_IMAGE_TYPE_3D

748 | Chapter 12. Resource Creation
extent.width must be less than or equal to imageCreateMaxExtent.width (as defined in Image Creation Limits)

extent.height must be less than or equal to imageCreateMaxExtent.height (as defined in Image Creation Limits)

extent.depth must be less than or equal to imageCreateMaxExtent.depth (as defined in Image Creation Limits)

extent.width must be less than or equal to imageCreateMaxExtent.width (as defined in Image Creation Limits)

extent.height must be less than or equal to imageCreateMaxExtent.height (as defined in Image Creation Limits)

extent.depth must be less than or equal to imageCreateMaxExtent.depth (as defined in Image Creation Limits)

If imageType is VK_IMAGE_TYPE_2D and flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, extent.width and extent.height must be equal and arrayLayers must be greater than or equal to 6

If imageType is VK_IMAGE_TYPE_1D, both extent.height and extent.depth must be 1

If imageType is VK_IMAGE_TYPE_2D, extent.depth must be 1

mipLevels must be less than or equal to the number of levels in the complete mipmap chain based on extent.width, extent.height, and extent.depth

mipLevels must be less than or equal to imageCreateMaxMipLevels (as defined in Image Creation Limits)

arrayLayers must be less than or equal to imageCreateMaxArrayLayers (as defined in Image Creation Limits)

If imageType is VK_IMAGE_TYPE_3D, arrayLayers must be 1

If samples is not VK_SAMPLE_COUNT_1_BIT, then imageType must be VK_IMAGE_TYPE_2D, flags must not contain VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, mipLevels must be equal to 1, and imageCreateMaybeLinear (as defined in Image Creation Limits) must be false,

If samples is not VK_SAMPLE_COUNT_1_BIT, usage must not contain VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT

If usage includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, then bits other than VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT must not be set

If usage includes VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.width must be less than or equal to
- VUID-VkImageCreateInfo-usage-00965
  If `usage` includes `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, `extent.height` must be less than or equal to `VkPhysicalDeviceLimits::maxFramebufferHeight`.

- VUID-VkImageCreateInfo-usage-02559
  If `usage` includes `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`, `extent.width` must be less than or equal to \( \frac{\text{maxFramebufferWidth}}{\text{minFragmentDensityTeoclSize}} \).

- VUID-VkImageCreateInfo-usage-02560
  If `usage` includes `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`, `extent.height` must be less than or equal to \( \frac{\text{maxFramebufferHeight}}{\text{minFragmentDensityTeoclSize}} \).

- VUID-VkImageCreateInfo-usage-00966
  If `usage` includes `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, `usage` must also contain at least one of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

- VUID-VkImageCreateInfo-samples-02258
  `samples` must be a bit value that is set in `imageCreateSampleCounts` (as defined in Image Creation Limits).

- VUID-VkImageCreateInfo-usage-00968
  If the multisampled storage images feature is not enabled, and `usage` contains `VK_IMAGE_USAGE_STORAGE_BIT`, `samples` must be `VK_SAMPLE_COUNT_1_BIT`.

- VUID-VkImageCreateInfo-flags-00969
  If the sparse bindings feature is not enabled, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`.

- VUID-VkImageCreateInfo-flags-01924
  If the sparse aliased residency feature is not enabled, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT`.

- VUID-VkImageCreateInfo-tiling-04121
  If `tiling` is `VK_IMAGE_TILING_LINEAR`, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- VUID-VkImageCreateInfo-imageType-00970
  If `imageType` is `VK_IMAGE_TYPE_1D`, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- VUID-VkImageCreateInfo-imageType-00971
  If the sparse residency for 2D images feature is not enabled, and `imageType` is `VK_IMAGE_TYPE_2D`, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- VUID-VkImageCreateInfo-imageType-00972
  If the sparse residency for 3D images feature is not enabled, and `imageType` is `VK_IMAGE_TYPE_3D`, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- VUID-VkImageCreateInfo-imageType-00973
  If the sparse residency for images with 2 samples feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_2_BIT`, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
If the sparse residency for images with 4 samples feature is not enabled, imageType is VK_IMAGE_TYPE_2D, and samples is VK_SAMPLE_COUNT_4_BIT, flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.

If the sparse residency for images with 8 samples feature is not enabled, imageType is VK_IMAGE_TYPE_2D, and samples is VK_SAMPLE_COUNT_8_BIT, flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.

If the sparse residency for images with 16 samples feature is not enabled, imageType is VK_IMAGE_TYPE_2D, and samples is VK_SAMPLE_COUNT_16_BIT, flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.

If flags contains VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT, it must also contain VK_IMAGE_CREATE_SPARSE_BINDING_BIT.

If any of the bits VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT are set, VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT must not also be set.

If the protected memory feature is not enabled, flags must not contain VK_IMAGE_CREATE_PROTECTED_BIT.

If any of the bits VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT are set, VK_IMAGE_CREATE_PROTECTED_BIT must not also be set.

If the pNext chain includes a VkExternalMemoryImageCreateInfoNV structure, it must not contain a VkExternalMemoryImageCreateInfo structure.

If the pNext chain includes a VkExternalMemoryImageCreateInfo structure, its handleTypes member must only contain bits that are also in VkExternalImageFormatProperties::externalMemoryProperties.compatibleHandleTypes, as returned by vkGetPhysicalDeviceImageFormatProperties2 with format, imageType, tiling, usage, and flags equal to those in this structure, and with a VkPhysicalDeviceExternalImageFormatInfo structure included in the pNext chain, with a handleType equal to any one of the handle types specified in VkExternalMemoryImageCreateInfo::handleTypes.

If the pNext chain includes a VkExternalMemoryImageCreateInfoNV structure, its handleTypes member must only contain bits that are also in VkExternalImageFormatPropertiesNV::externalMemoryProperties.compatibleHandleTypes, as returned by vkGetPhysicalDeviceExternalImageFormatPropertiesNV with format, imageType, tiling, usage, and flags equal to those in this structure, and with externalHandleType equal to any one of the handle types specified in.
VkExternalMemoryImageCreateInfoNV::handleTypes

If the logical device was created with VkDeviceGroupDeviceCreateInfo::physicalDeviceCount equal to 1, flags must not contain VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT

If flags contains VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT, then mipLevels must be one, arrayLayers must be one, imageType must be VK_IMAGE_TYPE_2D, and imageCreateMaybeLinear (as defined in Image Creation Limits) must be false

If flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, then format must be a block-compressed image format, an ETC compressed image format, or an ASTC compressed image format

If flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, then flags must also contain VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT

initialLayout must be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

If the pNext chain includes a VkExternalMemoryImageCreateInfo or VkExternalMemoryImageCreateInfoNV structure whose handleTypes member is not 0, initialLayout must be VK_IMAGE_LAYOUT_UNDEFINED

If the image format is one of those listed in Formats requiring sampler Y’CbCr conversion for VK_IMAGE_ASPECT_COLOR_BIT image views, then mipLevels must be 1

If the image format is one of those listed in Formats requiring sampler Y’CbCr conversion for VK_IMAGE_ASPECT_COLOR_BIT image views, samples must be VK_SAMPLE_COUNT_1_BIT

If the image format is one of those listed in Formats requiring sampler Y’CbCr conversion for VK_IMAGE_ASPECT_COLOR_BIT image views, imageType must be VK_IMAGE_TYPE_2D

If the image format is one of those listed in Formats requiring sampler Y’CbCr conversion for VK_IMAGE_ASPECT_COLOR_BIT image views, and the ycbcrImageArrays feature is not enabled, arrayLayers must be 1

If format is a multi-planar format, and if imageCreateFormatFeatures (as defined in Image Creation Limits) does not contain VK_FORMAT_FEATURE_DISJOINT_BIT, then flags must not contain VK_IMAGE_CREATE_DISJOINT_BIT

If format is not a multi-planar format, and flags does not include VK_IMAGE_CREATE_ALIAS_BIT, flags must not contain VK_IMAGE_CREATE_DISJOINT_BIT
If `format` has a \_422 or \_420 suffix, width must be a multiple of 2

• VUID-VkImageCreateInfo-format-04713

If `format` has a \_420 suffix, height must be a multiple of 2

• VUID-VkImageCreateInfo-tiling-02261

If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the `pNext` chain must include exactly one of `VkImageDrmFormatModifierListCreateInfoEXT` or `VkImageDrmFormatModifierExplicitCreateInfoEXT` structures

• VUID-VkImageCreateInfo-pNext-02262

If the `pNext` chain includes a `VkImageDrmFormatModifierListCreateInfoEXT` or `VkImageDrmFormatModifierExplicitCreateInfoEXT` structure, then `tiling` must be `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`

• VUID-VkImageCreateInfo-tiling-02353

If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and `flags` contains `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, then the `pNext` chain must include a `VkImageFormatListCreateInfo` structure with non-zero `viewFormatCount`

• VUID-VkImageCreateInfo-flags-01533

If `flags` contains `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` `format` must be a depth or depth/stencil format

• VUID-VkImageCreateInfo-pNext-02393

If the `pNext` chain includes a `VkExternalMemoryImageCreateInfo` structure whose `handleTypes` member includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, `imageType` must be `VK_IMAGE_TYPE_2D`

• VUID-VkImageCreateInfo-pNext-02394

If the `pNext` chain includes a `VkExternalMemoryImageCreateInfo` structure whose `handleTypes` member includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, `mipLevels` must either be 1 or equal to the number of levels in the complete mipmap chain based on `extent.width`, `extent.height`, and `extent.depth`

• VUID-VkImageCreateInfo-pNext-02396

If the `pNext` chain includes a `VkExternalFormatANDROID` structure whose `externalFormat` member is not 0, `flags` must not include `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`

• VUID-VkImageCreateInfo-pNext-02397

If the `pNext` chain includes a `VkExternalFormatANDROID` structure whose `externalFormat` member is not 0, `usage` must not include any usages except `VK_IMAGE_USAGE_SAMPLED_BIT`

• VUID-VkImageCreateInfo-pNext-02398

If the `pNext` chain includes a `VkExternalFormatANDROID` structure whose `externalFormat` member is not 0, `tiling` must be `VK_IMAGE_TILING_OPTIMAL`

• VUID-VkImageCreateInfo-format-02795

If `format` is a depth-stencil format, `usage` includes `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` and the `pNext` chain includes a `VkImageStencilUsageCreateInfo` structure, then its `VkImageStencilUsageCreateInfo::stencilUsage` member must also include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

• VUID-VkImageCreateInfo-format-02796
If format is a depth-stencil format, usage does not include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo::stencilUsage member must also not include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

- VUID-VkImageCreateInfo-format-02797

If format is a depth-stencil format, usage includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo::stencilUsage member must also include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT.

- VUID-VkImageCreateInfo-format-02798

If format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage member including VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.width must be less than or equal to VkPhysicalDeviceLimits::maxFramebufferWidth.

- VUID-VkImageCreateInfo-format-02537

If format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage member including VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.height must be less than or equal to VkPhysicalDeviceLimits::maxFramebufferHeight.

- VUID-VkImageCreateInfo-format-02538

If the multisampled storage images feature is not enabled, format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage including VK_IMAGE_USAGE_STORAGE_BIT, samples must be VK_SAMPLE_COUNT_1_BIT.

- VUID-VkImageCreateInfo-flags-02050

If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV, imageType must be VK_IMAGE_TYPE_2D or VK_IMAGE_TYPE_3D.

- VUID-VkImageCreateInfo-flags-02051

If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV, it must not contain VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT and the format must not be a depth/stencil format.

- VUID-VkImageCreateInfo-flags-02052

If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV and imageType is VK_IMAGE_TYPE_2D, extent.width and extent.height must be greater than 1.

- VUID-VkImageCreateInfo-flags-02053

If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV and imageType is VK_IMAGE_TYPE_3D, extent.width, extent.height, and extent.depth must be greater than 1.

- VUID-VkImageCreateInfo-imageType-02082

If usage includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, imageType...
**must** be `VK_IMAGE_TYPE_2D`

- VUID-VkImageCreateInfo-samples-02083
  If `usage` includes `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, `samples` must be `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkImageCreateInfo-tiling-02084
  If `usage` includes `VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV`, `tiling` must be `VK_IMAGE_TILING_OPTIMAL`

- VUID-VkImageCreateInfo-flags-02565
  If `flags` contains `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`, `tiling` must be `VK_IMAGE_TILING_OPTIMAL`

- VUID-VkImageCreateInfo-flags-02566
  If `flags` contains `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`, `imageType` must be `VK_IMAGE_TYPE_2D`

- VUID-VkImageCreateInfo-flags-02567
  If `flags` contains `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`, `flags` must not contain `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`

- VUID-VkImageCreateInfo-flags-02568
  If `flags` contains `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`, `mipLevels` must be `1`

- VUID-VkImageCreateInfo-imageView2DOn3DImage-04459
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageView2DOn3DImage` is `VK_FALSE`, `flags` must not contain `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT`.

- VUID-VkImageCreateInfo-multisampleArrayImage-04460
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::multisampleArrayImage` is `VK_FALSE`, and `samples` is not `VK_SAMPLE_COUNT_1_BIT`, then `arrayLayers` must be `1`.

- VUID-VkImageCreateInfo-pNext-04737
  If a `VkImageFormatListCreateInfo` structure was included in the `pNext` chain and `VkImageFormatListCreateInfo::viewFormatCount` is not zero then all of the formats in `VkImageFormatListCreateInfo::pViewFormats` must be compatible with the `format` as described in the compatibility table.

- VUID-VkImageCreateInfo-flags-04738
  If `flags` does not contain `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` and the `pNext` chain include a `VkImageFormatListCreateInfo` structure then `VkImageFormatListCreateInfo::viewFormatCount` must be `0` or `1`

- VUID-VkImageCreateInfo-usage-04815
  If `usage` includes `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`, then the `pNext` chain must include a valid `VkVideoProfilesKHR` structure which includes at least one `VkVideoProfileKHR` with a decode codec-operation.

- VUID-VkImageCreateInfo-usage-04816
  If `usage` includes `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`, then the `pNext` chain must include a valid `VkVideoProfilesKHR` structure which includes at least one `VkVideoProfileKHR` with an encode codec-operation.
Valid Usage (Implicit)

- **VUID-VkImageCreateInfo-sType-sType**
  
  *sType must be VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO*

- **VUID-VkImageCreateInfo-pNext-pNext**
  
  Each *pNext* member of any structure (including this one) in the *pNext* chain must be either NULL or a pointer to a valid instance of VkDedicatedAllocationImageCreateInfoNV, VkExternalFormatANDROID, VkExternalMemoryImageCreateInfo, VkImageDrmFormatModifierExplicitCreateInfoEXT, VkImageDrmFormatModifierListCreateInfoEXT, VkImageFormatListCreateInfo, VkImageStencilUsageCreateInfo, VkImageSwapchainCreateInfoKHR, VkVideoProfileKHR, or VkVideoProfilesKHR

- **VUID-VkImageCreateInfo-sType-unique**
  
  The *sType* value of each struct in the *pNext* chain must be unique

- **VUID-VkImageCreateInfo-flags-parameter**
  
  *flags must be a valid combination of VkImageCreateFlagBits values*

- **VUID-VkImageCreateInfo-imageType-parameter**
  
  *imageType must be a valid VkImageType value*

- **VUID-VkImageCreateInfo-format-parameter**
  
  *format must be a valid VkFormat value*

- **VUID-VkImageCreateInfo-samples-parameter**
  
  *samples must be a valid VkSampleCountFlagBits value*

- **VUID-VkImageCreateInfo-tiling-parameter**
  
  *tiling must be a valid VkImageTiling value*

- **VUID-VkImageCreateInfo-usage-parameter**
  
  *usage must be a valid combination of VkImageUsageFlagBits values*

- **VUID-VkImageCreateInfo-usage-requiredbitmask**
  
  *usage must not be 0*

- **VUID-VkImageCreateInfo-sharingMode-parameter**
  
  *sharingMode must be a valid VkSharingMode value*

- **VUID-VkImageCreateInfo-initialLayout-parameter**
  
  *initialLayout must be a valid VkImageLayout value*

---

The `VkImageStencilUsageCreateInfo` structure is defined as:

```c
typedef struct VkImageStencilUsageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageUsageFlags stencilUsage;
} VkImageStencilUsageCreateInfo;
```
or the equivalent

```c
// Provided by VK_EXT_separate_stencil_usage
typedef VkImageStencilUsageCreateInfo VkImageStencilUsageCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stencilUsage` is a bitmask of `VkImageUsageFlagBits` describing the intended usage of the stencil aspect of the image.

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageStencilUsageCreateInfo` structure, then that structure includes the usage flags specific to the stencil aspect of the image for an image with a depth-stencil format.

This structure specifies image usages which only apply to the stencil aspect of a depth/stencil format image. When this structure is included in the `pNext` chain of `VkImageCreateInfo`, the stencil aspect of the image must only be used as specified by `stencilUsage`. When this structure is not included in the `pNext` chain of `VkImageCreateInfo`, the stencil aspect of an image must only be used as specified `VkImageCreateInfo::usage`. Use of other aspects of an image are unaffected by this structure.

This structure can also be included in the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` to query additional capabilities specific to image creation parameter combinations including a separate set of usage flags for the stencil aspect of the image using `vkGetPhysicalDeviceImageFormatProperties2`. When this structure is not included in the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` then the implicit value of `stencilUsage` matches that of `VkPhysicalDeviceImageFormatInfo2::usage`.

### Valid Usage

- VUID-VkImageStencilUsageCreateInfo-stencilUsage-02539
  If `stencilUsage` includes `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, it must not include bits other than `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

### Valid Usage (Implicit)

- VUID-VkImageStencilUsageCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_STENCIL_USAGE_CREATE_INFO`

- VUID-VkImageStencilUsageCreateInfo-stencilUsage-parameter
  `stencilUsage` must be a valid combination of `VkImageUsageFlagBits` values

- VUID-VkImageStencilUsageCreateInfo-stencilUsage-requiredbitmask
  `stencilUsage` must not be 0
If the pNext chain includes a VkDedicatedAllocationImageCreateInfoNV structure, then that structure includes an enable controlling whether the image will have a dedicated memory allocation bound to it.

The VkDedicatedAllocationImageCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_dedicated_allocation
typedef struct VkDedicatedAllocationImageCreateInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           dedicatedAllocation;
} VkDedicatedAllocationImageCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dedicatedAllocation` specifies whether the image will have a dedicated allocation bound to it.

**Note**
Using a dedicated allocation for color and depth/stencil attachments or other large images may improve performance on some devices.

**Valid Usage**

- VUID-VkDedicatedAllocationImageCreateInfoNV-dedicatedAllocation-00994
  If `dedicatedAllocation` is `VK_TRUE`, `VkImageCreateInfo::flags` must not include `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT`

**Valid Usage (Implicit)**

- VUID-VkDedicatedAllocationImageCreateInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_IMAGE_CREATE_INFO_NV`

To define a set of external memory handle types that may be used as backing store for an image, add a VkExternalMemoryImageCreateInfo structure to the pNext chain of the VkImageCreateInfo structure. The VkExternalMemoryImageCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryImageCreateInfo {
    VkStructureType                    sType;
    const void*                        pNext;
    VkExternalMemoryHandleTypeFlags    handleTypes;
} VkExternalMemoryImageCreateInfo;
```
or the equivalent

```c
// Provided by VK_KHR_external_memory
typedef VkExternalMemoryImageCreateInfo VkExternalMemoryImageCreateInfoKHR;
```

**Note**

A `VkExternalMemoryImageCreateInfo` structure with a non-zero `handleType` field must be included in the creation parameters for an image that will be bound to memory that is either exported or imported.

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is zero, or a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more external memory handle types.

**Valid Usage (Implicit)**

- `VUID-VkExternalMemoryImageCreateInfo-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO`
- `VUID-VkExternalMemoryImageCreateInfo-handleTypes-parameter`  
  `handleTypes` must be a valid combination of `VkExternalMemoryHandleTypeFlagBits` values

If the `pNext` chain includes a `VkExternalMemoryImageCreateInfoNV` structure, then that structure defines a set of external memory handle types that may be used as backing store for the image.

The `VkExternalMemoryImageCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_external_memory
typedef struct VkExternalMemoryImageCreateInfoNV {
    VkStructureType                      sType;
    const void*                          pNext;
    VkExternalMemoryHandleTypeFlagsNV    handleTypes;
} VkExternalMemoryImageCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is zero, or a bitmask of `VkExternalMemoryHandleTypeFlagBitsNV` specifying one or more external memory handle types.
Valid Usage (Implicit)

- **VUID-VkExternalMemoryImageCreateInfoNV-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO_NV`

- **VUID-VkExternalMemoryImageCreateInfoNV-handleTypes-parameter**
  
  `handleTypes` **must** be a valid combination of `VkExternalMemoryHandleTypeFlagBitsNV` values

To create an image with an **external format**, add a `VkExternalFormatANDROID` structure in the `pNext` chain of `VkImageCreateInfo`. `VkExternalFormatANDROID` is defined as:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkExternalFormatANDROID {
    VkStructureType sType;
    void* pNext;
    uint64_t externalFormat;
} VkExternalFormatANDROID;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `externalFormat` is an implementation-defined identifier for the external format

If `externalFormat` is zero, the effect is as if the `VkExternalFormatANDROID` structure was not present. Otherwise, the `image` will have the specified external format.

Valid Usage

- **VUID-VkExternalFormatANDROID-externalFormat-01894**

  `externalFormat` **must** be 0 or a value returned in the `externalFormat` member of `VkAndroidHardwareBufferFormatPropertiesANDROID` by an earlier call to `vkGetAndroidHardwareBufferPropertiesANDROID`

Valid Usage (Implicit)

- **VUID-VkExternalFormatANDROID-sType-sType**

  `sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_FORMAT_ANDROID`

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageSwapchainCreateInfoKHR` structure, then that structure includes a swapchain handle indicating that the image will be bound to memory from that swapchain.

The `VkImageSwapchainCreateInfoKHR` structure is defined as:
typedef struct VkImageSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
} VkImageSwapchainCreateInfoKHR;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **swapchain** is **VK_NULL_HANDLE** or a handle of a swapchain that the image will be bound to.

### Valid Usage

- **VUID-VkImageSwapchainCreateInfoKHR-swapchain-00995**
  If **swapchain** is not **VK_NULL_HANDLE**, the fields of **VkImageCreateInfo** must match the implied image creation parameters of the swapchain

### Valid Usage (Implicit)

- **VUID-VkImageSwapchainCreateInfoKHR-sType-sType**
  **sType** must be **VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR**

- **VUID-VkImageSwapchainCreateInfoKHR-swapchain-parameter**
  If **swapchain** is not **VK_NULL_HANDLE**, **swapchain** must be a valid **VkSwapchainKHR** handle

If the **pNext** list of **VkImageCreateInfo** includes a **VkImageFormatListCreateInfo** structure, then that structure contains a list of all formats that can be used when creating views of this image.

The **VkImageFormatListCreateInfo** structure is defined as:

typedef struct VkImageFormatListCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t viewFormatCount;
    const VkFormat* pViewFormats;
} VkImageFormatListCreateInfo;

or the equivalent

// Provided by VK_KHR_image_format_list
typedef VkImageFormatListCreateInfo VkImageFormatListCreateInfoKHR;

Chapter 12. Resource Creation | 761
• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **viewFormatCount** is the number of entries in the **pViewFormats** array.

• **pViewFormats** is an array which lists of all formats which can be used when creating views of this image.

If **viewFormatCount** is zero, **pViewFormats** is ignored and the image is created as if the **VkImageFormatListCreateInfo** structure were not included in the **pNext** list of **VkImageCreateInfo**.

---

**Valid Usage (Implicit)**

- **VUID-VkImageFormatListCreateInfo-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_IMAGE_FORMAT_LIST_CREATE_INFO**

- **VUID-VkImageFormatListCreateInfo-pViewFormats-parameter**
  - If **viewFormatCount** is not 0, **pViewFormats** must be a valid pointer to an array of **viewFormatCount** valid **VkFormat** values

If the **pNext** chain of **VkImageCreateInfo** includes a **VkImageDrmFormatModifierListCreateInfoEXT** structure, then the image will be created with one of the Linux DRM format modifiers listed in the structure. The choice of modifier is implementation-dependent.

The **VkImageDrmFormatModifierListCreateInfoEXT** structure is defined as:

```c
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkImageDrmFormatModifierListCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           drmFormatModifierCount;
    const uint64_t*    pDrmFormatModifiers;
} VkImageDrmFormatModifierListCreateInfoEXT;
```

• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **drmFormatModifierCount** is the length of the **pDrmFormatModifiers** array.

• **pDrmFormatModifiers** is a pointer to an array of Linux DRM format modifiers.

---

**Valid Usage**

- **VUID-VkImageDrmFormatModifierListCreateInfoEXT-pDrmFormatModifiers-02263**
  - Each modifier in **pDrmFormatModifiers** must be compatible with the parameters in **VkImageCreateInfo** and its **pNext** chain, as determined by querying **VkPhysicalDeviceImageFormatInfo2** extended with **VkPhysicalDeviceImageDrmFormatModifierInfoEXT**
Valid Usage (Implicit)

• **VUID-VkImageDrmFormatModifierListCreateInfoEXT-sType-sType**
  
  *sType must be* `VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_LIST_CREATE_INFO_EXT`

• **VUID-VkImageDrmFormatModifierListCreateInfoEXT-pDrmFormatModifiers-parameter**
  
  *pDrmFormatModifiers must be a valid pointer to an array of `drmFormatModifierCount` `uint64_t` values*

• **VUID-VkImageDrmFormatModifierListCreateInfoEXT-drmFormatModifierCount-arraylength**
  
  *`drmFormatModifierCount` must be greater than 0*

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageDrmFormatModifierExplicitCreateInfoEXT` structure, then the image will be created with the Linux DRM format modifier and memory layout defined by the structure.

The `VkImageDrmFormatModifierExplicitCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkImageDrmFormatModifierExplicitCreateInfoEXT {
    VkStructureType               sType;
    const void*                   pNext;
    uint64_t                      drmFormatModifier;
    uint32_t                      drmFormatModifierPlaneCount;
    const VkSubresourceLayout*    pPlaneLayouts;
} VkImageDrmFormatModifierExplicitCreateInfoEXT;
```

• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **drmFormatModifier** is the Linux DRM format modifier with which the image will be created.

• **drmFormatModifierPlaneCount** is the number of memory planes in the image (as reported by `VkDrmFormatModifierPropertiesEXT`) as well as the length of the `pPlaneLayouts` array.

• **pPlaneLayouts** is a pointer to an array of `VkSubresourceLayout` structures describing the image's memory planes.

The `i`th member of `pPlaneLayouts` describes the layout of the image's `i`th memory plane (that is, `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT`). In each element of `pPlaneLayouts`, the implementation must ignore `size`. The implementation calculates the size of each plane, which the application can query with `vkGetImageSubresourceLayout`.

When creating an image with `VkImageDrmFormatModifierExplicitCreateInfoEXT`, it is the application's responsibility to satisfy all valid usage requirements. However, the implementation must validate that the provided `pPlaneLayouts`, when combined with the provided `drmFormatModifier` and other creation parameters in `VkImageCreateInfo` and its `pNext` chain, produce a valid image. (This validation is necessarily implementation-dependent and outside the scope of Vulkan, and therefore not described by valid usage requirements). If this validation fails, then `vkCreateImage` returns `VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT`.

Chapter 12. Resource Creation | 763
Valid Usage

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-drmFormatModifier-02264
drmFormatModifier must be compatible with the parameters in VkImageCreateInfo and its pNext chain, as determined by querying VkPhysicalDeviceImageFormatInfo2 extended with VkPhysicalDeviceImageDrmFormatModifierInfoEXT

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-drmFormatModifierPlaneCount-02265
drmFormatModifierPlaneCount must be equal to the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with VkImageCreateInfo::format and drmFormatModifier, as found by querying VkDrmFormatModifierPropertiesListEXT

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-size-02267
For each element of pPlaneLayouts, size must be 0

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-arrayPitch-02268
For each element of pPlaneLayouts, arrayPitch must be 0 if VkImageCreateInfo::arrayLayers is 1

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-depthPitch-02269
For each element of pPlaneLayouts, depthPitch must be 0 if VkImageCreateInfo::extent.depth is 1

Valid Usage (Implicit)

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-sType-sType
sType must be VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_EXPLICIT_CREATE_INFO_EXT

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-pPlaneLayouts-parameter
If drmFormatModifierPlaneCount is not 0, pPlaneLayouts must be a valid pointer to an array of drmFormatModifierPlaneCount VkSubresourceLayout structures

Bits which can be set in VkImageViewUsageCreateInfo::usage, or VkImageStencilUsageCreateInfo::stencilUsage, or VkImageCreateInfo::usage, specifying intended usage of an image, are:
typedef enum VkImageUsageFlagBits {
    VK_IMAGE_USAGE_TRANSFER_SRC_BIT = 0x00000001,
    VK_IMAGE_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_IMAGE_USAGE_SAMPLED_BIT = 0x00000004,
    VK_IMAGE_USAGE_STORAGE_BIT = 0x00000008,
    VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT = 0x00000010,
    VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT = 0x00000020,
    VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT = 0x00000040,
    VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT = 0x00000080,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
        // Provided by VK_KHR_video_decode_queue
        VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR = 0x00000400,
    #endif
    #ifdef VK_ENABLE_BETA_EXTENSIONS
        // Provided by VK_KHR_video_decode_queue
        VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR = 0x00000800,
    #endif
    #ifdef VK_ENABLE_BETA_EXTENSIONS
        // Provided by VK_KHR_video_decode_queue
        VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR = 0x00001000,
    #endif
    #ifdef VK_ENABLE_BETA_EXTENSIONS
        // Provided by VK_KHR_video_encode_queue
        VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR = 0x00002000,
    #endif
    #ifdef VK_ENABLE_BETA_EXTENSIONS
        // Provided by VK_KHR_video_encode_queue
        VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR = 0x00004000,
    #endif
    #ifdef VK_ENABLE_BETA_EXTENSIONS
        // Provided by VK_KHR_video_encode_queue
        VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR = 0x00008000,
    #endif
    // Provided by VK_NV_shading_rate_image
    VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV = 0x00000100,
    // Provided by VK_EXT_fragment_density_map
    VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT = 0x00000200,
    // Provided by VK_KHR_fragment_shading_rate
    VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR =
        VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV,
} VkImageUsageFlagBits;

- **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** specifies that the image can be used as the source of a transfer command.
- **VK_IMAGE_USAGE_TRANSFER_DST_BIT** specifies that the image can be used as the destination of a transfer command.
- **VK_IMAGE_USAGE_SAMPLED_BIT** specifies that the image can be used to create a VkImageView suitable
for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and be sampled by a shader.

- VK_IMAGE_USAGE_STORAGE_BIT specifies that the image can be used to create a VkImageView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_STORAGE_IMAGE.

- VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT specifies that the image can be used to create a VkImageView suitable for use as a color or resolve attachment in a VkFramebuffer.

- VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT specifies that the image can be used to create a VkImageView suitable for use as a depth/stencil or depth/stencil resolve attachment in a VkFramebuffer.

- VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT specifies that the memory bound to this image will have been allocated with the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT (see Memory Allocation for more detail). This bit can be set for any image that can be used to create a VkImageView suitable for use as a color, resolve, depth/stencil, or input attachment.

- VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT specifies that the image can be used to create a VkImageView suitable for occupying VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT; be read from a shader as an input attachment; and be used as an input attachment in a framebuffer.

- VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT specifies that the image can be used to create a VkImageView suitable for use as a fragment density map image.

- VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR specifies that the image can be used to create a VkImageView suitable for use as a fragment shading rate attachment or shading rate image.

- VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR specifies that video decode operations can use the image as a reference picture, or a source of postprocessing, or transfer operation.

- VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR specifies that video encode operations can use the image to hold a reconstructed picture, and to act as a reference picture. This flag must be combined with VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR and VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR. VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR is required for Dpb image resources because these resources will be associated with reference pictures after acting as targets for video decode operations. VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR is required for Dpb image resources because the reference pictures associated with them act as information sources for subsequent decode operations.

- VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR specifies that the image can be used as an input picture for video encode operations.

- VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR specifies that video encode operations can use the image to hold a reconstructed picture, and to act as a reference picture. This flag must be combined with VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR and VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR. VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR is required for Dpb image resource because the reconstructed picture resulting from an encode operation will be written to it. VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR is required for Dpb image resources because it can be used as a reconstructed reference picture source for the encode operation.
typedef VkFlags VkImageUsageFlags;

VkImageUsageFlags is a bitmask type for setting a mask of zero or more VkImageUsageFlagBits.

When creating a VkImageView one of the following VkImageUsageFlagBits must be set:

- VK_IMAGE_USAGE_SAMPLED_BIT
- VK_IMAGE_USAGE_STORAGE_BIT
- VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT
- VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT
- VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT
- VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT
- VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
- VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT

Bits which can be set in VkImageCreateInfo::flags, specifying additional parameters of an image, are:
typedef enum VkImageCreateFlagBits {
    VK_IMAGE_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_IMAGE_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
    VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT = 0x00000008,
    VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_ALIAS_BIT = 0x00000400,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT = 0x00000040,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT = 0x00000020,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT = 0x00000080,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_EXTENDED_USAGE_BIT = 0x00000100,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_PROTECTED_BIT = 0x00000800,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_DISJOINT_BIT = 0x00000200,
    // Provided by VK_NV_corner_sampled_image
    VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV = 0x00002000,
    // Provided by VK_EXT_sample_locations
    VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT = 0x00001000,
    // Provided by VK_EXT_fragment_density_map
    VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT = 0x00004000,
    // Provided by VK_KHR_device_group with VK_KHR_bind_memory2
    VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT,
    // Provided by VK_KHR_maintenance1
    VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT_KHR = VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT_KHR = VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR = VK_IMAGE_CREATE_EXTENDED_USAGE_BIT,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_CREATE_DISJOINT_BIT_KHR = VK_IMAGE_CREATE_DISJOINT_BIT,
    // Provided by VK_KHR_bind_memory2
    VK_IMAGE_CREATE_ALIAS_BIT_KHR = VK_IMAGE_CREATE_ALIAS_BIT,
} VkImageCreateFlagBits;

- **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** specifies that the image will be backed using sparse memory binding.
- **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** specifies that the image can be partially backed using sparse memory binding. Images created with this flag must also be created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag.
• **VK_IMAGE_CREATE_SPARSE_ALIASED_BIT** specifies that the image will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another image (or another portion of the same image). Images created with this flag must also be created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag.

• **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** specifies that the image can be used to create a VkImageView with a different format from the image. For multi-planar formats, **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** specifies that a VkImageView can be created of a plane of the image.

• **VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT** specifies that the image can be used to create a VkImageView of type **VK_IMAGE_VIEW_TYPE_CUBE** or **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**.

• **VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT** specifies that the image can be used to create a VkImageView of type **VK_IMAGE_VIEW_TYPE_2D** or **VK_IMAGE_VIEW_TYPE_2D_ARRAY**.

• **VK_IMAGE_CREATE_PROTECTED_BIT** specifies that the image is a protected image.

• **VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT** specifies that the image can be used with a non-zero value of the splitInstanceBindRegionCount member of a VkBindImageMemoryDeviceGroupInfo structure passed into vkBindImageMemory2. This flag also has the effect of making the image use the standard sparse image block dimensions.

• **VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT** specifies that the image having a compressed format can be used to create a VkImageView with an uncompressed format where each texel in the image view corresponds to a compressed texel block of the image.

• **VK_IMAGE_CREATE_EXTENDED_USAGE_BIT** specifies that the image can be created with usage flags that are not supported for the format the image is created with but are supported for at least one format a VkImageView created from the image can have.

• **VK_IMAGE_CREATE_DISJOINT_BIT** specifies that an image with a multi-planar format must have each plane separately bound to memory, rather than having a single memory binding for the whole image; the presence of this bit distinguishes a disjoint image from an image without this bit set.

• **VK_IMAGE_CREATE_ALIAS_BIT** specifies that two images created with the same creation parameters and aliased to the same memory can interpret the contents of the memory consistently with each other, subject to the rules described in the Memory Aliasing section. This flag further specifies that each plane of a disjoint image can share an in-memory non-linear representation with single-plane images, and that a single-plane image can share an in-memory non-linear representation with a plane of a multi-planar disjoint image, according to the rules in Compatible formats of planes of multi-planar formats. If the pNext chain includes a VkExternalMemoryImageCreateInfo or VkExternalMemoryImageCreateInfoNV structure whose handleTypes member is not 0, it is as if **VK_IMAGE_CREATE_ALIAS_BIT** is set.

• **VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT** specifies that an image with a depth or depth/stencil format can be used with custom sample locations when used as a depth/stencil attachment.

• **VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV** specifies that the image is a corner-sampled image.

• **VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT** specifies that an image can be in a subsampled format which may be more optimal when written as an attachment by a render pass that has a fragment density map attachment. Accessing a subsampled image has additional
considerations:

- Image data read as an image sampler will have undefined values if the sampler was not created with flags containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` or was not sampled through the use of a combined image sampler with an immutable sampler in `VkDescriptorSetLayoutBinding`.

- Image data read with an input attachment will have undefined values if the contents were not written as an attachment in an earlier subpass of the same render pass.

- Image data read as an image sampler in the fragment shader will be additionally be read by the device during `VK_PIPELINE_STAGE_VERTEX_SHADER_BIT` if `VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::subsampledCoarseReconstructionEarlyAccess` is `VK_TRUE` and the sampler was created with flags containing `VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT`.

- Image data read with load operations are resampled to the fragment density of the render pass if `VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::subsampledLoads` is `VK_TRUE`. Otherwise, values of image data are undefined.

- Image contents outside of the render area take on undefined values if the image is stored as a render pass attachment.

See Sparse Resource Features and Sparse Physical Device Features for more details.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageCreateFlags;
```

`VkImageCreateFlags` is a bitmask type for setting a mask of zero or more `VkImageCreateFlagBits`.

Possible values of `VkImageCreateInfo::imageType`, specifying the basic dimensionality of an image, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageType {
    VK_IMAGE_TYPE_1D = 0,
    VK_IMAGE_TYPE_2D = 1,
    VK_IMAGE_TYPE_3D = 2,
} VkImageType;
```

- `VK_IMAGE_TYPE_1D` specifies a one-dimensional image.
- `VK_IMAGE_TYPE_2D` specifies a two-dimensional image.
- `VK_IMAGE_TYPE_3D` specifies a three-dimensional image.

Possible values of `VkImageCreateInfo::tiling`, specifying the tiling arrangement of texel blocks in an image, are:
• **VK_IMAGE_TILING_OPTIMAL** specifies optimal tiling (texels are laid out in an implementation-dependent arrangement, for more optimal memory access).

• **VK_IMAGE_TILING_LINEAR** specifies linear tiling (texels are laid out in memory in row-major order, possibly with some padding on each row).

• **VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT** indicates that the image’s tiling is defined by a Linux DRM format modifier. The modifier is specified at image creation with `VkImageDrmFormatModifierListCreateInfoEXT` or `VkImageDrmFormatModifierExplicitCreateInfoEXT`, and can be queried with `vkGetImageDrmFormatModifierPropertiesEXT`.

To query the memory layout of an image subresource, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageSubresourceLayout(
    VkDevice device,
    VkImage image,
    const VkImageSubresource* pSubresource,
    VkSubresourceLayout* pLayout);
```

• **device** is the logical device that owns the image.

• **image** is the image whose layout is being queried.

• **pSubresource** is a pointer to a `VkImageSubresource` structure selecting a specific image for the image subresource.

• **pLayout** is a pointer to a `VkSubresourceLayout` structure in which the layout is returned.

If the image is **linear**, then the returned layout is valid for **host access**.

If the image’s tiling is **VK_IMAGE_TILING_LINEAR** and its format is a **multi-planar format**, then `vkGetImageSubresourceLayout` describes one **format plane** of the image. If the image’s tiling is **VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT**, then `vkGetImageSubresourceLayout` describes one **memory plane** of the image. If the image’s tiling is **VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT** and the image is **non-linear**, then the returned layout has an implementation-dependent meaning; the vendor of the image’s DRM format modifier may provide documentation that explains how to interpret the returned layout.

`vkGetImageSubresourceLayout` is invariant for the lifetime of a single image. However, the subresource layout of images in Android hardware buffer external memory is not known until the
image has been bound to memory, so applications **must** not call `vkGetImageSubresourceLayout` for such an image before it has been bound.
Valid Usage

- **VUID-vkGetImageSubresourceLayout-image-02270**
  
  *image* must have been created with *tiling* equal to *VK_IMAGE_TILING_LINEAR* or *VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT*

- **VUID-vkGetImageSubresourceLayout-aspectMask-00997**
  
  The *aspectMask* member of *pSubresource* must only have a single bit set

- **VUID-vkGetImageSubresourceLayout-mipLevel-01716**
  
  The *mipLevel* member of *pSubresource* must be less than the *mipLevels* specified in *VkImageCreateInfo* when *image* was created

- **VUID-vkGetImageSubresourceLayout-arrayLayer-01717**
  
  The *arrayLayer* member of *pSubresource* must be less than the *arrayLayers* specified in *VkImageCreateInfo* when *image* was created

- **VUID-vkGetImageSubresourceLayout-format-04461**
  
  If *format* is a color format, the *aspectMask* member of *pSubresource* must be *VK_IMAGE_ASPECT_COLOR_BIT*

- **VUID-vkGetImageSubresourceLayout-format-04462**
  
  If *format* has a depth component, the *aspectMask* member of *pSubresource* must contain *VK_IMAGE_ASPECT_DEPTH_BIT*

- **VUID-vkGetImageSubresourceLayout-format-04463**
  
  If *format* has a stencil component, the *aspectMask* member of *pSubresource* must contain *VK_IMAGE_ASPECT_STENCIL_BIT*

- **VUID-vkGetImageSubresourceLayout-format-04464**
  
  If *format* does not contain a stencil or depth component, the *aspectMask* member of *pSubresource* must not contain *VK_IMAGE_ASPECT_DEPTH_BIT* or *VK_IMAGE_ASPECT_STENCIL_BIT*

- **VUID-vkGetImageSubresourceLayout-format-01581**
  
  If the *tiling* of the *image* is *VK_IMAGE_TILING_LINEAR* and its *format* is a multi-planar format with two planes, the *aspectMask* member of *pSubresource* must be *VK_IMAGE_ASPECT_PLANE_0_BIT* or *VK_IMAGE_ASPECT_PLANE_1_BIT*

- **VUID-vkGetImageSubresourceLayout-format-01582**
  
  If the *tiling* of the *image* is *VK_IMAGE_TILING_LINEAR* and its *format* is a multi-planar format with three planes, the *aspectMask* member of *pSubresource* must be *VK_IMAGE_ASPECT_PLANE_0_BIT*, *VK_IMAGE_ASPECT_PLANE_1_BIT* or *VK_IMAGE_ASPECT_PLANE_2_BIT*

- **VUID-vkGetImageSubresourceLayout-image-01895**
  
  If *image* was created with the *VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID* external memory handle type, then *image* must be bound to memory

- **VUID-vkGetImageSubresourceLayout-tiling-02271**
  
  If the *tiling* of the *image* is *VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT*, then the *aspectMask* member of *pSubresource* must be *VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT* and the index *i* must be less than the *VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount* associated with the image's *format* and *VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier*.
Valid Usage (Implicit)

- VUID-vkGetImageSubresourceLayout-device-parameter
  
  **device** must be a valid **VkDevice** handle

- VUID-vkGetImageSubresourceLayout-image-parameter
  
  **image** must be a valid **VkImage** handle

- VUID-vkGetImageSubresourceLayout-pSubresource-parameter
  
  **pSubresource** must be a valid pointer to a valid **VkImageSubresource** structure

- VUID-vkGetImageSubresourceLayout-pLayout-parameter
  
  **pLayout** must be a valid pointer to a **VkSubresourceLayout** structure

- VUID-vkGetImageSubresourceLayout-image-parent
  
  **image** must have been created, allocated, or retrieved from **device**

The **VkImageSubresource** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresource {
    VkImageAspectFlags aspectMask;
    uint32_t mipLevel;
    uint32_t arrayLayer;
} VkImageSubresource;
```

- **aspectMask** is a **VkImageAspectFlags** selecting the image *aspect*.
- **mipLevel** selects the mipmap level.
- **arrayLayer** selects the array layer.

Valid Usage (Implicit)

- VUID-VkImageSubresource-aspectMask-parameter
  
  **aspectMask** must be a valid combination of **VkImageAspectFlagBits** values

- VUID-VkImageSubresource-aspectMask-requiredbitmask
  
  **aspectMask** must not be 0

Information about the layout of the image subresource is returned in a **VkSubresourceLayout** structure:
// Provided by VK_VERSION_1_0

typedef struct VkSubresourceLayout {
    VkDeviceSize    offset;
    VkDeviceSize    size;
    VkDeviceSize    rowPitch;
    VkDeviceSize    arrayPitch;
    VkDeviceSize    depthPitch;
} VkSubresourceLayout;

- **offset** is the byte offset from the start of the image or the plane where the image subresource begins.
- **size** is the size in bytes of the image subresource. **size** includes any extra memory that is required based on **rowPitch**.
- **rowPitch** describes the number of bytes between each row of texels in an image.
- **arrayPitch** describes the number of bytes between each array layer of an image.
- **depthPitch** describes the number of bytes between each slice of 3D image.

If the image is **linear**, then **rowPitch**, **arrayPitch** and **depthPitch** describe the layout of the image subresource in linear memory. For uncompressed formats, **rowPitch** is the number of bytes between texels with the same x coordinate in adjacent rows (y coordinates differ by one). **arrayPitch** is the number of bytes between texels with the same x and y coordinate in adjacent array layers of the image (array layer values differ by one). **depthPitch** is the number of bytes between texels with the same x and y coordinate in adjacent slices of a 3D image (z coordinates differ by one). Expressed as an addressing formula, the starting byte of a texel in the image subresource has address:

```
// (x,y,z,layer) are in texel coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x*elementSize + offset
```

For compressed formats, the **rowPitch** is the number of bytes between compressed texel blocks in adjacent rows. **arrayPitch** is the number of bytes between compressed texel blocks in adjacent array layers. **depthPitch** is the number of bytes between compressed texel blocks in adjacent slices of a 3D image.

```
// (x,y,z,layer) are in compressed texel block coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x *compressedTexelBlockByteSize + offset;
```

The value of **arrayPitch** is undefined for images that were not created as arrays. **depthPitch** is defined only for 3D images.

If the image has a **single-plane** color format and its tiling is **VK_IMAGE_TILING_LINEAR**, then the aspectMask member of VkImageSubresource must be **VK_IMAGE_ASPECT_COLOR_BIT**.

If the image has a depth/stencil format and its tiling is **VK_IMAGE_TILING_LINEAR**, then aspectMask
**must** be either `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`. On implementations that store depth and stencil aspects separately, querying each of these image subresource layouts will return a different offset and size representing the region of memory used for that aspect. On implementations that store depth and stencil aspects interleaved, the same offset and size are returned and represent the interleaved memory allocation.

If the image has a **multi-planar format** and its tiling is `VK_IMAGE_TILING_LINEAR`, then the `aspectMask` member of `VkImageSubresource` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or (for 3-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`. Querying each of these image subresource layouts will return a different offset and size representing the region of memory used for that plane. If the image is **disjoint**, then the offset is relative to the base address of the plane. If the image is **non-disjoint**, then the offset is relative to the base address of the image.

If the image’s tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the `aspectMask` member of `VkImageSubresource` **must** be one of `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT`, where the maximum allowed plane index i is defined by the `VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount` associated with the image’s `VkImageCreateInfo::format` and `modifier`. The memory range used by the subresource is described by offset and size. If the image is **disjoint**, then the offset is relative to the base address of the **memory plane**. If the image is **non-disjoint**, then the offset is relative to the base address of the image. If the image is **non-linear**, then `rowPitch`, `arrayPitch`, and `depthPitch` have an implementation-dependent meaning.

If an image was created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the image has a **Linux DRM format modifier**. To query the **modifier**, call:

```c
// Provided by VK_EXT_image_drm_format_modifier
VkResult vkGetImageDrmFormatModifierPropertiesEXT(
    VkDevice device,                     // The logical device that owns the image.
    VkImage image,                      // The queried image.
    VkImageDrmFormatModifierPropertiesEXT* pProperties
    // Will return properties of the image's DRM format modifier.
);
```

**Valid Usage**

- VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-02272
  - `image` **must** have been created with **tiling** equal to `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`
Valid Usage (Implicit)

- VUID-vkGetImageDrmFormatModifierPropertiesEXT-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-parameter
image must be a valid VkImage handle

- VUID-vkGetImageDrmFormatModifierPropertiesEXT-pProperties-parameter
pProperties must be a valid pointer to a VkImageDrmFormatModifierPropertiesEXT structure

- VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-parent
image must have been created, allocated, or retrieved from device

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkImageDrmFormatModifierPropertiesEXT structure is defined as:

```c
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkImageDrmFormatModifierPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint64_t drmFormatModifier;
} VkImageDrmFormatModifierPropertiesEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `drmFormatModifier` returns the image's Linux DRM format modifier.

If the image was created with VkImageDrmFormatModifierListCreateInfoEXT, then the returned `drmFormatModifier` must belong to the list of modifiers provided at time of image creation in VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers. If the image was created with VkImageDrmFormatModifierExplicitCreateInfoEXT, then the returned `drmFormatModifier` must be the modifier provided at time of image creation in VkImageDrmFormatModifierExplicitCreateInfoEXT::drmFormatModifier.
Valid Usage (Implicit)

- **VUID-VkImageDrmFormatModifierPropertiesEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_PROPERTIES_EXT`

- **VUID-VkImageDrmFormatModifierPropertiesEXT-pNext-pNext**
  
  `pNext` must be NULL

To destroy an image, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyImage(
    VkDevice device,
    VkImage image,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the image.
- `image` is the image to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- **VUID-vkDestroyImage-image-01000**
  
  All submitted commands that refer to `image`, either directly or via a `VkImageView`, must have completed execution

- **VUID-vkDestroyImage-image-01001**
  
  If `VkAllocationCallbacks` were provided when `image` was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyImage-image-01002**
  
  If no `VkAllocationCallbacks` were provided when `image` was created, `pAllocator` must be NULL

- **VUID-vkDestroyImage-image-04882**
  
  `image` must not have been acquired from `vkGetSwapchainImagesKHR`
Valid Usage (Implicit)

- VUID-vkDestroyImage-device-parameter
  
  **device** must be a valid **VkDevice** handle

- VUID-vkDestroyImage-image-parameter
  
  If **image** is not **VK_NULL_HANDLE**, **image** must be a valid **VkImage** handle

- VUID-vkDestroyImage-pAllocator-parameter
  
  If **pAllocator** is not NULL, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkDestroyImage-image-parent
  
  If **image** is a valid handle, it must have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **image** must be externally synchronized

12.3.1. Image Format Features

Valid uses of a **VkImage** may depend on the image’s **format features**, defined below. Such constraints are documented in the affected valid usage statement.

- If the image was created with **VK_IMAGE_TILING_LINEAR**, then its set of **format features** is the value of **VkFormatProperties::linearTilingFeatures** found by calling **vkGetPhysicalDeviceFormatProperties** on the same **format** as **VkImageCreateInfo::format**.

- If the image was created with **VK_IMAGE_TILING_OPTIMAL**, but without an Android hardware buffer external format, then its set of **format features** is the value of **VkFormatProperties::optimalTilingFeatures** found by calling **vkGetPhysicalDeviceFormatProperties** on the same **format** as **VkImageCreateInfo::format**.

- If the image was created with an Android hardware buffer external format, then its set of **format features** is the value of **VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures** found by calling **vkGetAndroidHardwareBufferPropertiesANDROID** on the Android hardware buffer that was imported to the **VkDeviceMemory** to which the image is bound.

- If the image was created with **VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT**, then:
  - The image’s DRM format modifier is the value of **VkImageDrmFormatModifierListCreateInfoEXT::drmFormatModifier** found by calling **vkGetImageDrmFormatModifierPropertiesEXT**.
  - Let **VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties** be the array found by calling **vkGetPhysicalDeviceFormatProperties2** on the same **format** as **VkImageCreateInfo::format**.
  - Let **VkDrmFormatModifierPropertiesEXT prop** be an array element whose **drmFormatModifier** member is the value of the image’s DRM format modifier.
Then the image set of format features is the value of taking the bitwise intersection over the collected \texttt{prop:drmFormatModifierTilingFeatures}.

### 12.3.2. Corner-Sampled Images

A \textit{corner-sampled image} is an image where unnormalized texel coordinates are centered on integer values rather than half-integer values.

A corner-sampled image has a number of differences compared to conventional texture image:

- Texels are centered on integer coordinates. See \textit{Unnormalized Texel Coordinate Operations}.
- Normalized coordinates are scaled using $\text{coord} \times (\text{dim} - 1)$ rather than $\text{coord} \times \text{dim}$, where \text{dim} is the size of one dimension of the image. See \textit{normalized texel coordinate transform}.
- Partial derivatives are scaled using $\text{coord} \times (\text{dim} - 1)$ rather than $\text{coord} \times \text{dim}$. See \textit{Scale Factor Operation}.
- Calculation of the next higher lod size goes according to $\lceil \text{dim} / 2 \rceil$ rather than $\lfloor \text{dim} / 2 \rfloor$. See \textit{Image Miplevel Sizing}.
- The minimum level size is 2x2 for 2D images and 2x2x2 for 3D images. See \textit{Image Miplevel Sizing}.

Corner-sampling is only supported for 2D and 3D images. When sampling a corner-sampled image, the sampler addressing mode \textbf{must} be \texttt{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE}. Corner-sampled images are not supported as cubemaps or depth/stencil images.

### 12.3.3. Image Miplevel Sizing

A \textit{complete mipmap chain} is the full set of miplevels, from the largest miplevel provided, down to the \textit{minimum mipmap size}.

**Conventional Images**

For conventional images, the dimensions of each successive miplevel, $n+1$, are:

\[
\text{width}_{n+1} = \max(\lfloor \text{width}_n / 2 \rfloor, 1)
\]

\[
\text{height}_{n+1} = \max(\lfloor \text{height}_n / 2 \rfloor, 1)
\]

\[
\text{depth}_{n+1} = \max(\lfloor \text{depth}_n / 2 \rfloor, 1)
\]

where \text{width}_n, \text{height}_n, and \text{depth}_n are the dimensions of the next larger miplevel, $n$.

The minimum mipmap size is:

- 1 for one-dimensional images,
- 1x1 for two-dimensional images, and
• 1x1x1 for three-dimensional images.

The number of levels in a complete mipmap chain is:

$$\lfloor \log_2(\max(\text{width}_0, \text{height}_0, \text{depth}_0)) \rfloor + 1$$

where \(\text{width}_0\), \(\text{height}_0\), and \(\text{depth}_0\) are the dimensions of the largest (most detailed) mipmap level, 0.

### Corner-Sampled Images

For corner-sampled images, the dimensions of each successive mipmap level, \(n+1\), are:

$$\text{width}_{n+1} = \max(\lceil \text{width}_n/2 \rceil, 2)$$

$$\text{height}_{n+1} = \max(\lceil \text{height}_n/2 \rceil, 2)$$

$$\text{depth}_{n+1} = \max(\lceil \text{depth}_n/2 \rceil, 2)$$

where \(\text{width}_n\), \(\text{height}_n\), and \(\text{depth}_n\) are the dimensions of the next larger mipmap level, \(n\).

The minimum mipmap level size is:

• 2x2 for two-dimensional images, and
• 2x2x2 for three-dimensional images.

The number of levels in a complete mipmap chain is:

$$\lceil \log_2(\max(\text{width}_0, \text{height}_0, \text{depth}_0)) \rceil$$

where \(\text{width}_0\), \(\text{height}_0\), and \(\text{depth}_0\) are the dimensions of the largest (most detailed) mipmap level, 0.

### 12.4. Image Layouts

Images are stored in implementation-dependent opaque layouts in memory. Each layout has limitations on what kinds of operations are supported for image subresources using the layout. At any given time, the data representing an image subresource in memory exists in a particular layout which is determined by the most recent layout transition that was performed on that image subresource. Applications have control over which layout each image subresource uses, and can transition an image subresource from one layout to another. Transitions can happen with an image memory barrier, included as part of a \(\text{vkCmdPipelineBarrier}\) or a \(\text{vkCmdWaitEvents}\) command buffer command (see Image Memory Barriers), or as part of a subpass dependency within a render pass (see \(\text{VkSubpassDependency}\)). The image layout is per-image subresource, and separate image subresources of the same image can be in different layouts at the same time with one exception - depth and stencil aspects of a given image subresource must always be in the same layout.
Note

Each layout may offer optimal performance for a specific usage of image memory. For example, an image with a layout of VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL may provide optimal performance for use as a color attachment, but be unsupported for use in transfer commands. Applications can transition an image subresource from one layout to another in order to achieve optimal performance when the image subresource is used for multiple kinds of operations. After initialization, applications need not use any layout other than the general layout, though this may produce suboptimal performance on some implementations.

Upon creation, all image subresources of an image are initially in the same layout, where that layout is selected by the VkImageCreateInfo::initialLayout member. The initialLayout must be either VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED. If it is VK_IMAGE_LAYOUT_PREINITIALIZED, then the image data can be preinitialized by the host while using this layout, and the transition away from this layout will preserve that data. If it is VK_IMAGE_LAYOUT_UNDEFINED, then the contents of the data are considered to be undefined, and the transition away from this layout is not guaranteed to preserve that data. For either of these initial layouts, any image subresources must be transitioned to another layout before they are accessed by the device.

Host access to image memory is only well-defined for linear images and for image subresources of those images which are currently in either the VK_IMAGE_LAYOUT_PREINITIALIZED or VK_IMAGE_LAYOUT_GENERAL layout. Calling vkGetImageSubresourceLayout for a linear image returns a subresource layout mapping that is valid for either of those image layouts.

The set of image layouts consists of:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageLayout {
    VK_IMAGE_LAYOUT_UNDEFINED = 0,
    VK_IMAGE_LAYOUT_GENERAL = 1,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL = 4,
    VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL = 5,
    VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL = 6,
    VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL = 7,
    VK_IMAGE_LAYOUT_PREINITIALIZED = 8,

    // Provided by VK_VERSION_1_1
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL = 1000117000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL = 1000117001,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL = 1000241000,
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL = 1000241001,
    VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL = 1000241002,
    VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL = 1000241003,

    // Provided by VK_KHR_swapchain
    VK_IMAGE_LAYOUT_PRESENT_SRC_KHR = 1000001002,

    #ifdef VK_ENABLE_BETA_EXTENSIONS
    VK_IMAGE_LAYOUT_PRESENT_SRC_KHR = 1000001002,
    #endif
};
```
# Provided by VK_KHR_video_decode_queue

VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR = 1000024000,
#endif

#ifdef VK_ENABLE_BETA_EXTENSIONS
# Provided by VK_KHR_video_decode_queue

VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR = 1000024001,
#endif

#ifdef VK_ENABLE_BETA_EXTENSIONS
# Provided by VK_KHR_video_decode_queue

VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR = 1000024002,
#endif

#ifdef VK_ENABLE_BETA_EXTENSIONS
# Provided by VK_KHR_video_decode_queue

VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR = 1000299000,
#endif

#ifdef VK_ENABLE_BETA_EXTENSIONS
# Provided by VK_KHR_video_encode_queue

VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR = 1000299001,
#endif

#ifdef VK_ENABLE_BETA_EXTENSIONS
# Provided by VK_KHR_video_encode_queue

VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR = 1000299002,
#endif

// Provided by VK_KHR_shared_presentable_image

VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR = 1000111000,

// Provided by VK_KHR_shared_presentable_image

VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV = 1000164003,

// Provided by VK_KHR_shading_rate_image

VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT = 1000218000,

// Provided by VK_KHR_synchronization2

VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR = 1000314000,

// Provided by VK_KHR_synchronization2

VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR = 1000314001,

// Provided by VK_KHR_maintenance2

VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL_KHR =
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL,

// Provided by VK_KHR_maintenance2

VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL_KHR =
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL,

// Provided by VK_KHR_fragment_shading_rate

VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR =
VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV,

// Provided by VK_KHR_separate_depth_stencil_layouts

VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL_KHR =
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL,

// Provided by VK_KHR_separate_depth_stencil_layouts

VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL_KHR =
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL,
The type(s) of device access supported by each layout are:

- **VK_IMAGE_LAYOUT_UNDEFINED** specifies that the layout is unknown. Image memory cannot be transitioned into this layout. This layout can be used as the initialLayout member of VkImageCreateInfo. This layout can be used in place of the current image layout in a layout transition, but doing so will cause the contents of the image's memory to be undefined.

- **VK_IMAGE_LAYOUT_PREINITIALIZED** specifies that an image's memory is in a defined layout and cannot be populated by data, but that it has not yet been initialized by the driver. Image memory cannot be transitioned into this layout. This layout can be used as the initialLayout member of VkImageCreateInfo. This layout is intended to be used as the initial layout for an image whose contents are written by the host, and hence the data can be written to memory immediately, without first executing a layout transition. Currently, VK_IMAGE_LAYOUT_PREINITIALIZED is only useful with linear images because there is not a standard layout defined for VK_IMAGE_TILING_OPTIMAL images.

- **VK_IMAGE_LAYOUT_GENERAL** supports all types of device access.

- **VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR** specifies a layout that must only be used with attachment accesses in the graphics pipeline.

- **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR** specifies a layout allowing read only access as an attachment, or in shaders as a sampled image, combined image/sampler, or input attachment.

- **VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL** must only be used as a color or resolve attachment in a VkFramebuffer. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT usage bit enabled.

- **VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read and write access as a depth/stencil attachment. It is equivalent to VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL and VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL.

- **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read only access as a depth/stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL and VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

- **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for depth/stencil format images allowing read and write access to the stencil aspect as a stencil attachment, and read only access to the depth aspect as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL and VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL.

- **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for depth/stencil format images allowing read and write access to the stencil aspect as a stencil attachment, and read only access to the depth aspect as a depth attachment, and read only access to the stencil aspect as a stencil attachment or in shaders as a sampled image,
combined image/sampler, or input attachment. It is equivalent to
\texttt{VK\_IMAGE\_LAYOUT\_DEPTH\_ATTACHMENT\_OPTIMAL} and \texttt{VK\_IMAGE\_LAYOUT\_STENCIL\_READ\_ONLY\_OPTIMAL}.

- \texttt{VK\_IMAGE\_LAYOUT\_DEPTH\_ATTACHMENT\_OPTIMAL} specifies a layout for the depth aspect of a
  depth/stencil format image allowing read and write access as a depth attachment.
- \texttt{VK\_IMAGE\_LAYOUT\_DEPTH\_READ\_ONLY\_OPTIMAL} specifies a layout for the depth aspect of a
  depth/stencil format image allowing read-only access as a depth attachment or in shaders as a
  sampled image, combined image/sampler, or input attachment.
- \texttt{VK\_IMAGE\_LAYOUT\_STENCIL\_ATTACHMENT\_OPTIMAL} specifies a layout for the stencil aspect of a
  depth/stencil format image allowing read and write access as a stencil attachment.
- \texttt{VK\_IMAGE\_LAYOUT\_STENCIL\_READ\_ONLY\_OPTIMAL} specifies a layout for the stencil aspect of a
  depth/stencil format image allowing read-only access as a stencil attachment or in shaders as a
  sampled image, combined image/sampler, or input attachment.
- \texttt{VK\_IMAGE\_LAYOUT\_SHADER\_READ\_ONLY\_OPTIMAL} specifies a layout allowing read-only access in a
  shader as a sampled image, combined image/sampler, or input attachment. This layout is valid
  only for image subresources of images created with the \texttt{VK\_IMAGE\_USAGE\_SAMPLED\_BIT} or
  \texttt{VK\_IMAGE\_USAGE\_INPUT\_ATTACHMENT\_BIT} usage bit enabled.
- \texttt{VK\_IMAGE\_LAYOUT\_TRANSFER\_SRC\_OPTIMAL} must only be used as a source image of a transfer
  command (see the definition of \texttt{VK\_PIPELINE\_STAGE\_TRANSFER\_BIT}). This layout is valid only for
  image subresources of images created with the \texttt{VK\_IMAGE\_USAGE\_TRANSFER\_SRC\_BIT} usage bit
  enabled.
- \texttt{VK\_IMAGE\_LAYOUT\_TRANSFER\_DST\_OPTIMAL} must only be used as a destination image of a transfer
  command. This layout is valid only for image subresources of images created with the
  \texttt{VK\_IMAGE\_USAGE\_TRANSFER\_DST\_BIT} usage bit enabled.
- \texttt{VK\_IMAGE\_LAYOUT\_PRESENT\_SRC\_KHR} must only be used for presenting a presentable image for
display. A swapchain's image must be transitioned to this layout before calling
\texttt{vkQueuePresentKHR}, and must be transitioned away from this layout after calling
\texttt{vkAcquireNextImageKHR}.
- \texttt{VK\_IMAGE\_LAYOUT\_SHARED\_PRESENT\_KHR} is valid only for shared presentable images, and must be
  used for any usage the image supports.
- \texttt{VK\_IMAGE\_LAYOUT\_FRAGMENT\_SHADING\_RATE\_ATTACHMENT\_OPTIMAL\_KHR} must only be used as a
  fragment shading rate attachment or shading rate image. This layout is valid only for image
  subresources of images created with the \texttt{VK\_IMAGE\_USAGE\_FRAGMENT\_SHADING\_RATE\_ATTACHMENT\_BIT\_KHR} usage bit enabled.
- \texttt{VK\_IMAGE\_LAYOUT\_FRAGMENT\_DENSITY\_MAP\_OPTIMAL\_EXT} must only be used as a fragment density
  map attachment in a \texttt{VkRenderPass}. This layout is valid only for image subresources of images
  created with the \texttt{VK\_IMAGE\_USAGE\_FRAGMENT\_DENSITY\_MAP\_BIT\_EXT} usage bit enabled.
- \texttt{VK\_IMAGE\_LAYOUT\_VIDEO\_DECODE\_DST\_KHR} must only be used as a decode output image of a \texttt{video
  decode operation}. This layout is valid only for image subresources of images created with the
  \texttt{VK\_IMAGE\_USAGE\_VIDEO\_DECODE\_DST\_BIT\_KHR} usage bit enabled.
- \texttt{VK\_IMAGE\_LAYOUT\_VIDEO\_DECODE\_SRC\_KHR} must only be used as a decode source image of a \texttt{video
  decode operation}. This layout is valid only for image subresources of images created with the
  \texttt{VK\_IMAGE\_USAGE\_VIDEO\_DECODE\_SRC\_BIT\_KHR} usage bit enabled.
• **VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR** must only be used as a decode source or destination image of a *video decode operation*. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR** must only be used as a encode output image of a *video encode operation*. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR** must only be used as a encode source image of a *video encode operation*. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR** must only be used as a encode source or destination image of a *video encode operation*. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR** usage bit enabled.

The layout of each image subresource is not a state of the image subresource itself, but is rather a property of how the data in memory is organized, and thus for each mechanism of accessing an image in the API the application must specify a parameter or structure member that indicates which image layout the image subresource(s) are considered to be in when the image will be accessed. For transfer commands, this is a parameter to the command (see Clear Commands and Copy Commands). For use as a framebuffer attachment, this is a member in the substructures of the **VkRenderPassCreateInfo** (see Render Pass). For use in a descriptor set, this is a member in the **VkDescriptorImageInfo** structure (see Descriptor Set Updates).

### 12.4.1. Image Layout Matching Rules

At the time that any command buffer command accessing an image executes on any queue, the layouts of the image subresources that are accessed must all match exactly the layout specified via the API controlling those accesses, except in case of accesses to an image with a depth/stencil format performed through descriptors referring to only a single aspect of the image, where the following relaxed matching rules apply:

• Descriptors referring just to the depth aspect of a depth/stencil image only need to match in the image layout of the depth aspect, thus **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** and **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL** are considered to match.

• Descriptors referring just to the stencil aspect of a depth/stencil image only need to match in the image layout of the stencil aspect, thus **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** and **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** are considered to match.

When performing a layout transition on an image subresource, the old layout value must either equal the current layout of the image subresource (at the time the transition executes), or else **VK_IMAGE_LAYOUT_UNDEFINED** (implying that the contents of the image subresource need not be preserved). The new layout used in a transition must not be **VK_IMAGE_LAYOUT_UNDEFINED** or **VK_IMAGE_LAYOUT_PREINITIALIZED**.

The image layout of each image subresource of a depth/stencil image created with **VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT** is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus applications must provide the same sample locations that were last used to render to the given image
subresource whenever a layout transition of the image subresource happens, otherwise the contents of the depth aspect of the image subresource become undefined.

In addition, depth reads from a depth/stencil attachment referring to an image subresource range of a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range return undefined values.

Similarly, depth writes to a depth/stencil attachment referring to an image subresource range of a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range make the contents of the depth aspect of those image subresources undefined.

12.5. Image Views

Image objects are not directly accessed by pipeline shaders for reading or writing image data. Instead, *image views* representing contiguous ranges of the image subresources and containing additional metadata are used for that purpose. Views must be created on images of compatible types, and must represent a valid subset of image subresources.

Image views are represented by `VkImageView` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImageView)
```

The types of image views that can be created are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageViewType {
    VK_IMAGE_VIEW_TYPE_1D = 0,
    VK_IMAGE_VIEW_TYPE_2D = 1,
    VK_IMAGE_VIEW_TYPE_3D = 2,
    VK_IMAGE_VIEW_TYPE_CUBE = 3,
    VK_IMAGE_VIEW_TYPE_1D_ARRAY = 4,
    VK_IMAGE_VIEW_TYPE_2D_ARRAY = 5,
    VK_IMAGE_VIEW_TYPE_CUBE_ARRAY = 6,
} VkImageViewType;
```

The exact image view type is partially implicit, based on the image's type and sample count, as well as the view creation parameters as described in the image view compatibility table for `vkCreateImageView`. This table also shows which SPIR-V `OpTypeImage Dim` and `Arrayed` parameters correspond to each image view type.

To create an image view, call:
// Provided by VK_VERSION_1_0
VkResult vkCreateImageView(
    VkDevice                                    device,
    const VkImageViewCreateInfo*                pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkImageView*                                pView);

- **device** is the logical device that creates the image view.
- **pCreateInfo** is a pointer to a `VkImageViewCreateInfo` structure containing parameters to be used to create the image view.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pView** is a pointer to a `VkImageView` handle in which the resulting image view object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateImageView-device-parameter  
  **device** must be a valid `VkDevice` handle
- VUID-vkCreateImageView-pCreateInfo-parameter  
  **pCreateInfo** must be a valid pointer to a valid `VkImageViewCreateInfo` structure
- VUID-vkCreateImageView-pAllocator-parameter  
  If **pAllocator** is not NULL, **pAllocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateImageView-pView-parameter  
  **pView** must be a valid pointer to a `VkImageView` handle

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkImageViewCreateInfo` structure is defined as:
// Provided by VK_VERSION_1_0
typedef struct VkImageViewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageViewCreateFlags flags;
    VkImage image;
    VkImageViewType viewType;
    VkFormat format;
    VkComponentMapping components;
    VkImageSubresourceRange subresourceRange;
} VkImageViewCreateInfo;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is a bitmask of VkImageViewCreateFlagBits describing additional parameters of the image view.
• image is a VkImage on which the view will be created.
• viewType is a VkImageViewType value specifying the type of the image view.
• format is a VkFormat describing the format and type used to interpret texel blocks in the image.
• components is a VkComponentMapping specifying a remapping of color components (or of depth or stencil components after they have been converted into color components).
• subresourceRange is a VkImageSubresourceRange selecting the set of mipmap levels and array layers to be accessible to the view.

Some of the image creation parameters are inherited by the view. In particular, image view creation inherits the implicit parameter usage specifying the allowed usages of the image view that, by default, takes the value of the corresponding usage parameter specified in VkImageCreateInfo at image creation time. The implicit usage can be overridden by adding a VkImageViewUsageCreateInfo structure to the pNext chain, but the view usage must be a subset of the image usage. If the image was has a depth-stencil format and was created with a VkImageStencilUsageCreateInfo structure included in the pNext chain of VkImageCreateInfo, the usage is calculated based on the subresource.aspectMask provided:

• If aspectMask includes only VK_IMAGE_ASPECT_STENCIL_BIT, the implicit usage is equal to VkImageStencilUsageCreateInfo::stencilUsage.
• If aspectMask includes only VK_IMAGE_ASPECT_DEPTH_BIT, the implicit usage is equal to VkImageCreateInfo::usage.
• If both aspects are included in aspectMask, the implicit usage is equal to the intersection of VkImageCreateInfo::usage and VkImageStencilUsageCreateInfo::stencilUsage.

If image was created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT flag, and if the format of the image is not multi-planar, format can be different from the image's format, but if image was created without the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag and they are not equal they must be compatible. Image format compatibility is defined in the Format Compatibility Classes section.
Views of compatible formats will have the same mapping between texel coordinates and memory locations irrespective of the format, with only the interpretation of the bit pattern changing.

**Note**

Values intended to be used with one view format may not be exactly preserved when written or read through a different format. For example, an integer value that happens to have the bit pattern of a floating point denorm or NaN may be flushed or canonicalized when written or read through a view with a floating point format. Similarly, a value written through a signed normalized format that has a bit pattern exactly equal to \( -2^b \) may be changed to \( -2^b + 1 \) as described in Conversion from Normalized Fixed-Point to Floating-Point.

If image was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag, format must be compatible with the image’s format as described above, or must be an uncompressed format in which case it must be size-compatible with the image’s format, as defined for copying data between images. In this case the resulting image view’s texel dimensions equal the dimensions of the selected mip level divided by the compressed texel block size and rounded up.

The VkComponentMapping components member describes a remapping from components of the image to components of the vector returned by shader image instructions. This remapping must be the identity swizzle for storage image descriptors, input attachment descriptors, framebuffer attachments, and any VkImageView used with a combined image sampler that enables sampler Y’C\(b\)

If the image view is to be used with a sampler which supports sampler Y’C\(b\) conversion, an identically defined object of type VkSamplerYcbcrConversion to that used to create the sampler must be passed to vkCreateImageView in a VkSamplerYcbcrConversionInfo included in the pNext chain of VkImageViewCreateInfo. Conversely, if a VkSamplerYcbcrConversion object is passed to vkCreateImageView, an identically defined VkSamplerYcbcrConversion object must be used when sampling the image.

If the image has a multi-planar format and subresourceRange.aspectMask is VK_IMAGE_ASPECT_COLOR_BIT, and image has been created with a usage value not containing any of the VK_IMAGE_USAGE_VIDEO_DECODER_DST_BIT_KHR, VK_IMAGE_USAGE_VIDEO_DECODER_SRC_BIT_KHR, VK_IMAGE_USAGE_VIDEO_DECODER_DBP_BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODER_DST_BIT_KHR, and VK_IMAGE_USAGE_VIDEO_ENCODER_DBP_BIT_KHR flags, then the format must be identical to the image format, and the sampler to be used with the image view must enable sampler Y’C\(b\) conversion.

If the image has a multi-planar format and the image has been created with a usage value containing any of the VK_IMAGE_USAGE_VIDEO_DECODER_DST_BIT_KHR, VK_IMAGE_USAGE_VIDEO_DECODER_SRC_BIT_KHR, and VK_IMAGE_USAGE_VIDEO_DECODER_DBP_BIT_KHR flags, then all of the video decode operations would ignore the VkSamplerYcbcrConversionInfo structure and/or sampler Y’C\(b\) conversion object, associated with the image view. If the image has a multi-planar format and the image has been created with a usage value containing any of the VK_IMAGE_USAGE_VIDEO_ENCODER_DST_BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODER_SRC_BIT_KHR, and VK_IMAGE_USAGE_VIDEO_ENCODER_DBP_BIT_KHR flags, then all of the video encode operations would ignore the VkSamplerYcbcrConversionInfo structure and/or sampler Y’C\(b\) conversion object, associated with the image view.
If `image` was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` and the image has a multi-planar format, and if `subresourceRange.aspectMask` is `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`, format must be compatible with the corresponding plane of the image, and the sampler to be used with the image view must not enable sampler Y'CbCr conversion. The width and height of the single-plane image view must be derived from the multi-planar image’s dimensions in the manner listed for plane compatibility for the plane.

Any view of an image plane will have the same mapping between texel coordinates and memory locations as used by the channels of the color aspect, subject to the formulae relating texel coordinates to lower-resolution planes as described in Chroma Reconstruction. That is, if an R or B plane has a reduced resolution relative to the G plane of the multi-planar image, the image view operates using the \((u_{\text{plane}}, v_{\text{plane}})\) unnormalized coordinates of the reduced-resolution plane, and these coordinates access the same memory locations as the \((u_{\text{color}}, v_{\text{color}})\) unnormalized coordinates of the color aspect for which chroma reconstruction operations operate on the same \((i_{\text{plane}}, j_{\text{plane}})\) coordinates.

Valid Usage

- **VUID-VkImageViewCreateInfo-image-01003**
  
  If `image` was not created with `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT` then `viewType` must not be `VK_IMAGE_VIEW_TYPE_CUBE` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

- **VUID-VkImageViewCreateInfo-viewType-01004**
  
  If the `image cubemap arrays` feature is not enabled, `viewType` must not be `VK_IMAGE_VIEW_TYPE_CUBE` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

- **VUID-VkImageViewCreateInfo-image-01005**
  
  If `image` was created with `VK_IMAGE_TYPE_3D` but without `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set then `viewType` must not be `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`.

- **VUID-VkImageViewCreateInfo-image-04441**
  
  `image` must have been created with a `usage` value containing at least one of the usages defined in the `valid image usage` list for image views.

- **VUID-VkImageViewCreateInfo-usage-02273**
  
  The `format features` of the resultant image view must contain at least one bit.

- **VUID-VkImageViewCreateInfo-usage-02274**
  
  If `usage` contains `VK_IMAGE_USAGE_SAMPLED_BIT`, then the `format features` of the resultant image view must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`.

- **VUID-VkImageViewCreateInfo-usage-02275**
  
  If `usage` contains `VK_IMAGE_USAGE_STORAGE_BIT`, then the image view's `format features` must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT`.

- **VUID-VkImageViewCreateInfo-usage-02276**
  
  If `usage` contains `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, then the image view's `format features` must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`.

- **VUID-VkImageViewCreateInfo-usage-02277**
  
  If `usage` contains `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, then the image view's `format features` must contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkImageViewCreateInfo-usage-02652**
  
  If `usage` contains `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, then the image view's `format features` must contain at least one of `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkImageViewCreateInfo-subresourceRange-01478**
  
  `subresourceRange.baseMipLevel` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

- **VUID-VkImageViewCreateInfo-subresourceRange-01718**
  
  If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` must be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

- **VUID-VkImageViewCreateInfo-image-02571**
  
  If `image` was created with `usage` containing `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`, `subresourceRange.levelCount` must be 1.
If image is not a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set, or viewType is not VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.baseArrayLayer must be less than the arrayLayers specified in VkImageCreateInfo when image was created.

If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, image is not a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set, or viewType is not VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.layerCount must be non-zero and subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the arrayLayers specified in VkImageCreateInfo when image was created.

If image is a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set, and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.baseArrayLayer must be less than the depth computed from baseMipLevel and extent.depth specified in VkImageCreateInfo when image was created, according to the formula defined in Image Miplevel Sizing.

If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, image is a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set, and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.layerCount must be non-zero and subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the depth computed from baseMipLevel and extent.depth specified in VkImageCreateInfo when image was created, according to the formula defined in Image Miplevel Sizing.

If image was created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT flag, but without the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag, and if the format of the image is not a multi-planar format, format must be compatible with the format used to create image, as defined in Format Compatibility Classes.

If image was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag, format must be compatible with, or must be an uncompressed format that is size-compatible with, the format used to create image.

If image was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag, the levelCount and layerCount members of subresourceRange must both be 1.

If image was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag and format is a non-compressed format, viewType must not be VK_IMAGE_VIEW_TYPE_3D.

If a VkImageFormatListCreateInfo structure was included in the pNext chain of the VkImageCreateInfo structure used when creating image and VkImageFormatListCreateInfo::viewFormatCount is not zero then format must be one of the
formats in `VkImageFormatListCreateInfo::pViewFormats`

- **VUID-VkImageViewCreateInfo-image-01586**
  If *image* was created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT flag, if the *format* of the *image* is a multi-planar format, and if `subresourceRange.aspectMask` is one of VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT, then *format* must be compatible with the *VkFormat* for the plane of the *image format* indicated by `subresourceRange.aspectMask`, as defined in Compatible formats of planes of multi-planar formats.

- **VUID-VkImageViewCreateInfo-image-01762**
  If *image* was not created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT flag, or if the *format* of the *image* is a multi-planar format and if `subresourceRange.aspectMask` is VK_IMAGE_ASPECT_COLOR_BIT, *format* must be identical to the *format* used to create *image*.

- **VUID-VkImageViewCreateInfo-format-04724**
  If *format* is one of those listed in Formats requiring sampler Y’CbCr conversion for VK_IMAGE_ASPECT_COLOR_BIT image views, then the pNext chain must include a `VkSamplerYcbcrConversionInfo` structure with a conversion value other than VK_NULL_HANDLE.

- **VUID-VkImageViewCreateInfo-format-04714**
  If *format* has a _422_ or _420_ suffix then *image* must have been created with a width that is a multiple of 2.

- **VUID-VkImageViewCreateInfo-format-04715**
  If *format* has a _420_ suffix then *image* must have been created with a height that is a multiple of 2.

- **VUID-VkImageViewCreateInfo-pNext-01970**
  If the pNext chain includes a `VkSamplerYcbcrConversionInfo` structure with a conversion value other than VK_NULL_HANDLE, all members of components must have the identity swizzle.

- **VUID-VkImageViewCreateInfo-image-01020**
  If *image* is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkImageViewCreateInfo-subResourceRange-01021**
  `subresourceRange` and `viewType` must be compatible with the image, as described in the compatibility table.

- **VUID-VkImageViewCreateInfo-image-02399**
  If *image* has an external format, *format* must be VK_FORMAT_UNDEFINED.

- **VUID-VkImageViewCreateInfo-image-02400**
  If *image* has an external format, the pNext chain must include a `VkSamplerYcbcrConversionInfo` structure with a conversion object created with the same external format as *image*.

- **VUID-VkImageViewCreateInfo-image-02401**
  If *image* has an external format, all members of components must be the identity swizzle.

- **VUID-VkImageViewCreateInfo-image-02086**
  If *image* was created with usage containing...
If the shadingRateImage feature is enabled, and if image was created with usage containing VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV, format must be VK_FORMAT_R8_UINT

If the attachmentFragmentShadingRate feature is enabled, and the usage for the image view includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, then the image view's format features must contain VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

If the attachmentFragmentShadingRate feature is enabled, the usage for the image view includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, and layeredShadingRateAttachments is VK_FALSE, subresourceRange.layerCount must be 1

If dynamic fragment density map feature is not enabled, flags must not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT

If deferred fragment density map feature is not enabled, flags must not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT

If flags contains VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT, flags must not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT

If image was created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT and usage containing VK_IMAGE_USAGE_SAMPLED_BIT, subresourceRange.layerCount must be less than or equal to VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::maxSubsampledArrayLayers

If flags does not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT and image was created with usage containing VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT, its flags must not contain any of VK_IMAGE_CREATE_PROTECTED_BIT, VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT

If the pNext chain includes a VkImageViewUsageCreateInfo structure, its usage member must not include any bits that were not set in the usage member of the VkImageCreateInfo structure used to create image

If the pNext chain includes a VkImageViewUsageCreateInfo structure, and image was not created with a VkImageStencilUsageCreateInfo structure included in the pNext chain of VkImageCreateInfo, its usage member must not include any bits that were not set in the usage member of the VkImageCreateInfo structure used to create image

If the pNext chain includes a VkImageViewUsageCreateInfo structure, image was created with a VkImageStencilUsageCreateInfo structure included in the pNext chain of
 VkImageCreateInfo, and subResourceRange.aspectMask includes VK_IMAGE_ASPECT_STENCIL_BIT, the usage member of the VkImageViewUsageCreateInfo instance must not include any bits that were not set in the usage member of the VkImageStenciUsageCreateInfo structure used to create image

- VUID-VkImageViewCreateInfo-pNext-02664
  If the pNext chain includes a VkImageViewUsageCreateInfo structure, image was created with a VkImageStenciUsageCreateInfo structure included in the pNext chain of VkImageCreateInfo, and subResourceRange.aspectMask includes bits other than VK_IMAGE_ASPECT_STENCIL_BIT, the usage member of the VkImageViewUsageCreateInfo structure must not include any bits that were not set in the usage member of the VkImageStenciUsageCreateInfo structure used to create image

- VUID-VkImageViewCreateInfo-viewType-02960
  If viewType is VK_IMAGE_VIEW_TYPE_CUBE and subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, subresourceRange.layerCount must be 6

- VUID-VkImageViewCreateInfo-viewType-02961
  If viewType is VK_IMAGE_VIEW_TYPE_CUBE_ARRAY and subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, subresourceRange.layerCount must be a multiple of 6

- VUID-VkImageViewCreateInfo-viewType-02962
  If viewType is VK_IMAGE_VIEW_TYPE_CUBE and subresourceRange.layerCount is VK_REMAINING_ARRAY_LAYERS, the remaining number of layers must be 6

- VUID-VkImageViewCreateInfo-viewType-02963
  If viewType is VK_IMAGE_VIEW_TYPE_CUBE_ARRAY and subresourceRange.layerCount is VK_REMAINING_ARRAY_LAYERS, the remaining number of layers must be a multiple of 6

- VUID-VkImageViewCreateInfo-imageViewFormatSwizzle-04465
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatSwizzle is VK_FALSE, all elements of components must be VK_COMPONENT_SWIZZLE_IDENTITY.

- VUID-VkImageViewCreateInfo-imageViewFormatReinterpretation-04466
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatReinterpretation is VK_FALSE, the VkFormat in format must not contain a different number of components, or a different number of bits in each component, than the format of the VkImage in image.

- VUID-VkImageViewCreateInfo-image-04817
  If image was created with usage containing VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR, VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, then the viewType must be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY and all members of components must have the identity swizzle

- VUID-VkImageViewCreateInfo-image-04818
  If image was created with usage containing VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR, then the viewType must be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY and all members of components must have the identity swizzle
Valid Usage (Implicit)

- **VUID-VkImageViewCreateInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO`

- **VUID-VkImageViewCreateInfo-pNext-pNext**
  - Each `pNext` member of any structure (including this one) in the `pNext` chain must be either NULL or a pointer to a valid instance of `VkImageViewASTCDecodeModeEXT`, `VkImageViewUsageCreateInfo`, `VkSamplerYcbcrConversionInfo`, `VkVideoProfileKHR`, or `VkVideoProfilesKHR`

- **VUID-VkImageViewCreateInfo-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkImageViewCreateInfo-flags-parameter**
  - `flags` must be a valid combination of `VkImageViewCreateFlagBits` values

- **VUID-VkImageViewCreateInfo-image-parameter**
  - `image` must be a valid `VkImage` handle

- **VUID-VkImageViewCreateInfo-viewType-parameter**
  - `viewType` must be a valid `VkImageViewType` value

- **VUID-VkImageViewCreateInfo-format-parameter**
  - `format` must be a valid `VkFormat` value

- **VUID-VkImageViewCreateInfo-components-parameter**
  - `components` must be a valid `VkComponentMapping` structure

- **VUID-VkImageViewCreateInfo-subresourceRange-parameter**
  - `subresourceRange` must be a valid `VkImageSubresourceRange` structure

Bits which can be set in `VkImageViewCreateInfo::flags`, specifying additional parameters of an image, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageViewCreateFlagBits {
    // Provided by VK_EXT_fragment_density_map
    VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_fragment_density_map2
    VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT = 0x00000002,
} VkImageViewCreateFlagBits;
```

- **VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT** specifies that the fragment density map will be read by device during `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- **VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT** specifies that the fragment density map will be read by the host during `VkEndCommandBuffer` for the primary command buffer that the render pass is recorded into

// Provided by VK_VERSION_1_0
typedef VkFlags VkImageViewCreateFlags;

**VkImageViewCreateFlags** is a bitmask type for setting a mask of zero or more **VkImageViewCreateFlagBits**.

The set of usages for the created image view can be restricted compared to the parent image's usage flags by adding a **VkImageViewUsageCreateInfo** structure to the **pNext** chain of **VkImageViewCreateInfo**.

The **VkImageViewUsageCreateInfo** structure is defined as:

// Provided by VK_VERSION_1_1
typedef struct VkImageViewUsageCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkImageUsageFlags    usage;
} VkImageViewUsageCreateInfo;

or the equivalent

// Provided by VK_KHR_maintenance2
typedef VkImageViewUsageCreateInfo VkImageViewUsageCreateInfoKHR;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **usage** is a bitmask describing the allowed usages of the image view. See **VkImageUsageFlagBits** for a description of the supported bits.

When this structure is chained to **VkImageViewCreateInfo** the **usage** field overrides the implicit **usage** parameter inherited from image creation time and its value is used instead for the purposes of determining the valid usage conditions of **VkImageViewCreateInfo**.

### Valid Usage (Implicit)

- **VUID-VkImageViewUsageCreateInfo-sType-sType** 
  **sType** must be **VK_STRUCTURE_TYPE_IMAGE_VIEW_USAGE_CREATE_INFO**

- **VUID-VkImageViewUsageCreateInfo-usage-parameter**
  **usage** must be a valid combination of **VkImageUsageFlagBits** values

- **VUID-VkImageViewUsageCreateInfo-usage-requiredbitmask**
  **usage** must not be **0**

The **VkImageSubresourceRange** structure is defined as:
// Provided by VK_VERSION_1_0

typedef struct VkImageSubresourceRange {
    VkImageAspectFlags aspectMask;
    uint32_t baseMipLevel;
    uint32_t levelCount;
    uint32_t baseArrayLayer;
    uint32_t layerCount;
} VkImageSubresourceRange;

• `aspectMask` is a bitmask of `VkImageAspectFlagBits` specifying which aspect(s) of the image are included in the view.
• `baseMipLevel` is the first mipmap level accessible to the view.
• `levelCount` is the number of mipmap levels (starting from `baseMipLevel`) accessible to the view.
• `baseArrayLayer` is the first array layer accessible to the view.
• `layerCount` is the number of array layers (starting from `baseArrayLayer`) accessible to the view.

The number of mipmap levels and array layers must be a subset of the image subresources in the image. If an application wants to use all mip levels or layers in an image after the `baseMipLevel` or `baseArrayLayer`, it can set `levelCount` and `layerCount` to the special values `VK_REMAINING_MIP_LEVELS` and `VK_REMAINING_ARRAY_LAYERS` without knowing the exact number of mip levels or layers.

For cube and cube array image views, the layers of the image view starting at `baseArrayLayer` correspond to faces in the order +X, -X, +Y, -Y, +Z, -Z. For cube arrays, each set of six sequential layers is a single cube, so the number of cube maps in a cube map array view is `layerCount / 6`, and image array layer (`baseArrayLayer + i`) is face index `(i mod 6)` of cube `i / 6`. If the number of layers in the view, whether set explicitly in `layerCount` or implied by `VK_REMAINING_ARRAY_LAYERS`, is not a multiple of 6, the last cube map in the array must not be accessed.

`aspectMask` must be only `VK_IMAGE_ASPECT_COLOR_BIT`, `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` if `format` is a color, depth-only or stencil-only format, respectively, except if `format` is a multi-planar format. If using a depth/stencil format with both depth and stencil components, `aspectMask` must include at least one of `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`, and can include both.

When the `VkImageSubresourceRange` structure is used to select a subset of the slices of a 3D image's mip level in order to create a 2D or 2D array image view of a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT`, `baseArrayLayer` and `layerCount` specify the first slice index and the number of slices to include in the created image view. Such an image view can be used as a framebuffer attachment that refers only to the specified range of slices of the selected mip level. However, any layout transitions performed on such an attachment view during a render pass instance still apply to the entire subresource referenced which includes all the slices of the selected mip level.

When using an image view of a depth/stencil image to populate a descriptor set (e.g. for sampling in the shader, or for use as an input attachment), the `aspectMask` must only include one bit and selects whether the image view is used for depth reads (i.e. using a floating-point sampler or input attachment in the shader) or stencil reads (i.e. using an unsigned integer sampler or input
attachment in the shader). When an image view of a depth/stencil image is used as a depth/stencil framebuffer attachment, the aspectMask is ignored and both depth and stencil image subresources are used.

When creating a VkImageView, if sampler Y’CbCr conversion is enabled in the sampler, the aspectMask of a subresourceRange used by the VkImageView must be VK_IMAGE_ASPECT_COLOR_BIT.

When creating a VkImageView, if sampler Y’CbCr conversion is not enabled in the sampler and the image format is multi-planar, the image must have been created with VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT, and the aspectMask of the VkImageView’s subresourceRange must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT or VK_IMAGE_ASPECT_PLANE_2_BIT.

Valid Usage

• VUID-VkImageSubresourceRange-levelCount-01720
  If levelCount is not VK_REMAINING_MIP_LEVELS, it must be greater than 0

• VUID-VkImageSubresourceRange-layerCount-01721
  If layerCount is not VK_REMAINING_ARRAY_LAYERS, it must be greater than 0

• VUID-VkImageSubresourceRange-aspectMask-01670
  If aspectMask includes VK_IMAGE_ASPECT_COLOR_BIT, then it must not include any of VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT

• VUID-VkImageSubresourceRange-aspectMask-02278
  aspectMask must not include VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT for any index i

Valid Usage (Implicit)

• VUID-VkImageSubresourceRange-aspectMask-parameter
  aspectMask must be a valid combination of VkImageAspectFlagBits values

• VUID-VkImageSubresourceRange-aspectMask-requiredbitmask
  aspectMask must not be 0

Bits which can be set in an aspect mask to specify aspects of an image for purposes such as identifying a subresource, are:
typedef enum VkImageAspectFlagBits {
    VK_IMAGE_ASPECT_COLOR_BIT = 0x00000001,
    VK_IMAGE_ASPECT_DEPTH_BIT = 0x00000002,
    VK_IMAGE_ASPECT_STENCIL_BIT = 0x00000004,
    VK_IMAGE_ASPECT_METADATA_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_0_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_1_BIT = 0x00000020,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_2_BIT = 0x00000040,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT = 0x00000080,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT = 0x00000100,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT = 0x00000200,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT = 0x00000400,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_0_BIT_KHR = VK_IMAGE_ASPECT_PLANE_0_BIT,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_1_BIT_KHR = VK_IMAGE_ASPECT_PLANE_1_BIT,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_2_BIT_KHR = VK_IMAGE_ASPECT_PLANE_2_BIT,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_2_BIT_KHR = VK_IMAGE_ASPECT_PLANE_2_BIT,
} VkImageAspectFlagBits;

- **VK_IMAGE_ASPECT_COLOR_BIT** specifies the color aspect.
- **VK_IMAGE_ASPECT_DEPTH_BIT** specifies the depth aspect.
- **VK_IMAGE_ASPECT_STENCIL_BIT** specifies the stencil aspect.
- **VK_IMAGE_ASPECT_METADATA_BIT** specifies the metadata aspect, used for sparse sparse resource operations.
- **VK_IMAGE_ASPECT_PLANE_0_BIT** specifies plane 0 of a multi-planar image format.
- **VK_IMAGE_ASPECT_PLANE_1_BIT** specifies plane 1 of a multi-planar image format.
- **VK_IMAGE_ASPECT_PLANE_2_BIT** specifies plane 2 of a multi-planar image format.
- **VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT** specifies memory plane 0.
- **VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT** specifies memory plane 1.
- **VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT** specifies memory plane 2.
- **VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT** specifies memory plane 3.

// Provided by VK_VERSION_1_0
typedef VkFlags VkImageAspectFlags;
**VkImageAspectFlags** is a bitmask type for setting a mask of zero or more **VkImageAspectFlagBits**.

The **VkComponentMapping** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkComponentMapping {
    VkComponentSwizzle r;
    VkComponentSwizzle g;
    VkComponentSwizzle b;
    VkComponentSwizzle a;
} VkComponentMapping;
```

- **r** is a **VkComponentSwizzle** specifying the component value placed in the R component of the output vector.
- **g** is a **VkComponentSwizzle** specifying the component value placed in the G component of the output vector.
- **b** is a **VkComponentSwizzle** specifying the component value placed in the B component of the output vector.
- **a** is a **VkComponentSwizzle** specifying the component value placed in the A component of the output vector.

**Valid Usage (Implicit)**

- **VUID-VkComponentMapping-r-parameter**
  - **r** must be a valid **VkComponentSwizzle** value
- **VUID-VkComponentMapping-g-parameter**
  - **g** must be a valid **VkComponentSwizzle** value
- **VUID-VkComponentMapping-b-parameter**
  - **b** must be a valid **VkComponentSwizzle** value
- **VUID-VkComponentMapping-a-parameter**
  - **a** must be a valid **VkComponentSwizzle** value

Possible values of the members of **VkComponentMapping**, specifying the component values placed in each component of the output vector, are:
typedef enum VkComponentSwizzle {
    VK_COMPONENT_SWIZZLE_IDENTITY = 0,
    VK_COMPONENT_SWIZZLE_ZERO = 1,
    VK_COMPONENT_SWIZZLE_ONE = 2,
    VK_COMPONENT_SWIZZLE_R = 3,
    VK_COMPONENT_SWIZZLE_G = 4,
    VK_COMPONENT_SWIZZLE_B = 5,
    VK_COMPONENT_SWIZZLE_A = 6,
} VkComponentSwizzle;

- **VK_COMPONENT_SWIZZLE_IDENTITY** specifies that the component is set to the identity swizzle.
- **VK_COMPONENT_SWIZZLE_ZERO** specifies that the component is set to zero.
- **VK_COMPONENT_SWIZZLE_ONE** specifies that the component is set to either 1 or 1.0, depending on whether the type of the image view format is integer or floating-point respectively, as determined by the Format Definition section for each VkFormat.
- **VK_COMPONENT_SWIZZLE_R** specifies that the component is set to the value of the R component of the image.
- **VK_COMPONENT_SWIZZLE_G** specifies that the component is set to the value of the G component of the image.
- **VK_COMPONENT_SWIZZLE_B** specifies that the component is set to the value of the B component of the image.
- **VK_COMPONENT_SWIZZLE_A** specifies that the component is set to the value of the A component of the image.

Setting the identity swizzle on a component is equivalent to setting the identity mapping on that component. That is:

<table>
<thead>
<tr>
<th>Component</th>
<th>Identity Mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>components.r</td>
<td>VK_COMPONENT_SWIZZLE_R</td>
</tr>
<tr>
<td>components.g</td>
<td>VK_COMPONENT_SWIZZLE_G</td>
</tr>
<tr>
<td>components.b</td>
<td>VK_COMPONENT_SWIZZLE_B</td>
</tr>
<tr>
<td>components.a</td>
<td>VK_COMPONENT_SWIZZLE_A</td>
</tr>
</tbody>
</table>

If the pNext list includes a VkImageViewASTCDecodeModeEXT structure, then that structure includes a parameter specifying the decode mode for image views using ASTC compressed formats.

The VkImageViewASTCDecodeModeEXT structure is defined as:
typedef struct VkImageViewASTCDecodeModeEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkFormat           decodeMode;
} VkImageViewASTCDecodeModeEXT;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **decodeMode** is the intermediate format used to decode ASTC compressed formats.

**Valid Usage**

- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02230
  decodeMode must be one of VK_FORMAT_R16G16B16A16_SFLOAT, VK_FORMAT_R8G8B8A8_UNORM, or VK_FORMAT_E5B9G9R9_UFLOAT_PACK32

- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02231
  If the decodeModeSharedExponent feature is not enabled, decodeMode must not be VK_FORMAT_E5B9G9R9_UFLOAT_PACK32

- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02232
  If decodeMode is VK_FORMAT_R8G8B8A8_UNORM the image view must not include blocks using any of the ASTC HDR modes

- VUID-VkImageViewASTCDecodeModeEXT-format-04084
  format of the image view must be one of the ASTC Compressed Image Formats

If format uses sRGB encoding then the decodeMode has no effect.

**Valid Usage (Implicit)**

- VUID-VkImageViewASTCDecodeModeEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT

- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-parameter
  decodeMode must be a valid VkFormat value

To destroy an image view, call:

// Provided by VK_VERSION_1_0
void vkDestroyImageView(
    VkDevice                                    device,
    VkImageView                                 imageView,
    const VkAllocationCallbacks*                pAllocator);

- **device** is the logical device that destroys the image view.
• **imageView** is the image view to destroy.
• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyImageView-imageView-01026**
  All submitted commands that refer to **imageView** must have completed execution

- **VUID-vkDestroyImageView-imageView-01027**
  If **VkAllocationCallbacks** were provided when **imageView** was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroyImageView-imageView-01028**
  If no **VkAllocationCallbacks** were provided when **imageView** was created, **pAllocator** must be **NULL**.

### Valid Usage (Implicit)

- **VUID-vkDestroyImageView-device-parameter**
  **device** must be a valid **VkDevice** handle.

- **VUID-vkDestroyImageView-imageView-parameter**
  If **imageView** is not **VK_NULL_HANDLE**, **imageView** must be a valid **VkImageView** handle.

- **VUID-vkDestroyImageView-pAllocator-parameter**
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure.

- **VUID-vkDestroyImageView-imageView-parent**
  If **imageView** is a valid handle, it must have been created, allocated, or retrieved from **device**.

### Host Synchronization

- Host access to **imageView** must be externally synchronized.

To get the handle for an image view, call:

```c
// Provided by VK_NVX_image_view_handle
uint32_t vkGetImageViewHandleNVX(
    VkDevice device,
    const VkImageViewHandleInfoNVX* pInfo);
```

- **device** is the logical device that owns the image view.
- **pInfo** describes the image view to query and type of handle.
Valid Usage (Implicit)

- VUID-vkGetImageViewHandleNVX-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetImageViewHandleNVX-pInfo-parameter
pInfo must be a valid pointer to a valid VkImageViewHandleInfoNVX structure

The VkImageViewHandleInfoNVX structure is defined as:

```c
// Provided by VK_NVX_image_view_handle
typedef struct VkImageViewHandleInfoNVX {
    VkStructureType     sType;
    const void*         pNext;
    VkImageView         imageView;
    VkDescriptorType    descriptorType;
    VkSampler           sampler;
} VkImageViewHandleInfoNVX;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `imageView` is the image view to query.
- `descriptorType` is the type of descriptor for which to query a handle.
- `sampler` is the sampler to combine with the image view when generating the handle.

Valid Usage

- VUID-VkImageViewHandleInfoNVX-descriptorType-02654
descriptorType must be VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
  VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER

- VUID-VkImageViewHandleInfoNVX-sampler-02655
sampler must be a valid VkSampler if descriptorType is
  VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER

- VUID-VkImageViewHandleInfoNVX-imageView-02656
If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or
  VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, the image that imageView was created from
  must have been created with the VK_IMAGE_USAGE_SAMPLED_BIT usage bit set

- VUID-VkImageViewHandleInfoNVX-imageView-02657
If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, the image that imageView was
  created from must have been created with the VK_IMAGE_USAGE_STORAGE_BIT usage bit set
Valid Usage (Implicit)

- **VUID-VkImageViewHandleInfoNVX-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_VIEW_HANDLE_INFO_NVX`.

- **VUID-VkImageViewHandleInfoNVX-pNext-pNext**
  
  `pNext` must be `NULL`.

- **VUID-VkImageViewHandleInfoNVX-imageView-parameter**
  
  `imageView` must be a valid `VkImageView` handle.

- **VUID-VkImageViewHandleInfoNVX-descriptorType-parameter**
  
  `descriptorType` must be a valid `VkDescriptorType` value.

- **VUID-VkImageViewHandleInfoNVX-sampler-parameter**
  
  If `sampler` is `VK_NULL_HANDLE`, `sampler` must be a valid `VkSampler` handle.

- **VUID-VkImageViewHandleInfoNVX-commonparent**
  
  Both of `imageView`, and `sampler` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

To get the device address for an image view, call:

```c
// Provided by VK_NVX_image_view_handle
VkResult vkGetImageViewAddressNVX(
    VkDevice                                    device,
    VkImageView                                 imageView,
    VkImageViewAddressPropertiesNVX*            pProperties);
```

- `device` is the logical device that owns the image view.
- `imageView` is a handle to the image view.
- `pProperties` contains the device address and size when the call returns.

Valid Usage (Implicit)

- **VUID-vkGetImageViewAddressNVX-device-parameter**
  
  `device` must be a valid `VkDevice` handle.

- **VUID-vkGetImageViewAddressNVX-imageView-parameter**
  
  `imageView` must be a valid `VkImageView` handle.

- **VUID-vkGetImageViewAddressNVX-pProperties-parameter**
  
  `pProperties` must be a valid pointer to a `VkImageViewAddressPropertiesNVX` structure.

- **VUID-vkGetImageViewAddressNVX-imageView-parent**
  
  `imageView` must have been created, allocated, or retrieved from `device`.
Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**

The `VkImageViewAddressPropertiesNVX` structure is defined as:

```c
// Provided by VK_NVX_image_view_handle
typedef struct VkImageViewAddressPropertiesNVX {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceAddress    deviceAddress;
    VkDeviceSize       size;
} VkImageViewAddressPropertiesNVX;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceAddress` is the device address of the image view.
- `size` is the size in bytes of the image view device memory.

**Valid Usage (Implicit)**

- **VUID-VkImageViewAddressPropertiesNVX-sType-sType**  
  `sType` **must be** `VK_STRUCTURE_TYPE_IMAGE_VIEW_ADDRESS_PROPERTIES_NVX`
- **VUID-VkImageViewAddressPropertiesNVX-pNext-pNext**  
  `pNext` **must be** `NULL`

### 12.5.1. Image View Format Features

Valid uses of a `VkImageView` may depend on the image view’s `format features`, defined below. Such constraints are documented in the affected valid usage statement.

- If `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_LINEAR`, then the image view’s set of `format features` is the value of `VkFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same `format` as `VkImageViewCreateInfo::format`.

- If `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_OPTIMAL`, but without an Android hardware buffer external format, then the image view’s set of `format features` is the value of `VkFormatProperties::optimalTilingFeatures` found by calling
vkGetPhysicalDeviceFormatProperties on the same format as VkImageViewCreateInfo::format.

- If VkImageViewCreateInfo::image was created with an Android hardware buffer external format, then the image views's set of format features is the value of VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures found by calling vkGetAndroidHardwareBufferPropertiesANDROID on the Android hardware buffer that was imported to the VkDeviceMemory to which the VkImageViewCreateInfo::image is bound.

- If VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then:
  - The image's DRM format modifier is the value of VkImageDrmFormatModifierListCreateInfoEXT::drmFormatModifier found by calling vkGetImageDrmFormatModifierPropertiesEXT.
  - Let VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties be the array found by calling vkGetPhysicalDeviceFormatProperties2 on the same format as VkImageViewCreateInfo::format.
  - Let VkDrmFormatModifierPropertiesEXT prop be an array element whose drmFormatModifier member is the value of the image's DRM format modifier.
  - Then the image view's set of format features is the value of taking the bitwise intersection, over the collected prop::drmFormatModifierTilingFeatures.

### 12.6. Acceleration Structures

Acceleration structures are an opaque structure that is built by the implementation to more efficiently perform spatial queries on the provided geometric data. For this extension, an acceleration structure is either a top-level acceleration structure containing a set of bottom-level acceleration structures or a bottom-level acceleration structure containing either a set of axis-aligned bounding boxes for custom geometry or a set of triangles.

Each instance in the top-level acceleration structure contains a reference to a bottom-level acceleration structure as well as an instance transform plus information required to index into the shader bindings. The top-level acceleration structure is what is bound to the acceleration descriptor, for example to trace inside the shader in the ray tracing pipeline.

Acceleration structures are represented by VkAccelerationStructureKHR handles:

```c
// Provided by VK_KHR_acceleration_structure
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkAccelerationStructureKHR)
```

Acceleration structures for the VK_NV_ray_tracing extension are represented by the similar VkAccelerationStructureNV handles:

```c
// Provided by VK_NV_ray_tracing
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkAccelerationStructureNV)
```

To create acceleration structures, call:
// Provided by VK_NV_ray_tracing
VkResult vkCreateAccelerationStructureNV(
    VkDevice                                    device,
    const VkAccelerationStructureCreateInfoNV*  pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkAccelerationStructureNV*                  pAccelerationStructure);

• **device** is the logical device that creates the buffer object.

• **pCreateInfo** is a pointer to a `VkAccelerationStructureCreateInfoNV` structure containing parameters affecting creation of the acceleration structure.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

• **pAccelerationStructure** is a pointer to a `VkAccelerationStructureNV` handle in which the resulting acceleration structure object is returned.

Similar to other objects in Vulkan, the acceleration structure creation merely creates an object with a specific “shape” as specified by the information in `VkAccelerationStructureInfoNV` and `compactedSize` in `pCreateInfo`. Populating the data in the object after allocating and binding memory is done with `vkCmdBuildAccelerationStructureNV` and `vkCmdCopyAccelerationStructureNV`.

Acceleration structure creation uses the count and type information from the geometries, but does not use the data references in the structures.

### Valid Usage (Implicit)

- **VUID-vkCreateAccelerationStructureNV-device-parameter**  
  
  **device** must be a valid `VkDevice` handle

- **VUID-vkCreateAccelerationStructureNV-pCreateInfo-parameter**  
  
  **pCreateInfo** must be a valid pointer to a valid `VkAccelerationStructureCreateInfoNV` structure

- **VUID-vkCreateAccelerationStructureNV-pAllocator-parameter**  
  
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateAccelerationStructureNV-pAccelerationStructure-parameter**  
  
  **pAccelerationStructure** must be a valid pointer to a `VkAccelerationStructureNV` handle

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
The `VkAccelerationStructureCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkAccelerationStructureCreateInfoNV {
    VkStructureType                  sType;
    const void*                      pNext;
    VkDeviceSize                     compactedSize;
    VkAccelerationStructureInfoNV    info;
} VkAccelerationStructureCreateInfoNV;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **compactedSize** is the size from the result of `vkCmdWriteAccelerationStructuresPropertiesNV` if this acceleration structure is going to be the target of a compacting copy.
- **info** is the `VkAccelerationStructureInfoNV` structure specifying further parameters of the created acceleration structure.

**Valid Usage**

- VUID-VkAccelerationStructureCreateInfoNV-compactedSize-02421
  If `compactedSize` is not 0 then both `info.geometryCount` and `info.instanceCount` must be 0

**Valid Usage (Implicit)**

- VUID-VkAccelerationStructureCreateInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_NV`
- VUID-VkAccelerationStructureCreateInfoNV-pNext-pNext
  `pNext` must be NULL
- VUID-VkAccelerationStructureCreateInfoNV-info-parameter
  `info` must be a valid `VkAccelerationStructureInfoNV` structure

The `VkAccelerationStructureInfoNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkAccelerationStructureInfoNV {
    VkStructureType                        sType;
    const void*                            pNext;
    VkAccelerationStructureTypeNV          type;
    VkBuildAccelerationStructureFlagsNV    flags;
    uint32_t                               instanceCount;
    uint32_t                               geometryCount;
    const VkGeometryNV*                    pGeometries;
} VkAccelerationStructureInfoNV;
```
• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **type** is a `VkAccelerationStructureTypeNV` value specifying the type of acceleration structure that will be created.

• **flags** is a bitmask of `VkBuildAccelerationStructureFlagBitsNV` specifying additional parameters of the acceleration structure.

• **instanceCount** specifies the number of instances that will be in the new acceleration structure.

• **geometryCount** specifies the number of geometries that will be in the new acceleration structure.

• **pGeometries** is a pointer to an array of `geometryCount` `VkGeometryNV` structures containing the scene data being passed into the acceleration structure.

`VkAccelerationStructureInfoNV` contains information that is used both for acceleration structure creation with `vkCreateAccelerationStructureNV` and in combination with the actual geometric data to build the acceleration structure with `vkCmdBuildAccelerationStructureNV`. 
Valid Usage

- **VUID-VkAccelerationStructureInfoNV-geometryCount-02422**
  
  `geometryCount` **must** be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxGeometryCount`

- **VUID-VkAccelerationStructureInfoNV-instanceCount-02423**
  
  `instanceCount` **must** be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxInstanceCount`

- **VUID-VkAccelerationStructureInfoNV-maxTriangleCount-02424**
  
  The total number of triangles in all geometries **must** be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxTriangleCount`

- **VUID-VkAccelerationStructureInfoNV-type-02425**
  
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_NV` then `geometryCount` **must** be 0

- **VUID-VkAccelerationStructureInfoNV-type-02426**
  
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV` then `instanceCount` **must** be 0

- **VUID-VkAccelerationStructureInfoNV-type-02786**
  
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV` then the `geometryType` member of each geometry in `pGeometries` **must** be the same

- **VUID-VkAccelerationStructureInfoNV-type-04623**
  
  `type` **must** not be `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`

- **VUID-VkAccelerationStructureInfoNV-flags-02592**
  
  If `flags` has the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_NV` bit set, then it **must** not have the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_NV` bit set

- **VUID-VkAccelerationStructureInfoNV-scratch-02781**
  
  `scratch` **must** have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag

- **VUID-VkAccelerationStructureInfoNV-instanceData-02782**
  
  If `instanceData` is not `VK_NULL_HANDLE`, `instanceData` **must** have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag
Valid Usage (Implicit)

- **VUID-VkAccelerationStructureInfoNV-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_INFO_NV`

- **VUID-VkAccelerationStructureInfoNV-pNext-pNext**
  - `pNext` must be `NULL`

- **VUID-VkAccelerationStructureInfoNV-type-parameter**
  - `type` must be a valid `VkAccelerationStructureTypeNV` value

- **VUID-VkAccelerationStructureInfoNV-flags-parameter**
  - `flags` must be a valid combination of `VkBuildAccelerationStructureFlagBitsNV` values

- **VUID-VkAccelerationStructureInfoNV-pGeometries-parameter**
  - If `geometryCount` is not 0, `pGeometries` must be a valid pointer to an array of `geometryCount` valid `VkGeometryNV` structures

To create an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCreateAccelerationStructureKHR(
    VkDevice                                    device,
    const VkAccelerationStructureCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkAccelerationStructureKHR*                 pAccelerationStructure);
```

- **device** is the logical device that creates the acceleration structure object.

- **pCreateInfo** is a pointer to a `VkAccelerationStructureCreateInfoKHR` structure containing parameters affecting creation of the acceleration structure.

- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

- **pAccelerationStructure** is a pointer to a `VkAccelerationStructureKHR` handle in which the resulting acceleration structure object is returned.

Similar to other objects in Vulkan, the acceleration structure creation merely creates an object with a specific “shape”. The type and quantity of geometry that can be built into an acceleration structure is determined by the parameters of `VkAccelerationStructureCreateInfoKHR`.

Populating the data in the object after allocating and binding memory is done with commands such as `vkCmdBuildAccelerationStructuresKHR`, `vkBuildAccelerationStructuresKHR`, `vkCmdCopyAccelerationStructureKHR`, and `vkCopyAccelerationStructureKHR`.

The input buffers passed to acceleration structure build commands will be referenced by the implementation for the duration of the command. After the command completes, the acceleration structure may hold a reference to any acceleration structure specified by an active instance contained therein. Apart from this referencing, acceleration structures must be fully self-contained. The application may re-use or free any memory which was used by the command as an input or as scratch without affecting the results of ray traversal.
Valid Usage

- VUID-vkCreateAccelerationStructureKHR-accelerationStructure-03611
  The `accelerationStructure` feature must be enabled

- VUID-vkCreateAccelerationStructureKHR-deviceAddress-03488
  If `VkAccelerationStructureCreateInfoKHR::deviceAddress` is not zero, the `accelerationStructureCaptureReplay` feature must be enabled

- VUID-vkCreateAccelerationStructureKHR-device-03489
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled

Valid Usage (Implicit)

- VUID-vkCreateAccelerationStructureKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkCreateAccelerationStructureKHR-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkAccelerationStructureCreateInfoKHR` structure

- VUID-vkCreateAccelerationStructureKHR-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateAccelerationStructureKHR-pAccelerationStructure-parameter
  `pAccelerationStructure` must be a valid pointer to a `VkAccelerationStructureKHR` handle

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`

The `VkAccelerationStructureCreateInfoKHR` structure is defined as:
typedef struct VkAccelerationStructureCreateInfoKHR {  
  VkStructureType                          sType;  
  const void*                              pNext;  
  VkAccelerationStructureCreateFlagsKHR    createFlags;  
  VkBuffer                                 buffer;  
  VkDeviceSize                             offset;  
  VkDeviceSize                             size;  
  VkAccelerationStructureTypeKHR           type;  
  VkDeviceAddress                          deviceAddress;  
} VkAccelerationStructureCreateInfoKHR;

• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **createFlags** is a bitmask of **VkAccelerationStructureCreateFlagBitsKHR** specifying additional creation parameters of the acceleration structure.

• **buffer** is the buffer on which the acceleration structure will be stored.

• **offset** is an offset in bytes from the base address of the buffer at which the acceleration structure will be stored, and **must** be a multiple of **256**.

• **size** is the size required for the acceleration structure.

• **type** is a **VkAccelerationStructureTypeKHR** value specifying the type of acceleration structure that will be created.

• **deviceAddress** is the device address requested for the acceleration structure if the **accelerationStructureCaptureReplay** feature is being used.

If **deviceAddress** is zero, no specific address is requested.

If **deviceAddress** is not zero, **deviceAddress** **must** be an address retrieved from an identically created acceleration structure on the same implementation. The acceleration structure **must** also be placed on an identically created **buffer** and at the same **offset**.

Applications **should** avoid creating acceleration structures with application-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR** errors.
Note

The expected usage for this is that a trace capture/replay tool will add the `VK_BUFFER_CREATEDEVICE_ADDRESS_CAPTURE_REPLAY_BIT` flag to all buffers that use `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT`, and `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` to all buffers used as storage for an acceleration structure where `deviceAddress` is not zero. During capture the tool will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Apps/tools should avoid mixing app-provided and implementation-provided addresses for buffers created with `VK_BUFFER_CREATEDEVICE_ADDRESS_CAPTURE_REPLAY_BIT`, to avoid address space allocation conflicts.

Applications should create an acceleration structure with a specific `VkAccelerationStructureTypeKHR` other than `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

If the acceleration structure will be the target of a build operation, the required size for an acceleration structure can be queried with `vkGetAccelerationStructureBuildSizesKHR`. If the acceleration structure is going to be the target of a compacting copy, `vkCmdWriteAccelerationStructuresPropertiesKHR` or `vkWriteAccelerationStructuresPropertiesKHR` can be used to obtain the compacted size required.

Valid Usage

- VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-03612
  If `deviceAddress` is not zero, `createFlags` must include `VK_ACCELERATION_STRUCTURE_CREATEDEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`

- VUID-VkAccelerationStructureCreateInfoKHR-createFlags-03613
  If `createFlags` includes `VK_ACCELERATION_STRUCTURE_CREATEDEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`, `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureCaptureReplay` must be `VK_TRUE`

- VUID-VkAccelerationStructureCreateInfoKHR-buffer-03614
  `buffer` must have been created with a usage value containing `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR`

- VUID-VkAccelerationStructureCreateInfoKHR-buffer-03615
  `buffer` must not have been created with `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`

- VUID-VkAccelerationStructureCreateInfoKHR-offset-03616
  The sum of `offset` and `size` must be less than the size of `buffer`

- VUID-VkAccelerationStructureCreateInfoKHR-offset-03734
  `offset` must be a multiple of 256 bytes
Valid Usage (Implicit)

- **sType must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_KHR`
- **pNext must** be `NULL`
- **createFlags must** be a valid combination of `VkAccelerationStructureCreateFlagBitsKHR` values
- **buffer must** be a valid `VkBuffer` handle
- **type must** be a valid `VkAccelerationStructureTypeKHR` value

To get the build sizes for an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
void vkGetAccelerationStructureBuildSizesKHR(
    VkDevice                                    device,
    VkAccelerationStructureBuildTypeKHR         buildType,
    const          VkAccelerationStructureBuildGeometryInfoKHR* pBuildInfo,
    const          uint32_t*                             pMaxPrimitiveCounts,
    VkAccelerationStructureBuildSizesInfoKHR*   pSizeInfo);
```

- **device** is the logical device that will be used for creating the acceleration structure.
- **buildType** defines whether host or device operations (or both) are being queried for.
- **pBuildInfo** is a pointer to a `VkAccelerationStructureBuildGeometryInfoKHR` structure describing parameters of a build operation.
- **pMaxPrimitiveCounts** is a pointer to an array of `pBuildInfo->geometryCount` `uint32_t` values defining the number of primitives built into each geometry.
- **pSizeInfo** is a pointer to a `VkAccelerationStructureBuildSizesInfoKHR` structure which returns the size required for an acceleration structure and the sizes required for the scratch buffers, given the build parameters.

The `srcAccelerationStructure`, `dstAccelerationStructure`, and `mode` members of `pBuildInfo` are ignored. Any `VkDeviceOrHostAddressKHR` members of `pBuildInfo` are ignored by this command, except that the `hostAddress` member of `VkAccelerationStructureGeometryTrianglesDataKHR::transformData` will be examined to check if it is `NULL`.

An acceleration structure created with the `accelerationStructureSize` returned by this command supports any build or update with a `VkAccelerationStructureBuildGeometryInfoKHR` structure and array of `VkAccelerationStructureBuildRangeInfoKHR` structures subject to the following properties:

- The `build` command is a host build command, and `buildType` is
VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR or
VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR

• The build command is a device build command, and buildType is
  VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR or
  VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR

• For VkAccelerationStructureBuildGeometryInfoKHR:
  ◦ Its type, and flags members are equal to those specified in pBuildInfo.
  ◦ geometryCount is less than or equal to that specified in pBuildInfo.
  ◦ For each element of either pGeometries or ppGeometries at a given index, its geometryType member is equal to that specified in pBuildInfo.
  ◦ For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, the vertexFormat and indexType members of geometry.triangles are equal to those specified in the same element in pBuildInfo.
  ◦ For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, the maxVertex member of geometry.triangles is less than or equal to that specified in the same element in pBuildInfo.
  ◦ For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the applicable address in the transformData member of geometry.triangles is not NULL, the corresponding transformData.hostAddress parameter in pBuildInfo is not NULL.

  • For each VkAccelerationStructureBuildRangeInfoKHR corresponding to the
    VkAccelerationStructureBuildGeometryInfoKHR:
    ◦ Its primitiveCount member is less than or equal to the corresponding element of pMaxPrimitiveCounts.

Similarly, the updateScratchSize value will support any build command specifying the
VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR mode under the above conditions, and the
buildScratchSize value will support any build command specifying the
VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR mode under the above conditions.
Valid Usage

- VUID-vkGetAccelerationStructureBuildSizesKHR-rayTracingPipeline-03617
  The rayTracingPipeline or rayQuery feature must be enabled

- VUID-vkGetAccelerationStructureBuildSizesKHR-device-03618
  If device was created with multiple physical devices, then the
  bufferDeviceAddressMultiDevice feature must be enabled

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-03619
  If pBuildInfo->geometryCount is not 0, pMaxPrimitiveCounts must be a valid pointer to an
  array of pBuildInfo->geometryCount uint32_t values

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-03785
  If pBuildInfo->pGeometries or pBuildInfo->ppGeometries has a geometryType of
  VK_GEOMETRY_TYPE_INSTANCES_KHR, each pMaxPrimitiveCounts[i] must be less than or equal to
  VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount

Valid Usage (Implicit)

- VUID-vkGetAccelerationStructureBuildSizesKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetAccelerationStructureBuildSizesKHR-buildType-parameter
  buildType must be a valid VkAccelerationStructureBuildTypeKHR value

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-parameter
  pBuildInfo must be a valid pointer to a valid
  VkAccelerationStructureBuildGeometryInfoKHR structure

- VUID-vkGetAccelerationStructureBuildSizesKHR-pMaxPrimitiveCounts-parameter
  If pMaxPrimitiveCounts is not NULL, pMaxPrimitiveCounts must be a valid pointer to an array
  of pBuildInfo->geometryCount uint32_t values

- VUID-vkGetAccelerationStructureBuildSizesKHR-pSizeInfo-parameter
  pSizeInfo must be a valid pointer to a VkAccelerationStructureBuildSizesInfoKHR structure

The VkAccelerationStructureBuildSizesInfoKHR structure describes the required build sizes for an
acceleration structure and scratch buffers and is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildSizesInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize accelerationStructureSize;
    VkDeviceSize updateScratchSize;
    VkDeviceSize buildScratchSize;
} VkAccelerationStructureBuildSizesInfoKHR;
```
• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **accelerationStructureSize** is the size in bytes required in a `VkAccelerationStructureKHR` for a build or update operation.
• **updateScratchSize** is the size in bytes required in a scratch buffer for an update operation.
• **buildScratchSize** is the size in bytes required in a scratch buffer for a build operation.

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureBuildSizesInfoKHR-sType-sType**
  - `sType` **must be** `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_SIZES_INFO_KHR`
- **VUID-VkAccelerationStructureBuildSizesInfoKHR-pNext-pNext**
  - `pNext` **must be** **NULL**

Values which **can be set** in `VkAccelerationStructureCreateInfoKHR::type` or `VkAccelerationStructureInfoNV::type` specifying the type of acceleration structure, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureTypeKHR {
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR = 0,
    VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR = 1,
    VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR = 2,
    // Provided by VK_NV_ray_tracing
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_NV =
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR,
    // Provided by VK_NV_ray_tracing
    VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV =
    VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR,
} VkAccelerationStructureTypeKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkAccelerationStructureTypeKHR VkAccelerationStructureTypeNV;
```

- **VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR** is a top-level acceleration structure containing instance data referring to bottom-level acceleration structures.
- **VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR** is a bottom-level acceleration structure containing the AABBs or geometry to be intersected.
- **VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR** is an acceleration structure whose type is determined at build time used for special circumstances.

**Bits which can be set** in `VkAccelerationStructureCreateInfoKHR::createFlags` specifying additional
creation parameters for acceleration structures, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureCreateFlagBitsKHR {
    VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = 0x00000001,
} VkAccelerationStructureCreateFlagBitsKHR;
```

- **VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR** specifies that the acceleration structure's address can be saved and reused on a subsequent run.

```c
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkAccelerationStructureCreateFlagsKHR;
```

`VkAccelerationStructureCreateFlagsKHR` is a bitmask type for setting a mask of zero or more `VkAccelerationStructureCreateFlagBitsKHR`.

Bits which can be set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` or `VkAccelerationStructureInfoNV::flags` specifying additional parameters for acceleration structure builds, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureFlagBitsKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR = 0x00000001,
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR = 0x00000002,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR = 0x00000004,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR = 0x00000008,
    VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR = 0x00000010,
    // Provided by VK_NV_ray_tracing
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_NV = VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_BUILD_ACCELERATION_STRUCTURE.Allow_COMPACTION_BIT_NV = VK_BUILD_ACCELERATION_STRUCTURE.Allow_COMPACTION_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_NV = VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_NV = VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_NV = VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR,
} VkBuildAccelerationStructureFlagBitsKHR;
```

or the equivalent
 typedef VkBuildAccelerationStructureFlagBitsKHR
VkBuildAccelerationStructureFlagBitsNV;

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR** indicates that the specified acceleration structure can be updated with update of *VK_TRUE* in `vkCmdBuildAccelerationStructuresKHR` or `vkCmdBuildAccelerationStructureNV`.

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR** indicates that the specified acceleration structure can act as the source for a copy acceleration structure command with mode of **VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR** to produce a compacted acceleration structure.

• **VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR** indicates that the given acceleration structure build should prioritize trace performance over build time.

• **VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR** indicates that the given acceleration structure build should prioritize build time over trace performance.

• **VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR** indicates that this acceleration structure should minimize the size of the scratch memory and the final result build, potentially at the expense of build time or trace performance.

  
  
  **Note**

  **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR** and **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR** may take more time and memory than a normal build, and so should only be used when those features are needed.

 typedef VkFlags VkBuildAccelerationStructureFlagsKHR;

 or the equivalent

```
// Provided by VK_NV_ray_tracing
typedef VkBuildAccelerationStructureFlagsKHR VkBuildAccelerationStructureFlagsNV;
```

**VkBuildAccelerationStructureFlagsKHR** is a bitmask type for setting a mask of zero or more **VkBuildAccelerationStructureFlagBitsKHR**.

The **VkGeometryNV** structure describes geometry in a bottom-level acceleration structure and is defined as:
typedef struct VkGeometryNV {
    VkStructureType            sType;
    const void*                pNext;
    VkGeometryTypeKHR          geometryType;
    VkGeometryDataNV           geometry;
    VkGeometryFlagsKHR         flags;
} VkGeometryNV;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **geometryType** specifies the VkGeometryTypeKHR which this geometry refers to.
- **geometry** contains the geometry data as described in VkGeometryDataNV.
- **flags** has VkGeometryFlagBitsKHR describing options for this geometry.

### Valid Usage

- VUID-VkGeometryNV-geometryType-03503
  geometryType must be VK_GEOMETRY_TYPE_TRIANGLES_NV or VK_GEOMETRY_TYPE_AABBS_NV

### Valid Usage (Implicit)

- VUID-VkGeometryNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_GEOMETRY_NV
- VUID-VkGeometryNV-pNext-pNext
  pNext must be NULL
- VUID-VkGeometryNV-geometryType-parameter
  geometryType must be a valid VkGeometryTypeKHR value
- VUID-VkGeometryNV-geometry-parameter
  geometry must be a valid VkGeometryDataNV structure
- VUID-VkGeometryNV-flags-parameter
  flags must be a valid combination of VkGeometryFlagBitsKHR values

Geometry types are specified by VkGeometryTypeKHR, which takes values:
typedef enum VkGeometryTypeKHR {
    VK_GEOMETRY_TYPE_TRIANGLES_KHR = 0,
    VK_GEOMETRY_TYPE_AABBS_KHR = 1,
    VK_GEOMETRY_TYPE_INSTANCES_KHR = 2,
} VkGeometryTypeKHR;

or the equivalent

typedef VkGeometryTypeKHR VkGeometryTypeNV;

- **VK_GEOMETRY_TYPE_TRIANGLES_KHR** specifies a geometry type consisting of triangles.
- **VK_GEOMETRY_TYPE_AABBS_KHR** specifies a geometry type consisting of axis-aligned bounding boxes.
- **VK_GEOMETRY_TYPE_INSTANCES_KHR** specifies a geometry type consisting of acceleration structure instances.

Bits specifying additional parameters for geometries in acceleration structure builds, are:

typedef enum VkGeometryFlagBitsKHR {
    VK_GEOMETRY_OPAQUE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR = 0x00000002,
} VkGeometryFlagBitsKHR;

or the equivalent

typedef VkGeometryFlagBitsKHR VkGeometryFlagBitsNV;

- **VK_GEOMETRY_OPAQUE_BIT_KHR** indicates that this geometry does not invoke the any-hit shaders even if present in a hit group.
- **VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR** indicates that the implementation **must** only call the any-hit shader a single time for each primitive in this geometry. If this bit is absent an implementation **may** invoke the any-hit shader more than once for this geometry.
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkGeometryFlagsKHR;

or the equivalent

// Provided by VK_NV_ray_tracing
typedef VkGeometryFlagsKHR VkGeometryFlagsNV;

VkGeometryFlagsKHR is a bitmask type for setting a mask of zero or more VkGeometryFlagBitsKHR.

The VkGeometryDataNV structure specifies geometry in a bottom-level acceleration structure and is defined as:

// Provided by VK_NV_ray_tracing
typedef struct VkGeometryDataNV {
    VkGeometryTrianglesNV triangles;
    VkGeometryAABBNV aabbs;
} VkGeometryDataNV;

- triangles contains triangle data if VkGeometryNV::geometryType is VK_GEOMETRY_TYPE_TRIANGLES_NV.
- aabbs contains axis-aligned bounding box data if VkGeometryNV::geometryType is VK_GEOMETRY_TYPE_AABBS_NV.

Valid Usage (Implicit)

- VUID-VkGeometryDataNV-triangles-parameter
  triangles must be a valid VkGeometryTrianglesNV structure
- VUID-VkGeometryDataNV-aabbs-parameter
  aabbs must be a valid VkGeometryAABBNV structure

The VkGeometryTrianglesNV structure specifies triangle geometry in a bottom-level acceleration structure and is defined as:
typedef struct VkGeometryTrianglesNV {
    VkStructureType sType;
    const void* pNext;
    VkBuffer vertexData;
    VkDeviceSize vertexOffset;
    uint32_t vertexCount;
    VkDeviceSize vertexStride;
    VkFormat vertexFormat;
    VkBuffer indexData;
    VkDeviceSize indexOffset;
    uint32_t indexCount;
    VkIndexType indexType;
    VkBuffer transformData;
    VkDeviceSize transformOffset;
} VkGeometryTrianglesNV;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **vertexData** is the buffer containing vertex data for this geometry.
- **vertexOffset** is the offset in bytes within **vertexData** containing vertex data for this geometry.
- **vertexCount** is the number of valid vertices.
- **vertexStride** is the stride in bytes between each vertex.
- **vertexFormat** is a **VkFormat** describing the format of each vertex element.
- **indexData** is the buffer containing index data for this geometry.
- **indexOffset** is the offset in bytes within **indexData** containing index data for this geometry.
- **indexCount** is the number of indices to include in this geometry.
- **indexType** is a **VkIndexType** describing the format of each index.
- **transformData** is an optional buffer containing an **VkTransformMatrixNV** structure defining a transformation to be applied to this geometry.
- **transformOffset** is the offset in bytes in **transformData** of the transform information described above.

If **indexType** is **VK_INDEX_TYPE_NONE_NV**, then this structure describes a set of triangles determined by **vertexCount**. Otherwise, this structure describes a set of indexed triangles determined by **indexCount**.
Valid Usage

- **vertexOffset** must be less than the size of **vertexData**
- **vertexOffset** must be a multiple of the component size of **vertexFormat**
- **vertexFormat** must be one of **VK_FORMAT_R32G32B32_SFLOAT**, **VK_FORMAT_R32G32_SFLOAT**, **VK_FORMAT_R16G16B16_SFLOAT**, **VK_FORMAT_R16G16_SFLOAT**, **VK_FORMAT_R16G16_SNORM**, or **VK_FORMAT_R16G16B16_SNORM**
- **vertexStride** must be less than or equal to $2^{32} - 1$
- **indexOffset** must be less than the size of **indexData**
- **indexOffset** must be a multiple of the element size of **indexType**
- **indexType** must be **VK_INDEX_TYPE_UINT16**, **VK_INDEX_TYPE_UINT32**, or **VK_INDEX_TYPE_NONE_NV**
- **indexData** must be **VK_NULL_HANDLE** if **indexType** is **VK_INDEX_TYPE_NONE_NV**
- **indexData** must be a valid **VkBuffer** handle if **indexType** is not **VK_INDEX_TYPE_NONE_NV**
- **indexCount** must be 0 if **indexType** is **VK_INDEX_TYPE_NONE_NV**
- **transformOffset** must be less than the size of **transformData**
- **transformOffset** must be a multiple of 16
Valid Usage (Implicit)

- VUID-VkGeometryTrianglesNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_GEOMETRY_TRIANGLES_NV

- VUID-VkGeometryTrianglesNV-pNext-pNext
  pNext must be NULL

- VUID-VkGeometryTrianglesNV-vertexData-parameter
  If vertexData is not VK_NULL_HANDLE, vertexData must be a valid VkBuffer handle

- VUID-VkGeometryTrianglesNV-vertexFormat-parameter
  vertexFormat must be a valid VkFormat value

- VUID-VkGeometryTrianglesNV-indexData-parameter
  If indexData is not VK_NULL_HANDLE, indexData must be a valid VkBuffer handle

- VUID-VkGeometryTrianglesNV-indexType-parameter
  indexType must be a valid VkIndexType value

- VUID-VkGeometryTrianglesNV-transformData-parameter
  If transformData is not VK_NULL_HANDLE, transformData must be a valid VkBuffer handle

- VUID-VkGeometryTrianglesNV-commonparent
  Each of indexData, transformData, and vertexData that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

The VkGeometryAABBNV structure specifies axis-aligned bounding box geometry in a bottom-level acceleration structure, and is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkGeometryAABBNV {
    VkStructureType sType;
    const void* pNext;
    VkBuffer aabbData;
    uint32_t numAABBs;
    uint32_t stride;
    VkDeviceSize offset;
} VkGeometryAABBNV;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **aabbData** is the buffer containing axis-aligned bounding box data.
- **numAABBs** is the number of AABBs in this geometry.
- **stride** is the stride in bytes between AABBs in aabbData.
- **offset** is the offset in bytes of the first AABB in aabbData.

The AABB data in memory is six 32-bit floats consisting of the minimum x, y, and z values followed by the maximum x, y, and z values.
Valid Usage

- VUID-VkGeometryAABBNV-offset-02439
  offset must be less than the size of aabbData
- VUID-VkGeometryAABBNV-offset-02440
  offset must be a multiple of 8
- VUID-VkGeometryAABBNV-stride-02441
  stride must be a multiple of 8

Valid Usage (Implicit)

- VUID-VkGeometryAABBNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_GEOMETRY_AABB_NV
- VUID-VkGeometryAABBNV-pNext-pNext
  pNext must be NULL
- VUID-VkGeometryAABBNV-aabbData-parameter
  If aabbData is not VK_NULL_HANDLE, aabbData must be a valid VkBuffer handle

To destroy an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
void vkDestroyAccelerationStructureKHR(
    VkDevice                                    device,
    VkAccelerationStructureKHR                  accelerationStructure,
    const VkAllocationCallbacks*                pAllocator);
```

- device is the logical device that destroys the buffer.
- accelerationStructure is the acceleration structure to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02442
  All submitted commands that refer to accelerationStructure must have completed execution
- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02443
  If VkAllocationCallbacks were provided when accelerationStructure was created, a compatible set of callbacks must be provided here
- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02444
  If no VkAllocationCallbacks were provided when accelerationStructure was created, pAllocator must be NULL
Valid Usage (Implicit)

- VUID-vkDestroyAccelerationStructureKHR-device-parameter
  
  **device** must be a valid **VkDevice** handle

- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-parameter
  
  If **accelerationStructure** is not **VK_NULL_HANDLE**, **accelerationStructure** must be a valid **VkAccelerationStructureKHR** handle

- VUID-vkDestroyAccelerationStructureKHR-pAllocator-parameter
  
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-parent
  
  If **accelerationStructure** is a valid handle, it must have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **accelerationStructure** must be externally synchronized

To destroy an acceleration structure, call:

```c
// Provided by VK_NV_ray_tracing
void vkDestroyAccelerationStructureNV(
    VkDevice device, 
    VkAccelerationStructureNV accelerationStructure, 
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the buffer.
- **accelerationStructure** is the acceleration structure to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyAccelerationStructureNV-accelerationStructure-03752
  
  All submitted commands that refer to **accelerationStructure** must have completed execution

- VUID-vkDestroyAccelerationStructureNV-accelerationStructure-03753
  
  If **VkAllocationCallbacks** were provided when **accelerationStructure** was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyAccelerationStructureNV-accelerationStructure-03754
  
  If no **VkAllocationCallbacks** were provided when **accelerationStructure** was created, **pAllocator** must be **NULL**
Valid Usage (Implicit)

- VUID-vkDestroyAccelerationStructureNV-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkDestroyAccelerationStructureNV-accelerationStructure-parameter
  
  If `accelerationStructure` is not `VK_NULL_HANDLE`, `accelerationStructure` must be a valid `VkAccelerationStructureNV` handle

- VUID-vkDestroyAccelerationStructureNV-pAllocator-parameter
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyAccelerationStructureNV-accelerationStructure-parent
  
  If `accelerationStructure` is a valid handle, it must have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `accelerationStructure` must be externally synchronized

An acceleration structure has memory requirements for the structure object itself, scratch space for the build, and scratch space for the update.

Scratch space is allocated as a `VkBuffer`, so for `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV` and `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV` the `pMemoryRequirements->alignment` and `pMemoryRequirements->memoryTypeBits` values returned by this call must be filled with zero, and should be ignored by the application.

To query the memory requirements, call:

```c
// Provided by VK_NV_ray_tracing
void vkGetAccelerationStructureMemoryRequirementsNV(
    VkDevice device,                           
    const VkAccelerationStructureMemoryRequirementsInfoNV* pInfo,  
    VkMemoryRequirements2KHR* pMemoryRequirements);
```

- `device` is the logical device on which the acceleration structure was created.
- `pInfo` specifies the acceleration structure to get memory requirements for.
- `pMemoryRequirements` returns the requested acceleration structure memory requirements.
Valid Usage (Implicit)

- **VUID-vkGetAccelerationStructureMemoryRequirementsNV-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkGetAccelerationStructureMemoryRequirementsNV-pInfo-parameter**
  - `pInfo` must be a valid pointer to a valid `VkAccelerationStructureMemoryRequirementsInfoNV` structure

- **VUID-vkGetAccelerationStructureMemoryRequirementsNV-pMemoryRequirements-parameter**
  - `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2KHR` structure

The `VkAccelerationStructureMemoryRequirementsInfoNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkAccelerationStructureMemoryRequirementsInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureMemoryRequirementsTypeNV type;
    VkAccelerationStructureNV accelerationStructure;
} VkAccelerationStructureMemoryRequirementsInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `type` selects the type of memory requirement being queried.
  - `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV` returns the memory requirements for the object itself.
  - `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV` returns the memory requirements for the scratch memory when doing a build.
  - `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV` returns the memory requirements for the scratch memory when doing an update.
- `accelerationStructure` is the acceleration structure to be queried for memory requirements.
Possible values of `type` in `VkAccelerationStructureMemoryRequirementsInfoNV` are:

```c
typedef enum VkAccelerationStructureMemoryRequirementsTypeNV {
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV = 0,
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV = 1,
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV = 2,
} VkAccelerationStructureMemoryRequirementsTypeNV;
```

- **VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV** requests the memory requirement for the `VkAccelerationStructureNV` backing store.
- **VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV** requests the memory requirement for scratch space during the initial build.
- **VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV** requests the memory requirement for scratch space during an update.

Possible values of `buildType` in `vkGetAccelerationStructureBuildSizesKHR` are:

```c
typedef enum VkAccelerationStructureBuildTypeKHR {
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR = 0,
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR = 1,
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR = 2,
} VkAccelerationStructureBuildTypeKHR;
```

- **VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR** requests the memory requirement for operations performed by the host.
- **VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR** requests the memory requirement for operations performed by the device.
- **VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR** requests the memory requirement for operations performed by either the host, or the device.

To attach memory to one or more acceleration structures at a time, call:

```c
// Provided by VK_NV_ray_tracing
VkResult vkBindAccelerationStructureMemoryNV(
    VkDevice                                    device,
    uint32_t                                    bindInfoCount,
    const VkBindAccelerationStructureMemoryInfoNV* pBindInfos);
```

- **device** is the logical device that owns the acceleration structures and memory.
- **bindInfoCount** is the number of elements in **pBindInfos**.
- **pBindInfos** is a pointer to an array of `VkBindAccelerationStructureMemoryInfoNV` structures describing acceleration structures and memory to bind.
Valid Usage (Implicit)

- VUID-vkBindAccelerationStructureMemoryNV-device-parameter
  
  `device` must be a valid `VkDevice` handle.

- VUID-vkBindAccelerationStructureMemoryNV-pBindInfos-parameter
  
  `pBindInfos` must be a valid pointer to an array of `bindInfoCount` valid `VkBindAccelerationStructureMemoryInfoNV` structures.

- VUID-vkBindAccelerationStructureMemoryNV-bindInfoCount-arraylength
  
  `bindInfoCount` must be greater than 0.

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkBindAccelerationStructureMemoryInfoNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkBindAccelerationStructureMemoryInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureNV accelerationStructure;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    uint32_t deviceIndexCount;
    const uint32_t* pDeviceIndices;
} VkBindAccelerationStructureMemoryInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `accelerationStructure` is the acceleration structure to be attached to memory.
- `memory` is a `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of memory that is to be bound to the acceleration structure. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified acceleration structure.
- `deviceIndexCount` is the number of elements in `pDeviceIndices`.
- `pDeviceIndices` is a pointer to an array of device indices.
Valid Usage

• VUID-VkBindAccelerationStructureMemoryInfoNV-accelerationStructure-03620
  \texttt{accelerationStructure} must not already be backed by a memory object

• VUID-VkBindAccelerationStructureMemoryInfoNV-memoryOffset-03621
  \texttt{memoryOffset} must be less than the size of \texttt{memory}

• VUID-VkBindAccelerationStructureMemoryInfoNV-memory-03622
  \texttt{memory} must have been allocated using one of the memory types allowed in the
  \texttt{memoryTypeBits} member of the \texttt{VkMemoryRequirements} structure returned from a call to
  \texttt{vkGetAccelerationStructureMemoryRequirementsNV} with \texttt{accelerationStructure} and type
  of \texttt{VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV}

• VUID-VkBindAccelerationStructureMemoryInfoNV-memoryOffset-03623
  \texttt{memoryOffset} must be an integer multiple of the \texttt{alignment} member of the
  \texttt{VkMemoryRequirements} structure returned from a call to
  \texttt{vkGetAccelerationStructureMemoryRequirementsNV} with \texttt{accelerationStructure} and type
  of \texttt{VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV}

• VUID-VkBindAccelerationStructureMemoryInfoNV-size-03624
  The \texttt{size} member of the \texttt{VkMemoryRequirements} structure returned from a call to
  \texttt{vkGetAccelerationStructureMemoryRequirementsNV} with \texttt{accelerationStructure} and type
  of \texttt{VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV} must be less than or
  equal to the size of \texttt{memory} minus \texttt{memoryOffset}

Valid Usage (Implicit)

• VUID-VkBindAccelerationStructureMemoryInfoNV-sType-sType
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_BIND_ACCELERATION_STRUCTURE_MEMORY_INFO_NV}

• VUID-VkBindAccelerationStructureMemoryInfoNV-pNext-pNext
  \texttt{pNext} must be \texttt{NULL}

• VUID-VkBindAccelerationStructureMemoryInfoNV-accelerationStructure-parameter
  \texttt{accelerationStructure} must be a valid \texttt{VkAccelerationStructureNV} handle

• VUID-VkBindAccelerationStructureMemoryInfoNV-memory-parameter
  \texttt{memory} must be a valid \texttt{VkDeviceMemory} handle

• VUID-VkBindAccelerationStructureMemoryInfoNV-pDeviceIndices-parameter
  If \texttt{deviceIndexCount} is not 0, \texttt{pDeviceIndices} must be a valid pointer to an array of
  \texttt{deviceIndexCount} \texttt{uint32_t} values

• VUID-VkBindAccelerationStructureMemoryInfoNV-commonparent
  Both of \texttt{accelerationStructure}, and \texttt{memory} must have been created, allocated, or retrieved
  from the same \texttt{VkDevice}

To allow constructing geometry instances with device code if desired, we need to be able to query a
opaque handle for an acceleration structure. This handle is a value of 8 bytes. To get this handle, call:
// Provided by VK_NV_ray_tracing
VkResult vkGetAccelerationStructureHandleNV(
    VkDevice                                    device,
    VkAccelerationStructureNV                   accelerationStructure,
    size_t                                      dataSize,
    void*                                       pData);

• **device** is the logical device that owns the acceleration structures.
• **accelerationStructure** is the acceleration structure.
• **dataSize** is the size in bytes of the buffer pointed to by **pData**.
• **pData** is a pointer to a user-allocated buffer where the results will be written.

### Valid Usage

- VUID-vkGetAccelerationStructureHandleNV-dataSize-02240
  **dataSize** must be large enough to contain the result of the query, as described above
- VUID-vkGetAccelerationStructureHandleNV-accelerationStructure-02787
  **accelerationStructure** must be bound completely and contiguously to a single
  VkDeviceMemory object via **vkBindAccelerationStructureMemoryNV**

### Valid Usage (Implicit)

- VUID-vkGetAccelerationStructureHandleNV-device-parameter
  **device** must be a valid **VkDevice** handle
- VUID-vkGetAccelerationStructureHandleNV-accelerationStructure-parameter
  **accelerationStructure** must be a valid **VkAccelerationStructureNV** handle
- VUID-vkGetAccelerationStructureHandleNV-pData-parameter
  **pData** must be a valid pointer to an array of **dataSize** bytes
- VUID-vkGetAccelerationStructureHandleNV-dataSize-arraylength
  **dataSize** must be greater than 0
- VUID-vkGetAccelerationStructureHandleNV-accelerationStructure-parent
  **accelerationStructure** must have been created, allocated, or retrieved from **device**
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

To query the 64-bit device address for an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkDeviceAddress vkGetAccelerationStructureDeviceAddressKHR(
    VkDevice device,
    const VkAccelerationStructureDeviceAddressInfoKHR* pInfo);
```

- `device` is the logical device that the accelerationStructure was created on.
- `pInfo` is a pointer to a `VkAccelerationStructureDeviceAddressInfoKHR` structure specifying the acceleration structure to retrieve an address for.

The 64-bit return value is an address of the acceleration structure, which can be used for device and shader operations that involve acceleration structures, such as ray traversal and acceleration structure building.

If the acceleration structure was created with a non-zero value of `VkAccelerationStructureCreateInfoKHR::deviceAddress` the return value will be the same address.

If the acceleration structure was created with a type of `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR` the returned address must be consistent with the relative offset to other acceleration structures of type of `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR` allocated with the same `VkBuffer`. That is, the difference in returned addresses between the two must be the same as the difference in offsets provided at acceleration structure creation.

**Note**
The acceleration structure device address may be different from the buffer device address corresponding to the acceleration structure’s start offset in its storage buffer for acceleration structure types other than `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

Valid Usage

- VUID-vkGetAccelerationStructureDeviceAddressKHR-device-03504
  
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled
Valid Usage (Implicit)

- VUID-vkGetAccelerationStructureDeviceAddressKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetAccelerationStructureDeviceAddressKHR-pInfo-parameter
pInfo must be a valid pointer to a valid VkAccelerationStructureDeviceAddressInfoKHR structure

The VkAccelerationStructureDeviceAddressInfoKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureDeviceAddressInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR accelerationStructure;
} VkAccelerationStructureDeviceAddressInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- accelerationStructure specifies the acceleration structure whose address is being queried.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureDeviceAddressInfoKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_DEVICE_ADDRESS_INFO_KHR

- VUID-VkAccelerationStructureDeviceAddressInfoKHR-pNext-pNext
pNext must be NULL

- VUID-VkAccelerationStructureDeviceAddressInfoKHR-accelerationStructure-parameter
accelerationStructure must be a valid VkAccelerationStructureKHR handle

12.7. Resource Memory Association

Resources are initially created as virtual allocations with no backing memory. Device memory is allocated separately (see Device Memory) and then associated with the resource. This association is done differently for sparse and non-sparse resources.

Resources created with any of the sparse creation flags are considered sparse resources. Resources created without these flags are non-sparse. The details on resource memory association for sparse resources is described in Sparse Resources.

Non-sparse resources must be bound completely and contiguously to a single VkDeviceMemory object before the resource is passed as a parameter to any of the following operations:
• creating image or buffer views
• updating descriptor sets
• recording commands in a command buffer

Once bound, the memory binding is immutable for the lifetime of the resource.

In a logical device representing more than one physical device, buffer and image resources exist on all physical devices but can be bound to memory differently on each. Each such replicated resource is an instance of the resource. For sparse resources, each instance can be bound to memory arbitrarily differently. For non-sparse resources, each instance can either be bound to the local or a peer instance of the memory, or for images can be bound to rectangular regions from the local and/or peer instances. When a resource is used in a descriptor set, each physical device interprets the descriptor according to its own instance’s binding to memory.

**Note**

There are no new copy commands to transfer data between physical devices. Instead, an application can create a resource with a peer mapping and use it as the source or destination of a transfer command executed by a single physical device to copy the data from one physical device to another.

To determine the memory requirements for a buffer resource, call:

```c
// Provided by VK_VERSION_1_0
void vkGetBufferMemoryRequirements(
    device,
    buffer,
    pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `buffer` is the buffer to query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements` structure in which the memory requirements of the buffer object are returned.

**Valid Usage (Implicit)**

- `VUID-vkGetBufferMemoryRequirements-device-parameter`  
  `device` must be a valid `VkDevice` handle

- `VUID-vkGetBufferMemoryRequirements-buffer-parameter`  
  `buffer` must be a valid `VkBuffer` handle

- `VUID-vkGetBufferMemoryRequirements-pMemoryRequirements-parameter`  
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements` structure

- `VUID-vkGetBufferMemoryRequirements-buffer-parent`  
  `buffer` must have been created, allocated, or retrieved from `device`
To determine the memory requirements for an image resource which is not created with the
VK_IMAGE_CREATE_DISJOINT_BIT flag set, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageMemoryRequirements(
    VkDevice                                    device,
    VkImage                                     image,
    VkMemoryRequirements*                       pMemoryRequirements);
```

- **device** is the logical device that owns the image.
- **image** is the image to query.
- **pMemoryRequirements** is a pointer to a `VkMemoryRequirements` structure in which the memory
  requirements of the image object are returned.

### Valid Usage

- **VUID-vkGetImageMemoryRequirements-image-01588**
  - `image` must not have been created with the VK_IMAGE_CREATE_DISJOINT_BIT flag set

- **VUID-vkGetImageMemoryRequirements-image-04004**
  - If `image` was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID
    external memory handle type, then `image` must be bound to memory

### Valid Usage (Implicit)

- **VUID-vkGetImageMemoryRequirements-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkGetImageMemoryRequirements-image-parameter**
  - `image` must be a valid `VkImage` handle

- **VUID-vkGetImageMemoryRequirements-pMemoryRequirements-parameter**
  - `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements` structure

- **VUID-vkGetImageMemoryRequirements-image-parent**
  - `image` must have been created, allocated, or retrieved from `device`

The `VkMemoryRequirements` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryRequirements {
    VkDeviceSize    size;
    VkDeviceSize    alignment;
    uint32_t        memoryTypeBits;
} VkMemoryRequirements;
```
• **size** is the size, in bytes, of the memory allocation **required** for the resource.

• **alignment** is the alignment, in bytes, of the offset within the allocation **required** for the resource.

• **memoryTypeBits** is a bitmask and contains one bit set for every supported memory type for the resource. Bit \( i \) is set if and only if the memory type \( i \) in the `VkPhysicalDeviceMemoryProperties` structure for the physical device is supported for the resource.

The precise size of images that will be bound to external Android hardware buffer memory is unknown until the memory has been imported or allocated, so applications **must** not call `vkGetImageMemoryRequirements` or `vkGetImageMemoryRequirements2` with such an `VkImage` before it has been bound to memory. When importing Android hardware buffer memory, the **allocationSize** can be determined by calling `vkGetAndroidHardwareBufferPropertiesANDROID`. When allocating new memory for a `VkImage` that **can** be exported to an Android hardware buffer, the memory's **allocationSize** **must** be zero; the actual size will be determined by the dedicated image’s parameters. After the memory has been allocated, the amount of space allocated from the memory’s heap **can** be obtained by getting the image’s memory requirements or by calling `vkGetAndroidHardwareBufferPropertiesANDROID` with the Android hardware buffer exported from the memory.

When allocating new memory for a `VkBuffer` that **can** be exported to an Android hardware buffer an application **may** still call `vkGetBufferMemoryRequirements` or `vkGetBufferMemoryRequirements2` with `VkBuffer` before it has been bound to memory.

If the resource being queried was created with the `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT` external memory handle type, the value of **size** has no meaning and **should** be ignored.

The implementation guarantees certain properties about the memory requirements returned by `vkGetBufferMemoryRequirements2`, `vkGetImageMemoryRequirements2`, `vkGetBufferMemoryRequirements` and `vkGetImageMemoryRequirements`:

• The **memoryTypeBits** member always contains at least one bit set.

• If **buffer** is a `VkBuffer` not created with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bit set, or if **image** is linear image, then the **memoryTypeBits** member always contains at least one bit set corresponding to a `VkMemoryType` with a `propertyFlags` that has both the `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` bit and the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` bit set. In other words, mappable coherent memory **can** always be attached to these objects.

• If **buffer** was created with `VkExternalMemoryBufferCreateInfo::handleTypes` set to 0 or **image** was created with `VkExternalMemoryImageCreateInfo::handleTypes` set to 0, the **memoryTypeBits** member always contains at least one bit set corresponding to a `VkMemoryType` with a `propertyFlags` that has the `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` bit set.

• The **memoryTypeBits** member is identical for all `VkBuffer` objects created with the same value for the **flags** and **usage** members in the `VkBufferCreateInfo` structure and the **handleTypes** member of the `VkExternalMemoryBufferCreateInfo` structure passed to `vkCreateBuffer`. Further, if `usage1` and `usage2` of type `VkBufferUsageFlags` are such that the bits set in `usage2` are a subset of the bits.
set in `usage1`, and they have the same `flags` and `VkExternalMemoryBufferCreateInfo::handleTypes`, then the bits set in `memoryTypeBits` returned for `usage1` must be a subset of the bits set in `memoryTypeBits` returned for `usage2`, for all values of `flags`.

- The `alignment` member is a power of two.
- The `alignment` member is identical for all `VkBuffer` objects created with the same combination of values for the `usage` and `flags` members in the `VkBufferCreateInfo` structure passed to `vkCreateBuffer`.
- The `alignment` member satisfies the buffer descriptor offset alignment requirements associated with the `VkBuffer`'s `usage`:
  - If `usage` included `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT` or `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`, `alignment` must be an integer multiple of `VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`.
  - If `usage` included `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT`, `alignment` must be an integer multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`.
  - If `usage` included `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT`, `alignment` must be an integer multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`.
- For images created with a color format, the `memoryTypeBits` member is identical for all `VkImage` objects created with the same combination of values for the `tiling` member, the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` bit of the `flags` member, the `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` bit of the `flags` member, `handleTypes` member of `VkExternalMemoryImageCreateInfo`, and the `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` of the `usage` member in the `VkImageCreateInfo` structure passed to `vkCreateImage`.
- For images created with a depth/stencil format, the `memoryTypeBits` member is identical for all `VkImage` objects created with the same combination of values for the `format` member, the `tiling` member, the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` bit of the `flags` member, the `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` bit of the `flags` member, `handleTypes` member of `VkExternalMemoryImageCreateInfo`, and the `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` of the `usage` member in the `VkImageCreateInfo` structure passed to `vkCreateImage`.
- If the memory requirements are for a `VkImage`, the `memoryTypeBits` member must not refer to a `VkMemoryType` with a `propertyFlags` that has the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set if the `image` did not have `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` bit set in the `usage` member of the `VkImageCreateInfo` structure passed to `vkCreateImage`.
- If the memory requirements are for a `VkBuffer`, the `memoryTypeBits` member must not refer to a `VkMemoryType` with a `propertyFlags` that has the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>The implication of this requirement is that lazily allocated memory is disallowed for buffers in all cases.</td>
</tr>
</tbody>
</table>

- The `size` member is identical for all `VkBuffer` objects created with the same combination of creation parameters specified in `VkBufferCreateInfo` and its `pNext` chain.
- The `size` member is identical for all `VkImage` objects created with the same combination of creation parameters specified in `VkImageCreateInfo` and its `pNext` chain.
Note
This, however, does not imply that they interpret the contents of the bound memory identically with each other. That additional guarantee, however, can be explicitly requested using `VK_IMAGE_CREATE_ALIAS_BIT`.

To determine the memory requirements for a buffer resource, call:

```c
// Provided by VK_VERSION_1_1
void vkGetBufferMemoryRequirements2(
    VkDevice device,
    const VkBufferMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetBufferMemoryRequirements2KHR(
    VkDevice device,
    const VkBufferMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `pInfo` is a pointer to a `VkBufferMemoryRequirementsInfo2` structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

**Valid Usage (Implicit)**

- `VUID-vkGetBufferMemoryRequirements2-device-parameter`  
  `device` must be a valid `VkDevice` handle

- `VUID-vkGetBufferMemoryRequirements2-pInfo-parameter`  
  `pInfo` must be a valid pointer to a valid `VkBufferMemoryRequirementsInfo2` structure

- `VUID-vkGetBufferMemoryRequirements2-pMemoryRequirements-parameter`  
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure

The `VkBufferMemoryRequirementsInfo2` structure is defined as:
```c
// Provided by VK_VERSION_1_1
typedef struct VkBufferMemoryRequirementsInfo2 {
    VkStructureType    sType;
    const void*        pNext;
    VkBuffer           buffer;
} VkBufferMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkBufferMemoryRequirementsInfo2 VkBufferMemoryRequirementsInfo2KHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **buffer** is the buffer to query.

### Valid Usage (Implicit)

- VUID-VkBufferMemoryRequirementsInfo2-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_BUFFER_MEMORY_REQUIREMENTS_INFO_2**

- VUID-VkBufferMemoryRequirementsInfo2-pNext-pNext
  
  **pNext** must be **NULL**

- VUID-VkBufferMemoryRequirementsInfo2-buffer-parameter
  
  **buffer** must be a valid **VkBuffer** handle

To determine the memory requirements for an image resource, call:

```c
// Provided by VK_VERSION_1_1
void vkGetImageMemoryRequirements2(
    VkDevice                                    device,
    const VkImageMemoryRequirementsInfo2*       pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetImageMemoryRequirements2KHR(
    VkDevice                                    device,
    const VkImageMemoryRequirementsInfo2*       pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

- **device** is the logical device that owns the image.
• pInfo is a pointer to a VkImageMemoryRequirementsInfo2 structure containing parameters required for the memory requirements query.

• pMemoryRequirements is a pointer to a VkMemoryRequirements2 structure in which the memory requirements of the image object are returned.

Valid Usage (Implicit)

• VUID-vkGetImageMemoryRequirements2-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetImageMemoryRequirements2-pInfo-parameter
pInfo must be a valid pointer to a valid VkImageMemoryRequirementsInfo2 structure

• VUID-vkGetImageMemoryRequirements2-pMemoryRequirements-parameter
pMemoryRequirements must be a valid pointer to a VkMemoryRequirements2 structure

The VkImageMemoryRequirementsInfo2 structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageMemoryRequirementsInfo2 VkImageMemoryRequirementsInfo2KHR;
```

• sType is the type of this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• image is the image to query.
Valid Usage

- VUID-VkImageMemoryRequirementsInfo2-image-01589
  If image was created with a multi-planar format and the VK_IMAGE_CREATE_DISJOINT_BIT flag, there must be a VkImagePlaneMemoryRequirementsInfo included in the pNext chain of the VkImageMemoryRequirementsInfo2 structure.

- VUID-VkImageMemoryRequirementsInfo2-image-02279
  If image was created with VK_IMAGE_CREATE_DISJOINT_BIT and with VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then there must be a VkImagePlaneMemoryRequirementsInfo included in the pNext chain of the VkImageMemoryRequirementsInfo2 structure.

- VUID-VkImageMemoryRequirementsInfo2-image-01590
  If image was not created with the VK_IMAGE_CREATE_DISJOINT_BIT flag, there must not be a VkImagePlaneMemoryRequirementsInfo included in the pNext chain of the VkImageMemoryRequirementsInfo2 structure.

- VUID-VkImageMemoryRequirementsInfo2-image-02280
  If image was created with a single-plane format and with any tiling other than VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then there must not be a VkImagePlaneMemoryRequirementsInfo included in the pNext chain of the VkImageMemoryRequirementsInfo2 structure.

- VUID-VkImageMemoryRequirementsInfo2-image-01897
  If image was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID external memory handle type, then image must be bound to memory.

Valid Usage (Implicit)

- VUID-VkImageMemoryRequirementsInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_MEMORY_REQUIREMENTS_INFO_2

- VUID-VkImageMemoryRequirementsInfo2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkImagePlaneMemoryRequirementsInfo

- VUID-VkImageMemoryRequirementsInfo2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkImageMemoryRequirementsInfo2-image-parameter
  image must be a valid VkImage handle

To determine the memory requirements for a plane of a disjoint image, add a VkImagePlaneMemoryRequirementsInfo structure to the pNext chain of the VkImageMemoryRequirementsInfo2 structure.

The VkImagePlaneMemoryRequirementsInfo structure is defined as:
or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkImagePlaneMemoryRequirementsInfo VkImagePlaneMemoryRequirementsInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `planeAspect` is the aspect corresponding to the image plane to query.

### Valid Usage

- **VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-02281**
  If the image's tiling is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, then `planeAspect` must be a single valid format plane for the image (that is, for a two-plane image `planeAspect` must be `VK_IMAGE_ASPECT_PLANE_0_BIT` or `VK_IMAGE_ASPECT_PLANE_1_BIT`, and for a three-plane image `planeAspect` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`).

- **VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-02282**
  If the image's tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `planeAspect` must be a single valid memory plane for the image (that is, `aspectMask` must specify a plane index that is less than the `VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount` associated with the image's format and `VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier`).

### Valid Usage (Implicit)

- **VUID-VkImagePlaneMemoryRequirementsInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_PLANE_MEMORY_REQUIREMENTS_INFO`

- **VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-parameter**
  `planeAspect` must be a valid `VkImageAspectFlagBits` value

The `VkMemoryRequirements2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImagePlaneMemoryRequirementsInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkImageAspectFlagBits    planeAspect;
} VkImagePlaneMemoryRequirementsInfo;
```
or the equivalent

```c
typedef struct VkMemoryRequirements2 {
  VkStructureType sType;
  void* pNext;
  VkMemoryRequirements memoryRequirements;
} VkMemoryRequirements2;
```

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **memoryRequirements** is a **VkMemoryRequirements** structure describing the memory requirements of the resource.

### Valid Usage (Implicit)

- VUID-VkMemoryRequirements2-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_MEMORY_REQUIREMENTS_2**

- VUID-VkMemoryRequirements2-pNext-pNext

  **pNext** must be **NULL** or a pointer to a valid instance of **VkMemoryDedicatedRequirements**

- VUID-VkMemoryRequirements2-sType-unique

  The **sType** value of each struct in the **pNext** chain must be unique

To determine the dedicated allocation requirements of a buffer or image resource, add a **VkMemoryDedicatedRequirements** structure to the **pNext** chain of the **VkMemoryRequirements2** structure passed as the **pMemoryRequirements** parameter of **vkGetBufferMemoryRequirements2** or **vkGetImageMemoryRequirements2**.

The **VkMemoryDedicatedRequirements** structure is defined as:

```c
typedef struct VkMemoryDedicatedRequirements {
  VkStructureType sType;
  void* pNext;
  VkBool32 prefersDedicatedAllocation;
  VkBool32 requiresDedicatedAllocation;
} VkMemoryDedicatedRequirements;
```

or the equivalent

```c
typedef VkMemoryRequirements2 VkMemoryRequirements2KHR;
```
typedef VkMemoryDedicatedRequirements VkMemoryDedicatedRequirementsKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **prefersDedicatedAllocation** specifies that the implementation would prefer a dedicated allocation for this resource. The application is still free to suballocate the resource but it may get better performance if a dedicated allocation is used.
- **requiresDedicatedAllocation** specifies that a dedicated allocation is required for this resource.

When the implementation sets **requiresDedicatedAllocation** to **VK_TRUE**, it must also set **prefersDedicatedAllocation** to **VK_TRUE**.

If the **VkMemoryDedicatedRequirements** structure is included in the **pNext** chain of the **VkMemoryRequirements2** structure passed as the **pMemoryRequirements** parameter of a **vkGetBufferMemoryRequirements2** call, **requiresDedicatedAllocation** may be **VK_TRUE** under one of the following conditions:

- The **pNext** chain of **VkBufferCreateInfo** for the call to **vkCreateBuffer** used to create the buffer being queried included a **VkExternalMemoryBufferCreateInfo** structure, and any of the handle types specified in **VkExternalMemoryBufferCreateInfo::handleTypes** requires dedicated allocation, as reported by **vkGetPhysicalDeviceExternalBufferProperties** in **VkExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures**, the **requiresDedicatedAllocation** field will be set to **VK_TRUE**.

In all other cases, **requiresDedicatedAllocation** must be set to **VK_FALSE** by the implementation whenever a **VkMemoryDedicatedRequirements** structure is included in the **pNext** chain of the **VkMemoryRequirements2** structure passed to a call to **vkGetBufferMemoryRequirements2**.

If the **VkMemoryDedicatedRequirements** structure is included in the **pNext** chain of the **VkMemoryRequirements2** structure passed as the **pMemoryRequirements** parameter of a **vkGetBufferMemoryRequirements2** call and **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** was set in **VkBufferCreateInfo::flags** when buffer was created then the implementation must set both **prefersDedicatedAllocation** and **requiresDedicatedAllocation** to **VK_FALSE**.

If the **VkMemoryDedicatedRequirements** structure is included in the **pNext** chain of the **VkMemoryRequirements2** structure passed as the **pMemoryRequirements** parameter of a **vkGetImageMemoryRequirements2** call, **requiresDedicatedAllocation** may be **VK_TRUE** under one of the following conditions:

- The **pNext** chain of **VkImageCreateInfo** for the call to **vkCreateImage** used to create the image being queried included a **VkExternalMemoryImageCreateInfo** structure, and any of the handle types specified in **VkExternalMemoryImageCreateInfo::handleTypes** requires dedicated allocation, as reported by **vkGetPhysicalDeviceImageFormatProperties2** in **VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures**, the **requiresDedicatedAllocation** field will be set to **VK_TRUE**.
In all other cases, `requiresDedicatedAllocation` must be set to `VK_FALSE` by the implementation whenever a `VkMemoryDedicatedRequirements` structure is included in the `pNext` chain of the `VkMemoryRequirements2` structure passed to a call to `vkGetImageMemoryRequirements2`.

If the `VkMemoryDedicatedRequirements` structure is included in the `pNext` chain of the `VkMemoryRequirements2` structure passed as the `pMemoryRequirements` parameter of a `vkGetImageMemoryRequirements2` call and `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` was set in `VkImageCreateInfo::flags` when image was created then the implementation must set both `prefersDedicatedAllocation` and `requiresDedicatedAllocation` to `VK_FALSE`.

Valid Usage (Implicit)

- `VUID-VkMemoryDedicatedRequirements-sType-sType`
  - `sType` must be `VK_STRUCTURE_TYPE_MEMORY_DEDICATED_REQUIREMENTS`

To attach memory to a buffer object, call:

```
// Provided by VK_VERSION_1_0
VkResult vkBindBufferMemory(
    VkDevice device,         // Logical device that owns the buffer and memory.
    VkBuffer buffer,        // Buffer to be attached to memory.
    VkDeviceMemory memory,  // Memory to attach, described by a VkDeviceMemory.
    VkDeviceSize memoryOffset);  // Start offset of the memory region to bind to the buffer.
```

- `device` is the logical device that owns the buffer and memory.
- `buffer` is the buffer to be attached to memory.
- `memory` is a `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the buffer. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified buffer.

`vkBindBufferMemory` is equivalent to passing the same parameters through `VkBindBufferMemoryInfo` to `vkBindBufferMemory2`. 
Valid Usage

- **VUID-vkBindBufferMemory-buffer-01029**
  
  *buffer must not already be backed by a memory object*

- **VUID-vkBindBufferMemory-buffer-01030**
  
  *buffer must not have been created with any sparse memory binding flags*

- **VUID-vkBindBufferMemory-memoryOffset-01031**
  
  *memoryOffset must be less than the size of memory*

- **VUID-vkBindBufferMemory-memory-01035**
  
  *memory must have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer*

- **VUID-vkBindBufferMemory-memoryOffset-01036**
  
  *memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer*

- **VUID-vkBindBufferMemory-size-01037**
  
  *The size member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer must be less than or equal to the size of memory minus memoryOffset*

- **VUID-vkBindBufferMemory-buffer-01444**
  
  *If buffer requires a dedicated allocation (as reported by vkGetBufferMemoryRequirements2 in VkMemoryDedicatedRequirements::requiresDedicatedAllocation for buffer), memory must have been created with VkDedicatedAllocationAllocateInfo::buffer equal to buffer*

- **VUID-vkBindBufferMemory-memory-01508**
  
  *If the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::buffer was not VK_NULL_HANDLE, then buffer must equal VkMemoryDedicatedAllocateInfo::buffer, and memoryOffset must be zero*

- **VUID-vkBindBufferMemory-None-01898**
  
  *If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit set, the buffer must be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT*

- **VUID-vkBindBufferMemory-None-01899**
  
  *If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit not set, the buffer must not be bound to a memory object created with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT*

- **VUID-vkBindBufferMemory-buffer-01038**
  
  *If buffer was created with VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation equal to VK_TRUE, memory must have been created with VkDedicatedAllocationMemoryAllocateInfoNV::buffer equal to a buffer handle created with identical creation parameters to buffer and memoryOffset must be zero*
If the value of `VkExportMemoryAllocateInfo::handleTypes` used to allocate `memory` is not 0, it must include at least one of the handles set in `VkExternalMemoryBufferCreateInfo::handleTypes` when `buffer` was created.

If `memory` was created by a memory import operation, that is not `VkImportAndroidHardwareBufferInfoANDROID` with a non-NULL `buffer` value, the external handle type of the imported memory must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` when `buffer` was created.

If `memory` was created with the `VkImportAndroidHardwareBufferInfoANDROID` memory import operation with a non-NULL `buffer` value, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID` must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` when `buffer` was created.

If the `VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddress` feature is enabled and `buffer` was created with the `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` bit set, `memory` must have been allocated with the `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT` bit set.

Valid Usage (Implicit)

- **device** must be a valid `VkDevice` handle
- **buffer** must be a valid `VkBuffer` handle
- **memory** must be a valid `VkDeviceMemory` handle
- **buffer** must have been created, allocated, or retrieved from **device**
- **memory** must have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **buffer** must be externally synchronized
### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`

To attach memory to buffer objects for one or more buffers at a time, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkBindBufferMemory2(
    VkDevice device,  // Logical device that owns the buffers and memory.
    uint32_t bindInfoCount, // Number of elements in pBindInfos.
    const VkBindBufferMemoryInfo* pBindInfos); // Pointer to array of bindInfoCount VkBindBufferMemoryInfo structures describing buffers and memory to bind.
```

or the equivalent command

```c
// Provided by VK_KHR_bind_memory2
VkResult vkBindBufferMemory2KHR(
    VkDevice device,  // Logical device that owns the buffers and memory.
    uint32_t bindInfoCount, // Number of elements in pBindInfos.
    const VkBindBufferMemoryInfo* pBindInfos); // Pointer to array of bindInfoCount VkBindBufferMemoryInfo structures describing buffers and memory to bind.
```

- `device` is the logical device that owns the buffers and memory.
- `bindInfoCount` is the number of elements in `pBindInfos`.
- `pBindInfos` is a pointer to an array of `VkBindBufferMemoryInfo` structures describing buffers and memory to bind.

On some implementations, it **may** be more efficient to batch memory bindings into a single command.
Valid Usage (Implicit)

- **VUID-vkBindBufferMemory2-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkBindBufferMemory2-pBindInfos-parameter**
  
  `pBindInfos` must be a valid pointer to an array of `bindInfoCount` valid `VkBindBufferMemoryInfo` structures

- **VUID-vkBindBufferMemory2-bindInfoCount-arraylength**
  
  `bindInfoCount` must be greater than 0

Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR**

`VkBindBufferMemoryInfo` contains members corresponding to the parameters of `vkBindBufferMemory`.

The `VkBindBufferMemoryInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkBuffer           buffer;
    VkDeviceMemory     memory;
    VkDeviceSize       memoryOffset;
} VkBindBufferMemoryInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2
typedef VkBindBufferMemoryInfo VkBindBufferMemoryInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is the buffer to be attached to memory.
• **memory** is a *VkDeviceMemory* object describing the device memory to attach.

• **memoryOffset** is the start offset of the region of **memory** which is to be bound to the buffer. The number of bytes returned in the *VkMemoryRequirements::size* member in **memory**, starting from **memoryOffset** bytes, will be bound to the specified buffer.
Valid Usage

- VUID-VkBindBufferMemoryInfo-buffer-01029
  buffer must not already be backed by a memory object

- VUID-VkBindBufferMemoryInfo-buffer-01030
  buffer must not have been created with any sparse memory binding flags

- VUID-VkBindBufferMemoryInfo-memoryOffset-01031
  memoryOffset must be less than the size of memory

- VUID-VkBindBufferMemoryInfo-memory-01035
  memory must have been allocated using one of the memory types allowed in the
  memoryTypeBits member of the VkMemoryRequirements structure returned from a call to
  vkGetBufferMemoryRequirements with buffer

- VUID-VkBindBufferMemoryInfo-memoryOffset-01036
  memoryOffset must be an integer multiple of the alignment member of the
  VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer

- VUID-VkBindBufferMemoryInfo-size-01037
  The size member of the VkMemoryRequirements structure returned from a call to
  vkGetBufferMemoryRequirements with buffer must be less than or equal to the size of memory
  minus memoryOffset

- VUID-VkBindBufferMemoryInfo-buffer-01444
  If buffer requires a dedicated allocation (as reported by
  vkGetBufferMemoryRequirements2 in VkMemoryDedicatedRequirements
  ::requiresDedicatedAllocation for buffer), memory must have been created with
  VkMemoryDedicatedAllocateInfo::buffer equal to buffer

- VUID-VkBindBufferMemoryInfo-memory-01508
  If the VkMemoryAllocateInfo provided when memory was allocated included a
  VkMemoryDedicatedAllocateInfo structure in its pNext chain, and
  VkMemoryDedicatedAllocateInfo::buffer was not VK_NULL_HANDLE, then buffer must
equal VkMemoryDedicatedAllocateInfo::buffer, and memoryOffset must be zero

- VUID-VkBindBufferMemoryInfo-None-01898
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit set, the buffer must
  be bound to a memory object allocated with a memory type that reports
  VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-VkBindBufferMemoryInfo-None-01899
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit not set, the buffer must
  not be bound to a memory object created with a memory type that reports
  VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-VkBindBufferMemoryInfo-buffer-01038
  If buffer was created with VkDedicatedAllocationBufferCreateInfoNV
  ::dedicatedAllocation equal to VK_TRUE, memory must have been created with
  VkDedicatedAllocationMemoryAllocateInfoNV::buffer equal to a buffer handle created
  with identical creation parameters to buffer and memoryOffset must be zero
If the value of `VkExportMemoryAllocateInfo::handleTypes` used to allocate `memory` is not 0, it must include at least one of the handles set in `VkExternalMemoryBufferCreateInfo::handleTypes` when `buffer` was created.

If `memory` was created by a memory import operation, that is not `VkImportAndroidHardwareBufferInfoANDROID` with a non-NULL `buffer` value, the external handle type of the imported memory must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` when `buffer` was created.

If `memory` was created with the `VkImportAndroidHardwareBufferInfoANDROID` memory import operation with a non-NULL `buffer` value, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID` must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` when `buffer` was created.

If the `pNext` chain includes a `VkBindBufferMemoryDeviceGroupInfo` structure, all instances of `memory` specified by `VkBindBufferMemoryDeviceGroupInfo::pDeviceIndices` must have been allocated.

### Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_INFO`
- `pNext` must be `NULL` or a pointer to a valid instance of `VkBindBufferMemoryDeviceGroupInfo`
- The `sType` value of each struct in the `pNext` chain must be unique
- `buffer` must be a valid `VkBuffer` handle
- `memory` must be a valid `VkDeviceMemory` handle
- Both of `buffer`, and `memory` must have been created, allocated, or retrieved from the same `VkDevice`
**Valid Usage**

- VUID-VkBindBufferMemoryDeviceGroupInfo-deviceIndexCount-01606
  - `deviceIndexCount` must either be zero or equal to the number of physical devices in the logical device

- VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-01607
  - All elements of `pDeviceIndices` must be valid device indices
Valid Usage (Implicit)

- VUID-VkBindBufferMemoryDeviceGroupInfo-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_DEVICE_GROUP_INFO`

- VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-parameter
  
  If `deviceIndexCount` is not 0, `pDeviceIndices` **must** be a valid pointer to an array of `deviceIndexCount` `uint32_t` values

To attach memory to a `VkImage` object created without the `VK_IMAGE_CREATE_DISJOINT_BIT` set, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBindImageMemory(
    VkDevice                                    device, 
    VkImage                                     image, 
    VkDeviceMemory                              memory, 
    VkDeviceSize                                memoryOffset);
```

- `device` is the logical device that owns the image and memory.
- `image` is the image.
- `memory` is the `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the image. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified image.

`vkBindImageMemory` is equivalent to passing the same parameters through `VkBindImageMemoryInfo` to `vkBindImageMemory2`. 
Valid Usage

- VUID-vkBindImageMemory-image-01044
  image must not already be backed by a memory object

- VUID-vkBindImageMemory-image-01045
  image must not have been created with any sparse memory binding flags

- VUID-vkBindImageMemory-memoryOffset-01046
  memoryOffset must be less than the size of memory

- VUID-vkBindImageMemory-image-01445
  If image requires a dedicated allocation (as reported by 
vkGetImageMemoryRequirements2 in VkMemoryDedicatedRequirements
  ::requiresDedicatedAllocation for image), memory must have been created with
  VkMemoryDedicatedAllocateInfo::image equal to image

- VUID-vkBindImageMemory-memory-02628
  If the dedicated allocation image aliasing feature is not enabled, and the
  VkMemoryAllocateInfo provided when memory was allocated included a
  VkMemoryDedicatedAllocateInfo structure in its pNext chain, and
  VkMemoryDedicatedAllocateInfo::image was not VK_NULL_HANDLE, then image must
  equal VkMemoryDedicatedAllocateInfo::image and memoryOffset must be zero

- VUID-vkBindImageMemory-memory-02629
  If the dedicated allocation image aliasing feature is enabled, and the
  VkMemoryAllocateInfo provided when memory was allocated included a
  VkMemoryDedicatedAllocateInfo structure in its pNext chain, and
  VkMemoryDedicatedAllocateInfo::image was not VK_NULL_HANDLE, then memoryOffset must be zero, and image must be either equal to
  VkMemoryDedicatedAllocateInfo::image or an image that was created using the same
  parameters in VkImageCreateInfo, with the exception that extent and arrayLayers may
  differ subject to the following restrictions: every dimension in the extent parameter of the
  image being bound must be equal to or smaller than the original image for which the
  allocation was created; and the arrayLayers parameter of the image being bound must
  be equal to or smaller than the original image for which the allocation was created

- VUID-vkBindImageMemory-None-01901
  If image was created with the VK_IMAGE_CREATE_PROTECTED_BIT bit set, the image must be
  bound to a memory object allocated with a memory type that reports
  VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-vkBindImageMemory-None-01902
  If image was created with the VK_IMAGE_CREATE_PROTECTED_BIT bit not set, the image must not be bound to a memory object created with a memory type that reports
  VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-vkBindImageMemory-image-01050
  If image was created with VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation
equal to VK_TRUE, memory must have been created with
  VkDedicatedAllocationMemoryAllocateInfoNV::image equal to an image handle created
  with identical creation parameters to image and memoryOffset must be zero

- VUID-vkBindImageMemory-memory-02728

Chapter 12. Resource Creation | 863
If the value of `VkExportMemoryAllocateInfo::handleTypes` used to allocate memory is not 0, it must include at least one of the handles set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created.

- **VUID-vkBindImageMemory-memory-02989**
  If memory was created by a memory import operation, that is not `VkImportAndroidHardwareBufferInfoANDROID` with a non-NULL buffer value, the external handle type of the imported memory must also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created.

- **VUID-vkBindImageMemory-memory-02990**
  If memory was created with the `VkImportAndroidHardwareBufferInfoANDROID` memory import operation with a non-NULL buffer value, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID` must also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created.

- **VUID-vkBindImageMemory-image-01608**
  `image` must not have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` set.

- **VUID-vkBindImageMemory-memory-01047**
  memory must have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with `image`.

- **VUID-vkBindImageMemory-memoryOffset-01048**
  `memoryOffset` must be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with `image`.

- **VUID-vkBindImageMemory-size-01049**
  The difference of the size of `memory` and `memoryOffset` must be greater than or equal to the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with the same `image`.

### Valid Usage (Implicit)

- **VUID-vkBindImageMemory-device-parameter**
  `device` must be a valid `VkDevice` handle.

- **VUID-vkBindImageMemory-image-parameter**
  `image` must be a valid `VkImage` handle.

- **VUID-vkBindImageMemory-memory-parameter**
  `memory` must be a valid `VkDeviceMemory` handle.

- **VUID-vkBindImageMemory-image-parent**
  `image` must have been created, allocated, or retrieved from `device`.

- **VUID-vkBindImageMemory-memory-parent**
  `memory` must have been created, allocated, or retrieved from `device`.
Host Synchronization

- Host access to image must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To attach memory to image objects for one or more images at a time, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkBindImageMemory2(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindImageMemoryInfo* pBindInfos);
```

or the equivalent command

```c
// Provided by VK_KHR_bind_memory2
VkResult vkBindImageMemory2KHR(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindImageMemoryInfo* pBindInfos);
```

- `device` is the logical device that owns the images and memory.
- `bindInfoCount` is the number of elements in `pBindInfos`.
- `pBindInfos` is a pointer to an array of `VkBindImageMemoryInfo` structures, describing images and memory to bind.

On some implementations, it may be more efficient to batch memory bindings into a single command.
Valid Usage

- VUID-vkBindImageMemory2-pBindInfos-02858
  If any VkBindImageMemoryInfo::image was created with VK_IMAGE_CREATE_DISJOINT_BIT then all planes of VkBindImageMemoryInfo::image must be bound individually in separate pBindInfos

- VUID-vkBindImageMemory2-pBindInfos-04006
  pBindInfos must not refer to the same image subresource more than once

Valid Usage (Implicit)

- VUID-vkBindImageMemory2-device-parameter
  device must be a valid VkDevice handle

- VUID-vkBindImageMemory2-pBindInfos-parameter
  pBindInfos must be a valid pointer to an array of bindInfoCount valid VkBindImageMemoryInfo structures

- VUID-vkBindImageMemory2-bindInfoCount-arraylength
  bindInfoCount must be greater than 0

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

VkBindImageMemoryInfo contains members corresponding to the parameters of vkBindImageMemory.

The VkBindImageMemoryInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryInfo {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
} VkBindImageMemoryInfo;
```
or the equivalent

```c
// Provided by VK_KHR_bind_memory2
typedef VkBindImageMemoryInfo VkBindImageMemoryInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **image** is the image to be attached to memory.
- **memory** is a `VkDeviceMemory` object describing the device memory to attach.
- **memoryOffset** is the start offset of the region of `memory` which is to be bound to the image. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified image.
Valid Usage

- VUID-VkBindImageMemoryInfo-image-01044
  image must not already be backed by a memory object

- VUID-VkBindImageMemoryInfo-image-01045
  image must not have been created with any sparse memory binding flags

- VUID-VkBindImageMemoryInfo-memoryOffset-01046
  memoryOffset must be less than the size of memory

- VUID-VkBindImageMemoryInfo-image-01445
  If image requires a dedicated allocation (as reported by vkGetImageMemoryRequirements2 in VkMemoryDedicatedRequirements::requiresDedicatedAllocation for image), memory must have been created with VkMemoryDedicatedAllocateInfo::image equal to image

- VUID-VkBindImageMemoryInfo-memory-02628
  If the dedicated allocation image aliasing feature is not enabled, and the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::image was not VK_NULL_HANDLE, then image must equal VkMemoryDedicatedAllocateInfo::image and memoryOffset must be zero

- VUID-VkBindImageMemoryInfo-memory-02629
  If the dedicated allocation image aliasing feature is enabled, and the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::image was not VK_NULL_HANDLE, then memoryOffset must be zero, and image must be either equal to VkMemoryDedicatedAllocateInfo::image or an image that was created using the same parameters in VkImageCreateInfo, with the exception that extent and arrayLayers may differ subject to the following restrictions: every dimension in the extent parameter of the image being bound must be equal to or smaller than the original image for which the allocation was created; and the arrayLayers parameter of the image being bound must be equal to or smaller than the original image for which the allocation was created

- VUID-VkBindImageMemoryInfo-None-01901
  If image was created with the VK_IMAGE_CREATE_PROTECTED_BIT bit set, the image must be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-VkBindImageMemoryInfo-None-01902
  If image was created with the VK_IMAGE_CREATE_PROTECTED_BIT bit not set, the image must not be bound to a memory object created with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-VkBindImageMemoryInfo-image-01050
  If image was created with VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation equal to VK_TRUE, memory must have been created with VkDedicatedAllocationMemoryAllocateInfoNV::image equal to an image handle created with identical creation parameters to image and memoryOffset must be zero

- VUID-VkBindImageMemoryInfo-memory-02728
If the value of \texttt{VkExportMemoryAllocateInfo::handleTypes} used to allocate \texttt{memory} is not 0, it \textbf{must} include at least one of the handles set in \texttt{VkExternalMemoryImageCreateInfo::handleTypes} when \texttt{image} was created.

- \textbf{VUID-VkBindImageMemoryInfo-memory-02989} If \texttt{memory} was created by a memory import operation, that is not \texttt{VkImportAndroidHardwareBufferInfoANDROID} with a non-NULL \texttt{buffer} value, the external handle type of the imported memory \textbf{must} also have been set in \texttt{VkExternalMemoryImageCreateInfo::handleTypes} when \texttt{image} was created.

- \textbf{VUID-VkBindImageMemoryInfo-memory-02990} If \texttt{memory} was created with the \texttt{VkImportAndroidHardwareBufferInfoANDROID} memory import operation with a non-NULL \texttt{buffer} value, \texttt{VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID} \textbf{must} also have been set in \texttt{VkExternalMemoryImageCreateInfo::handleTypes} when \texttt{image} was created.

- \textbf{VUID-VkBindImageMemoryInfo-pNext-01615} If the \texttt{pNext} chain does not include a \texttt{VkBindImagePlaneMemoryInfo} structure, \texttt{memory} \textbf{must} have been allocated using one of the memory types allowed in the \texttt{memoryTypeBits} member of the \texttt{VkMemoryRequirements} structure returned from a call to \texttt{vkGetImageMemoryRequirements2} with \texttt{image}.

- \textbf{VUID-VkBindImageMemoryInfo-pNext-01616} If the \texttt{pNext} chain does not include a \texttt{VkBindImagePlaneMemoryInfo} structure, \texttt{memoryOffset} \textbf{must} be an integer multiple of the \texttt{alignment} member of the \texttt{VkMemoryRequirements} structure returned from a call to \texttt{vkGetImageMemoryRequirements2} with the same \texttt{image}.

- \textbf{VUID-VkBindImageMemoryInfo-pNext-01617} If the \texttt{pNext} chain does not include a \texttt{VkBindImagePlaneMemoryInfo} structure, the difference of the size of \texttt{memory} and \texttt{memoryOffset} \textbf{must} be greater than or equal to the \texttt{size} member of the \texttt{VkMemoryRequirements} structure returned from a call to \texttt{vkGetImageMemoryRequirements2} with the same \texttt{image}.

- \textbf{VUID-VkBindImageMemoryInfo-pNext-01618} If the \texttt{pNext} chain includes a \texttt{VkBindImagePlaneMemoryInfo} structure, \texttt{image} \textbf{must} have been created with the \texttt{VK_IMAGE_CREATE_DISJOINT_BIT} bit set.

- \textbf{VUID-VkBindImageMemoryInfo-pNext-01619} If the \texttt{pNext} chain includes a \texttt{VkBindImagePlaneMemoryInfo} structure, \texttt{memory} \textbf{must} have been allocated using one of the memory types allowed in the \texttt{memoryTypeBits} member of the \texttt{VkMemoryRequirements} structure returned from a call to \texttt{vkGetImageMemoryRequirements2} with \texttt{image} and where \texttt{VkBindImagePlaneMemoryInfo::planeAspect} corresponds to the \texttt{VkImagePlaneMemoryRequirementsInfo::planeAspect} in the \texttt{VkImageMemoryRequirementsInfo2} structure's \texttt{pNext} chain.

- \textbf{VUID-VkBindImageMemoryInfo-pNext-01620} If the \texttt{pNext} chain includes a \texttt{VkBindImagePlaneMemoryInfo} structure, \texttt{memoryOffset} \textbf{must} be an integer multiple of the \texttt{alignment} member of the \texttt{VkMemoryRequirements} structure returned from a call to \texttt{vkGetImageMemoryRequirements2} with \texttt{image} and where \texttt{VkBindImagePlaneMemoryInfo::planeAspect} corresponds to the \texttt{VkImagePlaneMemoryRequirementsInfo::planeAspect} in the
If the `pNext` chain includes a `VkBindImagePlaneMemoryInfo` structure, the difference of the size of `memory` and `memoryOffset` must be greater than or equal to the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with the same `image` and where `VkBindImagePlaneMemoryInfo::planeAspect` corresponds to the `VkImagePlaneMemoryRequirementsInfo::planeAspect` in the `VkImageMemoryRequirementsInfo2` structure's `pNext` chain.

If the `pNext` chain includes a `VkBindImageMemoryDeviceGroupInfo` structure, all instances of `memory` specified by `VkBindImageMemoryDeviceGroupInfo::pDeviceIndices` must have been allocated.

If the `pNext` chain includes a `VkBindImageMemoryDeviceGroupInfo` structure, and `VkBindImageMemoryDeviceGroupInfo::splitInstanceBindRegionCount` is not zero, then `image` must have been created with the `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` bit set.

If the `pNext` chain includes a `VkBindImageMemoryDeviceGroupInfo` structure, all elements of `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions` must be valid rectangles contained within the dimensions of `image`.

If the `pNext` chain includes a `VkBindImageMemoryDeviceGroupInfo` structure, the union of the areas of all elements of `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions` that correspond to the same instance of `image` must cover the entire image.

If `image` was created with a valid swapchain handle in `VkImageSwapchainCreateInfoKHR::swapchain`, then the `pNext` chain must include a `VkBindImageMemorySwapchainInfoKHR` structure containing the same swapchain handle.

If the `pNext` chain includes a `VkBindImageMemorySwapchainInfoKHR` structure, `memory` must be `VK_NULL_HANDLE`.

If the `pNext` chain does not include a `VkBindImageMemorySwapchainInfoKHR` structure, `memory` must be a valid `VkDeviceMemory` handle.
Valid Usage (Implicit)

- **VUID-VkBindImageMemoryInfo-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_INFO`

- **VUID-VkBindImageMemoryInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkBindImageMemoryDeviceGroupInfo`, `VkBindImageMemorySwapchainInfoKHR`, or `VkBindImagePlaneMemoryInfo`

- **VUID-VkBindImageMemoryInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkBindImageMemoryInfo-image-parameter**
  
  `image` must be a valid `VkImage` handle

- **VUID-VkBindImageMemoryInfo-commonparent**
  
  Both of `image`, and `memory` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

// Provided by VK_VERSION_1_1

typedef struct VkBindImageMemoryDeviceGroupInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           deviceIndexCount;
    const uint32_t*    pDeviceIndices;
    uint32_t           splitInstanceBindRegionCount;
    const VkRect2D*    pSplitInstanceBindRegions;
} VkBindImageMemoryDeviceGroupInfo;

or the equivalent

// Provided by VK_KHR_device_group with VK_KHR_bind_memory2

typedef VkBindImageMemoryDeviceGroupInfo VkBindImageMemoryDeviceGroupInfoKHR;

If the `pNext` list of `VkBindImageMemoryInfo` includes a `VkBindImageMemoryDeviceGroupInfo` structure, then that structure determines how memory is bound to images across multiple devices in a device group.

The `VkBindImageMemoryDeviceGroupInfo` structure is defined as:

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **deviceIndexCount** is the number of elements in `pDeviceIndices`.
- **pDeviceIndices** is a pointer to an array of device indices.
- **splitInstanceBindRegionCount** is the number of elements in `pSplitInstanceBindRegions`. 
• pSplitInstanceBindRegions is a pointer to an array of VkRect2D structures describing which regions of the image are attached to each instance of memory.

If deviceIndexCount is greater than zero, then on device index i image is attached to the instance of the memory on the physical device with device index pDeviceIndices[i].

Let N be the number of physical devices in the logical device. If splitInstanceBindRegionCount is greater than zero, then pSplitInstanceBindRegions is an array of $N^2$ rectangles, where the image region specified by the rectangle at element $i*N+j$ in resource instance i is bound to the memory instance j. The blocks of the memory that are bound to each sparse image block region use an offset in memory, relative to memoryOffset, computed as if the whole image were being bound to a contiguous range of memory. In other words, horizontally adjacent image blocks use consecutive blocks of memory, vertically adjacent image blocks are separated by the number of bytes per block multiplied by the width in blocks of image, and the block at (0,0) corresponds to memory starting at memoryOffset.

If splitInstanceBindRegionCount and deviceIndexCount are zero and the memory comes from a memory heap with the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if pDeviceIndices contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of the memory.

If splitInstanceBindRegionCount and deviceIndexCount are zero and the memory comes from a memory heap without the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if pDeviceIndices contains an array of zeros. In other words, by default each physical device attaches to instance zero.
Valid Usage

- VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01633
  At least one of `deviceIndexCount` and `splitInstanceBindRegionCount` **must** be zero.

- VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01634
  `deviceIndexCount` **must** either be zero or equal to the number of physical devices in the logical device.

- VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-01635
  All elements of `pDeviceIndices` **must** be valid device indices.

- VUID-VkBindImageMemoryDeviceGroupInfo-splitInstanceBindRegionCount-01636
  `splitInstanceBindRegionCount` **must** either be zero or equal to the number of physical devices in the logical device squared.

- VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-01637
  Elements of `pSplitInstanceBindRegions` that correspond to the same instance of an image **must** not overlap.

- VUID-VkBindImageMemoryDeviceGroupInfo-offset-01638
  The `offset.x` member of any element of `pSplitInstanceBindRegions` **must** be a multiple of the sparse image block width (`VkSparseImageFormatProperties::imageGranularity.width`) of all non-metadata aspects of the image.

- VUID-VkBindImageMemoryDeviceGroupInfo-offset-01639
  The `offset.y` member of any element of `pSplitInstanceBindRegions` **must** be a multiple of the sparse image block height (`VkSparseImageFormatProperties::imageGranularity.height`) of all non-metadata aspects of the image.

- VUID-VkBindImageMemoryDeviceGroupInfo-extent-01640
  The `extent.width` member of any element of `pSplitInstanceBindRegions` **must** either be a multiple of the sparse image block width of all non-metadata aspects of the image, or else `extent.width + offset.x` **must** equal the width of the image subresource.

- VUID-VkBindImageMemoryDeviceGroupInfo-extent-01641
  The `extent.height` member of any element of `pSplitInstanceBindRegions` **must** either be a multiple of the sparse image block height of all non-metadata aspects of the image, or else `extent.height + offset.y` **must** equal the width of the image subresource.
Valid Usage (Implicit)

- VUID-VkBindImageMemoryDeviceGroupInfo-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_DEVICE_GROUP_INFO

- VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-parameter
  
  If deviceIndexCount is not 0, pDeviceIndices must be a valid pointer to an array of deviceIndexCount uint32_t values

- VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-parameter
  
  If splitInstanceBindRegionCount is not 0, pSplitInstanceBindRegions must be a valid pointer to an array of splitInstanceBindRegionCount VkRect2D structures

If the pNext chain of VkBindImageMemoryInfo includes a VkBindImageMemorySwapchainInfoKHR structure, then that structure includes a swapchain handle and image index indicating that the image will be bound to memory from that swapchain.

The VkBindImageMemorySwapchainInfoKHR structure is defined as:

```c
// Provided by VK_KHR_swapchain with VK_VERSION_1_1, VK_KHR_device_group with
// VK_KHR_swapchain
typedef struct VkBindImageMemorySwapchainInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSwapchainKHR     swapchain;
    uint32_t           imageIndex;
} VkBindImageMemorySwapchainInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- swapchain is VK_NULL_HANDLE or a swapchain handle.
- imageIndex is an image index within swapchain.

If swapchain is not NULL, the swapchain and imageIndex are used to determine the memory that the image is bound to, instead of memory and memoryOffset.

Memory can be bound to a swapchain and use the pDeviceIndices or pSplitInstanceBindRegions members of VkBindImageMemoryDeviceGroupInfo.

Valid Usage

- VUID-VkBindImageMemorySwapchainInfoKHR-imageIndex-01644
  
  imageIndex must be less than the number of images in swapchain
Valid Usage (Implicit)

- VUID-VkBindImageMemorySwapchainInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR

- VUID-VkBindImageMemorySwapchainInfoKHR-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

Host Synchronization

- Host access to swapchain must be externally synchronized

In order to bind planes of a disjoint image, add a VkBindImagePlaneMemoryInfo structure to the pNext chain of VkBindImageMemoryInfo.

The VkBindImagePlaneMemoryInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImagePlaneMemoryInfo {
    VkStructureType         sType;
    const void*              pNext;
    VkImageAspectFlagBits    planeAspect;
} VkBindImagePlaneMemoryInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_yccbcr_conversion
typedef VkBindImagePlaneMemoryInfo VkBindImagePlaneMemoryInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- planeAspect is the aspect of the disjoint image plane to bind.
Valid Usage

- **VUID-VkBindImagePlaneMemoryInfo-planeAspect-02283**
  If the image’s tiling is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, then planeAspect must be a single valid format plane for the image (that is, for a two-plane image planeAspect must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT, and for a three-plane image planeAspect must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT or VK_IMAGE_ASPECT_PLANE_2_BIT).

- **VUID-VkBindImagePlaneMemoryInfo-planeAspect-02284**
  If the image’s tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then planeAspect must be a single valid memory plane for the image (that is, aspectMask must specify a plane index that is less than the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with the image’s format and VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier).

Valid Usage (Implicit)

- **VUID-VkBindImagePlaneMemoryInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_BIND_IMAGE_PLANE_MEMORY_INFO

- **VUID-VkBindImagePlaneMemoryInfo-planeAspect-parameter**
  planeAspect must be a valid VkImageAspectFlagBits value

Buffer-Image Granularity

There is an implementation-dependent limit, bufferImageGranularity, which specifies a page-like granularity at which linear and non-linear resources must be placed in adjacent memory locations to avoid aliasing. Two resources which do not satisfy this granularity requirement are said to alias. bufferImageGranularity is specified in bytes, and must be a power of two. Implementations which do not impose a granularity restriction may report a bufferImageGranularity value of one.

**Note**

Despite its name, bufferImageGranularity is really a granularity between “linear” and “non-linear” resources.

Given resourceA at the lower memory offset and resourceB at the higher memory offset in the same VkDeviceMemory object, where one resource is linear and the other is non-linear (as defined in the Glossary), and the following:

- resourceA.end = resourceA.memoryOffset + resourceA.size - 1
- resourceA.endPage = resourceA.end & ~(bufferImageGranularity-1)
- resourceB.start = resourceB.memoryOffset
- resourceB.startPage = resourceB.start & ~(bufferImageGranularity-1)

The following property must hold:
That is, the end of the first resource (A) and the beginning of the second resource (B) must be on separate “pages” of size \texttt{bufferImageGranularity}. \texttt{bufferImageGranularity} may be different than the physical page size of the memory heap. This restriction is only needed when a linear resource and a non-linear resource are adjacent in memory and will be used simultaneously. The memory ranges of adjacent resources can be closer than \texttt{bufferImageGranularity}, provided they meet the alignment requirement for the objects in question.

Sparse block size in bytes and sparse image and buffer memory alignments must all be multiples of the \texttt{bufferImageGranularity}. Therefore, memory bound to sparse resources naturally satisfies the \texttt{bufferImageGranularity}.

### 12.8. Resource Sharing Mode

Buffer and image objects are created with a \textit{sharing mode} controlling how they can be accessed from queues. The supported sharing modes are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSharingMode {
    VK_SHARING_MODE_EXCLUSIVE = 0,
    VK_SHARING_MODE_CONCURRENT = 1,
} VkSharingMode;
```

- **\texttt{VK_SHARING_MODE_EXCLUSIVE}** specifies that access to any range or image subresource of the object will be exclusive to a single queue family at a time.
- **\texttt{VK_SHARING_MODE_CONCURRENT}** specifies that concurrent access to any range or image subresource of the object from multiple queue families is supported.

\textbf{Note} \texttt{VK_SHARING_MODE_CONCURRENT} may result in lower performance access to the buffer or image than \texttt{VK_SHARING_MODE_EXCLUSIVE}.

Ranges of buffers and image subresources of image objects created using **\texttt{VK_SHARING_MODE_EXCLUSIVE}** must only be accessed by queues in the queue family that has \textit{ownership} of the resource. Upon creation, such resources are not owned by any queue family; ownership is implicitly acquired upon first use within a queue. Once a resource using **\texttt{VK_SHARING_MODE_EXCLUSIVE}** is owned by some queue family, the application must perform a queue family ownership transfer to make the memory contents of a range or image subresource accessible to a different queue family.

\textbf{Note} Images still require a layout transition from **\texttt{VK_IMAGE_LAYOUT_UNDEFINED}** or **\texttt{VK_IMAGE_LAYOUT_PREINITIALIZED}** before being used on the first queue.

A queue family can take ownership of an image subresource or buffer range of a resource created
with `VK_SHARING_MODE_EXCLUSIVE`, without an ownership transfer, in the same way as for a resource that was just created; however, taking ownership in this way has the effect that the contents of the image subresource or buffer range are undefined.

Ranges of buffers and image subresources of image objects created using `VK_SHARING_MODE_CONCURRENT` must only be accessed by queues from the queue families specified through the `queueFamilyIndexCount` and `pQueueFamilyIndices` members of the corresponding create info structures.

### 12.8.1. External Resource Sharing

Resources should only be accessed in the Vulkan instance that has exclusive ownership of their underlying memory. Only one Vulkan instance has exclusive ownership of a resource's underlying memory at a given time, regardless of whether the resource was created using `VK_SHARING_MODE_EXCLUSIVE` or `VK_SHARING_MODE_CONCURRENT`. Applications can transfer ownership of a resource's underlying memory only if the memory has been imported from or exported to another instance or external API using external memory handles. The semantics for transferring ownership outside of the instance are similar to those used for transferring ownership of `VK_SHARING_MODE_EXCLUSIVE` resources between queues, and is also accomplished using `VkBufferMemoryBarrier` or `VkImageMemoryBarrier` operations. Applications must

1. Release exclusive ownership from the source instance or API.
2. Ensure the release operation has completed using semaphores or fences.
3. Acquire exclusive ownership in the destination instance or API

Unlike queue ownership transfers, the destination instance or API is not specified explicitly when releasing ownership, nor is the source instance or API specified when acquiring ownership. Instead, the image or memory barrier's `dstQueueFamilyIndex` or `srcQueueFamilyIndex` parameters are set to the reserved queue family index `VK_QUEUE_FAMILY_EXTERNAL` or `VK_QUEUE_FAMILY_FOREIGN_EXT` to represent the external destination or source respectively.

Binding a resource to a memory object shared between multiple Vulkan instances or other APIs does not change the ownership of the underlying memory. The first entity to access the resource implicitly acquires ownership. Accessing a resource backed by memory that is owned by a particular instance or API has the same semantics as accessing a `VK_SHARING_MODE_EXCLUSIVE` resource, with one exception: Implementations must ensure layout transitions performed on one member of a set of identical subresources of identical images that alias the same range of an underlying memory object affect the layout of all the subresources in the set.

As a corollary, writes to any image subresources in such a set must not make the contents of memory used by other subresources in the set undefined. An application can define the content of a subresource of one image by performing device writes to an identical subresource of another image provided both images are bound to the same region of external memory. Applications may also add resources to such a set after the content of the existing set members has been defined without making the content undefined by creating a new image with the initial layout `VK_IMAGE_LAYOUT_UNDEFINED` and binding it to the same region of external memory as the existing images.
Because layout transitions apply to all identical images aliasing the same region of external memory, the actual layout of the memory backing a new image as well as an existing image with defined content will not be undefined. Such an image is not usable until it acquires ownership of its memory from the existing owner. Therefore, the layout specified as part of this transition will be the true initial layout of the image. The undefined layout specified when creating it is a placeholder to simplify valid usage requirements.

12.9. Memory Aliasing

A range of a VkDeviceMemory allocation is aliased if it is bound to multiple resources simultaneously, as described below, via vkBindImageMemory, vkBindBufferMemory, vkBindAccelerationStructureMemoryNV, via sparse memory bindings, or by binding the memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms.

Consider two resources, resource\textsubscript{A} and resource\textsubscript{B}, bound respectively to memory range\textsubscript{A} and range\textsubscript{B}. Let paddedRange\textsubscript{A} and paddedRange\textsubscript{B} be, respectively, range\textsubscript{A} and range\textsubscript{B} aligned to bufferImageGranularity. If the resources are both linear or both non-linear (as defined in the Glossary), then the resources alias the memory in the intersection of range\textsubscript{A} and range\textsubscript{B}. If one resource is linear and the other is non-linear, then the resources alias the memory in the intersection of paddedRange\textsubscript{A} and paddedRange\textsubscript{B}.

Applications can alias memory, but use of multiple aliases is subject to several constraints.

Memory aliasing can be useful to reduce the total device memory footprint of an application, if some large resources are used for disjoint periods of time.

When a non-linear, non-VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT image is bound to an aliased range, all image subresources of the image overlap the range. When a linear image is bound to an aliased range, the image subresources that (according to the image’s advertised layout) include bytes from the aliased range overlap the range. When a VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT image has sparse image blocks bound to an aliased range, only image subresources including those sparse image blocks overlap the range, and when the memory bound to the image’s mip tail overlaps an aliased range all image subresources in the mip tail overlap the range.

Buffers, and linear image subresources in either the VK_IMAGE_LAYOUT_PREINITIALIZED or VK_IMAGE_LAYOUT_GENERAL layouts, are host-accessible subresources. That is, the host has a well-defined addressing scheme to interpret the contents, and thus the layout of the data in memory can be consistently interpreted across aliases if each of those aliases is a host-accessible subresource. Non-linear images, and linear image subresources in other layouts, are not host-accessible.

If two aliases are both host-accessible, then they interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

If two aliases are both images that were created with identical creation parameters, both were
created with the `VK_IMAGE_CREATE_ALIAS_BIT` flag set, and both are bound identically to memory except for `VkBindImageMemoryDeviceGroupInfo::pDeviceIndices` and `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions`, then they interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

Additionally, if an individual plane of a multi-planar image and a single-plane image alias the same memory, then they also interpret the contents of the memory in consistent ways under the same conditions, but with the following modifications:

- Both must have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag.
- The single-plane image must have a `VkFormat` that is equivalent to that of the multi-planar image’s individual plane.
- The single-plane image and the individual plane of the multi-planar image must be bound identically to memory except for `VkBindImageMemoryDeviceGroupInfo::pDeviceIndices` and `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions`.
- The width and height of the single-plane image are derived from the multi-planar image’s dimensions in the manner listed for plane compatibility for the aliased plane.
- If either image’s tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then both images must be linear.
- All other creation parameters must be identical.

Aliases created by binding the same memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

Otherwise, the aliases interpret the contents of the memory differently, and writes via one alias make the contents of memory partially or completely undefined to the other alias. If the first alias is a host-accessible subresource, then the bytes affected are those written by the memory operations according to its addressing scheme. If the first alias is not host-accessible, then the bytes affected are those overlapped by the image subresources that were written. If the second alias is a host-accessible subresource, the affected bytes become undefined. If the second alias is a non-host-accessible, all sparse image blocks (for sparse partially-resident images) or all image subresources (for non-sparse image and fully resident sparse images) that overlap the affected bytes become undefined.

If any image subresources are made undefined due to writes to an alias, then each of those image subresources must have its layout transitioned from `VK_IMAGE_LAYOUT_UNDEFINED` to a valid layout before it is used, or from `VK_IMAGE_LAYOUT_PREINITIALIZED` if the memory has been written by the host. If any sparse blocks of a sparse image have been made undefined, then only the image subresources containing them must be transitioned.

Use of an overlapping range by two aliases must be separated by a memory dependency using the appropriate access types if at least one of those uses performs writes, whether the aliases interpret memory consistently or not. If buffer or image memory barriers are used, the scope of the barrier must contain the entire range and/or set of image subresources that overlap.

If two aliasing image views are used in the same framebuffer, then the render pass must declare
the attachments using the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, and follow the other rules listed in that section.

**Note**
Memory recycled via an application suballocator (i.e. without freeing and reallocating the memory objects) is not substantially different from memory aliasing. However, a suballocator usually waits on a fence before recycling a region of memory, and signaling a fence involves sufficient implicit dependencies to satisfy all the above requirements.
Chapter 13. Samplers

**VkSampler** objects represent the state of an image sampler which is used by the implementation to read image data and apply filtering and other transformations for the shader.

Samplers are represented by **VkSampler** handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSampler)
```

To create a sampler object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateSampler(  
    VkDevice                                    device,  
    const VkSamplerCreateInfo*                  pCreateInfo,  
    const VkAllocationCallbacks*                pAllocator,  
    VkSampler*                                  pSampler);
```

- **device** is the logical device that creates the sampler.
- **pCreateInfo** is a pointer to a **VkSamplerCreateInfo** structure specifying the state of the sampler object.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pSampler** is a pointer to a **VkSampler** handle in which the resulting sampler object is returned.

 Valid Usage

- **VUID-vkCreateSampler-maxSamplerAllocationCount-04110**

  There must be less than **VkPhysicalDeviceLimits::maxSamplerAllocationCount** **VkSampler** objects currently created on the device.
Valid Usage (Implicit)

- **VUID-vkCreateSampler-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkCreateSampler-pCreateInfo-parameter**
  
  `pCreateInfo` must be a valid pointer to a valid `VkSamplerCreateInfo` structure

- **VUID-vkCreateSampler-pAllocator-parameter**
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateSampler-pSampler-parameter**
  
  `pSampler` must be a valid pointer to a `VkSampler` handle

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkSamplerCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSamplerCreateInfo {
    VkStructureType         sType;
    const void*             pNext;
    VkSamplerCreateFlags    flags;
    VkFilter                magFilter;
    VkFilter                minFilter;
    VkSamplerMipmapMode     mipmapMode;
    VkSamplerAddressMode    addressModeU;
    VkSamplerAddressMode    addressModeV;
    VkSamplerAddressMode    addressModeW;
    float                    mipLodBias;
    VkBool32                 anisotropyEnable;
    float                    maxAnisotropy;
    VkBool32                 compareEnable;
    VkCompareOp              compareOp;
    float                    minLod;
    float                    maxLod;
    VkBorderColor           borderColor;
    VkBool32                 unnormalizedCoordinates;
} VkSamplerCreateInfo;
```
• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is a bitmask of **VkSamplerCreateFlagBits** describing additional parameters of the sampler.

• **magFilter** is a **VkFilter** value specifying the magnification filter to apply to lookups.

• **minFilter** is a **VkFilter** value specifying the minification filter to apply to lookups.

• **mipmapMode** is a **VkSamplerMipmapMode** value specifying the mipmap filter to apply to lookups.

• **addressModeU** is a **VkSamplerAddressMode** value specifying the addressing mode for outside [0..1] range for U coordinate.

• **addressModeV** is a **VkSamplerAddressMode** value specifying the addressing mode for outside [0..1] range for V coordinate.

• **addressModeW** is a **VkSamplerAddressMode** value specifying the addressing mode for outside [0..1] range for W coordinate.

• **mipLodBias** is the bias to be added to mipmap LOD (level-of-detail) calculation and bias provided by image sampling functions in SPIR-V, as described in the **Level-of-Detail Operation** section.

• **anisotropyEnable** is **VK_TRUE** to enable anisotropic filtering, as described in the **Texel Anisotropic Filtering** section, or **VK_FALSE** otherwise.

• **maxAnisotropy** is the anisotropy value clamp used by the sampler when **anisotropyEnable** is **VK_TRUE**. If **anisotropyEnable** is **VK_FALSE**, **maxAnisotropy** is ignored.

• **compareEnable** is **VK_TRUE** to enable comparison against a reference value during lookups, or **VK_FALSE** otherwise.

  ◦ Note: Some implementations will default to shader state if this member does not match.

• **compareOp** is a **VkCompareOp** value specifying the comparison function to apply to fetched data before filtering as described in the **Depth Compare Operation** section.

• **minLod** is used to clamp the minimum of the computed LOD value.

• **maxLod** is used to clamp the maximum of the computed LOD value. To avoid clamping the maximum value, set **maxLod** to the constant **VK_LOD_CLAMP_NONE**.

• **borderColor** is a **VkBorderColor** value specifying the predefined border color to use.

• **unnormalizedCoordinates** controls whether to use unnormalized or normalized texel coordinates to address texels of the image. When set to **VK_TRUE**, the range of the image coordinates used to lookup the texel is in the range of zero to the image dimensions for x, y and z. When set to **VK_FALSE** the range of image coordinates is zero to one.

When **unnormalizedCoordinates** is **VK_TRUE**, images the sampler is used with in the shader have the following requirements:

  ◦ The **viewType** must be either **VK_IMAGE_VIEW_TYPE_1D** or **VK_IMAGE_VIEW_TYPE_2D**.

  ◦ The image view must have a single layer and a single mip level.

When **unnormalizedCoordinates** is **VK_TRUE**, image built-in functions in the shader that use the sampler have the following requirements:

  ◦ The functions must not use projection.
The functions **must** not use offsets.

### Mapping of OpenGL to Vulkan filter modes

*magFilter* values of `VK_FILTER_NEAREST` and `VK_FILTER_LINEAR` directly correspond to `GL_NEAREST` and `GL_LINEAR` magnification filters. *minFilter* and *mipmapMode* combine to correspond to the similarly named OpenGL minification filter of `GL_minFilter_MIPMAP_mipmapMode` (e.g. *minFilter* of `VK_FILTER_LINEAR` and *mipmapMode* of `VK_SAMPLER_MIPMAP_MODE_NEAREST` correspond to `GL_LINEAR_MIPMAP_NEAREST`).

There are no Vulkan filter modes that directly correspond to OpenGL minification filters of `GL_LINEAR` or `GL_NEAREST`, but they can be emulated using `VK_SAMPLER_MIPMAP_MODE_NEAREST, minLod = 0, and maxLod = 0.25, and using minFilter = VK_FILTER_LINEAR or minFilter = VK_FILTER_NEAREST, respectively.`

Note that using a *maxLod* of zero would cause magnification to always be performed, and the *magFilter* to always be used. This is valid, just not an exact match for OpenGL behavior. Clamping the maximum LOD to 0.25 allows the λ value to be non-zero and minification to be performed, while still always rounding down to the base level. If the *minFilter* and *magFilter* are equal, then using a *maxLod* of zero also works.

The maximum number of sampler objects which can be simultaneously created on a device is implementation-dependent and specified by the `maxSamplerAllocationCount` member of the `VkPhysicalDeviceLimits` structure.

**Note**

For historical reasons, if `maxSamplerAllocationCount` is exceeded, some implementations may return `VK_ERROR_TOO_MANY_OBJECTS`. Exceeding this limit will result in undefined behavior, and an application should not rely on the use of the returned error code in order to identify when the limit is reached.

Since `VkSampler` is a non-dispatchable handle type, implementations may return the same handle for sampler state vectors that are identical. In such cases, all such objects would only count once against the `maxSamplerAllocationCount` limit.
Valid Usage

- **VUID-VkSamplerCreateInfo-mipLodBias-01069**
  
  The absolute value of `mipLodBias` must be less than or equal to `VkPhysicalDeviceLimits::maxSamplerLodBias`

- **VUID-VkSamplerCreateInfo-samplerMipLodBias-04467**
  
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::samplerMipLodBias` is `VK_FALSE`, `mipLodBias` must be zero.

- **VUID-VkSamplerCreateInfo-maxLod-01973**
  
  `maxLod` must be greater than or equal to `minLod`

- **VUID-VkSamplerCreateInfo-anisotropyEnable-01070**
  
  If the anisotropic sampling feature is not enabled, `anisotropyEnable` must be `VK_FALSE`

- **VUID-VkSamplerCreateInfo-anisotropyEnable-01071**
  
  If `anisotropyEnable` is `VK_TRUE`, `maxAnisotropy` must be between 1.0 and `VkPhysicalDeviceLimits::maxSamplerAnisotropy`, inclusive

- **VUID-VkSamplerCreateInfo-minFilter-01645**
  
  If sampler `Y'CBCR` conversion is enabled and the potential format features of the sampler `Y'CBCR` conversion do not support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT`, `minFilter` and `magFilter` must be equal to the sampler `Y'CBCR` conversion's chromaFilter

- **VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01072**
  
  If `unnormalizedCoordinates` is `VK_TRUE`, `minFilter` and `magFilter` must be equal

- **VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01073**
  
  If `unnormalizedCoordinates` is `VK_TRUE`, `mipmapMode` must be `VK_SAMPLER_MIPMAP_MODE_NEAREST`

- **VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01074**
  
  If `unnormalizedCoordinates` is `VK_TRUE`, `minLod` and `maxLod` must be zero

- **VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01075**
  
  If `unnormalizedCoordinates` is `VK_TRUE`, `addressModeU` and `addressModeV` must each be either `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` or `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`

- **VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01076**
  
  If `unnormalizedCoordinates` is `VK_TRUE`, `anisotropyEnable` must be `VK_FALSE`

- **VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01077**
  
  If `unnormalizedCoordinates` is `VK_TRUE`, `compareEnable` must be `VK_FALSE`

- **VUID-VkSamplerCreateInfo-addressModeU-01078**
  
  If any of `addressModeU`, `addressModeV` or `addressModeW` are `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`, `borderColor` must be a valid `VkBorderColor` value

- **VUID-VkSamplerCreateInfo-addressModeU-01646**
  
  If sampler `Y'CBCR` conversion is enabled, `addressModeU`, `addressModeV`, and `addressModeW` must be `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`, `anisotropyEnable` must be `VK_FALSE`, and `unnormalizedCoordinates` must be `VK_FALSE`
The sampler reduction mode must be set to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE if sampler Y’CbCr conversion is enabled.

If samplerMirrorClampToEdge is not enabled, and if the VK_KHR_sampler_mirror_clamp_to_edge extension is not enabled, addressModeU, addressModeV and addressModeW must not be VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE.

If compareEnable is VK_TRUE, compareOp must be a valid VkCompareOp value.

If either magFilter or minFilter is VK_FILTER_CUBIC_EXT, anisotropyEnable must be VK_FALSE.

If compareEnable is VK_TRUE, the reductionMode member of VkSamplerReductionModeCreateInfo must be VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE.

If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then minFilter and magFilter must be equal.

If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then mipmapMode must be VK_SAMPLER_MIPMAP_MODE_NEAREST.

If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then minLod and maxLod must be zero.

If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then addressModeU and addressModeV must each be either VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE or VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER.

If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then anisotropyEnable must be VK_FALSE.

If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then compareEnable must be VK_FALSE.

If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then unnormalizedCoordinates must be VK_FALSE.

If borderColor is one of VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT, then a VkSamplerCustomBorderColorCreateInfoEXT must be present in the pNext chain.

If the customBorderColors feature is not enabled, borderColor must not be VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT.
If `borderColor` is one of `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`, and `VkSamplerCustomBorderColorCreateInfoEXT::format` is not `VK_FORMAT_UNDEFINED`, `VkSamplerCustomBorderColorCreateInfoEXT::customBorderColor` must be within the range of values representable in `format`.

The maximum number of samplers with custom border colors which can be simultaneously created on a device is implementation-dependent and specified by the `maxCustomBorderColorSamplers` member of the `VkPhysicalDeviceCustomBorderColorPropertiesEXT` structure.

### Valid Usage (Implicit)

- **sType must be** `VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO`
- **pNext chain** must be either `NULL` or a pointer to a valid instance of `VkSamplerCustomBorderColorCreateInfoEXT`, `VkSamplerReductionModeCreateInfo`, or `VkSamplerYcbcrConversionInfo`
- **The sType value of each struct in the pNext chain must be unique**
- **flags** must be a valid combination of `VkSamplerCreateFlagBits` values
- **magFilter** must be a valid `VkFilter` value
- **minFilter** must be a valid `VkFilter` value
- **mipmapMode** must be a valid `VkSamplerMipmapMode` value
- **addressModeU** must be a valid `VkSamplerAddressMode` value
- **addressModeV** must be a valid `VkSamplerAddressMode` value
- **addressModeW** must be a valid `VkSamplerAddressMode` value

Bits which can be set in `VkSamplerCreateInfo::flags`, specifying additional parameters of a sampler, are:
typedef enum VkSamplerCreateFlagBits {
    VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT = 0x00000001,
    VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT = 0x00000002,
} VkSamplerCreateFlagBits;

• **VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT** specifies that the sampler will read from an image created with flags containing **VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT**.

• **VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT** specifies that the implementation may use approximations when reconstructing a full color value for texture access from a subsampled image.

Note

The approximations used when **VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT** is specified are implementation defined. Some implementations may interpolate between fragment density levels in a subsampled image. In that case, this bit may be used to decide whether the interpolation factors are calculated per fragment or at a coarser granularity.

typedef VkFlags VkSamplerCreateFlags;

**VkSamplerCreateFlags** is a bitmask type for setting a mask of zero or more **VkSamplerCreateFlagBits**.

The **VkSamplerReductionModeCreateInfo** structure is defined as:

typedef struct VkSamplerReductionModeCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerReductionMode reductionMode;
} VkSamplerReductionModeCreateInfo;

or the equivalent

// Provided by VK_EXT_sampler_filter_minmax
typedef VkSamplerReductionModeCreateInfo VkSamplerReductionModeCreateInfoEXT;

• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **reductionMode** is a **VkSamplerReductionMode** value controlling how texture filtering combines
If the \texttt{pNext} chain of \texttt{VkSamplerCreateInfo} includes a \texttt{VkSamplerReductionModeCreateInfo} structure, then that structure includes a mode that controls how texture filtering combines texel values.

If this structure is not present, \texttt{reductionMode} is considered to be \texttt{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE}.

### Valid Usage (Implicit)

- \texttt{VUID-VkSamplerReductionModeCreateInfo-sType-sType}  
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_SAMPLER_REDUCTION_MODE_CREATE_INFO}

- \texttt{VUID-VkSamplerReductionModeCreateInfo-reductionMode-parameter}  
  \texttt{reductionMode} must be a valid \texttt{VkSamplerReductionMode} value

Reduction modes are specified by \texttt{VkSamplerReductionMode}, which takes values:

```c
typedef enum VkSamplerReductionMode {
    VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE = 0,
    VK_SAMPLER_REDUCTION_MODE_MIN = 1,
    VK_SAMPLER_REDUCTION_MODE_MAX = 2,
    // Provided by VK_EXT_sampler_filter_minmax
    VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_EXT = VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE,
    // Provided by VK_EXT_sampler_filter_minmax
    VK_SAMPLER_REDUCTION_MODE_MIN_EXT = VK_SAMPLER_REDUCTION_MODE_MIN,
    // Provided by VK_EXT_sampler_filter_minmax
    VK_SAMPLER_REDUCTION_MODE_MAX_EXT = VK_SAMPLER_REDUCTION_MODE_MAX,
} VkSamplerReductionMode;
```

or the equivalent

```c
// Provided by VK_EXT_sampler_filter_minmax
typedef VkSamplerReductionMode VkSamplerReductionModeEXT;
```

- \texttt{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE} specifies that texel values are combined by computing a weighted average of values in the footprint, using weights as specified in the image operations chapter.

- \texttt{VK_SAMPLER_REDUCTION_MODE_MIN} specifies that texel values are combined by taking the component-wise minimum of values in the footprint with non-zero weights.

- \texttt{VK_SAMPLER_REDUCTION_MODE_MAX} specifies that texel values are combined by taking the component-wise maximum of values in the footprint with non-zero weights.

Possible values of the \texttt{VkSamplerCreateInfo::magFilter} and \texttt{minFilter} parameters, specifying filters used for texture lookups, are:
typedef enum VkFilter {
    VK_FILTER_NEAREST = 0,
    VK_FILTER_LINEAR = 1,
    // Provided by VK_IMG_filter_cubic
    VK_FILTER_CUBIC_IMG = 100015000,
    // Provided by VK_EXT_filter_cubic
    VK_FILTER_CUBIC_EXT = VK_FILTER_CUBIC_IMG,
} VkFilter;

- **VK_FILTER_NEAREST** specifies nearest filtering.
- **VK_FILTER_LINEAR** specifies linear filtering.
- **VK_FILTER_CUBIC_EXT** specifies cubic filtering.

These filters are described in detail in *Texel Filtering*.

Possible values of the `VkSamplerCreateInfo::mipmapMode`, specifying the mipmap mode used for texture lookups, are:

typedef enum VkSamplerMipmapMode {
    VK_SAMPLER_MIPMAP_MODE_NEAREST = 0,
    VK_SAMPLER_MIPMAP_MODE_LINEAR = 1,
} VkSamplerMipmapMode;

- **VK_SAMPLER_MIPMAP_MODE_NEAREST** specifies nearest filtering.
- **VK_SAMPLER_MIPMAP_MODE_LINEAR** specifies linear filtering.

These modes are described in detail in *Texel Filtering*.

Possible values of the `VkSamplerCreateInfo::addressMode*` parameters, specifying the behavior of sampling with coordinates outside the range [0,1] for the respective u, v, or w coordinate as defined in the *Wrapping Operation* section, are:

typedef enum VkSamplerAddressMode {
    VK_SAMPLER_ADDRESS_MODE_REPEAT = 0,
    VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT = 1,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE = 2,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER = 3,
    // Provided by VK_KHR_sampler_mirror_clamp_to_edge
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE = 4,
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE_KHR =
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE,
} VkSamplerAddressMode;
- `VK_SAMPLER_ADDRESS_MODE_REPEAT` specifies that the repeat wrap mode will be used.
- `VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT` specifies that the mirrored repeat wrap mode will be used.
- `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` specifies that the clamp to edge wrap mode will be used.
- `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER` specifies that the clamp to border wrap mode will be used.
- `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` specifies that the mirror clamp to edge wrap mode will be used. This is only valid if the `VK_KHR_sampler_mirror_clamp_to_edge` extension is enabled.

Possible values of `VkSamplerCreateInfo::borderColor`, specifying the border color used for texture lookups, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBorderColor {
    VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK = 0,
    VK_BORDER_COLOR_INT_TRANSPARENT_BLACK = 1,
    VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK = 2,
    VK_BORDER_COLOR_INT_OPAQUE_BLACK = 3,
    VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE = 4,
    VK_BORDER_COLOR_INT_OPAQUE_WHITE = 5,
    // Provided by VK_EXT_custom_border_color
    VK_BORDER_COLOR_FLOAT_CUSTOM_EXT = 1000287003,
    // Provided by VK_EXT_custom_border_color
    VK_BORDER_COLOR_INT_CUSTOM_EXT = 1000287004,
} VkBorderColor;
```

- `VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK` specifies a transparent, floating-point format, black color.
- `VK_BORDER_COLOR_INT_TRANSPARENT_BLACK` specifies a transparent, integer format, black color.
- `VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK` specifies an opaque, floating-point format, black color.
- `VK_BORDER_COLOR_INT_OPAQUE_BLACK` specifies an opaque, integer format, black color.
- `VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE` specifies an opaque, floating-point format, white color.
- `VK_BORDER_COLOR_INT_OPAQUE_WHITE` specifies an opaque, integer format, white color.
- `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` indicates that a `VkSamplerCustomBorderColorCreateInfoEXT` structure is present in the `VkSamplerCreateInfo::pNext` chain which contains the color data in floating-point format.
- `VK_BORDER_COLOR_INT_CUSTOM_EXT` indicates that a `VkSamplerCustomBorderColorCreateInfoEXT` structure is present in the `VkSamplerCreateInfo::pNext` chain which contains the color data in integer format.

These colors are described in detail in `Texel Replacement`.

To destroy a sampler, call:
// Provided by VK_VERSION_1_0
void vkDestroySampler(
    VkDevice                                    device,
    VkSampler                                   sampler,
    const VkAllocationCallbacks*                pAllocator);

- **device** is the logical device that destroys the sampler.
- **sampler** is the sampler to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroySampler-sampler-01082**
  All submitted commands that refer to **sampler** must have completed execution

- **VUID-vkDestroySampler-sampler-01083**
  If **VkAllocationCallbacks** were provided when **sampler** was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroySampler-sampler-01084**
  If no **VkAllocationCallbacks** were provided when **sampler** was created, **pAllocator** must be NULL

### Valid Usage (Implicit)

- **VUID-vkDestroySampler-device-parameter**
  **device** must be a valid **VkDevice** handle

- **VUID-vkDestroySampler-sampler-parameter**
  If **sampler** is not **VK_NULL_HANDLE**, **sampler** must be a valid **VkSampler** handle

- **VUID-vkDestroySampler-pAllocator-parameter**
  If **pAllocator** is not NULL, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- **VUID-vkDestroySampler-sampler-parent**
  If **sampler** is a valid handle, it must have been created, allocated, or retrieved from **device**

### Host Synchronization

- Host access to **sampler** must be externally synchronized
13.1. Sampler Y'CbCr conversion

To create a sampler with Y'CbCr conversion enabled, add a VkSamplerYcbcrConversionInfo structure to the pNext chain of the VkSamplerCreateInfo structure. To create a sampler Y'CbCr conversion, the samplerYcbcrConversion feature must be enabled. Conversion must be fixed at pipeline creation time, through use of a combined image sampler with an immutable sampler in VkDescriptorSetLayoutBinding.

A VkSamplerYcbcrConversionInfo must be provided for samplers to be used with image views that access VK_IMAGE_ASPECT_COLOR_BIT if the format appears in Formats requiring sampler Y'CbCr conversion for VK_IMAGE_ASPECT_COLOR_BIT image views, or if the image view has an external format.

The VkSamplerYcbcrConversionInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerYcbcrConversion conversion;
} VkSamplerYcbcrConversionInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversionInfo VkSamplerYcbcrConversionInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **conversion** is a VkSamplerYcbcrConversion handle created with vkCreateSamplerYcbcrConversion.

Valid Usage (Implicit)

- VUID-VkSamplerYcbcrConversionInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_INFO
- VUID-VkSamplerYcbcrConversionInfo-conversion-parameter
  conversion must be a valid VkSamplerYcbcrConversion handle

A sampler Y'CbCr conversion is an opaque representation of a device-specific sampler Y'CbCr conversion description, represented as a VkSamplerYcbcrConversion handle:
or the equivalent

```cpp
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversion VkSamplerYcbcrConversionKHR;
```

To create a `VkSamplerYcbcrConversion`, call:

```cpp
// Provided by VK_VERSION_1_1
VkResult vkCreateSamplerYcbcrConversion(
    VkDevice                                    device,
    const VkSamplerYcbcrConversionCreateInfo*   pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSamplerYcbcrConversion*                   pYcbcrConversion);
```

or the equivalent command

```cpp
// Provided by VK_KHR_sampler_ycbcr_conversion
VkResult vkCreateSamplerYcbcrConversionKHR(
    VkDevice                                    device,
    const VkSamplerYcbcrConversionCreateInfo*   pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSamplerYcbcrConversion*                   pYcbcrConversion);
```

- `device` is the logical device that creates the sampler Y’C_{A}C_{B}C_{R} conversion.
- `pCreateInfo` is a pointer to a `VkSamplerYcbcrConversionCreateInfo` structure specifying the requested sampler Y’C_{A}C_{B}C_{R} conversion.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pYcbcrConversion` is a pointer to a `VkSamplerYcbcrConversion` handle in which the resulting sampler Y’C_{A}C_{B}C_{R} conversion is returned.

The interpretation of the configured sampler Y’C_{A}C_{B}C_{R} conversion is described in more detail in the description of sampler Y’C_{A}C_{B}C_{R} conversion in the Image Operations chapter.

### Valid Usage

- **VUID-vkCreateSamplerYcbcrConversion-None-01648**

  The sampler Y’C_{A}C_{B}C_{R} conversion feature must be enabled
Valid Usage (Implicit)

- VUID-vkCreateSamplerYcbcrConversion-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCreateSamplerYcbcrConversion-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkSamplerYcbcrConversionCreateInfo structure

- VUID-vkCreateSamplerYcbcrConversion-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateSamplerYcbcrConversion-pYcbcrConversion-parameter
  pYcbcrConversion must be a valid pointer to a VkSamplerYcbcrConversion handle

Return Codes

Success

  - VK_SUCCESS

Failure

  - VK_ERROR_OUT_OF_HOST_MEMORY
  - VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkSamplerYcbcrConversionCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
    VkSamplerYcbcrModelConversion ycbcrModel;
    VkSamplerYcbcrRange ycbcrRange;
    VkComponentMapping components;
    VkChromaLocation xChromaOffset;
    VkChromaLocation yChromaOffset;
    VkFilter chromaFilter;
    VkBool32 forceExplicitReconstruction;
} VkSamplerYcbcrConversionCreateInfo;
```

or the equivalent

```
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversionCreateInfo VkSamplerYcbcrConversionCreateInfoKHR;
```
• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **format** is the format of the image from which color information will be retrieved.

• **ycbcrModel** describes the color matrix for conversion between color models.

• **ycbcrRange** describes whether the encoded values have headroom and foot room, or whether the encoding uses the full numerical range.

• **components** applies a *swizzle* based on **VkComponentSwizzle** enums prior to range expansion and color model conversion.

• **xChromaOffset** describes the **sample location** associated with downsampled chroma channels in the x dimension. **xChromaOffset** has no effect for formats in which chroma channels are not downsampled horizontally.

• **yChromaOffset** describes the **sample location** associated with downsampled chroma channels in the y dimension. **yChromaOffset** has no effect for formats in which the chroma channels are not downsampled vertically.

• **chromaFilter** is the filter for chroma reconstruction.

• **forceExplicitReconstruction** can be used to ensure that reconstruction is done explicitly, if supported.

  
  ![](image)

  **Note**
  Setting **forceExplicitReconstruction** to **VK_TRUE** may have a performance penalty on implementations where explicit reconstruction is not the default mode of operation.

  If **format** supports **VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT** the **forceExplicitReconstruction** value behaves as if it was set to **VK_TRUE**.

If the **pNext** chain includes a **VkExternalFormatANDROID** structure with non-zero **externalFormat** member, the sampler **Y’C_bC_r** conversion object represents an **external format conversion**, and **format** must be **VK_FORMAT_UNDEFINED**. Such conversions must only be used to sample image views with a matching **external format**. When creating an external format conversion, the value of **components** is ignored.
Valid Usage

- VUID-VkSamplerYcbcrConversionCreateInfo-format-01904
  If an external format conversion is being created, format must be VK_FORMAT_UNDEFINED

- VUID-VkSamplerYcbcrConversionCreateInfo-format-04061
  If an external format conversion is not being created, format must represent unsigned normalized values (i.e. the format must be a UNORM format)

- VUID-VkSamplerYcbcrConversionCreateInfo-format-01650
  The potential format features of the sampler Y’C_B conversion must support VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT or VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT

- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01651
  If the potential format features of the sampler Y’C_B conversion do not support VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT, xChromaOffset and yChromaOffset must not be VK_CHROMA_LOCATION_COSITED_EVEN if the corresponding channels are downsampled

- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01652
  If the potential format features of the sampler Y’C_B conversion do not support VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT, xChromaOffset and yChromaOffset must not be VK_CHROMA_LOCATION_MIDPOINT if the corresponding channels are downsampled

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02581
  If the format has a _422 or _420 suffix, then components.g must be the identity swizzle

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02582
  If the format has a _422 or _420 suffix, then components.a must be the identity swizzle, VK_COMPONENT_SWIZZLE_ONE, or VK_COMPONENT_SWIZZLE_ZERO

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02583
  If the format has a _422 or _420 suffix, then components.r must be the identity swizzle or VK_COMPONENT_SWIZZLE_B

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02584
  If the format has a _422 or _420 suffix, then components.b must be the identity swizzle or VK_COMPONENT_SWIZZLE_R

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02585
  If the format has a _422 or _420 suffix, and if either components.r or components.b is the identity swizzle, both values must be the identity swizzle

- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrModel-01655
  If ycbcrModel is not VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY, then components.r, components.g, and components.b must correspond to channels of the format; that is, components.r, components.g, and components.b must not be VK_COMPONENT_SWIZZLE_ZERO or VK_COMPONENT_SWIZZLE_ONE, and must not correspond to a channel which contains zero or one as a consequence of conversion to RGBA

- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrRange-02748
  If ycbcrRange is VK_SAMPLER_YCBCR_RANGE_ITU_NARROW then the R, G and B channels obtained by applying the component swizzle to format must each have a bit-depth greater than or equal to 8
If the potential format features of the sampler \( Y'C'_B'C'_R \) conversion do not support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCE_ABLE_BIT`, `forceExplicitReconstruction` must be `VK_FALSE`.

If the potential format features of the sampler \( Y'C'_B'C'_R \) conversion do not support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT`, `chromaFilter` must not be `VK_FILTER_LINEAR`.

**Valid Usage (Implicit)**

- **VUID-VkSamplerYcbcrConversionCreateInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_CREATE_INFO`.

- **VUID-VkSamplerYcbcrConversionCreateInfo-pNext-pNext**
  
  `pNext` must be `NULL` or a pointer to a valid instance of `VkExternalFormatANDROID`.

  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkSamplerYcbcrConversionCreateInfo-format-parameter**
  
  `format` must be a valid `VkFormat` value.

- **VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrModel-parameter**
  
  `ycbcrModel` must be a valid `VkSamplerYcbcrModelConversion` value.

- **VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrRange-parameter**
  
  `ycbcrRange` must be a valid `VkSamplerYcbcrRange` value.

- **VUID-VkSamplerYcbcrConversionCreateInfo-components-parameter**
  
  `components` must be a valid `VkComponentMapping` structure.

- **VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-parameter**
  
  `xChromaOffset` must be a valid `VkChromaLocation` value.

- **VUID-VkSamplerYcbcrConversionCreateInfo-yChromaOffset-parameter**
  
  `yChromaOffset` must be a valid `VkChromaLocation` value.

- **VUID-VkSamplerYcbcrConversionCreateInfo-chromaFilter-parameter**
  
  `chromaFilter` must be a valid `VkFilter` value.

If `chromaFilter` is `VK_FILTER_NEAREST`, chroma samples are reconstructed to luma channel resolution using nearest-neighbour sampling. Otherwise, chroma samples are reconstructed using interpolation. More details can be found in the description of sampler \( Y'C'_B'C'_R \) conversion in the Image Operations chapter.

`VkSamplerYcbcrModelConversion` defines the conversion from the source color model to the shader color model. Possible values are:

If `chromaFilter` is `VK_FILTER_NEAREST`, chroma samples are reconstructed to luma channel resolution using nearest-neighbour sampling. Otherwise, chroma samples are reconstructed using interpolation. More details can be found in the description of sampler \( Y'C'_B'C'_R \) conversion in the Image Operations chapter.

`VkSamplerYcbcrModelConversion` defines the conversion from the source color model to the shader color model. Possible values are:
or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrModelConversion VkSamplerYcbcrModelConversionKHR;
```

- **VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY** specifies that the input values to the conversion are unmodified.
- **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY** specifies no model conversion but the inputs are range expanded as for YCbCr.
- **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709** specifies the color model conversion from Y'CbCr to R'G'B' defined in BT.709 and described in the “BT.709 Y'CbCr conversion” section of the Khronos Data Format Specification.
- **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601** specifies the color model conversion from Y'CbCr to R'G'B' defined in BT.601 and described in the “BT.601 Y'CbCr conversion” section of the Khronos Data Format Specification.
- **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020** specifies the color model conversion from Y'CbCr to R'G'B' defined in BT.2020 and described in the “BT.2020 Y'CbCr conversion” section of the Khronos Data Format Specification.

In the **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_*** color models, for the input to the sampler Y'CbCr range expansion and model conversion:
• the Y (Y’ luma) channel corresponds to the G channel of an RGB image.
• the CB (Cb or “U” blue color difference) channel corresponds to the B channel of an RGB image.
• the CR (Cr or “V” red color difference) channel corresponds to the R channel of an RGB image.
• the alpha channel, if present, is not modified by color model conversion.

These rules reflect the mapping of channels after the channel swizzle operation (controlled by `VkSamplerYcbcrConversionCreateInfo::components`).

**Note**
For example, an “YUVA” 32-bit format comprising four 8-bit channels can be implemented as `VK_FORMAT_R8G8B8A8_UNORM` with a component mapping:

- `components.a = VK_COMPONENT_SWIZZLE_IDENTITY`
- `components.r = VK_COMPONENT_SWIZZLE_B`
- `components.g = VK_COMPONENT_SWIZZLE_R`
- `components.b = VK_COMPONENT_SWIZZLE_G`

The `VkSamplerYcbcrRange` enum describes whether color channels are encoded using the full range of numerical values or whether values are reserved for headroom and foot room. `VkSamplerYcbcrRange` is defined as:

```c
// Provided by VK_VERSION_1_1
typedef enum VkSamplerYcbcrRange {
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL = 0,
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW = 1,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_FULL,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_NARROW,
} VkSamplerYcbcrRange;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrRange VkSamplerYcbcrRangeKHR;
```

- `VK_SAMPLER_YCBCR_RANGE_ITU_FULL` specifies that the full range of the encoded values are valid and interpreted according to the ITU “full range” quantization rules.
- `VK_SAMPLER_YCBCR_RANGE_ITU_NARROW` specifies that headroom and foot room are reserved in the numerical range of encoded values, and the remaining values are expanded according to the ITU “narrow range” quantization rules.

The formulae for these conversions is described in the [Sampler Y’CbCr Range Expansion](#) section of the [Image Operations](#) chapter.
No range modification takes place if `ycbcrModel` is `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY`; the `ycbcrRange` field of `VkSamplerYcbcrConversionCreateInfo` is ignored in this case.

The `VkChromaLocation` enum defines the location of downscaled chroma channel samples relative to the luma samples, and is defined as:

```c
// Provided by VK_VERSION_1_1
typedef enum VkChromaLocation {
    VK_CHROMA_LOCATION_COSITED_EVEN = 0,
    VK_CHROMA_LOCATION_MIDPOINT = 1,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_CHROMA_LOCATION_COSITED_EVEN_KHR = VK_CHROMA_LOCATION_COSITED_EVEN,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_CHROMA_LOCATION_MIDPOINT_KHR = VK_CHROMA_LOCATION_MIDPOINT,
} VkChromaLocation;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkChromaLocation VkChromaLocationKHR;
```

- `VK_CHROMA_LOCATION_COSITED_EVEN` specifies that downscaled chroma samples are aligned with luma samples with even coordinates.
- `VK_CHROMA_LOCATION_MIDPOINT` specifies that downscaled chroma samples are located halfway between each even luma sample and the nearest higher odd luma sample.

To destroy a sampler `Y'C_bC_r` conversion, call:

```c
// Provided by VK_VERSION_1_1
void vkDestroySamplerYcbcrConversion(
    VkDevice device,
    VkSamplerYcbcrConversion ycbcrConversion,
    const VkAllocationCallbacks* pAllocator);
```

or the equivalent command

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
void vkDestroySamplerYcbcrConversionKHR(
    VkDevice device,
    VkSamplerYcbcrConversion ycbcrConversion,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the `Y'C_bC_r` conversion.
- `ycbcrConversion` is the conversion to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage (Implicit)

- VUID-vkDestroySamplerYcbcrConversion-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parameter
  If ycbcrConversion is not VK_NULL_HANDLE, ycbcrConversion must be a valid VkSamplerYcbcrConversion handle

- VUID-vkDestroySamplerYcbcrConversion-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parent
  If ycbcrConversion is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to ycbcrConversion must be externally synchronized

In addition to the predefined border color values, applications can provide a custom border color value by including the VkSamplerCustomBorderColorCreateInfoEXT structure in the VkSamplerCreateInfo::pNext chain.

The VkSamplerCustomBorderColorCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_custom_border_color
typedef struct VkSamplerCustomBorderColorCreateInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkClearColorValue    customBorderColor;
    VkFormat             format;
} VkSamplerCustomBorderColorCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `customBorderColor` is a VkClearColorValue representing the desired custom sampler border color.
- `format` is a VkFormat representing the format of the sampled image view(s). This field may be VK_FORMAT_UNDEFINED if the customBorderColorWithoutFormat feature is enabled.
Valid Usage

- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-04013
  If provided \texttt{format} is not \texttt{VK\_FORMAT\_UNDEFINED} then the \texttt{VkSamplerCreateInfo:borderColor} type \textbf{must} match the sampled type of the provided \texttt{format}, as shown in the \textit{SPIR-V Sampled Type} column of the \textbf{Interpretation of Numeric Format} table.

- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-04014
  If the \texttt{customBorderColorWithoutFormat} feature is not enabled then \texttt{format} \textbf{must} not be \texttt{VK\_FORMAT\_UNDEFINED}.

- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-04015
  If the sampler is used to sample an image view of \texttt{VK\_FORMAT\_B4G4R4A4\_UNORM\_PACK16}, \texttt{VK\_FORMAT\_B5G6R5\_UNORM\_PACK16}, or \texttt{VK\_FORMAT\_B5G5R5A1\_UNORM\_PACK16} format then \texttt{format} \textbf{must} not be \texttt{VK\_FORMAT\_UNDEFINED}.

Valid Usage (Implicit)

- VUID-VkSamplerCustomBorderColorCreateInfoEXT-sType-sType
  \texttt{sType} \textbf{must} be \texttt{VK\_STRUCTURE\_TYPE\_SAMPLER\_CUSTOM\_BORDER\_COLOR\_CREATE\_INFO\_EXT}.

- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-parameter
  \texttt{format} \textbf{must} be a valid \texttt{VkFormat} value.
Chapter 14. Resource Descriptors

A descriptor is an opaque data structure representing a shader resource such as a buffer, buffer view, image view, sampler, or combined image sampler. Descriptors are organised into descriptor sets, which are bound during command recording for use in subsequent draw commands. The arrangement of content in each descriptor set is determined by a descriptor set layout, which determines what descriptors can be stored within it. The sequence of descriptor set layouts that can be used by a pipeline is specified in a pipeline layout. Each pipeline object can use up to maxBoundDescriptorSets (see Limits) descriptor sets.

Shaders access resources via variables decorated with a descriptor set and binding number that link them to a descriptor in a descriptor set. The shader interface mapping to bound descriptor sets is described in the Shader Resource Interface section.

Shaders can also access buffers without going through descriptors by using Physical Storage Buffer Access to access them through 64-bit addresses.

14.1. Descriptor Types

There are a number of different types of descriptor supported by Vulkan, corresponding to different resources or usage. The following sections describe the API definitions of each descriptor type. The mapping of each type to SPIR-V is listed in the Shader Resource and Descriptor Type Correspondence and Shader Resource and Storage Class Correspondence tables in the Shader Interfaces chapter.

14.1.1. Storage Image

A storage image (VK_DESCRIPTOR_TYPE_STORAGE_IMAGE) is a descriptor type associated with an image resource via an image view that load, store, and atomic operations can be performed on.

Storage image loads are supported in all shader stages for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

Stores to storage images are supported in compute shaders for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

Atomic operations on storage images are supported in compute shaders for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT.

When the fragmentStoresAndAtomics feature is enabled, stores and atomic operations are also supported for storage images in fragment shaders with the same set of image formats as supported in compute shaders. When the vertexPipelineStoresAndAtomics feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of image formats as supported in compute shaders.

The image subresources for a storage image must be in the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.
14.1.2. Sampler

A sampler descriptor (VK_DESCRIPTOR_TYPE_SAMPLER) is a descriptor type associated with a sampler object, used to control the behavior of sampling operations performed on a sampled image.

14.1.3. Sampled Image

A sampled image (VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE) is a descriptor type associated with an image resource via an image view that sampling operations can be performed on.

Shaders combine a sampled image variable and a sampler variable to perform sampling operations.

Sampled images are supported in all shader stages for image views whose format features contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT.

The image subresources for a sampled image must be in the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.

14.1.4. Combined Image Sampler

A combined image sampler (VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER) is a single descriptor type associated with both a sampler and an image resource, combining both a sampler and sampled image descriptor into a single descriptor.

If the descriptor refers to a sampler that performs Y’C_bC_r conversion or samples a subsampled image, the sampler must only be used to sample the image in the same descriptor. Otherwise, the sampler and image in this type of descriptor can be used freely with any other samplers and images.

The image subresources for a combined image sampler must be in the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.

**Note**

On some implementations, it may be more efficient to sample from an image using a combination of sampler and sampled image that are stored together in the descriptor set in a combined descriptor.

14.1.5. Uniform Texel Buffer

A uniform texel buffer (VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER) is a descriptor type associated with a buffer resource via a buffer view that formatted load operations can be performed on.
Uniform texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image.

Load operations from uniform texel buffers are supported in all shader stages for image formats which report support for the `VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT` feature bit via `vkGetPhysicalDeviceFormatProperties` in `VkFormatProperties::bufferFeatures`.

### 14.1.6. Storage Texel Buffer

A *storage texel buffer* (`VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`) is a descriptor type associated with a *buffer resource* via a *buffer view* that formatted load, store, and atomic operations *can* be performed on.

Storage texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image. Unlike *uniform texel buffers*, these buffers can also be written to in the same way as for *storage images*.

Storage texel buffer loads are supported in all shader stages for texel buffer formats which report support for the `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT` feature bit via `vkGetPhysicalDeviceFormatProperties` in `VkFormatProperties::bufferFeatures`.

Stores to storage texel buffers are supported in compute shaders for texel buffer formats which report support for the `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT` feature bit via `vkGetPhysicalDeviceFormatProperties` in `VkFormatProperties::bufferFeatures`.

Atomic operations on storage texel buffers are supported in compute shaders for texel buffer formats which report support for the `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT` feature bit via `vkGetPhysicalDeviceFormatProperties` in `VkFormatProperties::bufferFeatures`.

When the `fragmentStoresAndAtomics` feature is enabled, stores and atomic operations are also supported for storage texel buffers in fragment shaders with the same set of texel buffer formats as supported in compute shaders. When the `vertexPipelineStoresAndAtomics` feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of texel buffer formats as supported in compute shaders.

### 14.1.7. Storage Buffer

A *storage buffer* (`VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`) is a descriptor type associated with a *buffer resource* directly, described in a shader as a structure with various members that load, store, and atomic operations *can* be performed on.

Note

Atomic operations *can* only be performed on members of certain types as defined in the SPIR-V environment appendix.

### 14.1.8. Uniform Buffer

A *uniform buffer* (`VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`) is a descriptor type associated with a *buffer resource* directly, described in a shader as a structure with various members that load operations
can be performed on.

### 14.1.9. Dynamic Uniform Buffer

A *dynamic uniform buffer* (VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC) is almost identical to a *uniform buffer*, and differs only in how the offset into the buffer is specified. The base offset calculated by the VkDescriptorBufferInfo when initially updating the descriptor set is added to a *dynamic offset* when binding the descriptor set.

### 14.1.10. Dynamic Storage Buffer

A *dynamic storage buffer* (VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC) is almost identical to a *storage buffer*, and differs only in how the offset into the buffer is specified. The base offset calculated by the VkDescriptorBufferInfo when initially updating the descriptor set is added to a *dynamic offset* when binding the descriptor set.

### 14.1.11. Inline Uniform Block

An *inline uniform block* (VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT) is almost identical to a *uniform buffer*, and differs only in taking its storage directly from the encompassing descriptor set instead of being backed by buffer memory. It is typically used to access a small set of constant data that does not require the additional flexibility provided by the indirection enabled when using a uniform buffer where the descriptor and the referenced buffer memory are decoupled. Compared to push constants, they allow reusing the same set of constant data across multiple disjoint sets of draw and dispatch commands.

Inline uniform block descriptors *cannot* be aggregated into arrays. Instead, the array size specified for an inline uniform block descriptor binding specifies the binding’s capacity in bytes.

### 14.1.12. Input Attachment

An *input attachment* (VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT) is a descriptor type associated with an *image resource* via an *image view* that can be used for framebuffer local load operations in fragment shaders.

All image formats that are supported for color attachments (VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT) or depth/stencil attachments (VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT) for a given image tiling mode are also supported for input attachments.

The image subresources for an input attachment *must* be in a *valid image layout* in order to access its data in a shader.

### 14.1.13. Acceleration Structure

An *acceleration structure* (VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR or VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV) is a descriptor type that is used to retrieve scene geometry from within shaders that are used for ray traversal. Shaders have read-only access to the memory.
14.1.14. Mutable

A descriptor of mutable (VK_DESCRIPTOR_TYPE_MUTABLE_VALVE) type indicates that this descriptor can mutate to any of the descriptor types given in the VkMutableDescriptorTypeCreateInfoVALVE::pDescriptorTypes list of descriptor types in the pNext chain of VkDescriptorSetLayoutCreateInfo for this binding. At any point, each individual descriptor of mutable type has an active descriptor type. The active descriptor type can be any one of the declared types in pDescriptorTypes. Additionally, a mutable descriptor’s active descriptor type can be of the VK_DESCRIPTOR_TYPE_MUTABLE_VALVE type, which is the initial active descriptor type. The active descriptor type can change when the descriptor is updated. When a descriptor is consumed by binding a descriptor set, the active descriptor type is considered, not VK_DESCRIPTOR_TYPE_MUTABLE_VALVE.

An active descriptor type of VK_DESCRIPTOR_TYPE_MUTABLE_VALVE is considered an undefined descriptor. If a descriptor is consumed where the active descriptor type does not match what the shader expects, the descriptor is considered an undefined descriptor.

Note
To find which descriptor types are supported as VK_DESCRIPTOR_TYPE_MUTABLE_VALVE, the application can use vkGetDescriptorSetLayoutSupport with an VK_DESCRIPTOR_TYPE_MUTABLE_VALVE binding, with the list of descriptor types to query in the VkMutableDescriptorTypeCreateInfoVALVE::pDescriptorTypes array for that binding.

Note
The intention of a mutable descriptor type is that implementations allocate N bytes per descriptor, where N is determined by the maximum descriptor size for a given descriptor binding. Implementations are not expected to keep track of the active descriptor type, and it should be considered a C-like union type.

A mutable descriptor type is not considered as efficient in terms of run-time performance as using a non-mutable descriptor type, and applications are not encouraged to use them outside API layering efforts. Mutable descriptor types can be more efficient if the alternative is using many different descriptors to emulate mutable descriptor types.

14.2. Descriptor Sets

Descriptors are grouped together into descriptor set objects. A descriptor set object is an opaque object containing storage for a set of descriptors, where the types and number of descriptors is defined by a descriptor set layout. The layout object may be used to define the association of each descriptor binding with memory or other implementation resources. The layout is used both for determining the resources that need to be associated with the descriptor set, and determining the interface between shader stages and shader resources.
14.2.1. Descriptor Set Layout

A descriptor set layout object is defined by an array of zero or more descriptor bindings. Each individual descriptor binding is specified by a descriptor type, a count (array size) of the number of descriptors in the binding, a set of shader stages that can access the binding, and (if using immutable samplers) an array of sampler descriptors.

Descriptor set layout objects are represented by `VkDescriptorSetLayout` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSetLayout)
```

To create descriptor set layout objects, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateDescriptorSetLayout(
    VkDevice device,                  // Provided by VK_VERSION_1_0
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,   // Provided by VK_VERSION_1_0
    const VkAllocationCallbacks* pAllocator,      // Provided by VK_VERSION_1_0
    VkDescriptorSetLayout* pSetLayout);         // Provided by VK_VERSION_1_0
```

- `device` is the logical device that creates the descriptor set layout.
- `pCreateInfo` is a pointer to a `VkDescriptorSetLayoutCreateInfo` structure specifying the state of the descriptor set layout object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pSetLayout` is a pointer to a `VkDescriptorSetLayout` handle in which the resulting descriptor set layout object is returned.

**Valid Usage (Implicit)**

- VUID-vkCreateDescriptorSetLayout-device-parameter
  ```
  device must be a valid VkDevice handle
  ```

- VUID-vkCreateDescriptorSetLayout-pCreateInfo-parameter
  ```
  pCreateInfo must be a valid pointer to a valid VkDescriptorSetLayoutCreateInfo structure
  ```

- VUID-vkCreateDescriptorSetLayout-pAllocator-parameter
  ```
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
  ```

- VUID-vkCreateDescriptorSetLayout-pSetLayout-parameter
  ```
  pSetLayout must be a valid pointer to a VkDescriptorSetLayout handle
  ```
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

Information about the descriptor set layout is passed in a VkDescriptorSetLayoutCreateInfo structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetLayoutCreateInfo {
    VkStructureType        sType;
    const void*             pNext;
    VkDescriptorSetLayoutCreateFlags flags;
    uint32_t                bindingCount;
    const VkDescriptorSetLayoutBinding* pBindings;
} VkDescriptorSetLayoutCreateInfo;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkDescriptorSetLayoutCreateFlagBits specifying options for descriptor set layout creation.
- bindingCount is the number of elements in pBindings.
- pBindings is a pointer to an array of VkDescriptorSetLayoutBinding structures.
Valid Usage

- VUID-VkDescriptorSetLayoutCreateInfo-binding-00279
  The VkDescriptorSetLayoutBinding::binding members of the elements of the pBindings array must each have different values.

- VUID-VkDescriptorSetLayoutCreateInfo-flags-00280
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, then all elements of pBindings must not have a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC.

- VUID-VkDescriptorSetLayoutCreateInfo-flags-02208
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, then all elements of pBindings must not have a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT.

- VUID-VkDescriptorSetLayoutCreateInfo-flags-00281
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, then the total number of elements of all bindings must be less than or equal to VkPhysicalDevicePushDescriptorPropertiesKHR::maxPushDescriptors.

- VUID-VkDescriptorSetLayoutCreateInfo-flags-04590
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, flags must not contain VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE.

- VUID-VkDescriptorSetLayoutCreateInfo-flags-04591
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, pBindings must not have a descriptorType of VK_DESCRIPTOR_TYPE_MUTABLE_VALVE.

- VUID-VkDescriptorSetLayoutCreateInfo-flags-03000
  If any binding has the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT bit set, flags must include VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT.

- VUID-VkDescriptorSetLayoutCreateInfo-descriptorType-03001
  If any binding has the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT bit set, then all bindings must not have descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC.

- VUID-VkDescriptorSetLayoutCreateInfo-flags-04592
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT, flags must not contain VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE.

- VUID-VkDescriptorSetLayoutCreateInfo-descriptorType-04593
  If any binding has a descriptorType value of VK_DESCRIPTOR_TYPE_MUTABLE_VALVE, then a VkMutableDescriptorTypeCreateInfoVALVE must be present in the pNext chain.

- VUID-VkDescriptorSetLayoutCreateInfo-descriptorType-04594
  If a binding has a descriptorType value of VK_DESCRIPTOR_TYPE_MUTABLE_VALVE, then pImmutableSamplers must be NULL.

- VUID-VkDescriptorSetLayoutCreateInfo-flags-04595
  If VkPhysicalDeviceMutableDescriptorTypeFeaturesVALVE::mutableDescriptorType is not enabled, pBindings must not contain a descriptorType of VK_DESCRIPTOR_TYPE_MUTABLE_VALVE.
If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE`, `VkPhysicalDeviceMutableDescriptorTypeFeaturesVALVE::mutableDescriptorType` must be enabled.

### Valid Usage (Implicit)

- **VUID-VkDescriptorSetLayoutCreateInfo-sType-sType**
  
  - `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO`

- **VUID-VkDescriptorSetLayoutCreateInfo-pNext-pNext**

  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDescriptorSetLayoutBindingFlagsCreateInfo` or `VkMutableDescriptorTypeCreateInfoVALVE`

- **VUID-VkDescriptorSetLayoutCreateInfo-sType-unique**

  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-parameter**

  `flags` must be a valid combination of `VkDescriptorSetLayoutCreateFlagBits` values

- **VUID-VkDescriptorSetLayoutCreateInfo-pBindings-parameter**

  If `bindingCount` is not 0, `pBindings` must be a valid pointer to an array of `bindingCount` valid `VkDescriptorSetLayoutBinding` structures

Information about the possible descriptor types for mutable descriptor types is passed in a `VkMutableDescriptorTypeCreateInfoVALVE` structure as a `pNext` to a `VkDescriptorSetLayoutCreateInfo` structure or a `VkDescriptorPoolCreateInfo` structure.

The `VkMutableDescriptorTypeCreateInfoVALVE` structure is defined as:

```c
// Provided by VK_VALVE_mutable_descriptor_type
typedef struct VkMutableDescriptorTypeCreateInfoVALVE {
  VkStructureType                            sType;
  const void*                                pNext;
  uint32_t                                   mutableDescriptorTypeListCount;
  const VkMutableDescriptorTypeListVALVE*    pMutableDescriptorTypeLists;
} VkMutableDescriptorTypeCreateInfoVALVE;
```

- `sType` is the type of this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `mutableDescriptorTypeListCount` is the number of elements in `pMutableDescriptorTypeLists`.

- `pMutableDescriptorTypeLists` is a pointer to an array of `VkMutableDescriptorTypeListVALVE` structures.

If `mutableDescriptorTypeListCount` is zero or if this structure is not included in the `pNext` chain, the `VkMutableDescriptorTypeListVALVE` for each element is considered to be zero or `NULL` for each member. Otherwise, the descriptor set layout binding at `VkDescriptorSetLayoutCreateInfo`
::pBindings[i] uses the descriptor type lists in VkMutableDescriptorTypeCreateInfoVALVE::pMutableDescriptorTypeLists[i].

Valid Usage (Implicit)

- VUID-VkMutableDescriptorTypeCreateInfoVALVE-sType-sType
  sType must be VK_STRUCTURE_TYPE_MUTABLE_DESCRIPTOR_TYPE_CREATE_INFO_VALVE

- VUID-VkMutableDescriptorTypeCreateInfoVALVE-pMutableDescriptorTypeLists-parameter
  If mutableDescriptorTypeListCount is not 0, pMutableDescriptorTypeLists must be a valid pointer to an array of mutableDescriptorTypeListCount valid VkMutableDescriptorTypeListVALVE structures

The list of potential descriptor types a given mutable descriptor can mutate to is passed in a VkMutableDescriptorTypeListVALVE structure.

The VkMutableDescriptorTypeListVALVE structure is defined as:

```c
// Provided by VK_VALVE_mutable_descriptor_type
typedef struct VkMutableDescriptorTypeListVALVE {
    uint32_t descriptorTypeCount;
    const VkDescriptorType* pDescriptorTypes;
} VkMutableDescriptorTypeListVALVE;
```

- descriptorTypeCount is the number of elements in pDescriptorTypes.
- pDescriptorTypes is NULL or a pointer to an array of descriptorTypeCount VkDescriptorType values which define which descriptor types a given binding may mutate to.
Valid Usage

- VUID-VkMutableDescriptorTypeListVALVE-descriptorTypeCount-04597
  `descriptorTypeCount` must not be 0 if the corresponding binding is of `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE`

- VUID-VkMutableDescriptorTypeListVALVE-pDescriptorTypes-04598
  `pDescriptorTypes` must be a valid pointer to an array of `descriptorTypeCount` valid, unique `VkDescriptorType` values if the given binding is of `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE` type

- VUID-VkMutableDescriptorTypeListVALVE-descriptorTypeCount-04599
  `descriptorTypeCount` must be 0 if the corresponding binding is not of `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE`

- VUID-VkMutableDescriptorTypeListVALVE-pDescriptorTypes-04600
  `pDescriptorTypes` must not contain `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE`

- VUID-VkMutableDescriptorTypeListVALVE-pDescriptorTypes-04601
  `pDescriptorTypes` must not contain `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`

- VUID-VkMutableDescriptorTypeListVALVE-pDescriptorTypes-04602
  `pDescriptorTypes` must not contain `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`

- VUID-VkMutableDescriptorTypeListVALVE-pDescriptorTypes-04603
  `pDescriptorTypes` must not contain `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`

Valid Usage (Implicit)

- VUID-VkMutableDescriptorTypeListVALVE-pDescriptorTypes-parameter
  If `descriptorTypeCount` is not 0, `pDescriptorTypes` must be a valid pointer to an array of `descriptorTypeCount` valid `VkDescriptorType` values

Bits which can be set in `VkDescriptorSetLayoutCreateInfo::flags` to specify options for descriptor set layout are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorSetLayoutCreateFlagBits {
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT = 0x00000002,
    // Provided by VK_KHR_push_descriptor
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR = 0x00000001,
    // Provided by VK_VALVE_mutable_descriptor_type
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE = 0x00000004,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT = VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT,
} VkDescriptorSetLayoutCreateFlagBits;
```

- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` specifies that descriptor sets must not be allocated using this layout, and descriptors are instead pushed by
vkCmdPushDescriptorSetKHR.

- **VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT** specifies that descriptor sets using this layout must be allocated from a descriptor pool created with the **VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT** bit set. Descriptor set layouts created with this bit set have alternate limits for the maximum number of descriptors per-stage and per-pipeline layout. The non-UpdateAfterBind limits only count descriptors in sets created without this flag. The UpdateAfterBind limits count all descriptors, but the limits may be higher than the non-UpdateAfterBind limits.

- **VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT** specifies that descriptor sets using this layout must be allocated from a descriptor pool created with the **VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT** bit set. Descriptor set layouts created with this bit have no expressable limit for maximum number of descriptors per-stage. Host descriptor sets are limited only by available host memory, but may be limited for implementation specific reasons. Implementations may limit the number of supported descriptors to UpdateAfterBind limits or non-UpdateAfterBind limits, whichever is larger.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorSetLayoutCreateFlags;
```

**VkDescriptorSetLayoutCreateFlags** is a bitmask type for setting a mask of zero or more **VkDescriptorSetLayoutCreateFlagBits**.

The **VkDescriptorSetLayoutBinding** structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetLayoutBinding {
    uint32_t              binding;
    VkDescriptorType      descriptorType;
    uint32_t              descriptorCount;
    VkShaderStageFlags    stageFlags;
    const VkSampler*      pImmutableSamplers;
} VkDescriptorSetLayoutBinding;
```

- **binding** is the binding number of this entry and corresponds to a resource of the same binding number in the shader stages.

- **descriptorType** is a **VkDescriptorType** specifying which type of resource descriptors are used for this binding.

- **descriptorCount** is the number of descriptors contained in the binding, accessed in a shader as an array, except if **descriptorType** is **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT** in which case **descriptorCount** is the size in bytes of the inline uniform block. If **descriptorCount** is zero this binding entry is reserved and the resource must not be accessed from any stage via this binding within any pipeline using the set layout.

- **stageFlags** member is a bitmask of **VkShaderStageFlagBits** specifying which pipeline shader stages can access a resource for this binding. **VK_SHADER_STAGE_ALL** is a shorthand specifying that all defined shader stages, including any additional stages defined by extensions, can access the
If a shader stage is not included in `stageFlags`, then a resource **must** not be accessed from that stage via this binding within any pipeline using the set layout. Other than input attachments which are limited to the fragment shader, there are no limitations on what combinations of stages **can** use a descriptor binding, and in particular a binding **can** be used by both graphics stages and the compute stage.

- `pImmutableSamplers` affects initialization of samplers. If `descriptorType` specifies a `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` type descriptor, then `pImmutableSamplers` **can** be used to initialize a set of *immutable samplers*. Immutable samplers are permanently bound into the set layout and **must** not be changed; updating a `VK_DESCRIPTOR_TYPE_SAMPLER` descriptor with immutable samplers is not allowed and updates to a `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` descriptor with immutable samplers does not modify the samplers (the image views are updated, but the sampler updates are ignored). If `pImmutableSamplers` is not `NULL`, then it points to an array of sampler handles that will be copied into the set layout and used for the corresponding binding. Only the sampler handles **must** not be destroyed before the final use of the set layout and any descriptor pools and sets created using it. If `pImmutableSamplers` is `NULL`, then the sampler slots are dynamic and sampler handles **must** be bound into descriptor sets using this layout. If `descriptorType` is not one of these descriptor types, then `pImmutableSamplers` is **ignored**.

The above layout definition allows the descriptor bindings to be specified sparsely such that not all binding numbers between 0 and the maximum binding number need to be specified in the `pBindings` array. Bindings that are not specified have a `descriptorCount` and `stageFlags` of zero, and the value of `descriptorType` is undefined. However, all binding numbers between 0 and the maximum binding number in the `VkDescriptorSetLayoutCreateInfo::pBindings` array **may** consume memory in the descriptor set layout even if not all descriptor bindings are used, though it **should** not consume additional memory from the descriptor pool.

---

**Note**

The maximum binding number specified **should** be as compact as possible to avoid wasted memory.
Valid Usage

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-00282**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `descriptorCount` is not 0 and `pImmutableSamplers` is not NULL, `pImmutableSamplers` must be a valid pointer to an array of `descriptorCount` valid `VkSampler` handles.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-04604**
  If the `inlineUniformBlock` feature is not enabled, `descriptorType` must not be `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-02209**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` then `descriptorCount` must be a multiple of 4.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-02210**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` then `descriptorCount` must be less than or equal to `VkPhysicalDeviceInlineUniformBlockPropertiesEXT::maxInlineUniformBlockSize`.

- **VUID-VkDescriptorSetLayoutBinding-descriptorCount-00283**
  If `descriptorCount` is not 0, `stageFlags` must be a valid combination of `VkShaderStageFlagBits` values.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-01510**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` and `descriptorCount` is not 0, then `stageFlags` must be 0 or `VK_SHADER_STAGE_FRAGMENT_BIT`.

- **VUID-VkDescriptorSetLayoutBinding-pImmuneSamplers-04009**
  The sampler objects indicated by `pImmutableSamplers` must not have a `borderColor` with one of the values `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-04605**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE`, then `pImmutableSamplers` must be NULL.

Valid Usage (Implicit)

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-parameter**
  `descriptorType` must be a valid `VkDescriptorType` value.

If the `pNext` chain of a `VkDescriptorSetLayoutCreateInfo` structure includes a `VkDescriptorSetLayoutBindingFlagsCreateInfo` structure, then that structure includes an array of flags, one for each descriptor set layout binding.

The `VkDescriptorSetLayoutBindingFlagsCreateInfo` structure is defined as:
typedef struct VkDescriptorSetLayoutBindingFlagsCreateInfo {
    VkStructureType                      sType;
    const void*                          pNext;
    uint32_t                              bindingCount;
    const VkDescriptorBindingFlags*      pBindingFlags;
} VkDescriptorSetLayoutBindingFlagsCreateInfo;

or the equivalent

// Provided by VK_EXT_descriptor_indexing
typedef VkDescriptorSetLayoutBindingFlagsCreateInfo VkDescriptorSetLayoutBindingFlagsCreateInfoEXT;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **bindingCount** is zero or the number of elements in **pBindingFlags**.
- **pBindingFlags** is a pointer to an array of **VkDescriptorBindingFlags** bitfields, one for each descriptor set layout binding.

If **bindingCount** is zero or if this structure is not included in the **pNext** chain, the **VkDescriptorBindingFlags** for each descriptor set layout binding is considered to be zero. Otherwise, the descriptor set layout binding at **VkDescriptorSetLayoutCreateInfo::pBindings[i]** uses the flags in **pBindingFlags[i]**.
Valid Usage

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-bindingCount-03002
  If `bindingCount` is not zero, `bindingCount` must equal `VkDescriptorSetLayoutCreateInfo::bindingCount`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-flags-03003
  If `VkDescriptorSetLayoutCreateInfo::flags` includes `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`, then all elements of `pBindingFlags` must not include `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`, `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT`, or `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03004
  If an element of `pBindingFlags` includes `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`, then all other elements of `VkDescriptorSetLayoutCreateInfo::pBindings` must have a smaller value of `binding`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUniformBufferUpdateAfterBind-03005
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformBufferUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingSampledImageUpdateAfterBind-03006
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingSampledImageUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageImageUpdateAfterBind-03007
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageImageUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageBufferUpdateAfterBind-03008
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageBufferUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUniformTexelBufferUpdateAfterBind-03009
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformTexelBufferUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageTexelBufferUpdateAfterBind-03010
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageTexelBufferUpdateAfterBind` is not enabled, all bindings with...
When binding descriptors to a set layout, certain descriptor types must not use the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`. These types include:

- **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER**
  - Must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` if
    - `VkPhysicalDeviceInlineUniformBlockFeaturesEXT::descriptorBindingInlineUniformBlockUpdateAfterBind` is not enabled.
  - All bindings with descriptor type **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT** must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` if
    - `VkPhysicalDeviceInlineUniformBlockFeaturesEXT::descriptorBindingInlineUniformBlockUpdateAfterBind` is not enabled.

- **VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT**
  - Must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` if
    - `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUpdateUnusedWhilePending` is not enabled.

- **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC**
  - Must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` if
    - `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUpdateUnusedWhilePending` is not enabled.

- **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC**
  - Must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` if
    - `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUpdateUnusedWhilePending` is not enabled.

Valid Usage (Implicit):

- **sType** must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_BINDING_FLAGS_CREATE_INFO`.
- **pBindingFlags** must be a valid pointer to an array of `bindingCount` valid combinations of `VkDescriptorBindingFlagBits` values if `bindingCount` is not 0.
Bits which **can** be set in each element of `VkDescriptorSetLayoutBindingFlagsCreateInfo::pBindingFlags` to specify options for the corresponding descriptor set layout binding are:

```cpp
typedef enum VkDescriptorBindingFlagBits {
    VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT = 0x00000001,
    VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT = 0x00000002,
    VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT = 0x00000004,
    VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT = 0x00000008,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT = VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT_EXT = VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT_EXT = VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT_EXT = VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT,
} VkDescriptorBindingFlagBits;
```

or the equivalent

```cpp
// Provided by VK_EXT_descriptor_indexing
typedef VkDescriptorBindingFlagBits VkDescriptorBindingFlagBitsEXT;
```

- **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** indicates that if descriptors in this binding are updated between when the descriptor set is bound in a command buffer and when that command buffer is submitted to a queue, then the submission will use the most recently set descriptors for this binding and the updates do not invalidate the command buffer. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in `vkUpdateDescriptorSetWithTemplateKHR` and `vkUpdateDescriptorSets`. Multiple descriptors with this flag set **can** be updated concurrently in different threads, though the same descriptor **must** not be updated concurrently by two threads. Descriptors with this flag set **can** be updated concurrently with the set being bound to a command buffer in another thread, but not concurrently with the set being reset or freed.

- **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** indicates that descriptors in this binding that are not **dynamically used** need not contain valid descriptors at the time the descriptors are consumed. A descriptor is dynamically used if any shader invocation executes an instruction that performs any memory access using the descriptor.

- **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** indicates that descriptors in this binding **can** be updated after a command buffer has bound this descriptor set, or while a command buffer that uses this descriptor set is pending execution, as long as the descriptors that are updated are not used by those command buffers. If **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** is also set, then descriptors **can** be updated as long
as they are not dynamically used by any shader invocations. If
\texttt{VK\_DESCRIPTOR\_BINDING\_PARTIALLY\_BOUND\_BIT} is not set, then descriptors \textbf{can} be updated as long as
they are not statically used by any shader invocations.

- \texttt{VK\_DESCRIPTOR\_BINDING\_VARIABLE\_DESCRIPTOR\_COUNT\_BIT} indicates that this descriptor binding has
a variable size that will be specified when a descriptor set is allocated using this layout. The
value of \texttt{descriptorCount} is treated as an upper bound on the size of the binding. This \textbf{must} only
be used for the last binding in the descriptor set layout (i.e. the binding with the largest value of
binding). For the purposes of counting against limits such as \texttt{maxDescriptorSet*} and
\texttt{maxPerStageDescriptor*}, the full value of \texttt{descriptorCount} is counted, except for descriptor
bindings with a descriptor type of \texttt{VK\_DESCRIPTOR\_TYPE\_INLINE\_UNIFORM\_BLOCK\_EXT} where
\texttt{descriptorCount} specifies the upper bound on the byte size of the binding, thus it counts against
the \texttt{maxInlineUniformBlockSize} limit instead.

\textbf{Note}

Note that while \texttt{VK\_DESCRIPTOR\_BINDING\_UPDATE\_AFTER\_BIND\_BIT} and
\texttt{VK\_DESCRIPTOR\_BINDING\_UPDATE\_UNUSED\_WHILE\_PENDING\_BIT} both involve updates to
descriptor sets after they are bound, \texttt{VK\_DESCRIPTOR\_BINDING\_UPDATE\_UNUSED\_WHILE\_PENDING\_BIT} is a weaker requirement
since it is only about descriptors that are not used, whereas \texttt{VK\_DESCRIPTOR\_BINDING\_UPDATE\_AFTER\_BIND\_BIT} requires the implementation to
observe updates to descriptors that are used.

typedef VkFlags VkDescriptorBindingFlags;

or the equivalent

```c
// Provided by VK\_EXT\_descriptor\_indexing
typedef VkDescriptorBindingFlags VkDescriptorBindingFlagsEXT;
```

\texttt{VkDescriptorBindingFlags} is a bitmask type for setting a mask of zero or more
\texttt{VkDescriptorBindingFlagBits}.

To query information about whether a descriptor set layout \textbf{can} be created, call:

```c
// Provided by VK\_VERSION\_1\_1
void vkGetDescriptorSetLayoutSupport(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    VkDescriptorSetLayoutSupport* pSupport);
```

or the equivalent command
void vkGetDescriptorSetLayoutSupportKHR(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    VkDescriptorSetLayoutSupport* pSupport);

- `device` is the logical device that would create the descriptor set layout.
- `pCreateInfo` is a pointer to a `VkDescriptorSetLayoutCreateInfo` structure specifying the state of the descriptor set layout object.
- `pSupport` is a pointer to a `VkDescriptorSetLayoutSupport` structure, in which information about support for the descriptor set layout object is returned.

Some implementations have limitations on what fits in a descriptor set which are not easily expressible in terms of existing limits like `maxDescriptorSet*`, for example if all descriptor types share a limited space in memory but each descriptor is a different size or alignment. This command returns information about whether a descriptor set satisfies this limit. If the descriptor set layout satisfies the `VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors` limit, this command is guaranteed to return `VK_TRUE` in `VkDescriptorSetLayoutSupport::supported`. If the descriptor set layout exceeds the `VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors` limit, whether the descriptor set layout is supported is implementation-dependent and `may` depend on whether the descriptor sizes and alignments cause the layout to exceed an internal limit.

This command does not consider other limits such as `maxPerStageDescriptor*`, and so a descriptor set layout that is supported according to this command `must` still satisfy the pipeline layout limits such as `maxPerStageDescriptor*` in order to be used in a pipeline layout.

**Note**

This is a `VkDevice` query rather than `VkPhysicalDevice` because the answer `may` depend on enabled features.

**Valid Usage (Implicit)**

- `VUID-vkGetDescriptorSetLayoutSupport-device-parameter`
  
  `device` must be a valid `VkDevice` handle

- `VUID-vkGetDescriptorSetLayoutSupport-pCreateInfo-parameter`
  
  `pCreateInfo` must be a valid pointer to a valid `VkDescriptorSetLayoutCreateInfo` structure

- `VUID-vkGetDescriptorSetLayoutSupport-pSupport-parameter`
  
  `pSupport` must be a valid pointer to a `VkDescriptorSetLayoutSupport` structure

Information about support for the descriptor set layout is returned in a `VkDescriptorSetLayoutSupport` structure:
typedef struct VkDescriptorSetLayoutSupport {
    VkStructureType          sType;
    void*                     pNext;
    VkBool32                  supported;
} VkDescriptorSetLayoutSupport;

or the equivalent

typedef VkDescriptorSetLayoutSupport VkDescriptorSetLayoutSupportKHR;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supported` specifies whether the descriptor set layout can be created.

`supported` is set to `VK_TRUE` if the descriptor set can be created, or else is set to `VK_FALSE`.

Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutSupport-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_SUPPORT`

- VUID-VkDescriptorSetLayoutSupport-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkDescriptorSetVariableDescriptorCountLayoutSupport`

- VUID-VkDescriptorSetLayoutSupport-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

If the `pNext` chain of a `VkDescriptorSetLayoutSupport` structure includes a `VkDescriptorSetVariableDescriptorCountLayoutSupport` structure, then that structure returns additional information about whether the descriptor set layout is supported.

typedef struct VkDescriptorSetVariableDescriptorCountLayoutSupport {
    VkStructureType          sType;
    void*                     pNext;
    uint32_t                  maxVariableDescriptorCount;
} VkDescriptorSetVariableDescriptorCountLayoutSupport;

or the equivalent
typedef VkDescriptorSetVariableDescriptorCountLayoutSupport
VkDescriptorSetVariableDescriptorCountLayoutSupportEXT;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• maxVariableDescriptorCount indicates the maximum number of descriptors supported in the highest numbered binding of the layout, if that binding is variable-sized. If the highest numbered binding of the layout has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT then maxVariableDescriptorCount indicates the maximum byte size supported for the binding, if that binding is variable-sized.

If the create info includes a variable-sized descriptor, then supported is determined assuming the requested size of the variable-sized descriptor, and maxVariableDescriptorCount is set to the maximum size of that descriptor that can be successfully created (which is greater than or equal to the requested size passed in). If the create info does not include a variable-sized descriptor or if the VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingVariableDescriptorCount feature is not enabled, then maxVariableDescriptorCount is set to zero. For the purposes of this command, a variable-sized descriptor binding with a descriptorCount of zero is treated as if the descriptorCount is one, and thus the binding is not ignored and the maximum descriptor count will be returned. If the layout is not supported, then the value written to maxVariableDescriptorCount is undefined.

Valid Usage (Implicit)

• VUID-VkDescriptorSetVariableDescriptorCountLayoutSupport-sType-sType
sType must be
VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_LAYOUT_SUPPORT

The following examples show a shader snippet using two descriptor sets, and application code that creates corresponding descriptor set layouts.
GLSL example

// binding to a single sampled image descriptor in set 0
//
layout (set=0, binding=0) uniform texture2D mySampledImage;

// binding to an array of sampled image descriptors in set 0
//
layout (set=0, binding=1) uniform texture2D myArrayOfSampledImages[12];

// binding to a single uniform buffer descriptor in set 1
//
layout (set=1, binding=0) uniform myUniformBuffer
{
    vec4 myElement[32];
};
SPIR-V example

```assembly
...%1 = OpExtInstImport "GLSL.std.450"
...

OpName %9 "mySampledImage"
OpName %14 "myArrayOfSampledImages"
OpName %18 "myUniformBuffer"
OpMemberName %18 0 "myElement"
OpName %20 ""
OpDecorate %9 DescriptorSet 0
OpDecorate %9 Binding 0
OpDecorate %14 DescriptorSet 0

API example

```cpp
VkResult myResult;

const VkDescriptorSetLayoutBinding myDescriptorSetLayoutBinding[] =
{
    // binding to a single image descriptor
    {
        0,    // binding
        VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,    // descriptorType
        1,    // descriptorCount
        VK_SHADER_STAGE_FRAGMENT_BIT,       // stageFlags
```
// Create info for first descriptor set with two descriptor bindings
{
    VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO, // sType
    NULL, // pNext
    0, // flags
    2, // bindingCount
    &myDescriptorSetLayoutBinding[0] // pBindings
},

// Create info for second descriptor set with one descriptor binding
{
    VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO, // sType
    NULL, // pNext
    0, // flags
    1, // bindingCount
}
};

VkDescriptorSetLayout myDescriptorSetLayout[2];

// Create first descriptor set layout
myResult = vkCreateDescriptorSetLayout(myDevice,
    &myDescriptorSetLayoutCreateInfo[0],
To destroy a descriptor set layout, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyDescriptorSetLayout(
    VkDevice device,
    VkDescriptorSetLayout descriptorSetLayout,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the descriptor set layout.
- `descriptorSetLayout` is the descriptor set layout to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00284
  If `VkAllocationCallbacks` were provided when `descriptorSetLayout` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00285
  If no `VkAllocationCallbacks` were provided when `descriptorSetLayout` was created, `pAllocator` must be NULL
Valid Usage (Implicit)

- VUID-vkDestroyDescriptorSetLayout-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-parameter
  
  If `descriptorSetLayout` is not `VK_NULL_HANDLE`, `descriptorSetLayout` must be a valid `VkDescriptorSetLayout` handle

- VUID-vkDestroyDescriptorSetLayout-pAllocator-parameter
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-parent
  
  If `descriptorSetLayout` is a valid handle, it must have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `descriptorSetLayout` must be externally synchronized

14.2.2. Pipeline Layouts

Access to descriptor sets from a pipeline is accomplished through a *pipeline layout*. Zero or more descriptor set layouts and zero or more push constant ranges are combined to form a pipeline layout object describing the complete set of resources that can be accessed by a pipeline. The pipeline layout represents a sequence of descriptor sets with each having a specific layout. This sequence of layouts is used to determine the interface between shader stages and shader resources. Each pipeline is created using a pipeline layout.

Pipeline layout objects are represented by `VkPipelineLayout` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineLayout)
```

To create a pipeline layout, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineLayout(
    VkDevice                                    device,
    const VkPipelineLayoutCreateInfo*           pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkPipelineLayout*                           pPipelineLayout);
```

- `device` is the logical device that creates the pipeline layout.
- `pCreateInfo` is a pointer to a `VkPipelineLayoutCreateInfo` structure specifying the state of the
pipeline layout object.

- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pPipelineLayout** is a pointer to a `VkPipelineLayout` handle in which the resulting pipeline layout object is returned.

### Valid Usage (Implicit)

- **VUID-vkCreatePipelineLayout-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkCreatePipelineLayout-pCreateInfo-parameter**
  - `pCreateInfo` must be a valid pointer to a valid `VkPipelineLayoutCreateInfo` structure
- **VUID-vkCreatePipelineLayout-pAllocator-parameter**
  - If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreatePipelineLayout-pPipelineLayout-parameter**
  - `pPipelineLayout` must be a valid pointer to a `VkPipelineLayout` handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkPipelineLayoutCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineLayoutCreateInfo {
    VkStructureType         sType;
    const void*             pNext;
    VkPipelineLayoutCreateFlags flags;
    uint32_t                 setLayoutCount;
    const VkDescriptorSetLayout* pSetLayouts;
    uint32_t                 pushConstantRangeCount;
    const VkPushConstantRange* pPushConstantRanges;
} VkPipelineLayoutCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
• `setLayoutCount` is the number of descriptor sets included in the pipeline layout.

• `pSetLayouts` is a pointer to an array of `VkDescriptorSetLayout` objects.

• `pushConstantRangeCount` is the number of push constant ranges included in the pipeline layout.

• `pPushConstantRanges` is a pointer to an array of `VkPushConstantRange` structures defining a set of push constant ranges for use in a single pipeline layout. In addition to descriptor set layouts, a pipeline layout also describes how many push constants can be accessed by each stage of the pipeline.

---

**Note**

Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.
Valid Usage

- VUID-VkPipelineLayoutCreateInfo-setLayoutCount-00286
  
  `setLayoutCount` must be less than or equal to `VkPhysicalDeviceLimits::maxBoundDescriptorSets`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03016
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorSamplers`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03017
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` and `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorUniformBuffers`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03018
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorStorageBuffers`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03019
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorSampledImages`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03020
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorStorageImages`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03021
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorInputAttachments`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-02214
  
  The total number of bindings in descriptor set layouts created without the
VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceInlineUniformBlockPropertiesEXT::maxPerStageDescriptorInlineUniformBlocks

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03022
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindSamplers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03023
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER and VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindUniformBuffers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03024
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER and VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindStorageBuffers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03025
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, and VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindSampledImages

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03026
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindStorageImages

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03027
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindInputAttachments

- VUID-VkPipelineLayoutCreateInfo-descriptorType-02215
  The total number of bindings with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to
 VkPhysicalDeviceInlineUniformBlockPropertiesEXT::maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03028
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetSamplers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03029
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03030
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffersDynamic

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03031
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03032
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffersDynamic

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03033
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, and VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetSampledImages

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03034
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageImages
The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetInputAttachments`.

The total number of bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceInlineUniformBlockPropertiesEXT::maxDescriptorSetInlineUniformBlocks`.

The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSamplers`.

The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffers`.

The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffersDynamic`.

The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffers`.

The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffersDynamic`.

The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSampledImages`.

The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` and
VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageImages.

- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03043
  The total number of descriptors of the type VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindInputAttachments.

- VUID-VkPipelineLayoutCreateInfo-pPushConstantRanges-00292
  Any two elements of pPushConstantRanges must not include the same stage in stageFlags.

- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-00293
  pSetLayouts must not contain more than one descriptor set layout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR set.

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03571
  The total number of bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPerStageDescriptorAccelerationStructures.

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03572
  The total number of bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxDescriptorSetAccelerationStructures.

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03573
  The total number of bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxDescriptorSetUpdateAfterBindAccelerationStructures.

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03574
  The total number of bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxDescriptorSetUpdateAfterBindAccelerationStructures.
The total number of bindings with a `descriptorType` of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxDescriptorSetAccelerationStructures`.

The total number of `pImmutableSamplers` created with `flags` containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` or `VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT` across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::maxDescriptorSetSubsampledSamplers`.

Any element of `pSetLayouts` must not have been created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE` bit set.

---

**Valid Usage (Implicit)**

- `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO`
- `pNext` must be `NULL`
- `flags` must be `0`

If `setLayoutCount` is not `0`, `pSetLayouts` must be a valid pointer to an array of `setLayoutCount` valid `VkDescriptorSetLayout` handles.

If `pushConstantRangeCount` is not `0`, `pPushConstantRanges` must be a valid pointer to an array of `pushConstantRangeCount` valid `VkPushConstantRange` structures.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineLayoutCreateFlags;
```

`VkPipelineLayoutCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkPushConstantRange` structure is defined as:
// Provided by VK_VERSION_1_0

typedef struct VkPushConstantRange {
    VkShaderStageFlags    stageFlags;
    uint32_t              offset;
    uint32_t              size;
} VkPushConstantRange;

- **stageFlags** is a set of stage flags describing the shader stages that will access a range of push constants. If a particular stage is not included in the range, then accessing members of that range of push constants from the corresponding shader stage will return undefined values.

- **offset** and **size** are the start offset and size, respectively, consumed by the range. Both **offset** and **size** are in units of bytes and **must** be a multiple of 4. The layout of the push constant variables is specified in the shader.

**Valid Usage**

- VUID-VkPushConstantRange-offset-00294
  **offset** **must** be less than `VkPhysicalDeviceLimits::maxPushConstantsSize`

- VUID-VkPushConstantRange-offset-00295
  **offset** **must** be a multiple of 4

- VUID-VkPushConstantRange-size-00296
  **size** **must** be greater than 0

- VUID-VkPushConstantRange-size-00297
  **size** **must** be a multiple of 4

- VUID-VkPushConstantRange-size-00298
  **size** **must** be less than or equal to `VkPhysicalDeviceLimits::maxPushConstantsSize` minus **offset**

**Valid Usage (Implicit)**

- VUID-VkPushConstantRange-stageFlags-parameter
  **stageFlags** **must** be a valid combination of `VkShaderStageFlagBits` values

- VUID-VkPushConstantRange-stageFlags-requiredbitmask
  **stageFlags** **must** not be 0

Once created, pipeline layouts are used as part of pipeline creation (see **Pipelines**), as part of binding descriptor sets (see **Descriptor Set Binding**), and as part of setting push constants (see **Push Constant Updates**). Pipeline creation accepts a pipeline layout as input, and the layout **may** be used to map (set, binding, arrayElement) tuples to implementation resources or memory locations within a descriptor set. The assignment of implementation resources depends only on the bindings defined in the descriptor sets that comprise the pipeline layout, and not on any shader source.

All resource variables **statically used** in all shaders in a pipeline **must** be declared with a
(set, binding, arrayElement) that exists in the corresponding descriptor set layout and is of an appropriate descriptor type and includes the set of shader stages it is used by in `stageFlags`. The pipeline layout can include entries that are not used by a particular pipeline, or that are dead-code eliminated from any of the shaders. The pipeline layout allows the application to provide a consistent set of bindings across multiple pipeline compiles, which enables those pipelines to be compiled in a way that the implementation may cheaply switch pipelines without reprogramming the bindings.

Similarly, the push constant block declared in each shader (if present) must only place variables at offsets that are each included in a push constant range with `stageFlags` including the bit corresponding to the shader stage that uses it. The pipeline layout can include ranges or portions of ranges that are not used by a particular pipeline, or for which the variables have been dead-code eliminated from any of the shaders.

There is a limit on the total number of resources of each type that can be included in bindings in all descriptor set layouts in a pipeline layout as shown in Pipeline Layout Resource Limits. The “Total Resources Available” column gives the limit on the number of each type of resource that can be included in bindings in all descriptor sets in the pipeline layout. Some resource types count against multiple limits. Additionally, there are limits on the total number of each type of resource that can be used in any pipeline stage as described in Shader Resource Limits.

### Table 18. Pipeline Layout Resource Limits

Chapter 14. Resource Descriptors | 941
To destroy a pipeline layout, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipelineLayout(
    VkDevice device,
    VkPipelineLayout pipelineLayout,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the pipeline layout.
- `pipelineLayout` is the pipeline layout to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- VUID-vkDestroyPipelineLayout-pipelineLayout-00299
  If `VkAllocationCallbacks` were provided when `pipelineLayout` was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyPipelineLayout-pipelineLayout-00300
  If no `VkAllocationCallbacks` were provided when `pipelineLayout` was created, `pAllocator` must be NULL.

- VUID-vkDestroyPipelineLayout-pipelineLayout-02004
  `pipelineLayout` must not have been passed to any `vkCmd*` command for any command buffers that are still in the recording state when `vkDestroyPipelineLayout` is called.
Valid Usage (Implicit)

- **VUID-vkDestroyPipelineLayout-device-parameter**
  
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkDestroyPipelineLayout-pipelineLayout-parameter**
  
  If `pipelineLayout` is not `VK_NULL_HANDLE`, `pipelineLayout` **must** be a valid `VkPipelineLayout` handle

- **VUID-vkDestroyPipelineLayout-pAllocator-parameter**
  
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyPipelineLayout-pPipelineLayout-parent**
  
  If `pipelineLayout` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `pipelineLayout` **must** be externally synchronized

Pipeline Layout Compatibility

Two pipeline layouts are defined to be “compatible for push constants” if they were created with identical push constant ranges. Two pipeline layouts are defined to be “compatible for set N” if they were created with *identically defined* descriptor set layouts for sets zero through N, and if they were created with identical push constant ranges.

When binding a descriptor set (see *Descriptor Set Binding*) to set number N, if the previously bound descriptor sets for sets zero through N-1 were all bound using compatible pipeline layouts, then performing this binding does not disturb any of the lower numbered sets. If, additionally, the previously bound descriptor set for set N was bound using a pipeline layout compatible for set N, then the bindings in sets numbered greater than N are also not disturbed.

Similarly, when binding a pipeline, the pipeline **can** correctly access any previously bound descriptor sets which were bound with compatible pipeline layouts, as long as all lower numbered sets were also bound with compatible layouts.

Layout compatibility means that descriptor sets **can** be bound to a command buffer for use by any pipeline created with a compatible pipeline layout, and without having bound a particular pipeline first. It also means that descriptor sets **can** remain valid across a pipeline change, and the same resources will be accessible to the newly bound pipeline.
Implementor’s Note

A consequence of layout compatibility is that when the implementation compiles a pipeline layout and maps pipeline resources to implementation resources, the mechanism for set \( N \) should only be a function of sets \([0..N]\).

**Note**

Place the least frequently changing descriptor sets near the start of the pipeline layout, and place the descriptor sets representing the most frequently changing resources near the end. When pipelines are switched, only the descriptor set bindings that have been invalidated will need to be updated and the remainder of the descriptor set bindings will remain in place.

The maximum number of descriptor sets that can be bound to a pipeline layout is queried from physical device properties (see `maxBoundDescriptorSets` in **Limits**).
API example

```c
const VkDescriptorSetLayout layouts[] = { layout1, layout2 };

const VkPushConstantRange ranges[] = {
    {
        VK_SHADER_STAGE_VERTEX_BIT, // stageFlags
        0, // offset
        4 // size
    },
    {
        VK_SHADER_STAGE_FRAGMENT_BIT, // stageFlags
        4, // offset
        4 // size
    }
};

const VkPipelineLayoutCreateInfo createInfo = {
    VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO, // sType
    NULL, // pNext
    0, // flags
    2, // setLayoutCount
    layouts, // pSetLayouts
    2, // pushConstantRangeCount
    ranges // pPushConstantRanges
};

VkPipelineLayout myPipelineLayout;
myResult = vkCreatePipelineLayout(
    myDevice,
    &createInfo,
    NULL,
    &myPipelineLayout);
```

14.2.3. Allocation of Descriptor Sets

A descriptor pool maintains a pool of descriptors, from which descriptor sets are allocated. Descriptor pools are externally synchronized, meaning that the application must not allocate and/or free descriptor sets from the same pool in multiple threads simultaneously.

Descriptor pools are represented by VkDescriptorPool handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorPool)
```

To create a descriptor pool object, call:
// Provided by VK_VERSION_1_0
VkResult vkCreateDescriptorPool(
    VkDevice                                    device,
    const VkDescriptorPoolCreateInfo*           pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkDescriptorPool*                           pDescriptorPool);

• device is the logical device that creates the descriptor pool.

• pCreateInfo is a pointer to a VkDescriptorPoolCreateInfo structure specifying the state of the descriptor pool object.

• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

• pDescriptorPool is a pointer to a VkDescriptorPool handle in which the resulting descriptor pool object is returned.

The created descriptor pool is returned in pDescriptorPool.

Valid Usage (Implicit)

• VUID-vkCreateDescriptorPool-device-parameter
device must be a valid VkDevice handle

• VUID-vkCreateDescriptorPool-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkDescriptorPoolCreateInfo structure

• VUID-vkCreateDescriptorPool-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateDescriptorPool-pDescriptorPool-parameter
pDescriptorPool must be a valid pointer to a VkDescriptorPool handle

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR.Fragmentation_EXT

Additional information about the pool is passed in a VkDescriptorPoolCreateInfo structure:
typedef struct VkDescriptorPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorPoolCreateFlags flags;
    uint32_t maxSets;
    uint32_t poolSizeCount;
    const VkDescriptorPoolSize* pPoolSizes;
} VkDescriptorPoolCreateInfo;

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is a bitmask of `VkDescriptorPoolCreateFlagBits` specifying certain supported operations on the pool.
• `maxSets` is the maximum number of descriptor sets that can be allocated from the pool.
• `poolSizeCount` is the number of elements in `pPoolSizes`.
• `pPoolSizes` is a pointer to an array of `VkDescriptorPoolSize` structures, each containing a descriptor type and number of descriptors of that type to be allocated in the pool.

If multiple `VkDescriptorPoolSize` structures appear in the `pPoolSizes` array then the pool will be created with enough storage for the total number of descriptors of each type.

Fragmentation of a descriptor pool is possible and may lead to descriptor set allocation failures. A failure due to fragmentation is defined as failing a descriptor set allocation despite the sum of all outstanding descriptor set allocations from the pool plus the requested allocation requiring no more than the total number of descriptors requested at pool creation. Implementations provide certain guarantees of when fragmentation must not cause allocation failure, as described below.

If a descriptor pool has not had any descriptor sets freed since it was created or most recently reset then fragmentation must not cause an allocation failure (note that this is always the case for a pool created without the `VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT` bit set). Additionally, if all sets allocated from the pool since it was created or most recently reset use the same number of descriptors (of each type) and the requested allocation also uses that same number of descriptors (of each type), then fragmentation must not cause an allocation failure.

If an allocation failure occurs due to fragmentation, an application can create an additional descriptor pool to perform further descriptor set allocations.

If `flags` has the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set, descriptor pool creation may fail with the error `VK_ERROR_FRAGMENTATION` if the total number of descriptors across all pools (including this one) created with this bit set exceeds `maxUpdateAfterBindDescriptorsInAllPools`, or if fragmentation of the underlying hardware resources occurs.

If a `pPoolSizes[i]::type` is `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE`, a `VkMutableDescriptorTypeCreateInfoVALVE` struct in the `pNext` chain can be used to specify which mutable descriptor types can be allocated from the pool. If present in the `pNext` chain, `VkMutableDescriptorTypeCreateInfoVALVE::pMutableDescriptorTypeLists[i]` specifies which kind of
VK_DESCRIPTOR_TYPE_MUTABLE_VALVE descriptors can be allocated from this pool entry. If VkMutableDescriptorTypeCreateInfoVALVE does not exist in the pNext chain, or VkMutableDescriptorTypeCreateInfoVALVE::pMutableDescriptorTypeLists[i] is out of range, the descriptor pool allocates enough memory to be able to allocate a VK_DESCRIPTOR_TYPE_MUTABLE_VALVE descriptor with any supported VkDescriptorType as a mutable descriptor. A mutable descriptor can be allocated from a pool entry if the type list in VkDescriptorSetLayoutCreateInfo is a subset of the type list declared in the descriptor pool, or if the pool entry is created without a descriptor type list. Multiple pPoolSizes entries with VK_DESCRIPTOR_TYPE_MUTABLE_VALVE can be declared. When multiple such pool entries are present in pPoolSizes, they specify sets of supported descriptor types which either fully overlap, partially overlap, or are disjoint. Two sets fully overlap if the sets of supported descriptor types are equal. If the sets are not disjoint they partially overlap. A pool entry without a VkMutableDescriptorTypeListVALVE assigned to it is considered to partially overlap any other pool entry which has a VkMutableDescriptorTypeListVALVE assigned to it. The application must ensure that partial overlap does not exist in pPoolSizes.

Note
The requirement of no partial overlap is intended to resolve ambiguity for validation as there is no confusion which pPoolSizes entries will be allocated from. An implementation is not expected to depend on this requirement.

Valid Usage

- VUID-VkDescriptorPoolCreateInfo-maxSets-00301
  maxSets must be greater than 0

- VUID-VkDescriptorPoolCreateInfo-flags-04607
  If flags has the VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_VALVE bit set, then the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT bit must not be set

- VUID-VkDescriptorPoolCreateInfo-flags-04608
  If VkPhysicalDeviceMutableDescriptorTypeFeaturesVALVE::mutableDescriptorType is not enabled, pPoolSizes must not contain a descriptorType of VK_DESCRIPTOR_TYPE_MUTABLE_VALVE

- VUID-VkDescriptorPoolCreateInfo-flags-04609
  If flags has the VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_VALVE bit set, VkPhysicalDeviceMutableDescriptorTypeFeaturesVALVE::mutableDescriptorType must be enabled

- VUID-VkDescriptorPoolCreateInfo-pPoolSizes-04787
  If pPoolSizes contains a descriptorType of VK_DESCRIPTOR_TYPE_MUTABLE_VALVE, any other VK_DESCRIPTOR_TYPE_MUTABLE_VALVE element in pPoolSizes must not have sets of supported descriptor types which partially overlap
Valid Usage (Implicit)

- **VUID-VkDescriptorPoolCreateInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_CREATE_INFO`

- **VUID-VkDescriptorPoolCreateInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDescriptorPoolInlineUniformBlockCreateInfoEXT` or `VkMutableDescriptorTypeCreateInfoVALVE`.

- **VUID-VkDescriptorPoolCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkDescriptorPoolCreateInfo-flags-parameter**
  
  `flags` must be a valid combination of `VkDescriptorPoolCreateFlagBits` values.

- **VUID-VkDescriptorPoolCreateInfo-pPoolSizes-parameter**
  
  `pPoolSizes` must be a valid pointer to an array of `poolSizeCount` valid `VkDescriptorPoolSize` structures.

- **VUID-VkDescriptorPoolCreateInfo-poolSizeCount-arraylength**
  
  `poolSizeCount` must be greater than 0.

In order to be able to allocate descriptor sets having inline uniform block bindings the descriptor pool must be created with specifying the inline uniform block binding capacity of the descriptor pool, in addition to the total inline uniform data capacity in bytes which is specified through a `VkDescriptorPoolSize` structure with a `descriptorType` value of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`. This can be done by adding a `VkDescriptorPoolInlineUniformBlockCreateInfoEXT` structure to the `pNext` chain of `VkDescriptorPoolCreateInfo`.

The `VkDescriptorPoolInlineUniformBlockCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_inline_uniform_block
typedef struct VkDescriptorPoolInlineUniformBlockCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           maxInlineUniformBlockBindings;
} VkDescriptorPoolInlineUniformBlockCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxInlineUniformBlockBindings` is the number of inline uniform block bindings to allocate.
Valid Usage (Implicit)

- VUID-VkDescriptorPoolInlineUniformBlockCreateInfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_INLINE_UNIFORM_BLOCK_CREATE_INFO_EXT`

Bits which can be set in `VkDescriptorPoolCreateInfo::flags` to enable operations on a descriptor pool are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorPoolCreateFlagBits {
    VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT = 0x00000001,
    VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT = 0x00000002,
    // Provided by VK_VALVE_mutable_descriptor_type
    VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_VALVE = 0x00000004,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT =
        VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT,
} VkDescriptorPoolCreateFlagBits;
```

- `VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT` specifies that descriptor sets can return their individual allocations to the pool, i.e. all of `vkAllocateDescriptorSets`, `vkFreeDescriptorSets`, and `vkResetDescriptorPool` are allowed. Otherwise, descriptor sets allocated from the pool must not be individually freed back to the pool, i.e. only `vkAllocateDescriptorSets` and `vkResetDescriptorPool` are allowed.

- `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` specifies that descriptor sets allocated from this pool can include bindings with the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit set. It is valid to allocate descriptor sets that have bindings that do not set the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit from a pool that has `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` set.

- `VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_VALVE` specifies that this descriptor pool and the descriptor sets allocated from it reside entirely in host memory and cannot be bound. Descriptor sets allocated from this pool are partially exempt from the external synchronization requirement in `vkUpdateDescriptorSetWithTemplateKHR` and `vkUpdateDescriptorSets`. Descriptor sets and their descriptors can be updated concurrently in different threads, though the same descriptor must not be updated concurrently by two threads.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorPoolCreateFlags;
```

`VkDescriptorPoolCreateFlags` is a bitmask type for setting a mask of zero or more `VkDescriptorPoolCreateFlagBits`.

The `VkDescriptorPoolSize` structure is defined as:
```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorPoolSize {
    VkDescriptorType    type;
    uint32_t            descriptorCount;
} VkDescriptorPoolSize;
```

- **type** is the type of descriptor.
- **descriptorCount** is the number of descriptors of that type to allocate. If **type** is **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT** then **descriptorCount** is the number of bytes to allocate for descriptors of this type.

**Note**
When creating a descriptor pool that will contain descriptors for combined image samplers of multi-planar formats, an application needs to account for non-trivial descriptor consumption when choosing the **descriptorCount** value, as indicated by **VkSamplerYcbcrConversionImageFormatProperties::combinedImageSamplerDescriptorCount**.

### Valid Usage

- **VUID-VkDescriptorPoolSize-descriptorCount-00302**
  - **descriptorCount** must be greater than 0
- **VUID-VkDescriptorPoolSize-type-02218**
  - If **type** is **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT** then **descriptorCount** must be a multiple of 4

### Valid Usage (Implicit)

- **VUID-VkDescriptorPoolSize-type-parameter**
  - **type** must be a valid **VkDescriptorType** value

To destroy a descriptor pool, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyDescriptorPool(
    VkDevice                                    device,
    VkDescriptorPool                            descriptorPool,
    const VkAllocationCallbacks*                pAllocator);
```

- **device** is the logical device that destroys the descriptor pool.
- **descriptorPool** is the descriptor pool to destroy.
- **pAllocator** controls host memory allocation as described in the *Memory Allocation* chapter.
When a pool is destroyed, all descriptor sets allocated from the pool are implicitly freed and become invalid. Descriptor sets allocated from a given pool do not need to be freed before destroying that descriptor pool.

**Valid Usage**

- VUID-vkDestroyDescriptorPool-descriptorPool-00303
  All submitted commands that refer to descriptorPool (via any allocated descriptor sets) must have completed execution

- VUID-vkDestroyDescriptorPool-descriptorPool-00304
  If VkAllocationCallbacks were provided when descriptorPool was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyDescriptorPool-descriptorPool-00305
  If no VkAllocationCallbacks were provided when descriptorPool was created, pAllocator must be NULL

**Valid Usage (Implicit)**

- VUID-vkDestroyDescriptorPool-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyDescriptorPool-descriptorPool-parameter
  If descriptorPool is not VK_NULL_HANDLE, descriptorPool must be a valid VkDescriptorPool handle

- VUID-vkDestroyDescriptorPool-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyDescriptorPool-descriptorPool-parent
  If descriptorPool is a valid handle, it must have been created, allocated, or retrieved from device

**Host Synchronization**

- Host access to descriptorPool must be externally synchronized

Descriptor sets are allocated from descriptor pool objects, and are represented by VkDescriptorSet handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSet)
```

To allocate descriptor sets from a descriptor pool, call:
VkResult vkAllocateDescriptorSets(VkDevice device, const VkDescriptorSetAllocateInfo* pAllocateInfo, VkDescriptorSet* pDescriptorSets);

- **device** is the logical device that owns the descriptor pool.
- **pAllocateInfo** is a pointer to a VkDescriptorSetAllocateInfo structure describing parameters of the allocation.
- **pDescriptorSets** is a pointer to an array of VkDescriptorSet handles in which the resulting descriptor set objects are returned.

The allocated descriptor sets are returned in **pDescriptorSets**.

When a descriptor set is allocated, the initial state is largely uninitialized and all descriptors are undefined. Descriptors also become undefined if the underlying resource is destroyed. Descriptor sets containing undefined descriptors can still be bound and used, subject to the following conditions:

- For descriptor set bindings created with the VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT bit set, all descriptors in that binding that are dynamically used must have been populated before the descriptor set is consumed.
- For descriptor set bindings created without the VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT bit set, all descriptors in that binding that are statically used must have been populated before the descriptor set is consumed.
- Descriptor bindings with descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT can be undefined when the descriptor set is consumed; though values in that block will be undefined.
- Entries that are not used by a pipeline can have undefined descriptors.

If a call to vkAllocateDescriptorSets would cause the total number of descriptor sets allocated from the pool to exceed the value of VkDescriptorPoolCreateInfo::maxSets used to create pAllocateInfo->descriptorPool, then the allocation may fail due to lack of space in the descriptor pool. Similarly, the allocation may fail due to lack of space if the call to vkAllocateDescriptorSets would cause the number of any given descriptor type to exceed the sum of all the descriptorCount members of each element of VkDescriptorPoolCreateInfo::pPoolSizes with a type equal to that type.

Additionally, the allocation may also fail if a call to vkAllocateDescriptorSets would cause the total number of inline uniform block bindings allocated from the pool to exceed the value of VkDescriptorPoolInlineUniformBlockCreateInfoEXT::maxInlineUniformBlockBindings used to create the descriptor pool.

If the allocation fails due to no more space in the descriptor pool, and not because of system or device memory exhaustion, then VK_ERROR_OUT_OF_POOL_MEMORY must be returned.

vkAllocateDescriptorSets can be used to create multiple descriptor sets. If the creation of any of those descriptor sets fails, then the implementation must destroy all successfully created descriptor set objects from this command, set all entries of the pDescriptorSets array to VK_NULL_HANDLE.
Valid Usage (Implicit)

- VUID-vkAllocateDescriptorSets-device-parameter
  *device* must be a valid *VkDevice* handle

- VUID-vkAllocateDescriptorSets-pAllocateInfo-parameter
  *pAllocateInfo* must be a valid pointer to a valid *VkDescriptorSetAllocateInfo* structure

- VUID-vkAllocateDescriptorSets-pDescriptorSets-parameter
  *pDescriptorSets* must be a valid pointer to an array of *pAllocateInfo-*descriptorSetCount* *VkDescriptorSet* handles

- VUID-vkAllocateDescriptorSets-pAllocateInfo::descriptorSetCount-arraylength
  *pAllocateInfo-*descriptorSetCount* must be greater than 0

Host Synchronization

- Host access to *pAllocateInfo-*descriptorPool* must be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_FRAGMENTED_POOL
- VK_ERROR_OUT_OF_POOL_MEMORY

The *VkDescriptorSetAllocateInfo* structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorPool descriptorPool;
    uint32_t descriptorSetCount;
    const VkDescriptorSetLayout* pSetLayouts;
} VkDescriptorSetAllocateInfo;
```

- *sType* is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `descriptorPool` is the pool which the sets will be allocated from.

• `descriptorSetCount` determines the number of descriptor sets to be allocated from the pool.

• `pSetLayouts` is a pointer to an array of descriptor set layouts, with each member specifying how the corresponding descriptor set is allocated.

### Valid Usage

- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-00308  
  Each element of `pSetLayouts` must not have been created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` set

- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-03044  
  If any element of `pSetLayouts` was created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set, `descriptorPool` must have been created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set

- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-04610  
  If any element of `pSetLayouts` was created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE` bit set, `descriptorPool` must have been created with the `VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_VALVE` flag set

### Valid Usage (Implicit)

- VUID-VkDescriptorSetAllocateInfo-sType-sType  
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_ALLOCATE_INFO`

- VUID-VkDescriptorSetAllocateInfo-pNext-pNext  
  `pNext` must be `NULL` or a pointer to a valid instance of `VkDescriptorSetVariableDescriptorCountAllocateInfo`

- VUID-VkDescriptorSetAllocateInfo-sType-unique  
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkDescriptorSetAllocateInfo-descriptorPool-parameter  
  `descriptorPool` must be a valid `VkDescriptorPool` handle

- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-parameter  
  `pSetLayouts` must be a valid pointer to an array of `descriptorSetCount` valid `VkDescriptorSetLayout` handles

- VUID-VkDescriptorSetAllocateInfo-descriptorSetCount-arraylength  
  `descriptorSetCount` must be greater than 0

- VUID-VkDescriptorSetAllocateInfo-commonparent  
  Both of `descriptorPool`, and the elements of `pSetLayouts` must have been created, allocated, or retrieved from the same `VkDevice`

If the `pNext` chain of a `VkDescriptorSetAllocateInfo` structure includes a
The `VkDescriptorSetVariableDescriptorCountAllocateInfo` structure is defined as:

```c
typedef struct VkDescriptorSetVariableDescriptorCountAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t descriptorSetCount;
    const uint32_t* pDescriptorCounts;
} VkDescriptorSetVariableDescriptorCountAllocateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_descriptor_indexing
typedef VkDescriptorSetVariableDescriptorCountAllocateInfo VkDescriptorSetVariableDescriptorCountAllocateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `descriptorSetCount` is zero or the number of elements in `pDescriptorCounts`.
- `pDescriptorCounts` is a pointer to an array of descriptor counts, with each member specifying the number of descriptors in a variable descriptor count binding in the corresponding descriptor set being allocated.

If `descriptorSetCount` is zero or this structure is not included in the `pNext` chain, then the variable lengths are considered to be zero. Otherwise, `pDescriptorCounts[i]` is the number of descriptors in the variable count descriptor binding in the corresponding descriptor set layout. If the variable count descriptor binding in the corresponding descriptor set layout has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` then `pDescriptorCounts[i]` specifies the binding's capacity in bytes. If `VkDescriptorSetAllocateInfo::pSetLayouts[i]` does not include a variable count descriptor binding, then `pDescriptorCounts[i]` is ignored.

### Valid Usage

- **VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-descriptorSetCount-03045**
  If `descriptorSetCount` is not zero, `descriptorSetCount` must equal `VkDescriptorSetAllocateInfo::descriptorSetCount`

- **VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-pSetLayouts-03046**
  If `VkDescriptorSetAllocateInfo::pSetLayouts[i]` has a variable descriptor count binding, then `pDescriptorCounts[i]` must be less than or equal to the descriptor count specified for that binding when the descriptor set layout was created.
Valid Usage (Implicit)

- VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_ALLOCATE_INFO

- VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-pDescriptorCounts-parameter
  
  If descriptorSetCount is not 0, pDescriptorCounts must be a valid pointer to an array of descriptorSetCount uint32_t values.

To free allocated descriptor sets, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkFreeDescriptorSets(
    VkDevice device,  
    VkDescriptorPool descriptorPool,  
    uint32_t descriptorSetCount,  
    const VkDescriptorSet* pDescriptorSets);
```

- device is the logical device that owns the descriptor pool.
- descriptorPool is the descriptor pool from which the descriptor sets were allocated.
- descriptorSetCount is the number of elements in the pDescriptorSets array.
- pDescriptorSets is a pointer to an array of handles to VkDescriptorSet objects.

After calling vkFreeDescriptorSets, all descriptor sets in pDescriptorSets are invalid.

Valid Usage

- VUID-vkFreeDescriptorSets-pDescriptorSets-00309
  
  All submitted commands that refer to any element of pDescriptorSets must have completed execution.

- VUID-vkFreeDescriptorSets-pDescriptorSets-00310
  
  pDescriptorSets must be a valid pointer to an array of descriptorSetCount VkDescriptorSet handles, each element of which must either be a valid handle or VK_NULL_HANDLE.

- VUID-vkFreeDescriptorSets-descriptorPool-00312
  
  descriptorPool must have been created with the VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT flag.
Valid Usage (Implicit)

- **VUID-vkFreeDescriptorSets-device-parameter**
  
  *device must be a valid* `VkDevice` *handle*

- **VUID-vkFreeDescriptorSets-descriptorPool-parameter**
  
  *descriptorPool must be a valid* `VkDescriptorPool` *handle*

- **VUID-vkFreeDescriptorSets-descriptorSetCount-arraylength**
  
  *descriptorSetCount must be greater than 0*

- **VUID-vkFreeDescriptorSets-descriptorPool-parent**
  
  *descriptorPool must have been created, allocated, or retrieved from* `device`

- **VUID-vkFreeDescriptorSets-pDescriptorSets-parent**
  
  *Each element of pDescriptorSets that is a valid handle must have been created, allocated, or retrieved from* `descriptorPool`

Host Synchronization

- Host access to *descriptorPool must be externally synchronized*

- Host access to each member of *pDescriptorSets must be externally synchronized*

Return Codes

**Success**

- **VK_SUCCESS**

To return all descriptor sets allocated from a given pool to the pool, rather than freeing individual descriptor sets, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetDescriptorPool(
    VkDevice device,
    VkDescriptorPool descriptorPool,
    VkDescriptorPoolResetFlags flags);
```

- **device** is the logical device that owns the descriptor pool.

- **descriptorPool** is the descriptor pool to be reset.

- **flags** is reserved for future use.

Resetting a descriptor pool recycles all of the resources from all of the descriptor sets allocated from the descriptor pool back to the descriptor pool, and the descriptor sets are implicitly freed.
Valid Usage

- VUID-vkResetDescriptorPool-descriptorPool-00313
  All uses of descriptorPool (via any allocated descriptor sets) must have completed execution

Valid Usage (Implicit)

- VUID-vkResetDescriptorPool-device-parameter
device must be a valid VkDevice handle

- VUID-vkResetDescriptorPool-descriptorPool-parameter
descriptorPool must be a valid VkDescriptorPool handle

- VUID-vkResetDescriptorPool-flags-zerobitmask
  flags must be 0

- VUID-vkResetDescriptorPool-descriptorPool-parent
descriptorPool must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to descriptorPool must be externally synchronized

- Host access to any VkDescriptorSet objects allocated from descriptorPool must be externally synchronized

Return Codes

Success
- VK_SUCCESS

// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorPoolResetFlags;

VkDescriptorPoolResetFlags is a bitmask type for setting a mask, but is currently reserved for future use.

14.2.4. Descriptor Set Updates

Once allocated, descriptor sets can be updated with a combination of write and copy operations. To update descriptor sets, call:
void vkUpdateDescriptorSets(
    VkDevice device,
    uint32_t descriptorWriteCount,
    const VkWriteDescriptorSet* pDescriptorWrites,
    uint32_t descriptorCopyCount,
    const VkCopyDescriptorSet* pDescriptorCopies);

• `device` is the logical device that updates the descriptor sets.

• `descriptorWriteCount` is the number of elements in the `pDescriptorWrites` array.

• `pDescriptorWrites` is a pointer to an array of `VkWriteDescriptorSet` structures describing the descriptor sets to write to.

• `descriptorCopyCount` is the number of elements in the `pDescriptorCopies` array.

• `pDescriptorCopies` is a pointer to an array of `VkCopyDescriptorSet` structures describing the descriptor sets to copy between.

The operations described by `pDescriptorWrites` are performed first, followed by the operations described by `pDescriptorCopies`. Within each array, the operations are performed in the order they appear in the array.

Each element in the `pDescriptorWrites` array describes an operation updating the descriptor set using descriptors for resources specified in the structure.

Each element in the `pDescriptorCopies` array is a `VkCopyDescriptorSet` structure describing an operation copying descriptors between sets.

If the `dstSet` member of any element of `pDescriptorWrites` or `pDescriptorCopies` is bound, accessed, or modified by any command that was recorded to a command buffer which is currently in the recording or executable state, and any of the descriptor bindings that are updated were not created with the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` or `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT` bits set, that command buffer becomes invalid.

**Valid Usage**

- VUID-vkUpdateDescriptorSets-None-03047
  Descriptor bindings updated by this command which were created without the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` or `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT` bits set must not be used by any command that was recorded to a command buffer which is in the pending state.
Valid Usage (Implicit)

- **VUID-vkUpdateDescriptorSets-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-parameter**
  - If `descriptorWriteCount` is not 0, `pDescriptorWrites` must be a valid pointer to an array of `descriptorWriteCount` valid `VkWriteDescriptorSet` structures

- **VUID-vkUpdateDescriptorSets-pDescriptorCopies-parameter**
  - If `descriptorCopyCount` is not 0, `pDescriptorCopies` must be a valid pointer to an array of `descriptorCopyCount` valid `VkCopyDescriptorSet` structures

Host Synchronization

- Host access to `pDescriptorWrites[]`.dstSet must be externally synchronized
- Host access to `pDescriptorCopies[]`.dstSet must be externally synchronized

The `VkWriteDescriptorSet` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkWriteDescriptorSet {
    VkStructureType          sType;
    const void*              pNext;
    VkDescriptorSet          dstSet;
    uint32_t                  dstBinding;
    uint32_t                  dstArrayElement;
    uint32_t                  descriptorCount;
    VkDescriptorType         descriptorType;
    const VkDescriptorImageInfo*  pImageInfo;
    const VkDescriptorBufferInfo*  pBufferInfo;
    const VkBufferView*       pTexelBufferView;
} VkWriteDescriptorSet;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `dstSet` is the destination descriptor set to update.
- `dstBinding` is the descriptor binding within that set.
- `dstArrayElement` is the starting element in that array. If the descriptor binding identified by `dstSet` and `dstBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` then `dstArrayElement` specifies the starting byte offset within the binding.
- `descriptorCount` is the number of descriptors to update. If the descriptor binding identified by `dstSet` and `dstBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, then `descriptorCount` specifies the number of bytes to update. Otherwise, `descriptorCount` is one
of
•  the number of elements in pImageInfo
•  the number of elements in pBufferInfo
•  the number of elements in pTexelBufferView
•  a value matching the dataSize member of a VkWriteDescriptorSetInlineUniformBlockEXT structure in the pNext chain
•  a value matching the accelerationStructureCount of a VkWriteDescriptorSetAccelerationStructureKHR structure in the pNext chain

• descriptorType is a VkDescriptorType specifying the type of each descriptor in pImageInfo, pBufferInfo, or pTexelBufferView, as described below. If VkDescriptorSetLayoutBinding for dstSet at dstBinding is not equal to VK_DESCRIPTOR_TYPE_MUTABLE_VALUE, descriptorType must be the same type as that specified in VkDescriptorSetLayoutBinding for dstSet at dstBinding. The type of the descriptor also controls which array the descriptors are taken from.

• pImageInfo is a pointer to an array of VkDescriptorImageInfo structures or is ignored, as described below.

• pBufferInfo is a pointer to an array of VkDescriptorBufferInfo structures or is ignored, as described below.

• pTexelBufferView is a pointer to an array of VkBufferView handles as described in the Buffer Views section or is ignored, as described below.
